As regards Adverse Possession against the public, the case might be briefly treated by a paraphrase of the Irishman's essay on the Snakes of Ireland,—"There are no Snakes in Ireland."

Similarly, there can be no adverse possession against the public. The doctrine of common law. "Nullam tempus occurrit regi," (time does not run against the king) has long been accepted as applying here. Court decisions are practically unanimous in declaring that no occupancy of say, a portion of a public street or highway for however long a period, will give the trespasser legal title to the land so occupied. The same holds as regards any real estate owned by the public,—a school ground, a public park, a courthouse or jail lot. So also, of State or United States lands, forest reserves, etc.

The principle underlying this exception to the general doctrine is that in a public matter any one individual can be expected to feel but a slight interest. He is expected to defend his own property against possession, but not public property; nor, in the immense extent of public highways and other public lands can any public officer be expected to so defend it.*

Regarding corporations not public the doctrine is the same as it is regarding individuals. In the case of railways, however, court decisions are inconsistent and conflicting. The growing tendency to regard railway company as a public corporation, tends to give its Right-of-Way more and more the character of a public highway, against which adverse possession cannot run; while in the older view of it as a private corporation, its lands, like those of other private corporations, are as subject to adverse possession as those of an individual. But this is a branch of the doctrine which must be reserved for fuller treatment than is possible in the present paper.

The same plea must be entered as to the decisions of our Supreme Court regarding Adverse Possession in general, which in a paper like this, prepared for Wisconsin engineers, might be expected to receive full and careful treatment. It can only be said at this time, however, that in the main Wisconsin decisions have been in conformity with the general principles which have been laid down.

The exceptions have been so far as we have noted, in that treatment of what has been denominated above as "the Maine-Missouri doctrine." Regarding this doctrine, it is important to note that our court has executed a complete right-about-face. Its earlier decisions (down to and including the Fuller vs. Worth case, for which see below), were, we believe, universally in favor of the Maine-Missouri doctrine. Its later decisions have been squarely against it.*

The total aggregate of property lines which have become fixed by adverse possession is very great and is constantly increasing. The surveyor who has occasion to make re-locations of old lines should know the general provisions of the law on this subject both in his own and in his client's interest. By this it is not meant that the surveyor should usurp the place of judge and jury. His duty as an expert is to escertain and report the facts to his client. A knowledge of the force of adverse possession, however, should in many cases greatly assist him in sifting out and interpreting more or less discordant facts. The surveyor should never lose sight of the fact, that the court and jury have the final decision as to the proper location of the line. They at least are not likely to overlook the authority which the law gives to long continued possession.

In conclusion, the writers can only express again their sense that this subject is one of more importance to surveyors than the scant literature upon the subject would seem to indicate, and their hope that at some future time they may present a more complete treatment of the subject.

*See Stetousha vs. Lamb, 18 Neb. 619, 26 Nw. 374; O'Brien vs. Goslin, 20 Neb. 349, 30 Neb. 274.

*For cases supporting the above view see Charlotte vs. Pembroke Iron Works, 82 Me. 391; O'Connor vs. Pittsburg, 18 Pa. St. 187; Arundell vs. McCulloch, 10 Mass. 70; Milham vs. Sharp, 27 N. Y. 611. For contrary decisions, see Knight vs. Heaton, 22 Vt. 480; Beardslee vs. French, 48 Am. Dec. 507; Weber vs. Chapman, 42 N. H. 326, 80 Am. Dec. 111.

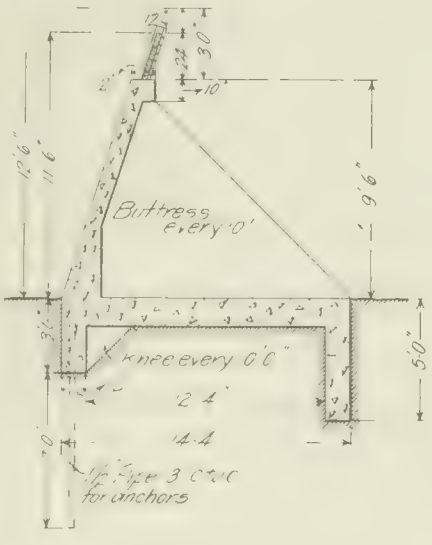
*See in favor of that doctrine: Graeven vs. Dieves, 68 Wis. 317; Fairfield vs. Barrette, 73-463; Dhein vs. Benscher, 83-316; Fuller vs. Worth, 91-406. And against it: Bishop vs. Bleyer, 105-330; Wollman vs. Ruehle, 104-693; Welton vs. Poynter, 96-406; Meyer vs. Hope, 101-123; Gilman vs. Brown, 91 N. W. 227, and the Jones Island case (Illinois Steel Co. vs. Various parties), of which references are not at hand.

LETTERS TO THE EDITOR.

What Caused the Failure of the Dansville Dam?

Editors: Descriptions of the failure of a dam at the plant of the George Sweet Manufacturing Co., near Dansville, N. Y., have appeared in the technical press and the only cause assigned has been poor workmanship. I enclose a sketch of the cross section from which all reinforcement has been omitted as not being necessary to elucidate my idea of the cause of failure.

The dimensions are as shown and the face slab reinforcement was designed to take care of the conditions raised by a flood level of 3 ft. over the top of the dam or 1 ft. over the top of the flash boards. The total length of the dam was 123 ft., and it cracked at a point 58 ft. from one end. This you will notice is very near the middle of the dam; in fact, about 3 ft. from the middle. I do not blame poor workmanship except as a contributing cause, for the design, in my opinion, is poor.



Sketch Section of Dansville Dam.

The face of the dam is nearly vertical, whereas with modern buttressed slab concrete dams the idea is to have the slab slope so the resultant pressures will serve to anchor the dam and strike the bottom slab within the middle third. In fact, the greater the flood height, within certain limits, the more stable the dam.

In a dam of the form here shown the pressure will be nearly horizontal and the bottom slab is turned into a girder 12 ins. thick and 14 ft. 4 ins. deep lying on top of the gravel and not supported at the ends so that proper reactions will be set up. Neither is it reinforced along the lower edge so it will act as a reinforced girder. It will be a nice little exercise in structural design for some of your readers to calculate the resisting moment of a plain concrete girder 12 ins. thick, 14 ft. 4 ins. deep, and having a span of 123 ft. The dam failed when the water reached a height of about 10 ft. above the floor slab. The pressure against the face of the dam can be calculated for such a condition and applied as a continuous load to find the bending moment exerted on the floor slab. The floor slab (thin, deep girder) can be assumed as resting on water-soaked gravel and therefore receiving little, if any, assistance from friction. My belief is that if reinforcement had been placed in the slab at its junction with the heel wall, sufficient in amount to properly reinforce the floor slab as a girder, the dam might be standing today. My sympathy is generally with the contractor in reinforced concrete failures. I have investigated many and while certain defects in workmanship were grave enough to make the structures dangerous, even though not unsafe, I have found too great a proportion due to defective design.

Q. E. F.

Chicago, Ill., Jan. 27, 1910.

The Reinforced Concrete Girder Bridge at Florence, Arizona—a Correction.

Sirs: I wish to thank you for your very friendly criticism of my plans for the reinforced concrete girder bridge at Florence, Arizona, in your issue of Jan. 19, 1910. I note that you give my address as Tucson, Arizona, and would appreciate your making the correction to the above address, as I have never lived in Tucson.

Thanking you again for your courtesy, I am

Very truly yours,

RICHARD R. RYAN,
Designing Engineer.

230 North Third St., Phoenix, Arizona, Jan. 24, 1910.

Reimbursing Contractors for Expense and Time Involved in Submitting Bids.

Sirs: We have been informed that in some places in the United States the custom obtains of reimbursing contractors for expense incurred and time involved in submitting bids. Can you give us any information about this?

H. C. McL.

Toronto, Ont., Jan. 20, 1910.

(If the custom referred to is in operation anywhere we hope to hear from such of our readers as possess knowledge concerning it. We know that nearly all contractors hope something of this sort will come to pass, but we do not know where the custom has been adopted. In Great Britain on certain classes of work, generally building operations, quantity surveyors take off quantities and contractors base their bids on these quantities, the surveyors being under heavy bonds to guarantee the accuracy of their work. This cuts down very largely the expense of estimating and mistakes are largely avoided. One man can take off the quantities very accurately at one-twentieth the expense of 20 men employed by 20 contractors, all of whom are hurried and likely to overlook some important items. This custom has not been established in the United States, although we know quantity surveyors from England who have tried to establish themselves in American cities. They have ended by becoming estimators for contractors or adjusters for insurance companies. A comparison of costs seems to indicate that it makes very little difference to the owner whether 20 men figure a job independently or whether the 20 men pay one man to figure quantities. This being the case it would look like common sense for the 20 men to get together and employ quantity surveyors under bonds to take off quantities. The bids would then be based on each bidder's idea of his own ability to buy material and handle labor. The cost of estimating is at present too high.—Editors.)

Sawdust Roads.—Sawdust roads are being constructed in Leon County, Florida, as follows: Two ridges of earth are thrown up with a road machine at the required width from each other and the space between is filled with a 6-in. bed of sawdust. This is followed with a smaller machine, which plows up and mixes the earth with the sawdust. The cost of construction is about $397 a mile.

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Railway Engineering and Maintenance of Way Association.
March 15-17, 1910. Annual convention at Chicago, Ill. Secy., E. H. Fritch, 962 Monadnock Block, Chicago, Ill.

American Society of Engineering Contractors.
Feb. 24-26, 1910. Annual convention at Chicago, Ill. Secy., Daniel J. Hauer, Park Row Building, New York, N. Y.

Connecticut Society of Civil Engineers.
Feb. 8, 1910. Annual meeting at New Haven, Conn. Secy., J. Frederick Jackson, Box 1304, New Haven, Conn.

Engineering Society of Wisconsin.
Feb. 23-25. Annual meeting at Milwaukee, Wis. Secy., W. G. Kirchoffer, 31 Vroman Bldg., Madison, Wis.

Illinois Association of Municipal Contractors.
Feb. 24-26. Annual meeting at Chicago, Ill. Secy., Orie T. Dunlap, Edwardsville, Ill.

Illinois Lumber Dealers' Association.
Feb. 16-18. Annual meeting at Chicago, Ill. Secy., Geo. K. Hotchkiss, 315 Dearborn St., Chicago.

Illinois Masons' Supply Association.
Feb. 16-18. Annual meeting at Chicago, Ill. Secy., Geo. K. Hotchkiss, 315 Dearborn St., Chicago.

Interstate Mantle and Tile Dealers' Association.
Feb. 15-19. Annual meeting at Chicago, Ill. Pres., Joseph W. Lantry, Wm. H. Jackson Co., Union Square, New York City.

Iowa Association of Cement Users.
March 9-11, 1910. Annual meeting in Cedar Rapids, Ia. Secy., Ira A. Williams, Iowa State College, Ames, Iowa.

Iowa Engineering Society.
Feb. 16-17, 1910. Annual convention at Cedar Rapids, Ia. Secy., A. H. Ford, Iowa City, Ia.

Missouri Highway Engineers' Association.
Feb. 17-18. Annual meeting at Kansas City, Mo. Secy., Curtis Hill, Columbia, Mo.

National Association of Cement Users.
Feb. 21-25, 1910. Annual meeting at Chicago, Ill. Secy., Geo. C. Wright. Address all communications to Edw. E. Krause, Asst. to the President, Harrison Bldg., Philadelphia, Pa.

National Brick Manufacturers' Association.
Feb. 7-12, 1910. Annual convention at Pittsburg, Pa. Secy., T. A. Randall, Indianapolis, Ind.

Ohio Engineering Society.
Feb. 8-10. Annual meeting at Columbus, Ohio. Secy., C. J. Knisley, New Philadelphia, O.

Northwestern Cement Products Association.
Feb. 18-21, 1910. Annual meeting at Chicago, Ill. Chairman of Executive Committee, O. U. Miracle, Minneapolis, Minn.

Western Drainage Contractors' Association.
Feb. 17, 1910. Fort, Dodge, Ia. Secy., S. F. Moeller, Knierim, Ia.

Notes from Technical Societies.

New England Water Works Association.—The officers of the New England Water Works Association elected for the ensuing year are as follows: President, George A. King; vice-presidents, Allen Hazen, Erman M. Peck, Michael F. Collins, Leonard Metcalf, Irving S. Wood, Frank A. McInnes; secretary, Willard Kent; treasurer, Lewis M. Bancroft; editor, Richard K. Hale.

American Society of Civil Engineers.—The following officers were elected at the 57th annual meeting of the American Society of Civil Engineers on Jan. 19: President, Mr. John A. Bensel, New York; vice-presidents to serve two years, Col. John T. Fanning, Minneapolis, Minn., Mr. Hunter McDonald, Nashville, Tenn.; directors, to serve three years, Mr. William E. Belknap and Mr. Horace Loomis of New York City, Mr. George A. Kimball, Boston, Mass., Mr. Percival Roberts, Jr., Philadelphia, Pa., Mr. Charles F. Loweth, Chicago, Ill., Mr. Arthur D. Foote, Grass Valley, Cal.

Nebraska Cement Users' Association.—The fourth annual convention of the Nebraska Cement Users' Association will be held in Lincoln, Neb., Feb. 1-3. In addition to the regular committee reports, the following papers and addresses will be presented: The Cement Block, Thos. Dougherty; Waterproofing Cement Blocks, Prof. Elmer E. Blackman; Art in Cement Stone, C. R. Lininger; Practical Hints to Develop the Cement Industry, Chas. D. Warner; Concrete Culverts and Country Bridges, C. A. P. Turner; Concrete Roadways B. F. Dippold; Ten-Minute Talk on Cement Tile, G. F. Lillie; Concrete Paving for Nebraska, H. C. McCord. There will be an exhibition of tools, machinery, etc., at the Auditorium. Mr. L. E. Porter, York, Neb., is president and Mr. Peter Palmer, Oakland, Neb., secretary-treasurer.

Indiana Engineering Society.—At the 13th annual convention of the Indiana Engineering Society in Indianapolis, Ind., Jan. 13, 14 and 15, the following officers were re-elected for another term: President, Mr. Edwin E. Watts; vice-president, Mr. C. C. Brown; secretary-treasurer, Mr. Charles Brossman; trustees, Messrs. D. B. Luten, W. S. Moore, W. K. Hatt, C. A. Tripp. The principal papers and discussions were on the subject of road and street improvements, and the society passed resolutions favoring the creation of a state highway commission. The subjects of stream pollution and sewage disposal were next in importance to highway work. A number of papers were presented which will shortly be printed in the proceedings.

The report of the Board of Directors for 1909 gave the membership of the society as 5,292, on Jan. 1, 1910, of whom 2,567 are members, 1,829 associate members, 701 juniors and the remainder are divided among associates, fellows, corresponding and honorary members. From 1895 to 1899, inclusive, the increase in membership was 24 per cent; from 1900 to 1904, inclusive, the increase was 45.6 per cent, and from 1905 to 1909, inclusive, the increase was 65.2 per cent. It is believed that at the present rate of increase the total membership will exceed 10,000 in less than seven years. In the past seven and one-half years the membership has doubled. The library now contains 65,751 individual pieces, of which 18,593 are bound and 36,243 are unbound volumes.

Engineers Society of Western Pennsylvania.—The 30th annual meeting of the society was held in Pittsburg Jan. 18, Mr. E. K. Morse, who succeeded to the presidency on the death of Geo. T. Barnsley in October, presiding. The annual report of the Board of Directors, including the reports of committees, sections and the treasurer, was read, indicating the general prosperity of the society during the past year. The membership of the society at the close of the year was 835. The following officers were elected for the ensuing year: President, E. K. Morse; vice-president, J. O. Handy; treasurer, A. E. Frost; directors, A. R. Reymer and Willis Whited. The annual banquet was held Jan. 29 at 6 o'clock in the Fort Pitt Hotel. Among the speakers were Geo. H. Neilson, toastmaster; President E. K. Morse; Dr. J. A. Holmes, director technologic branch of the U. S. Geological Survey; the Rev. Dr. Maitland Alexander; Geo. C. Johnston, and Frederick L. Bishop, the new head of the physics department of the University of Pittsburg.

Personals.

Mr. George T. Bolton has been appointed City Engineer of Cohoes, N. Y.

James W. Fuller, President of the Lehigh Car Wheel & Axle Works, Catasauqua, Pa., died Jan. 15.

Mr. Christopher Harrison has been appointed City Engineer of Everett, Mass., for the 12th consecutive time.

Samuel R. Probasco, Chief Engineer of the Department of Bridges of New York city, from 1898 to 1901, died Jan. 19, at his home in Burlington N. J.

Mr. Chas. T. Main, Mill Engineer and Architect, Boston, Mass., has moved his offices to Rooms 817-833, Boston Safe Deposit & Trust Co. Bldg., Boston, Mass.

Mr. Samuel Whinery, Consulting Engineer, New York city, has been retained by the city of Trenton, N. J., to investigate the street railway conditions in that city.

Mr. B. M. Laughead has been appointed Locating Engineer of the Buckhannon & Northern R. R., with headquarters at Morgantown, W. Va. The Buckhannon & Northern R. R. will extend from the Pennsylvania-West Virginia state line up the Monongahela River to Rivesville, W. Va.

Mr. Julius M. Bischoff was recently elected an Associate Member of the American Society of Civil Engineers. Mr. Bischoff is at present engaged on the reconstruction of the east approach of the Merchants' Bridge under traffic at St. Louis. He is Assistant Engineer of the Terminal Railroad Association of St. Louis.

Walter A. Brown, formerly Assistant City Engineer of Springfield, Mass., died Jan. 15, at the home of his father in that city. Mr. Brown was connected with the City Engineer's Department until 1907, when he removed to Greenfield, Mass., to go into an engineering business for himself.

Mr. Alexander Johnson, heretofore Consulting Engineer in the Department of Bridges of New York city, has been appointed Chief Engineer, succeeding Mr. Lazarus L. Mayer, who was recently appointed Bridge Commissioner. During the construction of the Williamsburg Bridge in New York city Mr. Johnson was Assistant Engineer under Mr. L. L. Buck, and as Consulting Engineer he had charge of the erection of the Manhattan Bridge.

Randolph MacDonald, a well known Canadian Contractor, died suddenly Jan. 21 at his home in Toronto, Ont. He built several important links of the Canadian Canal system, including Sections 1 and 2 of the Lachine Canal, Section 13 of the Soulanges Canal at Coteau Landing and Section 9 at Coteau du Lac, the last two sections costing $1,200,000.

Fayette Brown, President of the Brown Hoisting Machinery Co., of Cleveland, O., died Jan. 20, at his home in that city, aged 87 years. In 1880 Mr. Brown, with his two sons, Harvey H. and Alexander E., organized the Brown Hoisting & Conveying Co., which has since been reorganized into the Brown Hoisting Machinery Co. At the time of his death Mr. Brown was also Chairman of the Stewart Iron Co. and President of the Union Steel Screw Co., and the National Chemical Co.

Mr. F. A. Hall, who for the past twelve years has been Manager of the Chain Block & Hoist Department of the Yale & Towne Mfg. Co., 9 Murray St., New York, has resigned his position in order to accept election as Vice-President and Treasurer of the Cameron Engineering Co., of Brooklyn, N. Y. Mr. Hall's successor will be Mr. R. T. Hodgkins, who for several years has been his chief assistant. In his new connection Mr. Hall expects to make a specialty of trolleys and appliances for overhead handling of materials.

Mr. Edward B. Richardson, formerly Assistant Engineer with Messrs. Hollis French and Allen Hubbard, Consulting Engineers, and Mr. Richard K. Hale, formerly Assistant Engineer with Mr. Robert Spurr Weston and Messrs. Metcalf and Eddy, Consulting Engineers, have formed a partnership under the firm name of Richardson & Hale, and will engage in practice as Consulting Engineers with offices at 85 Water St., Boston, Mass., making a specialty of Mechanical, Electrical, Hydraulic and Sanitary Engineering.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Clinton Electrically Welded Wire.—Paper 9x12 ins. 48 pp. Clinton Wire Cloth Co., Clinton, Mass.

This handsome book shows examples of the use of Clinton electrically welded wire cloth and gives typical details of reinforced concrete floors, in which this wire cloth is used for reinforcement.

Parsons Trench Excavators.—The G. W. Parsons Co., Des Moines, Iowa.

A circular letter describes the Parsons Trench Excavator and is accompanied by half-tone views of the machine in operation in different cities.

Instruments of Precision.—Paper. 6x9 ins. 240 pp. C. L. Berger & Sons, 39 Williams street, Boston, Mass.

Part I of this book is a treatise on engineers' field instruments, their manufacture, adjustment and use, with description of gradientor, stadia, solar attachments, etc. Part II is a catalogue of the instruments made by this firm, with prices of same. Many of the illustrations are in color.

Engines, Pumps and Concrete Mixers.—The Fairbanks Co., Broome & Lafayette Sts., New York, N. Y.

Gas and gasoline engines are shown in many combinations in Bulletin 11; the Clover Leaf tilting concrete mixer in Bulletin 16 and the Albany Pump mounted for road contractors' use is described in a special circular.

Cost of Steam Shovel Work.—John Souther & Co., 185 Summer St., Boston, Mass.

This firm sends in a pamphlet full of useful data entitled "The Cost of Steam Shovel Work in Railway Betterment," and one entitled "Gravel and Hard Pan Steam Shovel," both circulars having special reference to the Souther shovel.

Ferro-Inclave.—Paper. 6x9½ ins. 40 pp. The Brown Hoisting Machinery Co., Cleveland, Ohio.

Ferro-Inclave is the name given to sheets of corrugated steel that fit by driving the ends together. It is used for roofs, sides of buildings and sides and bottoms of tanks. When put in place it is covered with plaster which is held in place by the corrugations. This booklet contains full instructions for use.

Koppel Railways for Contractors.—Paper. 6x9 ins. 18 pp. Orenstein-Arthur Koppel Co., Pittsburg, Pa.

This booklet describes and illustrates the use of small steel dump cars on contractors' work. This firm has a number of books, each devoted to some special piece of equipment for contractors and industrial plants.

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The Supreme Court of Indiana has reversed its former decision and has decided that the gravel road law is constitutional. This will result in the resumption of much gravel road work.—Two large contracts for levee and drainage work were let during the past week. One of these calling for the construction of 1,000,000 cu. yds. of earth work for the Burleson County Improvement District of Texas was secured by Roach & Stansell, Memphis, Tenn., at $176,000. The other contract, calling for 1,492,759 cu. yds. of levee work and 235,000 cu. yds. of ditch work near Carrollton, Ill., was secured by R. H. McWilliams, of Chicago, Ill., and J. A. McWilliams, of Mattoon, Ill.—Among the larger railroad contracts of the week are the following: J. W. Wright, Jr., Union Springs, Ala., for a 26-mile extension of the Union Springs & Northern R. R. in Alabama; the Electric Traction Construction Co., of Kansas City, Mo., for constructing the projected line of the Kansas Northwestern Ry.; the Electric Traction Construction Co. was also awarded the contracts for constructing the projected line of the Wheeling, Cadiz & Tuscarorus Traction Co.; the Utah Construction Co., Ogden, Utah, for grading 80 miles of the proposed Harriman road across Central Oregon; P. Welch of Foley, Welch & Stewart, for constructing 50 miles of the Victoria, Vancouver & Eastern R. R.—One feature of the week is the number of steam and electric railways which have advanced their preliminary work so far that it is only a question of a few days before construction contracts will be let. Among these companies are the following: Wichita Falls & Northwestern Ry., 60 miles of steam line to be let this month; the Raleigh & Southport Ry. steam line, extension to be let at once; San Diego, El Cajon & Escondito Ry., 60 mile electric line, to be let this month or next; Duluth, Winnipeg & Pacific Ry., 75 mile steam line, to be let this spring; the Pine Pass Ry., a 597 mile line in Canada, to be let soon; the Toledo, St. Louis & New Orleans R. R., 146 mile line, clearing contracts let and grading contracts to be let in March or April; and the Fostoria, Napoleon & Defiance Ry., a 53 mile line, contracts to be let early in April. —The contracts for the excavation of canals in the Everglades in Florida, bids for doing which were opened Sept. 22 last, is still hanging fire, the Trustees of the Internal Improvement Fund having not yet made a definite decision.—Jones Bros., of Cincinnati, have secured a large contract for excavation and foundation work for the new plant of the American Rolling Mills Co., at Middletown, O. The contract includes 60,000 cu. yds. of concrete masonry.—George W. Jackson, Inc., Chicago, Ill., and 46 Wall St., New York, was the low bidder, Jan. 24, for Contract 54, for constructing the Yonkers Siphon for the Board of Water Supply of New York City, his bid being $1,479,425.

The New York State Barge Canal.

Rapid progress was made during the past year in constructing the New York State Barge Canal. At the end of 1909 76 per cent of the total length had been placed under contract and it is expected that the whole of it will be let by April 1 next. The total length of the Barge Canal system, exclusive of the Niagara River, which is being improved by the federal government, and the Hudson River below Waterford, which it is anticipated the government will improve, is 433 miles. Of this amount at the end of 1909 314.2 miles were under contract at prices aggregating $54,138,329. In addition plans for 67.7 miles had been completed, plans for 9 miles more were over 75 per cent finished and the plans for the remaining 20.5 miles were well under way. Of the 53 new locks 15 had been completed at the end of the year, with the exception of gates and operating machinery. By a year from next spring it is expected that the eight movable dams in the Mohawk River will be in operation and will be used to aid in the dredging of the channel, by retaining water for the floating of dredging machinery. The large fixed dam across the Mohawk River near Crescent will be finished during next summer, as will also the concrete dam impounding the waters of the upper Mohawk at Delta in a reservcir having a flooded area of 2,800 acres. An important feature of the Barge Canal work is that it is being done within the original estimates. The estimates made in 1903 for construction on the portions of the canal now under contract amounted to $56,791,537, while the contract price for this work as revised by alterations was $54,138,329, or $2,653,208 within the original estimates.

Car Shortage in Iowa.

The state of Iowa has a car shortage at the present time and the following ingenuous explanation of the cause of it is being put forward by some of the papers of that state: This is the season of the year when the county assessors are beginning to make their assessments of the rolling stocks of railroad companies. These companies are required to pay an annual tax of 43 mills on the assessed value of their rolling stock in Iowa. It is now being argued that in order to reduce this tax as much as possible, the railroads are getting as much of their rolling stock out of the state as is possible and still have enough in Iowa to make an attempt to handle their business. Each county assessor fixes the valuation on the stock which he finds in his county. Hence there is every reason to believe, say those who have investigated the shortage, that just now the companies are getting their cars beyond the confines of the state in order to escape the assessment.

Gravel Road Work in Indiana.

There is great rejoicing among the road contractors, county commissioners, and bond buyers in Indiana over the recent decision of the state supreme court declaring the "3-mile gravel road" law constitutional. Since last November, when the court declared the law unconstitutional, there has been little doing in Indiana in the gravel road construction line. Many contracts under way were held up owing to the fact that county commissioners could not sell the bonds to pay for the work, and many contracts that were about to be let were held in abeyance. By the decision that the gravel road law is valid several million dollars is made secure to bond purchasers, to the contractors and to the various county authorities. In one county alone, Hamilton, work aggregating nearly $500,000 is affected. In another county, Madison, one construction company had contracts for 95 miles of gravel roads, work on which will now be started.

The man who stole a red hot stove will have a kindly feeling for the three men now under arrest at Binghamton, N. Y., charged with stealing a railway bridge. The bridge was a small, 40-ton structure, which had been replaced by a heavier one and was temporarily stored along the track near by. The three men are said to have carted the bridge to the city and sold it to a junk dealer for $18 and three drinks.

According to a report of the Secretary of State of Georgia ten railroads with a total capitalization of $2,227,000 and trackage of 424 miles were chartered in Georgia in 1909. Charters were also issued to two new electric railway lines with a total of 12 miles and a total capitalization of $200,000.

The prairie section of the transcontinental line of the Grand Trunk Pacific Ry. was completed on Jan. 22, when steel was laid to Wolf Creek at the foot of the Rocky Mountains, where the mountain section begins.

A bill is now before the Brazilian congress for extensive irrigation works, the cost to be defrayed by the issue of bonds, and the work to be done by railroad companies in whose zones the land to be improved lies.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ALABAMA.

J. W. Wright, Jr., Union Springs, Ala., has been awarded contracts to build an extension for the Union Springs & Northern R. R. from Fort Davis to Milstead, Ala., 26 miles. The contract provides for all grading, track laying and bridging, work to be completed in four months. Quite a good deal of this work will be let to station men.

CALIFORNIA.

The San Diego, El Cajon & Escondito Ry. Co. has completed surveys and has partly secured the capital for the construction of its projected 60-mile electric railway from San Diego to Escondido. Contracts for the construction of the railway will be let within 60 days. F. M. Fairchild, Oakland, Cal., is Chief Engineer, A. C. Riordan, San Diego, is President, and G. W. Pursell, San Diego, is General Manager.

We are advised that the contract for work north of Alturas on the Nevada-California-Oregon Ry. has not yet been let. Press reports stated that this contract had been let to Nugent & Richardson. Geo. S. Oliver, Reno, Nev., is Chief Engineer.

Grant Brothers Construction Co., 619 Security Bldg., Los Angeles, Cal., is working on a contract for about 4 or 5 miles of rock work on the Arizona Eastern R. R. The work includes a tunnel about 1,000 ft. long. The concrete work has been sublet, but the remainder of the work is being done by the Grant Brothers Construction Co. with its own equipment.

IDAHO.

The Pacific & Idaho Northern Ry. has completed surveys for a 16-mile extension from Evergreen to Meadows Valley, Idaho. The capital for the construction of this extension is available, but the date for awarding construction contracts has not been determined. E. M. Heigho, Weiser, Idaho, is President.

ILLINOIS

The Toledo, St. Louis & New Orleans R. R. Co. has completed surveys and has partly secured the capital for the construction of its projected 146-mile line. The route is as follows: Carmi, Ill., to Brookport, Ill., opposite Paducah, Ky., via Ridgeway, Lawler, Karbers Ridge and Golconda, with a branch to Thebes, Ill., via Big Bay, Oaktown and Tamms. Contracts for clearing the right of way have been let to P. J. Engles, Hicks P. O., Hardin County, Ill. The other contracts will be let in March or April. N. M. Burns, 948 Pierce Bldg., St. Louis, Mo., is President.

The Decatur, Illinois & Mattoon Transit Co., has asked a 2-year extension of its franchise in Sullivan. The company projects a 48-mile electric line through Sullivan, Dalton, City, and Mt. Zion to Decatur. Surveys for the line have been made, but the capital for construction has not been secured as yet and the time for awarding contracts is indefinite. A. M. Shaw, Dixon, Ill., is Engineer, and R. B. Starbuck, Mattoon, Ill., is President.

KANSAS.

Surveyors are now in progress for the projected 118-mile line of the Dakota, Kansas & Gulf R. R., from Beloit, Kan., to Kearney, Neb. W. H. Mitchell, Beloit, Kan., is President and Baxter L. Brown, St. Louis, Mo., is Chief Engineer.

The Electric Traction Construction Co., Commerce Bldg., Kansas City, Mo., has been awarded the contract for constructing the projected line of the Kansas Northwestern Ry., and has started work. Sub-contracts for the grading will be let on Feb. 10. The construction company is in the market for 60-lb. rails, spikes, cars, etc. The road starts from Great Bend, Kan.

The Garden City Gulf & Northern R. R. Co. of Garden City, Kan., will begin the construction of 75 miles of road south from Garden City by March 1. It is the intention to place all of this work under contract, but the company will likely award the work to the local contractors in sections of not exceeding five miles each. E. A. Tennis, Garden City, Kan., is interested.

KENTUCKY.

Sims Brothers, Railroad Contractors, Hanson, Ky., have some cart and car work to let. The work is suitable for small outfits and the prices are good.

MASSACHUSETTS.

The Engineering Department of the Boston & Maine R. R. has made estimates for building second track for about one mile at Gloucester, Mass., and has orders to make preliminary studies for eliminating grade crossings in Salem. This work if executed would mean rebuilding about ¾ of a mile through Salem.

MINNESOTA.

The Duluth, Winnipeg & Pacific Ry. has completed surveys and has secured the capital for the construction of its 75 mile steam line from Virginia, Minn., to Duluth. Construction contracts will be let in the spring. D. B. Hanna, Toronto, Ont., is President, and H. T. Hazen, 619 Lyceum Building, Duluth, Minn., is Chief Engineer.

MISSOURI.

Surveys have been made upon a 7½-mile electric railway to extend from Moberly, Mo., to Huntsville, Mo. The capital for the construction of the line has been secured and contracts will be let shortly. The work will involve the moving of 50,000 cu. yds. of material. C. B. Judd is Chief Engineer, and Calvin Manning, Ottumwa, Ia., is President.

MONTANA.

The Whitefish, Kalispel & Polson Electric Ry. Co. has been incorporated with a capital stock of $200,000 and proposes the construction of an electric railway from Kalispel northward to Whitefish and southward through Somers and Polson on the west shore of Flathead Lake. No work is to be done in the near future on the proposed line. G. H. Adams, Kalispel, Mont., is interested.

NORTH CAROLINA

The Raleigh & Southport Ry. Co. has arranged to extend its line south of Fayetteville, passing through Bladen County, but has not yet decided exactly where the construction will stop. It is expected to touch and perhaps cross the Seaboard Air Line Ry. between Clarkton and Wilmington, N. C. The line is now being surveyed and the location will begin next week, ties are being contracted for and grading will begin very soon. J. A. Mills, Raleigh, N. C., is President and General Manager.

NORTH DAKOTA.

The Great Northern Ry. has not yet definitely decided on the plans for its proposed cut off in this state. Ayr, Cass county, will be the eastern terminal and Surrey in Ward county, will be the western terminal. R. E. Taft, St. Paul, Minn., is Engineer of Construction, Great Northern Ry.

OHIO.

Peter McCave, Route 1, Washingtonville, O., is promoting a project for the construction of an electric railway from Youngstown to Salem, by way of Greenford and Lisbon. The total projected length is 34 miles.

The Electric Traction Construction Co., Commerce Bldg., Kansas City, Mo., has the contract for constructing the projected line of the Wheeling, Cadiz & Tuscarorus Traction Co., from Cadiz, O., and will sublet the grading, 46 bridges, trestles and culverts. A 60-lb. rail will be used and the construction company is in the market for rails, copper wire, poles, ties, etc.

The Fostoria, Napoleon & Defiance Ry. Co., which projects a 53-mile line, has secured the construction capital in part and his assurances of securing the remainder. Contracts will be let early in April. This company was recently incorporated and surveys for the line have not been made as yet. Chas. A. Bliss, 1047 Ohio Bldg., Toledo, O., is President. R. T. Betts, Toledo, O., is also interested.

OKLAHOMA.

The Wichita Falls & Northwestern Ry. has completed surveys and has secured the capital for the construction of its projected 60-mile steam line from Altus, Okla., west via Duke and Hollis, Okla., to Wellington, Tex. Contracts for the construction of the line will be let this month. J. A. Kemp, Wichita Falls, Tex., is President, and R. A. Thompson, Wichita Falls, Tex., is Chief Engineer.

OREGON.

The Union Traction & Terminal Co. of Coos Bay, has been formed and projects an electric railway from Marshfield, Ore., along the west shore of Coos Bay to North Bend, Ore. J. M. Blake, Marshfield, Ore., is president, and R. O. Graves, Marshfield, is secretary.

UTAH.

The Oregon Short Line R. R. has surveys under way for the construction of double tracks from Ogden, Utah, to Farmington, a distance of 21.4. The capital for the work has not been allotted as yet, and the time for letting contracts is indefinite.

We have received the following information under date of Jan. 23 regarding the recent flood damages to the San Pedro, Los Angeles & Salt Lake R. R.: "It is true that our road has experienced the worst flood in its history, in the Clover Creek Canyon and the Meadow Valley Wash, in the eastern part of Lincoln County, Nevada. The road-bed and track structures have been very seriously damaged and in part destroyed for a distance of 85 miles, and owing to the severe and unusual winter weather conditions, we are temporarily out of business as a through line. As yet nothing definite has been determined about the future procedure but investigations are on foot as to the advisability of rebuilding on the old line or seeking a new location not subject to the destructive floods which have been experienced in Clover Creek Canyon and Meadow Valley Wash."

WASHINGTON

The contract for the first 17 miles of the Toppenish, Simcoe & Western R. R. was let Jan. 17 to O. F. Leonard, railroad, canal and drainage contractor, North Yakima, Wash. Wm. H. Redman is Chief Engineer T. E. & W. R. R.

As stated in our last issue the J. H. Flick Construction Co., Old Colony Building, Chicago, Ill., has been awarded a contract for filling in a number of bridges on the line of the Chicago, Milwaukee & Puget Sound Ry. The contract calls for the filling in of a number of very large bridges, the work involving in the neighborhood of 2,000,000 cu. yards of material. The Flick Construction Co. will handle the work with about 70 12-yd. air dump

Over 40 years building Contractors' Tents, Tarpaulins and Canvas Goods of Every Kind

Stable Tent **30 x 49** 10 oz. army duck, roped on ridge, eaves, across bottom of gables and every seven feet over top with 6 foot detachable 10 oz. S. F. walls and poles for **$160.00** net. First-class in every respect. Other sizes and weights in same proportion. *Write for Catalogue.*

MORRISON TENT & AWNING CO., 115-117 OLIVE STREET ST. LOUIS, MO.

Western Wheeled Scraper Co. cars, using locomotives of the Baldwin consolidation type, eight drivers, 128,000 lb. on drivers. Work will be begun immediately.

CANADA.

The Pine Pass Ry. Co. has completed surveys for its projected 597 mile railway from Edmonton, Alberta, to Peace River, thence west through Pine Pass and South to Fort George. The matter of securing the capital for construction is under consideration and contracts will be let soon. M. Kimpe, Edmonton, Alberta, is interested.

Power Developments, Levees, Drainage and Irrigation Works.

COLORADO.

The Kiowa Valley Reservoir & Irrigation Co. is planning the construction of an irrigation system in Arapahoe and Elbert Counties to include about 90 miles of ditch work and three reservoirs. There is no rock work in any of it, as all of the work is in ground easy to move. The company will be glad to have contractors figure on the work. Lee A. Reynolds, 211 McPhee Bldg., Denver, Colo., is Secretary of the company.

ILLINOIS.

R. H. McWilliams, Royal Trust Bldg., Chicago, Ill., and J. A. McWilliams, Mattoon, Ill., were awarded the contract for levee and ditch work, bids for which were opened Jan. 20 at Carrollton, Ill. The work includes the construction of a levee (1,492,759 cu. yds.), muck ditch (42,220 cu yds.), and a drainage ditch (192,730 cu. yds.).

IOWA

The Indiana Drainage Co., Thompson, Ia., has been awarded the contract for open ditch work for four county drainage districts, bids for which were opened Jan. 21, at Forest City, Ia. The contract for tile work was let to Chris. Axelson, Martnus Sorensen and R. J. Cox. The open ditch work was let at 12¼ cts. per cubic yard. The work includes the following: 176,000 cu. yds. of open ditch work and 240 rods of 12-in. tile drains in District No. 1; 32,400 cu. yds. open ditch in Drainage District No. 8; 685 rods 6, 8, 10 and 12-in. tile drains in Sub-District No. 1, Drainage District No. 3.

INDIANA.

Contracts will be let Feb. 12, at the office of G. F. Stinchfield, County Surveyor, Valparaiso, Ind., for constructing the Jones ditch. The proposed work will be the construction of a dredge ditch, 6.41 miles long, 10 ft. base, requiring 93,454 cu. yds. of excavation. The estimated cost is $6,530. The contract for the construction of the Swanson-Lamporte ditch will be let Mar. 1 at the office of Mr. Stinchfield. This ditch is to be 8 miles in length, with a base width from 2 ft. to 10 ft., side slopes 1 to 1, and depth from 3 ft. to 8 ft. The total excavation is 68,594 cu. yds., and the estimated cost at 15 cts. per cubic yard is $10,210. The ditch can be constructed by using orange-peel, drag-line, revolving steam shovel or floating dredge for different parts at option of contractor.

NEW YORK.

The Snare & Triest Co., 143 Liberty St., New York City, has been awarded the contract for dredging and the construction of quay walls at the U. S. Navy Yard, New York The contract price was $84,480. Bids for this work were opened Jan. 8, by the Bureau of Yards and Docks, Navy Department. The award was made on Item 1 of the specifications for the work complete.

Bids are asked by Isidore Wachsman, Secretary Board of Contract and Supply, Albany, N. Y., until 3 p. m., Feb. 21, for improving the State St. pier for that city. The work will include the razing of all the present buildings on the pier, the removal of 100 feet from the southern end, the construction of concrete walls and boat landings, the raising of the present elevation by filling, paving the surface with concrete, the construction of grass plots and the erection of platforms, shelters and lavatory structures. The concrete wall will be 899 ft. long, the entire length of the pier, and 84 ft. across the two ends. The concrete structure will rest upon piles driven into the water and will be from 6 ft. in thickness at the bottom to about 1 ft. in thickness at the top. The wall will extend nearly 3 ft. above the ground. It will be built in sections, each 40 ft. long, and at each intersection there will be a life ladder. The entire southern end of the pier will be made a landing for both large and small boats and along the river side there will also be landings and steps, well provided with snubbing posts for fastening boats. Numerous grass plots, shrubbery, raised platforms covered with canopies, flag poles and electric lights will beautify the pier. Walter Melius is City Engineer of Albany.

OHIO.

Jones Bros., Cincinnati, O., have the contract for all excavation, concrete work, foundations for buildings and macadamizing, brick coping, walls, etc., for the new plant of the American Rolling Mills Co., to be built at Middletown, O. The contract includes 400,000 cu. yds. earth excavation, the making of various fills to level off property at 60,000 cu. yds. of concrete masonry. The American Bridge Co. is to do all the steel work for the building.

TEXAS.

Bids were opened Jan. 22 at Caldwell, Tex., for construction work in Burleson county Improvement District, the low bidders being Roach & Stansell, Memphis, Tenn., who submitted the following bids:

Clearing 75 acres @ $45	$ 3,375.00
Grubbing 30 acres @ $77	2,310.00
Sodding 100 acres @ $10	1,000.00
Earthwork, 1,000,000 cu. yds. @ 16.8c	168,000.00
Bridging lumber, 30 M. ft., B. M., @ $45	1,350.00
Total	$176,035.00

There were four bids submitted for which the totals amounted to $176,035, $176,900, $177,275 and $179,647.50. J. C. Nagle, College Station, Tex., is engineer for the district.

WISCONSIN.

The La Crosse Water Power Co., W. J. Ferris, President and General Manager, La Crosse, Wis., proposes building a dam just as soon as spring opens on the east fork of the Black River, near Hatfield, Wis. It will be a concrete dam, approximately 300 ft. long, 30 ft. high, with six 4x5 sluice gates, located at the bottom, the gates to be controlled by suitable floor stands. This will be a storage dam, no power house being built for the present, the water being stored to tide over the exceedingly dry seasons and to be used through the present canal and power house of the company.

Peter A. Pugh, New Cumberland, W. Va., has been awarded the contract for constructing 32 miles of oil pipe line in Gilmore and Dodridge Counties, W. Va., for the Freehold Oil & Gas Co.

The Chesapeake & Ohio Ry. has had surveys made between Charlottesville, Va., and Orange, Va., for double tracking the line between those two points.

The Southern Pacific Ry. is said to be collecting men and material at Gallup, N. Mex., preparatory to beginning work on its line to Farmington, N. Mex.

The West Virginia, Pittsburg & Atlantic R. R. Co. has applied for a franchise in Parsons, W. Va. R. F. Whitmer, President of the Dry Fork R. R., is also President of the new road.

A charter is to be taken out for building a railroad from Steedman, S. C., to Aiken, S. C. The company is to be known as the Aiken-Columbia R. R., and the line will practically follow the survey made some years ago which was an air line from Columbia to Augusta. Sufficient capital has been secured to build the first 8 miles of the road. A. O. Yearan, Samaria, S. C., and J. D. Protho, Aiken, S. C., are interested.

The Louisville Street Ry. Co., T. J. Minary, president, Louisville, Ky., is said to be planning the construction of an interurban line to extend out the Brownsboro road for a distance of at least 10 miles from Louisville.

The Richmond & Henrico Ry. Co., of Richmond, Va., has awarded a contract to the Pennsylvania Steel Co., for rails for 8 miles of trade, delivery to commence at once. The contract for ties has been awarded to the Burton Construction Co., of Richmond, which has already begun delivery.

The drainage commission of McHenry and Bottineau Counties, N. Dak., as the result of a recent decision of the Supreme Court will now proceed with the construction of a drainage canal to run from the northern part of McHenry County and the entire length of Bottineau County and 14 miles into Canada. The work will cost $125,000 and will be started in the spring. Towner, N. Dak., is the county seat of McHenry County.

Advices from Jackson, Ga., state that Captain W. F. Smith, who is building the 5-mile railroad line from Indian Springs to Jackson, has announced that the line will be completed and in operation by Aug. 1. Part of the line has already been graded and work will be resumed with renewed force within a short time. The road will operate gasoline cars.

Reports received at the general offices of the Arkansas Central R. R. at Fort Smith, Ark., indicate that work on the extension of the Subiaco, Paris & Eastern R. R. from Subiaco Abby east, is progressing rapidly. Col. Henry Stroup, Chief Engineer in charge of the work, reports that about 4 miles of the right of way has been graded. A large number of men and teams are engaged in throwing the dirt. Rails have not been ordered. It is proposed to complete the grading before the steel gangs are put to work. It will require several months to put the right of way in condition for receiving the ties and rails.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

R. L. Groome, who has been general agent for W. J. Oliver of Knoxville, Tenn., has accepted the position of superintendent of construction of the Cullman Coal & Coke Co., of Cullman, Ala. This company will construct a line of railroad 25 miles in length from Cullman, Ala., to Juliana, Ala.. The company owns 300,000 acres of coal and timber lands 52 miles north of Birmingham, and is building the line to develop this property.

The Board of Trade of Columbus, Ga., is taking steps to secure the extension of the Chattahooche Valley R. R., to Columbus from Jester, Ala., a distance of 18 miles. J. A. Avary, West Point, Ga., is General Manager C. V. R. R.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The North American Dredging Co., Merchants Exchange Bldg., San Francisco, has been awarded the contract for improving the San Pedro Harbor for the Outer Harbor Dock & Wharf Co., of Los Angeles. The work, which includes the digging out of the eastern and western channels of the Miner fill in San Pedro Harbor, will require 2,000,000 cu. yds. of excavation. Work will begun March 1 on both the eastern and western channels, the former being 400 ft. wide and 5,500 ft. long, while the dimensions of the latter are 600 by 6,000 ft. Two and possibly three machines will be kept constantly at work and employment given to more than 100 persons. About 7,000 ft. of wharfage probably will be ready for use within the next 18 months.

The Atchison, Topeka & Santa Fe Ry. has made estimates for widening its wharf at the San Diego end of the road. J. F. Parker, San Bernandino, is Superintendent of Bridges and Buildings.

The Los Angeles & Redondo Beach Ry. Co., of Los Angeles, is reported to be considering extending its line south to San Pedro. Right of way on bluff country lying north of Redondo Beach is stated to have been already secured.

The Sacramento-Riverside Bath & Park Co., H. A. McClelland, Director, Sacramento, is planning to erect a wharf and warehouse on the Sacramento River front.

A plan to build a concrete bulkhead 2,000 ft. long along the San Gabriel River near the Pacific Electric trestle at Los Corritos, between Long Beach and Los Angeles, is said to be favorably considered by the Carson brothers, owners of a ranch at that point. The bulkhead would cost $5,000.

Work is now under way on the reclamation of 30,000 acres of Colorado River bottom land opposite the city of Needles, Cal. The property is owned by the Cotton Land Co., composed of W. J. Hole, W. I. Hollingsworth, Louis Evans, H. V. Blenkiron, W. J. Burton and D. M. Martin, all of Los Angeles. The company has an authorized capital of $2,000,000, a large part of which will be used in development, and the same owners also control the Cotton, Water & Irrigation Co., capitalized at $1,000,000, to which will be entrusted the work of canaling and leveeing the tract. About 11 miles of canals and 15 miles of levees are in process of construction. Besides an extensive canal and levee system, many miles of good wagon roads, and a line of railroad 25 miles long are to be built through the property.

The Atchison, Topeka & Santa Fe Ry., H. C. Phillips, Chief Engineer Coast Lines, Los Angeles, is to build a 6-mile branch from Angiola to Alpaugh, to connect the former place with the main line.

The Southern Pacific Co. is securing land for the widening of its right of way between Tracy, Livermore, Stockton and Sacramento, so as to lay a 4-track system between the towns mentioned. The tracks of the company in Santa Cruz will also be doubled.

The Northern California Power Co. is employing about 350 men at Manton, most of these being engaged in constructing the tunels through which the water will be conveyed to the power plant at Inskip. About 500 men were laid off when the winter season began. The water ditch will pass through 4 tunnels, the longest of which is 4,300 ft. Another tunnel will be 1,500 ft. in length. Two shorter tunnels will each be 300 ft. long. The power plant at Inskip is rapidly approaching completion. All the machinery is on the ground and much of it is in place.

W. J. Baker of Chico is at the head of a company that proposes to build a $100,000 gold dredger to operate in Trinity River, five miles above Lewiston.

Realty holders in the territory between Sutter and Sacramento Sts., Grand Ave. and Dupont and Powell Sts. at San Francisco are to petition the supervisors to build a tunnel through between Bush and California Sts. The estimated cost is $350,000, and if the supervisors refuse to build the tunnel, it is probable the property holders will petition for the formation of an assessment district and in that way raise the money for the improvement. Dr. Hartland Law is interested.

Grading work for the Fresno, Hanford & Summit Lake Interurban line has been started between Fowler and Selma. This work is the filling in of two small arroyos, one located between Fowler and Selma and the other located between Selma and Kingsburg. As soon as these fills are completed the work of grading the remainder of the line will then start and everything will be in full swing. A power plant of 1,000 kw. capacity will be erected at Fowler, and a substation will be built at Laton. The estimated cost of the road is $890,000. George W. Elder, San Francisco, as stated in our last issue, has all of the grading contracts. F. S. Granger, Fresno National Bank Building, Fresno, is General Manager.

Business men of Dinube and Orosi are securing right of way for an extension of the line of the Visalia Electric Ry. of Visalia, from the present terminus to Naranjo to Orosi and on through Sultana to Dinuba.

The Link Belt Railway Co. has filed articles of incorporation at the office of the county clerk, at San Francisco, Cal., and proposes the construction of a standard gage line extending from Placerville, Cal., to the terminus of the Southern Pacific Branch, to the Breecher farm, east. The line will tap a virgin lumber district and will enter the mining country above Placerville. In addition to this railroad project the company is authorized to build wagon roads, acquire water rights and erect shops and section houses. The company is capitalized at $1,000 and the incorporators are L. T. Kitt, E. D. Kitt and W. S. Fox.

The Ontario & San Antonio Heights R. R. Co., a Huntington property, has filed with the County Recorder at San Bernardino a million-dollar trust deed. The bonds issued as a result of the trust deed will be used toward completing the Pomona-Upland loop, and when this is done the line is to be extended into the San Bernardino valley and connect with the San Bernardino Valley Traction system, which is also the property of the Huntington-Pacific-Electric interests. The Ontario-San Antonio line is to be rebuilt and connected with the Pomona lines of the Pacific Electric. William Kerckhoff, San Bernardino, is President of the Ontario & San Antonio Heights R. R.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Advices from Greeley state that the Laramie-Poudre Irrigation Co. has selected the Stove-Prairie reservoir site instead of the Roosevelt or the Elkhorn reservoir site proposed for its irrigation system. The Denver Tramway Co. has interests in this reservoir, and it is understood that a contract has been entered into by the Tramway Co. and the Laramie-Poudre Co. by which the irrigation district is to be supplied with water from Stove-Prairie at all times needed. This, however, will not interfere with the use of the water for power purposes. The reservoir will be built in the Poudre River above Fort Collins at "Little Narrows" and will have a dam 200 ft. high. The capacity of the reservoir will be 1,500,000,000 cu. ft. and cost $500,000. The reservoir will be the largest of the 10 reservoirs of the system, will be 100 ft. deep and the outlet ditch will draw from the bottom of the reservoir, thus furnishing immense water power for generating electricity. A power plant will be erected at the place where the outlet ditch leaves the reservoir.

The Canon City, Florence & Pueblo Water Co. has filed preliminary maps covering sections 1, 2, 3, 4 and 5 of extensions 1 and 2 of the DeWeese canal in the office of the county clerk and recorder at Canon City. Extension No. 1 will be an alternative canal and pipe line, the canal being 10.8 miles in length and the pipe line 6.2 miles in length. The estimated cost of this portion of the work is $685,000. Canal extension No. 1 will be 10 ft. in depth, 32 ft. wide on top, 16 ft. wide at the bottom and will have a grade of 3 ft. to the mile. The extension of canal No. 1 from station 252 to 263, a distance of 18.8 miles, is computed to cost $140,000. The waterway will be 52 ft. wide on top, 40 ft. at the bottom, will be 7 ft. deep and have a grade of 1.25 ft. to the mile. Section No. 3 will be 6 ft. in depth and will cost $75,000. From station 363 to 424, a distance of 10.8 miles, the canal will be 7 ft. deep, 54 ft. wide on top and 40 ft. wide at the bottom. This portion of the work will cost $80,000. Section 4, extending from station 165 to station 290, the canal will be 52 ft. wide on top, 40 ft. wide at the bottom, 6 ft. deep and will have a grade of 1.25 ft. to the mile. The estimated cost of this part of the undertaking will be $225,000. Section No. 5 of the canal, extending from station 290 to station 355, a distance of 14.6 miles, will be 6 ft. deep, 52 ft. wide at the top, 40 ft. wide at the bottom and will have a grade of 1.25 ft. to the mile.

Members of the Chamber of Commerce of Trinidad have revived the project of building a railroad from Trinidad to San Luis valley. It is probable that the organization will take steps toward procuring the necessary information to lay before capitalists, with a view to raising money enough to carry out the project.

James F. Hadley has been elected president of the Lone Tree Ditch & Reservoir Co., succeeding James Taft of Longmount, and plans are being made to form an irrigation district 20 miles northeast of Denver, adjoining the Antero district. One reservoir on Box Elder creek already belongs to the company and preparations are being made to build another.

The Oregon Short Line R. R. has surveyors in the field surveying a road from Cisco into the Paradox and thence south to Durango, where it will connect with the north extension of the Southern Pacific from Lordsburg, New Mexico. It was previously reported that there surveys were being made by the Denver & Rio Grande.

The Grand Junction & Grand River Valley Ry. Co., which has under construction a line from Grand Junction to Fruita, has secured a lighting franchise from the latter city.

The Union Pacific Ry. is planning much construction work in Colorado this year. Orders are said to have been issued to have the line into Fort Collins completed by July 1. The establishment of construction camps has begun and it is expected that the weather will permit the work to begin by the time the camps are located. Arrangements have been made for throwing about 2,000 men and between 400 and 600 teams onto this job to rush it to com-

THE COLUMBUS TENT & AWNING COMPANY, Columbus, Ohio

pletion. Engineers are now making the final locations for a cut-off on the main line from Denver to Fort Morgan and this construction work will soon begin. This new line will be 74 miles long, will cut off 38 miles between Denver and the east and will cost between $3,000,000 and $4,000,000. Engineers are also locating an extension of the Crow Creek branch completed last year and $1,000,000 will be spent in the extension northeast toward Wyoming. This line is headed toward Grover, Colo., and will invade the territory to be reached by the proposed Burlington line between Hudson and Greeley and on north to form the gulf-to-coast route. R. L. Huntley, Omaha, Neb., is Chief Engineer.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The construction of an interurban line from Carthage to Warsaw, Keokuk and Nauvoo is proposed. Chicago capitalists are stated to have offered to construct the road, which would cost about $200,000, providing the citizens of Carthage would take $40,000 in bonds or stock. In this plan the former right of way of the line, including a bridge that was started between Carthage and Hamilton two years ago, is to be acquired. A. W. O'Harra, Carthage, Ill., is interested.

The Burns Construction Co., Isabella Bldg., Chicago, Ill., which has the contract for building of the Dixon, Rock Falls & Southwestern Interurban line, has let the contract for all the steel rail needed to finish the line. The contract is for enough rail to cover a distance of 40 miles of roadbed. The rails are to be delivered at the nearest possible stations along the line while the work advances during the summer, and the contract provides that they shall be on the ground so as not to delay the work. The closing of the contract indicates that the building of the road has finally become assured. The Burns Co., which has charge of the construction, has already built the road from Tampico to Hoopole. Work on the road will commence as soon as weather conditions permit, and will be pushed as rapidly as possible during the summer.

Citizens of Fithian, Ill., are taking steps to secure the interurban company to construct a freight switch into that place.

The Peoria & Pekin Union Ry. Co. is reported to be planning a number of improvements for the coming year. The work includes the completion of its bridge at Peoria, Ill. W. E. Emery, Peoria, Ill., is Chief Engineer of the company.

At a recent meeting of the stockholders of the Taylorville Street Railway, Light & Power Co., of Taylorville, Ill., a new board of directors were elected, as follows: Grover Hoover, W. B. Adams, I. J. Perkins, Harry Cheney, J. H. Forrester, W. R. Richardson, T. H. Johnson, J. A. Adams and W. B. McBride. The company will at once rush to completion several extensions under consideration. Grover Hoover, President; Harry Cheney, Vice President; James A. Adams, Secretary.

Application has been made to the City Council of Elgin, Ill., for a franchise on city streets for the Elgin-Evanston Electric Ry., a proposed air line from the Chicago suburb to Elgin.

The Chicago Great Western R. R., W. H. Chadbourn, Chief Engineer, Chicago, is planning extensive improvements this year which will involve the expenditure of $12,000,000. The work scheduled includes the improvement of the roadbed on almost every section of the system. Much new track will be laid. Grades will be lowered and terminal facilities increased to such an extent that there will be no freight congestion in any of the large terminals in the northwest, where the company handles a large freight traffic. It is also planned to install automatic block signals on the eastern division between Chicago and Oelwein, Ia., 240 miles.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Indiana & Michigan Electric Co. has secured about 75 per cent of the land necessary to take care of the back water resulting from its proposed state line dam. Plans for the dam are now being prepared, but the structure will not be erected until early in 1911. The dam is to be one of a series erected by the company, chaining the St. Joseph River and furnishing electrical power and light for a large territory. F. A. Bryan, South Bend, Ind., is interested.

The townships of Union, Honey Creek and Princeton, in White county, will hold an election Feb. 14 to vote upon the question of a subsidy for the building of the Northwestern traction line. The sum of $15,000 is asked in each township.

Citizens of Brightwood, a suburb of Indianapolis, have asked the Indianapolis Traction & Terminal Co. to extend the Brightwood line from the present terminus at 25th St. north along Brightwood Ave. to 30th St. and west on 30th St. to Dearborn St.

The Shoals Power Co., of Shoals, Ind., has been incorporated with a capital stock of $50,000, and the following directors: Henry A. Mansfield, Samuel A. Teacher, Frederick M. Bachman, Frank T. Edenharter and William T. Mull.

R. J. Nooney, who has a 20-team outfit subbing from Lorimer-Gallager, of Chicago, Ill., on the Dublin & Bentonville cutoff, near Knightstown, Ind., has moved to Knightstown and will have a year's work at that place. He will start working as soon as the weather permits.

The Covington & Southeastern Traction Co., which started its construction work about a year ago at Kingman, has completed one mile of track and two more miles of grading and ties. When four miles of track are laid the company will then be entitled to the first installment of $65,000 from the trust company at Indianapolis, which has agreed to handle its securities.

The New York Central Lines is planning to double track between Shelbyville and Indianapolis. The work will probably be done this spring or summer.

Charles D. Kelso, of New Albany, who obtained the right of way for an electric railway from New Albany, Ind., to French Lick Springs, Ky., over the turnpikes of Floyd and Orange counties, it is understood, has secured the necessary financial backing to carry out the project.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Des Moines Railroad Promotion & Construction Co. of Des Moines is in correspondence now with people along the line from Des Moines to Centerville by way of Franklin township, Marion county, to find out what the sentiment is in support of an interurban service railroad. This line would be mainly along an earlier survey known as the Gates project. B. Schreiner, Des Moines, Ia., is engineer.

Business interests of Burlington have pledged $25,000 for the purpose of bringing to the city the extension of the Muscatine North & South R. R. The new owners are said to have promised not only to extend the line upon the payment of this bonus, but have indicated their intention of establishing a motor service over the entire road, which will give to Muscatine practically an interurban service on the line from that city to Burlington.

The Davenport Water Power Co., through its president, F. H. Griggs, has filed the formal acceptance of the franchise granted to it by the city of Davenport. By the acceptance of the franchise the city is said to be practically assured the water power plant which will cost in the neighborhood of $2,000,000 to $4,000,000 and on which work is expected to start as soon as preliminary arrangements can be completed.

The Tri-City Utilities Co., controlling the street railway system in Davenport, is reported to have stated that if the city council of Davenport will vote to give it a 25-year franchise from the present date they will guarantee to construct the Davenport-Muscatine interurban line. The present franchises in the city do not expire until the spring of 1924.

Promoters of the proposed railway from Waterloo, Ia., to a connecting point with the Northwestern and Milwaukee lines, have completed articles of incorporation and are to perfect a temporary organization at once. The southern terminus, however, has not yet been decided. Tama City, Belle Plaine and Marengo are favorable points, the latter city offering a large cash bonus for the line.

At the annual meeting of the stockholders of the Davenport-Manchester Interurban Ry. Co., Jan. 18, the following directors and officers were elected: Directors, George T. Baker, T. F. Halligan, Henry Vollmer and Sam T. White of Davenport; J. A. Voorhees and S. M. Murphy of Monticello; L. C. Matthews and F. B. Richardson of Manchester, and F. W. Rank of Moline. L. Matthews, Manchester, President; J. A. Voorhees, Monticello, Ia., Vice President; F. W. Rank, Moline, Ill., Secretary; T. F. Halligan, Treasurer. The company projects the construction of a line from Davenport, Ia., to Manchester.

Application has been made to the City Council of Albia by William A. Boland, 165 Broadway, New York, for a franchise to use the streets and alleys of the city for another interurban line. It is proposed to electrify the Albia & Centerville R. R., which Mr. Boland has purchased. Mr. Boland stated to the council that it was his intention, if the franchise was granted, to run electric cars between Albia and Centerville and later extend the line to the north.

An improvement fund of $20,000 has been subscribed for improvements on the Atlantic Northern & Southern Ry., and as soon as weather conditions will permit the work of ballasting and cutting down grades will be started. C. B. Judd, Atlantic, Ia., is Chief Engineer.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Wichita Terminal Association will have work started early in February on track improvements at Wichita, involving the expenditure of about $25,000. Other improvements will follow. O. J. Raymond, Roadmaster, will be in charge of the work.

The first allotment of new 85-lb. steel for the first 100 miles of the Central Branch of the Missouri Pacific will arrive in Atchison the middle of next month, the work of laying the new steel to be begun soon after. Eventually the entire division will receive new and heavier rails than those in use now.

Steps are being taken at Wichita to have the interurban line now being operated between Arkansas City and Winfield extended to

Wichita. The extension will be up the Walnut river to Douglas, and thence to Wichita. The city will be asked to vote $30,000 bonds for terminals.

The Topeka Ry. Co. of Topeka has decided that in case a proper ordinance is obtained from the city council of Topeka two extensions to the present street railway system will be put into effect as soon as the work can be done after the requisite permission is granted. One of the extensions is the much talked of road toward Shorey, which, it is expected, will intersect the present North Topeka line in the vicinity of Morse street, North Topeka, and may extend in the neighborhood of the city limits. The second extension will be built from Kansas avenue west to Central Park, taking in the scope of the city bounded on the north and south by West Seventeenth and West Twelfth Sts. F. G. Kelley, Topeka, is Secretary.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Lansing & Northeastern Construction Co. has filed an application with the State Railroad Commission for the approval of its plans of organization with $25,000 capital to build an electric road from Lansing to Owosso. The same men who composed the Northern Construction Co. compose the new company, which will build the road for the Michigan United Railroad.

The Muskegon Traction & Light Co., John T. Young, president and general manager, Muskegon, is planning a number of improvements on the steel car line and the gas and electric light plants and Lake Michigan parks. A large part of the Pine St. line is to be rebuilt. From the corner of Walton and Pine Sts. to the corner of Western Ave. and Pine St. the present 60-lb. rails are to be replaced with 70-lb. rails. This is to be done principally because the interurban traffic on this part of the line. On Pine St. south of Hartford St. and on Irwin and Nims Sts. the present 30-lb. rails are to be replaced with 60-lb. rails. Plans for the other improvements are now being considered and will be made public by the company as soon as definitely decided upon.

The Paw Paw Lake Interurban Co., controlled by the Benton Harbor & St. Joseph Railway Co., has secured a lease of the Pere Marquette Branch between Coloma and Paw Paw Lake. The interurban began building nearly a year ago and now has cars operating between Benton Harbor and Coloma. By securing the resort branch the local company have all the right of way between Benton Harbor and the lake, and in the spring will begin operating cars between the two points. From Coloma the interurban in the future may be extended to Watervliet, thence to Hartford.

The Benton Harbor & Paw Paw Lake Interurban Ry. Co. has secured additional right of way in Coloma, Mich., including the privilege to cross the yards of the Thayer Mill. This indicates that construction work will be pushed on to the lake in the spring.

Several petitions have been filed with the mayor of Detroit, Mich., requesting the extension of the Third Ave. car line out Hamilton Blvd.

The Bay County Construction Co. of Bay City, has been organized for the purpose of doing general engineering and railway construction business. The company consists of John H. Allerdyce of Detroit; Chas. W., Thos. L., Geo. W. and Frank S. Handy, and Chas. S. Ruttle, of Bay City. The new company will build and equip the new railroad which Handy Bros. of Bay City, are building from Bay City into the Thumb coal fields, grading for which is now progressing rapidly.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Duluth & Iron Range R. R., W. A. Clark, Chief Engineer, Duluth, Minn., is to build a short spur into the mine on section 30.

The Minneapolis, St. Paul & Sault Ste. Marie Ry. is stated to have decided to improve the line of the Wisconsin Central Ry. between the Twin Cities and Chicago. The plan is to shorten the line about 40 miles by building several cutoffs and to increase the equipment of the middle division between Menasha and Owen, Wis., a stretch of track which, it is said, is incapable of handling the traffic at present existing. Grades in many places will be reduced and many curves straightened. Thos. Green, Minneapolis, Minn., is Chief Engineer, Minneapolis, St. Paul & Sault Ste. Marie Ry.

The Wapheton-Breckenridge Street Ry. Co., which projects a line between Breckenridge, Minn., at Wahpeton, N. Dak., has secured the necessary capital and is planning to have construction work started early in the spring. At a meeting at Breckenridge, F. L. Strum was elected manager and was instructed to secure the necessary material. The other officers of the company are: President, Math Braun, Wapheton; vice president, Frank Miksche, Breckenridge; secretary, F. R Barnes, Wahpeton; treasurer, J. H. Ehlert, Breckenridge; directors, Math Braun, N. Freidericks, Henry Connolly, F. Miksche and J. H. Ehlert.

General offices of the Virginia & Rainy Lake Ry. Co. have been moved from Duluth, Minn., to Virginia, Minn., and the city will pass an ordinance granting street railway franchises to the company. It is probable that all the range cities will be connected by an interurban system.

Duluth and the Ranges.

BY PETER E. MEAGHER.

F. J. Callaham of J. W. Callaham & Son, contractors, was a caller at this office a short while ago. They are not doing anything at present but are in the market for a contract.

John Runquist, the railroad contractor, was awarded a contract by the Duluth, Missabe Northern Ry. to strip a gravel pit. There is about 150,000 cu. yds. in this work, and the same is to be started immediately. Mr. Runquist has been quite successful lately in getting contracts. This is the second one that he has received from these people in the last two weeks.

W. A. Kimball, representing the Lansing Wheelbarrow Co., was a caller at this office recently. This is his first trip up in this territory, and he said that the outlook for business was very bright.

W. F. King & Co., Duluth contractors, are very busy at the present time. They have a very large concrete job for the erection of piers for a large railroad bridge to be constructed for the Minnesota Steel Co., near Duluth, and are using two concrete mixers, and a large number of men on the same. They have also four or five pretty fair sized concrete jobs for the Duluth, Missabe Northern Ry. Co.

J. A. Higgins of Higgins & McDonald, railroad contractors, was a caller recently. They have completed their work on the Northern Pacific near Mandan, N. Dak., and at the present time, are engaged on a contract on the Soo Line near Duluth. They contemplate working on the same all of this winter.

E. A. Wickham & Co., with general offices at Council Bluffs, Iowa, write us that they have about 120 miles of team work to be let on the Northwestern Ry. in South Dakota. There is free transportation for men, teams and outfits on this work. All contractors interested in this matter, by writing the contractors direct will secure whatever information they desire.

W. A. Sharp of Minneapolis, called at this office a short while ago. Mr. Sharp is engaged in the equipment business, and this is his first trip to Duluth. He came up to look the ground over. We wish Mr. Sharp success in his new venture.

John C. Greenway, who recently resigned as general superintendent in charge of work for the Oliver Iron Mining Co. in the Coleraine District, which district takes in a large number of the Iron Mines of this firm, and is located about 60 miles north of Duluth, has returned here and has taken up again his old position. Mr. Greenway is one of the most popular men in the Iron Range District, and was well liked by every one of his employes, and by all the people that came in contact with him either in a business or a social way. We are very well pleased to see Mr. Greenway again one of our citizens.

Owen McDonnell, General Superintendent for Patrick McDonnell, the contractor, was a caller here recently. They are very busily engaged at the present time on a large sewer contract at Grand Forks, N. Dak., and expect to be quite busy for about three months on the same.

G. A. Jones, of Jones Brothers, railroad contractors, Cincinnati, O., was a caller on us a few days ago. He reported that his firm had secured a very nice contract at Middletown, O. In the contract there was about 500,000 yds. of earth, 50,000 yds. of concrete, and 2,000,000 brick. They expect to start on the same immediately. On their contract at Nashwauk, Minn., they are at the present time working two shifts, and have engaged at the present time, one 90-ton Bucyrus steam shovel, one 70-ton Vulcan, and 4 yd. dump cars. They are making excellent progress on this work.

Dale & Bumgardner, steam shovel contractors on the Soo Line, have closed down all their work at the present time on account of frost, and do not expect to start again until some time later on in the season.

Richard Evans, steam shovel contractor on the Soo Line, has closed down his shovels on account of frost, and does not expect to start up until later in the season, when he will put four shovels to work.

E. P. Arsneau, one of the old-time Duluth contractors who is now located at Spokane, Wash., was a caller on the writer a few days ago. He says that the territory around here is pretty good, but that Spokane has got it beat a mile. He is getting along very well out there, and we are very glad to hear it.

John Butler, of Butler Brothers, was a caller in Duluth recently. They are engaged on stripping contracts in the iron country near Duluth at the present time, and have about 12,000,000 yds. of work under construction at present.

F. J. Mann, railroad contractor, has taken some more work from Foley, Welch & Stewart, and expects to start one steam shovel immediately.

C. C. Smith, railroad contractor, has taken a contract from Foley, Welch & Stewart on the Soo Line, and will start one shovel and a 4-yd. car outfit on this work at once.

There are some rumors circulating around up here at present about some very nice contracts to be let in the very near future, some for stripping iron mines, and others for railroad construction. As yet we have been unable to find anything authentic in regards to this new work. But we can say with perfect safety that inside of the next six weeks there will be a lot of new work let in this vicinity.

The labor market in Duluth at the present time is in quite a healthy condition. There is not a great many men here. The men seem to be hanging on to their jobs, and as there has not been very much new work let recently, there seems to be enough men to go around.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City Engineer, of Springfield, is considering the matter of constructing a concrete waterway through the property of R. E. Everett on the west side of Main street, just north of Water street, in that city.

The town of St. Peters is considering constructing a levee for flood protection purposes. Frank Taubler, St. Peters, is interested.

The promoters of the Hannibal & Northern Missouri R. R., now under construction, are reported to have decided to abandon Kirksville and to run their line from Sioux City southwest into the Macon County coal fields by way of Macon. A surveyor has been examining the roadbed built by the Missouri & Mississippi R. R. in the early 70s and says the greater part of it can be used if the title can be obtained.

Final surveys have been started for the projected line of the St. Louis & Kansas City Electric Ry. Co. The right of way has been

CONTRACTORS!

Write us about our **Dry Duck Tents.** The real thing—**Water Proof** and **Mildew Proof.** The **Best** and only **Genuine Patented** process. The **Price** is right. The cheapest thing on the market.

BAKER & LOCKWOOD MFG. CO., Kansas City, Mo

secured and work is to begin on the east end, from Columbia to St. Louis. The first work is to be done between Columbia and Harrisburg, Boone county, in the coal fields. Twenty-five miles of the rails have already been bought for this section.

Subscriptions have been secured for practically $200,000 of bonds for building the projected line of the Mexico, Santa Fe & Perry Traction Co., of Mexico, Mo., and it is stated that construction work will be started at once. The first section of the line to be built will be 38 miles long and will extend from Mexico to Hereford, Callaway county, and north from Mexico to Santa Fe. There will be further extensions to Hannibal, Fulton and Jefferson City later.

It is expected that the Interstate Ry. Co., which projects a short line electric railway between St. Joseph and Kansas City will resume construction work in the spring. Ernest D. Martin, Marshall, Mo., is interested.

The Commercial Club of Macon is at work on a plan to induce the Chicago, Burlington & Quincy R. R. to complete its Iowa and St. Louis branch to Macon and to establish there its division headquarters between the Iowa terminal and St. Louis. Important municipal concessions will be offered the road and encouragement in the matter of right of way and yard space.

The franchise of the St. Joseph, Savannah Interurban Co. has been amended by the county court so as to cover the Savannah road for the remainder of the distance to the Andrew county line, from Industrial City, about a half mile. The contract for grading the roadbed will be let as soon as the frost is out of the ground.

The land owners a few miles east of Cedar City in Calloway County met recently at Jefferson City for the purpose of considering the project of forming a levee district. J. H. Nolan, Deputy State Labor Commissioner of Jefferson City, was present and spoke in favor of the proposition.

St. Louis Items.

BY A. B. KOENIG

The Board of Public Improvements' report on the abolition of grade crossings, expected to be submitted to the Municipal Assembly in the next week or ten days, will estimate the expense to the railroads at only $8,000,000 for the whole city. That sum includes several miles of track depression, a larger stretch of elevated tracks, and several viaducts. Missouri Pacific and Frisco tracks west of King's Highway are to be elevated, as are the Missouri Pacific's Oak Hill branch tracks south of the intersection with Morganfield road and the Terminal belt line west of King's Highway in the North end. The Wabash tracks through Forest Park, Poplar street tracks of the Iron Mountain from Seventh to the levee and the tracks crossing Tower Grove avenue, from about Grand to King's Highway, are to be depressed, including the Oak Hill line to Morganford road. In a number of places, including the stretch east of King's Highway on the North Terminal belt line and the Mill Creek Valley east of Grand, viaducts are to be required. With the exception of Ewing, Chouteau and Compton avenues these viaducts will be inexpensive. Union and King's Highway viaducts on the Terminal belt line, north, are to cost little more than $100,000 each, if that much, the streets and tracks now being at about the right grade for a short viaduct. A considerable part of the report is to be devoted to the Wabash tracks in Forest Park. About seven different solutions of that problem, each expensive to the railroad, are given. Depression of the tracks in the park and the approaches, King's Highway to Page, would cost the railroad, it is said, about $1,300,000. The board prefers the removal of the tracks from the park, and makes that plan one of the first of the seven. Poplar street is planned as a tunnel, and if the Iron Mountain wants to put its tracks under the street it will cost at least $500,000 to put them in a tunnel. It is expected, however, that because of the high cost the road will decide to abandon the tracks, or elevate them on private property to the south. The report discredits the claim of the railroads in relation to the Tower Grove crossing cost. A claim has been made that depressing the tracks would cost several million dollars, but the board's report figures it down to $1,300,000, which President Reber says is too high. Claims in relation to the switch tracks to the industrial plants along the lines also are considerably reduced, the aggregate for the three railroads being $210,000. The plans for each of the three roads are worked out separately, the cost to the Missouri Pacific for depressing its tracks 3,170 feet and paying its share of the bridging costs, being $255,000. The estimate for industrial track connections is but $25,000 for that road. The Oak Hill division of the Missouri Pacific, because of a longer depression of the tracks, 9,700 feet, and consequent greater expense would have to pay $810,000. The Frisco would be at an expense of $235,000, not including an estimate of $60,000 for a desirable but not indispensable viaduct over Park avenue. The depression of its tracks would be 292 feet. The following table, showing the expense to the Oak Hill road, shows how the costs were worked out by the board:

OAK HILL DIVISION EXPENSE.

	Amts.	Rate of cost.	Amt. of cost.
Main line, double tracks depression, linear feet.	10,200	$ 250	$ 25,500
Side track, depression, linear feet	3,800	125	4,875
Excavation, railroad tracks, cu. yds.	250,000	67	188,000
Excavation, retaining walls, cu. yds.	20,000	100	20,000
Back fill, retaining walls footing, cu. yds.	15,000	50	7,500
Concrete retaining walls, in footing, cu. yds.	12,000	500	60,000
Retaining walls, in forms, cu. yds.	32,000	750	240,000
For bridge floors, cu. yds.	730	1,000	7,300
Waterproofing, bridges sq. yds.	1,500	100	1,000
Roadway paving bridges, sq. ft.	20,000	20	4,120
Granitoid walks, bridges, sq. ft.	13,500	18	2,430
Granite curb, bridges, lin. ft.	1,100	100	1,100
Iron rail, bridges, lin. ft	630	100	630
Structural steel for bridges, in lbs.	485,000	4	19,400
Total cost			$558,853
Reconstruction Tower Grove storm sewer			7,147
Caring for industrial tracks			135,000
Four bridges reconstructing King's highway			87,000
Total cost			$810,000

Mr. Reber says the prices allowed for the excavation, concrete and other work per cubic yard, square foot, linear foot, etc., are higher than the work will really cost, thus raising the aggregate of the estimates beyond the necessary figures.

A. G. Taubert came in from Kansas City looking for concrete or pile driving work. 3118 E. 15th St., Kansas City, Mo., will catch him.

A bill introduced in the Council here on Jan. 25th on behalf of the Board of Public Improvements is intended to divide the cost of draining 2,581 acres of land between the city and the property owners. The land in question lies along the route of the South Harlem joint sewer district. There are 826 acres of the track outside of the city limits The entire cost of the improvement is estimated at $220,806. The amount it is proposed to tax the property owners for is $149,424 and the city $71,382. A second estimate places the total at $212,124, of which the property owners are to be assessed $143,549 and the city $68,575.

Farmers in Saline County, Missouri, have given right of way across that county to the St. Louis-Kansas City Electric Railway, which is now surveyed four miles beyond Arrow Rock. The road may branch at New Farnklin, according to W. B. Cauthorn, its chief engineer, who was in Columbia on Jan. 25 to close up right of way contracts. From New Franklin one route under consideration runs up the north side of the Missouri River near Arrow Rock crossing at that town. The other route crosses the Missouri at New Franklin and runs through the northern part of Cooper county into Saline. The survey of both branches has reached Arrow Rock. It will tap the undeveloped coal fields of Boone and Howard counties.

Improvements and additions costing approximately $400,000 are being made to the Granite City plant of the American Steel Foundries, which will double its capacity and will make it one of the largest steel plants in the world. The construction of buildings and installation of modern machinery will be completed by April 1, when 1,000 more employes will be needed than are now employed. Five years ago, what is known as the north plant of the Granite City foundry was abandoned. This building is now being enlarged 200 by 150 feet, making it 400 by 600 ft. in dimension. It will be the new home of the car wheel department and will be fitted with machinery of modern make. Up to date machinery for cleaning beams and mastings by an air-blast will be installed, together with entirely new machines for gardening steel core wheels. Two kneading furnaces will be constructed in the open hearth department. Two additional furnaces will be constructed in addition to the three furnaces now in use. Each furnace requires 500 employes in addition to 250 laborers about the various furnaces. The two new furnaces will add 1,000 workmen to the payrolls of the company. With the modern machinery and additional furnaces, the capacity of the plant will be doubled. The present plant in use is running at its full capacity and is behind in its orders. With the completion of the improvements this plant will be the most important in the group of seven plants owned by the company. At present 2,500 men are employed at the Granite City plant, and its payroll each two weeks is approximately $60,000. The appropriation made Jan. 1 for the improvement of the plant was $300,000. Up to this time $185,000 has been expended and it has been decided to ask for an additional appropriation of $100,000. The headquarters of the American Steel Foundries is in Chicago. The six other plants operated by the company are located at Sharon, Franklin and Pittsburg, Pa., Alliance, O., Indian Harbor, Ind., and East St. Louis.

J. Burke sublet a part of his work on the Burlington extension between Shoshoni and Powder River, Wyo., to N. Farlow, P. J. Fitzgerald, Jas. Riley, J. Pede. Burke's address after Feb. 1 will be Shoshoni, Wyo.

The river has receded, with but little prospect of a rise in time to interfere with the work on the eastern pier of the Municipal free bridge, and as a result the first caisson will be sunk in a few days, according to President Reber of the Board of Public Improvements. Henry W. Hodge, of the engineering firm of Boller & Hodge, of New York, who

are designing the bridge, was in conference with the Board of Public Improvements last week. The matter of acquiring lands for approaches on the east side was taken up during the discussion as the plans must necessarily be governed in accordance with the land to be acquired.

John Mahoney, his wife and his foreman, Thos. McQuire, were killed in Kansas City last Monday by Mahoney's automobile in which they were riding at the time plunging off the Cliff drive down a steep bank. In addition to the above, John O'Connor and Mahoney's two daughters were seriously injured and are not expected to live.

We welcome to our city King's Labor Agency, which opens on Feb. 1 at No. 11 S. 9th St. The well known T. J. Kincaid is going to be manager of same.

The Board of Public Improvements on Jan. 25 awarded contracts for twenty-seven streets to be improved at an aggregate cost of $335,289.34. Ordinances were also introduced in the Municipal Assembly for eight additional streets. Following are the contracts, streets, cost and contractors: Rowan avenue, Ridge to Easton, Parker Washington Company, $7,763.90; New Ashland Labadie to Ashland, same, $8,694.56; Shawmut, Wells to Easton, same, $2,861.34; Theodosia, Academy to Union, same, $5,827; same street, Union to Arlington, same company, $7,551; Alfred, Scanlan to Arsenal, P. J. Clifford Contracting Company, $8,418.90; Louisiana, Cherokee to Gravois, G. Eyermann & Bro., $3,873.51; Henrietta, Compton to Louisiana, same, $5,779.50; Twenty-first, Palm to Branch, Wm. H. Redemeyer, $2,947; same street, Penrose to Ferry, same company, $6,259.92; Potomac, Wisconsin to Jefferson, F. Ruecking, $11,030.60; Pestalozzi, Thirteenth to Jefferson, same, $21,611.94; Dakota, Nebraska to Minnesota, same, $4,256; Michigan, Dakota to Osceola, same, $6,685.19; Pennsylvania, Osage to Chippewa, same, $8,931; Grace, Fairview to McDonald, same, $2,784.42; Fassen, Virginia to Broadway, same, $11,326.92; Spring, St. Louis to Natural Bridge Road, Fruin-Bambrick Construction Company, $13,795.28; Twenty-second, Cass to Hebert, Jas. E. Perkinson, $37,410.11; Canaan, Newby to Broadway, same, $14,395.31; Natural Bridge road, Fair to Taylor, Skrainka Construction Company, $23,071.79; Connecticut, Russell to Morgan Ford road, Granite Bituminous Paving Company, $24,281.44; Scanlan, from Morgan Ford to Alfred, same, $5,927.30; Twenty-second, Washington to Cass, same, $37,270.84; Manchester, Barron to Sublette, Schneider Granite Company, $19,128.42; same street, Tamm to Prather, same company, $27,609.40; Arkansas, Winnebago to Miami, Barber Asphalt Paving Company, $5,764.88. Following are the eight ordinances: Brick—Palm, Broadway to Fourteenth; Coleman, Montgomery to Garrison; Penrose, Grand to Prairie; Gravois, Arsenal to Grand; Taylor, Ashland to Margaretta. Asphalt—Laurel, Ridge to Wells; Holly, Penrose to Carter, and High, Franklin to Biddle.

Jas. Skene & Son have finished their lock and dam work on the Big Sandy River in Kentucky. Skene spent the past week in town. He left here for New Orleans where he will be until after Mardi Gras and then go to his home in Huntington, W. Va.

Hickey Bros. are going to resume work in Dakota as soon as the weather will permit.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys are to be started shortly for the proposed electric railway to be built by the Whitefish & Polson Electric Railway Co., of which J. A. Edge, Kalispel, Mont., is president. The corporation was formed several weeks ago with the purpose of connecting the northern and southern ends of the county by rail.

The citizens of Laurel at a recent special election voted to grant a franchise to the Eastern Montana Electric Railway company for a line extending from Billings to that city, up the Clark's Fork valley, terminating at Red Lodge. The people of Red Lodge are expected to be called upon soon to vote on the franchise question.

The Great Northern Ry., A. H. Hogeland, Chief Engineer, St. Paul, has filed in the Great Falls land office a plat showing the proposed route of the branch line from Great Falls up the Sun River to a point near Augusta, which is to be constructed during the present year according to the announcement recently made. The line as it is now surveyed will run through Sun River and will pass very closely to the towns of Fort Shaw, Simms, Hepler and Augusta.

Walkun Baldwin & Co., bankers, William St., New York, representing a French syndicate of capitalists, are to send their representative, Daniel Giles, to Red Lodge to complete preliminaries of the work of building an electric interurban line from Billings, through Laurel, up the Clark's Fork Valley, terminating at Red Lodge. Preliminary surveys have been made in some parts of the county already; but early in the spring the complete survey will be made and actual work of construction begin, according to the New York bankers. The citizens of Laurel have voted by special election, without dissent, to grant a franchise to the Eastern Montana Electric Railway Co., an auxiliary of the company headed by Mr. Giles. Work will soon begin between Billings and Laurel.

An electric railway is projected for the Flathead Valley, and advices from Kalispell state that State Senator Thomas D. Long, who is promoting the project, has secured practically one-half the sum necessary to assure the construction of the line.

The first fatality connected with the construction of the Blackfoot railway from Bonner to the Blackfoot landing occurred on Jan. 19, when Julius Nelson, a powder man, was accidentally caught in an explosion of giant powder and blown to pieces. Nelson had been in the employ of the construction company only eight days, coming from Denver as an experienced powder man. The accident occurred in camp No. 1 of Clifton & Appolonio, about two miles north of Bonner station, and it is said to have been due to the carelessness of the man who was killed. Nelson is said to have violated his instructions and while drilling holes for blasting filled one with a full charge. Later, his drill became stuck in a hole nearby and the man placed a light charge of dynamite in it to release the drill. After lighting the fuse he swung it against a keg of giant powder, which exploded, discharging three others. Nelson was driven against the first hole, which he had filled, the concussion exploding the charge there and tearing the body to fragments.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Business men of Middletown, Conn., are signing petitions urging the New York, New Haven & Hartford R. R. Co. to begin as early as possible the task of double tracking the air line between Middletown and Willimantic. The railroad management has announced its intention of double tracking the road, but has not decided on any time for beginning the work. The company says that the improvement will be very expensive, and that the details of financing the operation must be worked out before construction can be undertaken.

The North Atlantic Dredging Co. of Brooklyn has been incorporated. The capital stock is placed at $25,000, and the directors are as follows: Sheldon C. Kniffin, John O'Connor and Thomas J. Muldoon of Brooklyn.

The Bolivar-Wellsville Construction Co. of Bolivar, N. Y., has been incorporated to build a trolley line from Bolivar to Wellsville, 19 miles long, at an estimated cost of $250,000. Franchises have been applied for in both villages. The company is composed of Benjamin F. Patterson of Brooklyn, N. Y., C. M. Van Curen and A. J. Matson of Bolivar.

The Lewiston & Youngstown Frontier Ry. Co. has filed an application with the City Board of Trustees for permission to construct, maintain and operate electric railway lines over certain streets in the village of Youngstown, N. Y.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Cincinnati, Hamilton & Dayton R. R., F. H. Alfred, Chief Engineer, Cincinnati, O., has begun preliminary work at Toledo on the construction of an ore dock and freight yards to cost about $1,500,000. The new freight yards which are to be built will have a storage capacity of 2,700 cars and will be constructed on the gravity plan. They will extend back from the new river frontage of the company to the road's Rossford yards. It is estimated that the yards alone will cost about $500,000. The ore dock will be of concrete on piling. About 350,000 cu. yds. of earth filling will be required for the dock. Contracts for the work are to be let early this month.

Plans for the re-organization of the Wheeling & Lake Erie R. R. and the Pittsburg Terminal Co. are reported to have progressed satisfactorily. The Wheeling & Lake Erie Co. will start out with a capitalization of $130,000,000, consisting of $40,000,000 preferred stock, $50,000,000 common stock and $15,000,000 outstanding of a new bond issue of $16,000,000, bearing 4 per cent interest. The road will connect Cleveland, Pittsburg and Erie, and will occupy a position where its influence in traffic matters will be felt. The Wheeling & Lake Erie is to be double tracked at a cost of $15,000,000 and $18,000,000 will be paid for equipment. H. T. Douglas, Jr., 509 Perry-Payne Building, Cleveland, O., is Chief Engineer of the W. & L. E. R. R.

Commissioners of Marion County, Marion, O., are considering estimates for widening, deepening and straightening the Little Scioto River. According to the estimates of Ed. S. Ault, County Surveyor, the work will cost about $65,000.

The Council of Bryan has granted the Ft. Wayne & Toledo Electric R. R. Co. a franchise to lay tracks and operate electric cars in Bryan, entering the town from the southwest over Center St. At Beach St. the tracks come north to High St., thence east on High St. to connect with the present tracks of the Toledo & Indiana. The franchise must be accepted by the company within 30 days, and becomes void if construction work is not begun within one year and the road in operation within two years. The Ft. Wayne & Toledo is being promoted by Indiana capitalists whose headquarters are at Maysville, near Ft. Wayne. As planned the road connects Bryan and Ft. Wayne, via Maysville, Hicksville Farmer and William Center. Some construction work was done near Maysville last fall.

The Pittsburg & Lake Erie R. R. has filed an amendment of its charter with the Secretary of State at Columbus, indicating that the arrangements for the connections between the P. & L. E., Lake Erie & Eastern and Pennsylvania railroad have been agreed upon at last and that the construction of the L. E. & E. will start in the near future. This amendment provides for the building of an extension at Struthers to connect the three railroads. J. A. Atwood, Pittsburg, Pa., is Chief Engineer.

To eliminate the disturbance with the canal at Dayton, Rubicon creek will be extended under the canal to the Great Miami river. City Engineer Cellarius of Dayton is in charge of the work.

An ordinance has been introduced into the city council of Dayton, O., providing for the extension of the City Railway Company's lines on certain streets.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Southwest Construction & Paving Co., of Muskogee, has been chartered with a capital stock of $25,000, the directors being Frank G. Mason, H. C. Davis, Marion White and C. F. Holderman.

The St. Louis, El Reno & Western Ry., W. M. Bushnell, general manager, Fort Smith, Ark., has surveys under way westward from El Reno for a mile for the extension of the

road to Cordell. It is said that actual construction work will be started about Feb. 15.

The citizens of Hollis have raised a $25,000 bonus for the Wichita Falls & Northwestern R. R.

Business men of Waurika have asked the Texas Southwestern Ry., W. B. Worsham, vice president, Henrietta, Tex., to extend its line to Waurika, with a view to securing a connection there with the Rock Island.

The Oklahoma Union Traction Co. which has just completed two miles of line in Tulsa, has announced that it is preparing to build lines to Sapulpa, Sand Springs and Bartlesville, in addition to a chain of extensions of track in Tulsa. The company has asked the City Commission of Tulsa for an amended charter, which will give it the right of several more streets not named in the franchise in order that a number of new lines may be laid at once.

Citizens of Okmulgee have subscribed $30,000 to build an electric line to what is known as the Preston oil pool, or "Hamilton Switch," a distance of six miles. The sum secured assures the building of the road at once.

The Enid, Ochiltree & Western R. R. has opened offices at Enid. The office is in charge of B. H. Tallmadge, Assistant General Manager. Liberal subscriptions to the stock have been made by citizens of Enid and assurances have been given in regard to the securing of rights of way, terminals, etc.

The Commercial Club of Muskogee has started a movement to secure the co-operation of clubs at Shawnee, Oklahoma City, Guthrie and Kingfisher, for the extension of the Fayetteville branch of the Frisco railroad running west from Okmulgee to the towns mentioned. This line now runs through Muskogee, from Fayetteville to Okmulgee, but it is considered highly desirable to have this cross section line extended.

The Cherokee & Oklahoma Western R. R. Co., which is contemplating the construction of a line from Clinton, Okla., to Butler, is now having surveys made for the extension of the line from Clinton to Chickasha to connect with the Rock Island and Oklahoma Central R. R.

Chickasha, Okla., has subscribed a $40,000 bonus to the Caddo Development Co., which proposes the construction of an interurban railway from El Reno, through Chickasha to Anadarko, Okla. Surveys for the projected line have already been completed and the work will be completed in two years, it is said.

The Oklahoma City and Fort Smith Traction Co. has been chartered to construct a 200-mile interurban railway line from Oklahoma City to Fort Smith, Ark. The company [illegible] City, Okla., [illegible] route as [illegible] counties: Oklahoma, Pottawatomie, Seminole, Okfuskee, Okmulgee, McIntosh, Muskogee, Haskell and LeFlore. The incorporators are V. C. Boilt, P. M. Moory, G. L. Wood, F. N. Wood, A. M. Gustie and John Wilds, all of Oklahoma City, Okla.

The Seaboard Air Line Ry., H. R. Artman, Assistant Engineer, Brimingham, Ala., is said to be planning to expend $160,000 in putting in a new concrete-lined tunnel at Rogers Gap, 20 miles east of Birmingham. The old tunnel was badly damaged by a recent fire.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Utah Construction Co., Ogden, Utah, is reported to have been awarded the contract for grading 80 miles of the proposed Harriman road across Central Oregon from Vale west into the Great Harney Valley. Construction work is to be started as soon as weather will permit and already several carloads of material have arrived at Vale, including three cars of dynamite, which will be used in blasting the roadbed in the Malheur canyon.

The Portland Railway, Light & Power Co. of Portland has completed surveys for the construction of an electric railway from West Oregon City to Oswego, a distance of four miles, in order to handle the logging business for the Willamette Pulp & Paper Co., the Crown-Columbia Pulp & Paper Co., and the Hawley Pulp & Paper Co. The line will be an extension of the Willamette Falls Railway, running south from West Oregon City past Willamette, and the surveys were made by Superintendent C. A. Miller, of the Willamette Falls Co. It is intended to have the road in operation within three months.

Robert Wakefield, Portland, Ore., who has the contract for constructing the Mount Tabor reservoirs for that city, has placed a 400-H.P. hydraulic sluicing plant in operation for sluicing away 500,000 cu. yds. of soil for the upper reservoir.

W. Hood, Chief Engineer Southern Pacific Ry., San Francisco, has been making estimates as to the cost of completing the Coos Bay branch of the S. P.

Twohy Bros., Spokane, Wash., have completed their contract for constructing 16 long sidings for the Oregon Railroad & Navigation Co. These sidings are scattered along a section of the line between a point just east of Pendleton and a point just east of Baker City.

The promoters of the Coos Bay & Boise R. R., which is being surveyed from Marshfield to Roseburg, are asking for a bonus of $150,000, the money not to be paid until 30 days after the road is in operation. The people of Coos Bay will be approached with subscription papers and an effort will be made to raise the nesessary bonus. Preliminary surveys for the line have reached Roseburg. F. A. Haines, Marshfield, is Chief Engineer.

Agreement has been reached between the Commercial Club of Pendleton and the Washington & Oregon Traction Co., assuring the line for that city. Construction work is to be started as soon as $50,000 is raised in Pendleton.

Ordinance is before the Common Council of Portland calling for a fill on East Second St. to Hawthorne Ave.

The Central Oregon & Pacific Ry. Co., incorporated a few months ago for the purpose of constructing a railroad up the Calapooia Valley from Brownsville, Ore., has secured seven miles of the right of way over which, according to the conditions, the line must be constructed within 12 months from Jan. 1, 1910. The proposed road will tap a rich timber country and will connect the Corvallis & Eastern line with the Curtiss Lumber Company's logging railroad.

The Street Railway Co. of Albany, Ore., is considering the improvement of its system during the coming year. The work includes the construction of a number of extensions and a loop throughout the southwestern part of the city.

The Craig Mountain Railroad Co. has started laying steel on its 5-mile line connecting with the Northern Pacific Ry., at the old government saw mill near Ruebens. A large concrete dam has been constructed for a storage basin for the logs and will also afford a lake for a summer resort planned by the company.

The Hood River Light & Power Co. has filed articles of incorporation at Portland, Ore., and proposes to develop water power, construct and otherwise acquire and operate transportation lines, including boats, steam or electric railways and airships and engage in packing, manufacturing, mercantile pursuits, express, telephone, telegraph and other public service branches of business. The papers provide for the construction of a railway from the mouth of Hood river to a point in the Mount Hood District and options in the right of way are to be secured at once. The principal offices of the company are at Portland and the incorporators are J. D. Wilcox, Portland, Ore., and Wirt Minor and R. Smith.

C. A. Miller, of the Portland Railway, Light & Power Co., has been ordered to start surveys for the construction of an electric railway from Oregon City, Ore., to Oswego, on the west side of the Willamette River. The road will connect with the Willamette Falls R. R., running from Oregon City to Willamette Falls and on to Tualatin River and probably on to a connection with the Oregon Electric at some point.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Somerset and Cambria branch of the Baltimore & Ohio R. R., according to more or less reliable reports, is to be double tracked. Plans for laying the additional tracks are said to have been completed and to be now in the hands of the executives in Baltimore. This work is included in the 1910 construction program which is being considered by the executives of the Baltimore & Ohio, and which will mean an expenditure of more than $50,000,000. To make possible the through service from Johnstown it will be necessary to construct the extension of the Quemahoning branch into the Benscreek coal field in Somerset county. A. M. Kinsman, Baltimore, Md., is Chief Engineer.

The Scranton & Lake Shore Ry. Co., of Scranton, Pa., has been chartered with a capital stock of $18,000 and proposes the construction of a 5-mile line.

The Buckhannon & Northern R. R. has been granted a franchise by the Commissioners of Monongahela county, W. Va. Final locations for the line are to be started shortly. The road is to extend from the Pennsylvania, West Virginia state line up the Monongahela River to Rivesville, W. Va. B. M. Laughead, Morgantown, W. Va., is locating engineer.

The Bradford County Traction Co. has reached an agreement with the W., S. & A. Traction Co. and it is now expected that work on the trolley road in Towanda borough will be started soon. The franchise granted at Towanda to the Bradford County Traction Co., will expire on March 15, unless real work on the line is begun before than time.

Title has been taken by Henry A. Phillips of Philadelphia, to a tract of about 29 acres at 44th Ave. and 30th St., recently purchased by a syndicate of capitalists for the purpose of building a great terminal for steamship lines. It is reported that the syndicate will spend close to $2,000,000 on improvements, which will include the filling in of much of the ground and the building of several large piers.

W. C. Riffert of Harrisburg, was recently in Lebanon County laying out a prospective route for a street railway line. The company, in which Mr. Riffert is interested, intends running a line from Reading to Bernville, to Rehrersburg, Fredericksburg and Jonestown. The route will include Grantville and Palmyra, where it is proposed to connect with the lines to be built by M. S. Hershey, the chocolate manufacturer, from that place to Hershey. This will make a continuous route from Reading to Harrisburg. The promoters propose building a line from Palmyra to Campbelltown, a distance of about 2 miles. M. S. Hershey intends building several lines in western Lebanon County, which will drain the dairy section of milk to be used in the manufacture of his product.

Notice of reorganization of the Monongahela Short line, a projected steam railroad for operation in Allegheny County, has been filed at Harrisburg. The rights of way and other property of the company were sold recently at sheriff's sale. The new company will have $200,000 capital and the following directors: W. S. Moorehead, K. F. Rafferty, C. A. and W. S. McClintock, G. S. Ebbert and E. H. Dermitt. The Monongahela & Southwestern R. R. Co., also sold recently, has filed similar papers, the capital and directors being the same as for the other road. Both lines are projected for operation in the Homestead district, near Pittsburg. The first line is 12 miles in length, running from Homestead into Snowden township, and the other, also a short line, runs out of Homestead in another direction. The companies were formed originally by B. F. Rafferty. Both were sold not long afterward, and again sold in 1906. They were acquired only a short time ago by the present holders. It is now stated that enough money is in sight to build the new roads, and that construction of them will be started shortly.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The American Construction Co., of Knoxville, Tenn., has been granted a permit to do

business in Texas. The capital stock is $100,000 and the offices are to be in Houston.

Samuel Lazarus, of St. Louis, Mo., president of the Quanah, Acme & Pacific Ry., is reported to have announced that the road would be extended either to El Paso or Roswell, N. Mex. C. E. Ensminger, Quanah, Tex., is General Manager.

Col. R. A. Love, Miles, Tex., has made a proposition to the citizens of Brady to build a road from Coleman to Llano, with an ultimate destination to San Antonio. His proposition is for Coleman and Brady to subscribe for the stock and proceed at once with the building. It is the intention to begin grading from Brady to Coleman to connect the two towns as soon as possible.

The Galveston Wharf Co., of Galveston, is to at once rebuild its pier at Galveston which was damaged to the extent of $10,000 by a fire on December 30.

Advices from Brownwood state that John Meade, Chief Engineer of the Brownwood North & South R. R., has had a party of surveyors in the field locating the road between that place and May. The old Connell and Comer survey will be followed pretty closely almost the entire distance. It is believed now grading can be commenced early in February unless too much bad weather interferes with the work of locating the line.

The first survey for the Dallas-Terrell Interurban line has been completed to the North Texas Hospital for the Insane, one mile east of Terrell, which it is stated will be the terminus of the new line at present. Work on the second survey, which is to run north of the Texas & Pacific, between Terrell and Forney and probably via Chisholm, will begin soon. C. L. Wakefield, under whose direction the surveys are being made, is said to have estimated that the cost of constructing the new road will be about $30,000 per mile and that the line from Dallas to Terrell will cost about $1,000,000.

The citizens of Pecos have entered into a contract with W. L. Carwile of Dallas for the construction of a railroad from Pecos City south to the Davis Mountains, incorporated under the name of the Pecos Valley Southern Ry. Company. Mr. Carwile posted a bond for $25,000 as a guarantee that he will have the road completed to the town of Balmorhea, 36 miles, by June 1, 1910, and an additional bond in the sum of $75,000 to protect the trustees in the partial payments which they have agreed to make as the work of construction advances. The trustees agree to pay to Mr. Carwile $100,000 in installments as the road reaches given points. Grading work is said to have been started.

The Coleman, Llano & Southern R. R. Co. has been chartered with a capital stock of $500,000 and principal headquarters at Coleman. The company proposes to build a line from Coleman to Brady and ultimately to San Antonio. The directors are as follows: H. N. Beakley, J. A. B. Miller, H. R. Starkwater, J. E. Roog-Scott and R. A. Lane. Surveys have been made and right of way is now being secured.

The Chicago, Rock Island & Pacific Ry., according to a statement of President H. U. Mudge is to expend at least $1,500,000 for improvements to its terminal facilities at Galveston, Tex.

The U. S. House of Representatives has passed the bill introduced in the house last December by Representative Gregg authorizing the Lone Star Canal Co. of Anahuac, Chambers County, Texas, to erect a dam across the mouth of Turtle bayou.

The directors of the San Angelo Junior Methodist College have offered the San Angelo St. Ry. Co. a bonus to extend its lines to the college, which is about 1½ miles from the court house.

Mr. Lowrey of Poteau, Okla., with local capitalists, has been in conference at Quanah regarding the construction of a belt street car line in Quanah. The franchise was secured some time ago and the plan is to run out Johnson St. as far as the Perry property, then turning west, going through the Brixill, Du Puy, Harwell and Parson properties, entering the southern end of the city at or near McDonald St., coming up that street as far as the court house, making connection with Johnson St.

J. F. Edwards, of St. Louis, Mo., who has a contract with the chamber of commerce of San Antonio to build a railroad south to connect with the Simmons road at Medina River and eventually to Brownsville, has a gang of men already at work. He is stated to have financial arrangements whereby the work will be very greatly rushed.

It looks now as though nothing would be done for some little time regarding the construction of the railroad from Harlingen in Cameron county, to San Antonio. The road was projected by Lon D. Hill, of Brownsville, and his plans were well under way when the announcement came that Edwin Hawley, B. F. Yoakum, et. al. obtained a controlling interest in the Missouri, Kansas & Texas Ry. He was said to be depending on the Katy road for connections and the road could not be carried out under the present circumstances.

Advices from Alvin, Tex., state that the proposition to issue $193,000 worth of drainage bonds has been carried.

The St. Louis, Brownsville & Mexico Ry. Co. has filed an amendment to its charter providing for the construction of two extensions, including about 72 miles of track. The first is from Samfordyce to Roma, a distance of 35 miles and the other extension from Bloomington to Port O'Connor, a distance of nearly 40 miles. The main line of the company, which is now under construction, is rapidly nearing completion.

A second route for the proposed line of the Dallas-Terrell Interurban Ry., mentioned in a recent issue, is being made. It will run north of the Texas & Pacific Ry., probably passing through Chisholm, the citizens of that village having offered the company a bonus of $50,000 and land for terminal purposes.

F. G. Hammock, promoter of the Colorado & Concho, is to let contracts for the construction of 50 miles of the line from Colorado City to Robert Lee, Texas. The line will later be constructed from Robert Lee, 28 miles to San Angelo, Texas. The route will follow a fertile valley along the Colorado river.

It is reported in the vicinity of Fort Worth, Texas, that the Fort Worth & Denver Railroad Co., has acquired the entire control of the Trinity Valley and Brazos Valley Railway, the Chicago, Rock Island & Pacific Railway Co. having sold its interest in the line.

President of the Fort Worth, Texas, Board of Trade has appointed a subscription committee to solicit a $125,000 bonus for the Watkins Company, which is planning the construction of an interurban line between Fort Worth and Mineral Wells. J. O. Watkins, Little Rock, Ark.; Paul Hurley, and J. S. S. Hansford, Fort Worth, Texas, are members of the company.

B. C. Stegman of Brownsville, Texas, is organizing a company to be capitalized at $60,000 to construct a railroad from West Brownsville, a suburb, through Brownsville to Matamoras, Mexico, and also a belt line around Brownsville. One-third of the stock has been subscribed and as soon as the remainder can be disposed of, an application will be filed with the city council for a franchise.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

City Council of Salt Lake City has voted to spend $25,000 for the enlarging of the surplus canal from the Jordan river to Great Salt Lake to take part of the flood waters in the Jordan during the spring floods. The work has been started by Street Supervisor Jake T. Raleigh. The purpose is to enlarge the surplus canal by deepening it about three feet and widening it 20 or 30 feet. Under the present plan the canal will be made to carry 1,400 second feet of water instead of 500, as at the present time.

The Spanish Valley Water & Land Co. has been incorporated with a capital stock of $300,000 and headquarters at Salt Lake City. The officers of the company are: W. H. Jones, president; W. W. Taylor, vice president; S. A. Jones, treasurer; George D. Winter, secretary; and Willard Hanson completing the board of directors. W. W. Taylor holds 2,996 shares, and each of the other directors hold one, making the 3,000 shares. Property of W. W. Taylor and water rights in Mill creek, San Juan and Grand counties, are taken for the full stock.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Monroe Water & Light Co. of Monroe, Wash., has purchased a five-acre tract on the bench lands northeast of town and propose to build a reservoir for storage purposes.

The City Council of Tacoma, acting as a committee of the whole, has voted to recommend the passage of an ordinance submitting to the vote of the people at the coming spring election the proposition of a special bond and warrant issue of $1,000,000 to build and equip city traction lines. The ordinance will provide for the expenditure of $750,000 for the building of a network of cable and electric lines with an additional $250,000 for equipment. Power will be furnished by the city's new power station now being constructed.

Advices from Rainier state plans are being perfected for the building of 12 miles of railroad track, extending from the sawmill on Johnson creek to a connection with the Milwaukee road at Rainier. The mill was built by Mr. Farrell, formerly right of way agent for the Oregon and Washington branch of the Union Pacific and brother of J. D. Farrell, Seattle, General Manager of that road.

The Big Bend Waterpower Co. will shortly commence development work on a new power plant 30 miles down the Spokane river from Spokane. The object of the company is to furnish power for manufacturers in and around Spokane, and to develop mines in the Coeur d'Alene belonging to incorporators of the company.

The Seattle Lighting Co., S. R. Hutchinson, Superintendent, Seattle, is planning to spend $125,000 for a new gas distributing station in Georgetown. The gas holder is already ordered.

Advices from Centralia state that the contract has been let to J. M. Evans for the construction of six miles of railroad to connect the Johnston Creek Lumber Co. with the Chicago & Milwaukee at its intersection with the Deschutes river. This company has recently been reorganized, with an increased capital stock and will do a general logging and mill business. David McVay is president; J. M. Farrell, vice president and manager; and L. H. Johnston, secretary and treasurer. The principal place of business is Centralia, Wash.

The Mount Adams Railway Co. of Portland, Ore., is to take out incorporation papers in the state of Washington. The company proposes building an electric railroad through the White Salmon River valley. The town of White Salmon, at the confluence of White Salmon and Columbia rivers, and Glenwood at the base of Mount Adams have been selected as terminals. Power will be obtained from the White Salmon river. The power site selected is near the town of White Salmon, and it is estimated to furnish 10,000 hp. The capital stock of the company will be $500,000, and it is said most of it has already been subscribed. A bond issue of $1,000,000 will be made with the intention of beginning actual construction this spring. The officers of the company are: Rudolph Lauterbach, president; R. Weires, vice president; Herbert L. Simpson, treasurer; and T. F. Shepler, secretary, all White Salmon property owners. In addition to theabove, the board of directors is composed of J. S. Merrill of Wall street, New York; W. W. Swan, a lumber man of White Salmon; A. H. Jewett of White Salmon; C. L. Colburn, manager of a private bank at White Salmon; R. Field, a real estate dealer of White Salmon; and H. O. Coughlan of Jersey City, N. J.

According to reports from Husum, Wash., the high line preliminary survey of the big Klickitat Canal has been finished and final survey will be made in the spring. The company has established a reservoir site at Bear Springs. The directors of the Klickitat Irri-

gation & Power Co., are L. K. Moore, W. H. Phillips, Ira W. Carter, T. J. Stockdale and E. D. Mineah.

Further information is available regarding the improvements of the Oregon & Washington R. R., in Tacoma, Wash., mentioned in our last issue. The terminal plans are far more extensive than at first supposed and will include the dredging of the Middle waterway to a width of 300 feet and a low tide depth of 22 feet, all costing $250,000; building a passenger depot, costing $300,000; car shops at South Tacoma, costing $200,000; general freight yards, including a gravity yard at South Tacoma, costing $200,000; city freight yards at the foot of Fifteenth street, costing $200,000; steel viaduct from the eastern portal of the tunnel across the business district and the tide flats to the city waterway, costing $2,000,000; warehouses and ocean docks and track connections, costing $250,000; tunnel, costing $2,500,000. All told the road will spend $6,000,000 in terminals, and the terminal property bought by the system amounts to another $6,000,000. J. D. Farrell, Seattle, Wash., is general manager.

Surveyors of the Oregon Railroad & Navigation Co., operating in the vicinity of Wilcox and LaCrosse have been called in, and also those of the Spokane-Indland Electric Ry. Co., and it is reported that the two interests who have been contesting for the 50 miles of right of way down the Union Flat will compromise the route in Whitman County. It is reported in the vicinity the Chicago, Milwaukee & Puget Sound R. R. Co., which is running lines from Palouse, the present terminus of the Bovill-Palouse logging road, down Four-Mile Flat to strike the Union Flat survey southeast of Colfax, will get the right of way.

The Spokane Traction Co. of Spokane, has applied for several franchises in the city for extensions of its system. One franchise is for the extension of the Union Park line east on 5th Ave. to the new city limits, an extension of a mile or more and calling for the double tracking of the line already laid on 3rd Ave. east of Sherman St.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Two Rivers Dredge Co., of Two Rivers, Wis., has about completed its big dredging contract at Sault Ste. Marie, on which it has been working for the past three years.

Recent purchases of land in the so-called Belt line district east of the Great Northern ore docks at Alloney has given rise to reports here in Superior that the Minneapolis, St. Paul & Sault Ste. Marie Ry., Thos. Green, Chief Engineer, Minneapolis, Minn., was to construct ore docks and yards at Allouez.

The Wisconsin & Michigan R. R., one of the John R. Walsh properties, was sold at Menominee, Mich., on Jan. 26, for taxes by order of the Auditor General of the State of Michigan. The road was bid in by John Marsch, 181 La Salle St., Chicago, Ill., the contractor who built the road. The price paid was $67,990.08, the amount of the unpaid taxes, with interest to date. Mr. Marsch now owns part of the road from Quinnebec to Iron Mountain, which he built, but was never paid for. It is understood that he purchased the line to protect his interests.

City Council of Milwaukee, Wis., has granted the Milwaukee Electric Ry. & Light Co., a franchise to cross the 16th St. viaduct and to operate on several streets in the city. John I. Beggs, President of the company, has contributed $45,000 for the improvement of the bridge.

Commercial clubs of Washburn and other towns in northern Wisconsin and Minnesota are taking steps to induce the Northern Pacific Ry. Co. to construct a branch line from Grantsburg to a point in Bayfield County connecting with the line and giving direct route from Twin Cities to Lake Superior.

Barnett & Record, contractors, Minneapolis, Minn., have a crew at work driving piles for the Berwind Fuel Co.'s dock extension at St. Louis Bay, Superior. The cribs which have been built at Duluth this winter are completed and will be moved across the bay and sunk as soon as navigation will permit their moving. It is expected that the ice will be gone about the middle of April and work started on the sinking of the crib. A 600 ft. extension is to be added to the dock which will add a three-quarter million capacity. The dock is now 1,200 ft. long.

The Soo is reported to be negotiating for the purchase of the Abbotsford & Northeastern R. R., which extends from Abbotsford and Athens and thence north several miles into timber land. It is reported that the new owners will extend the line to Merrill, and possibly to Antigo. Wm. L. Erbach, Athens, Wis., is Vice President of the A. & N. E. R. R.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Canadian Pacific Ry. has made an appropriation providing for the construction this year of 50 miles of the Kootenay Central Ry.

J. A. MacCullough, who is promoting a scheme for building an electric railway line between Calgary and Chester lake, a sheet of water distant about eight miles to the east of the city, has asked the city commissioners of Calgary, Alberta, for permission for the company to run its cars over the city railway system into the city along 8th and 9th Avenues to the Alberta hotel corner.

The House of Commons railway committee has reported bills respecting the Esquimalt & Nanaimo Ry., Edmonton, Dunnegan & British Columbia Ry. and the Kettle River Valley Ry. Cos. The first two bills ask for an extension of time for construction. The third bill authorizes the construction of a line from Coldwater, near Ruby Creek.

Construction work is to be started shortly on the 18-mile section of the Victoria, Vancouver & Eastern R. R. (Great Northern R. R.) recently awarded to J. W. Stewart as noted in our issue of Jan. 19. Mr. Stewart is a member of Foley, Welch & Stewart, Grand Trunk Pacific Ry. contractors. The contract for the 50-mile section of the V. V. & E. R. R. between Abbotsford and Hope was let to P. Welch of the above firm. Mr. Welch will have general supervision of the construction work both west of Princeton and west of the Hope mountains between Hope and Abbotsford.

Work is reported to be progressing rapidly on the British Columbia Electric Company's line from New Westminster to Chilliwack, B. C. Grading has been completed from New Westminster to Sumas, Wash., and steel laid to a point eight miles west of Abbotsford. On the Chilliwack end 13 miles of track has been laid bringing the line within 12 miles of Sumas.

Mexico Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Contracts on constructing the first section of the new railroad which is ultimately to extend from Monclova, Coahuila, to Chihuahua, Chih, a distance of 550 kilometers, is reported to have been let to Captain Scott of Coahuila. Construction work will be commenced out of Monclova at once as the concession has already been granted to Miguel Cardenas of Coahuila. The states of Coahuila and Chihuahua have both granted substantial subsidies, and it is also expected the government will vote a subsidy to aid the promotion of the line. It is estimated that the line will cost $25,000 per kilometer throughout the entire 550 kilometers. There are no difficult engineering problems to be encountered and the maximum grade will be three-fourths of one per cent. The line, for the greater part, will pass through a fertile valley.

A progress of about 83 ft. per day is being made in the construction of the tunnel in the City of Mexico for carrying water mains in several streets in that city. The following are the interior dimensions of the gallery or tunnel in which the pipes will be laid: 280 centimeters in width by 185 centimeters in height. The side walls are 6 in. thick, the floor is 10 in., and the roof 8 in., made of reinforced concrete. The main tube, which will carry the water, will be 4 ft. in diameter, and at the sides of the gallery will be compartments for electric light, power, telegraph and telephone line conduits. It is anticipated that the work of the gallery and the leveling of the streets will be completed by the end of April, another two months being required for the installation of the water piping. The work is in charge of Ing. Farando Arechavaleta, formerly for a long time in the service of the Central railroad, assisted by Ings. Manuel Jimenez Cincta, Emilo Subiaga, and Ioaquin Rivera. Some 800 men are at work, both in the streets and at the plant at San Lazaro, near the pumping station of the Grand Canal, where the concrete sections are being cast ready for placing in the tunnel. The sections are reinforced with lattice work of corrugated iron.

The Batopilas Mining Co., which has made a survey of the Batopilas River in the Batopilas district, state of Chihuahua, will erect a hydro-electric plant near Batopilas, for the purpose of providing power for operating its mines and reduction mill.

The Navidad Reduction & Mines Co. of San Francisco, Cal., which obtained a concession for the use of the water of the Ameca River, near San Sebastian, Jalisco, will soon be ready to start construction work.

The government of the state of Coahuila has granted a concession to the Kansas City, Mexico & Orient R. R. Co., to extend its proposed branch that is to run south from San Angelo, Tex., into Mexico. The route as described in the concession runs from Las Vacas, situated on the banks of the Rio Grande just opposite Del Rio, Tex., to Allende, where it will connect with the International division of the National Railways of Mexico. It is announced that final arrangements have been made by the company for the immediate construction of this branch from San Angelo to Allende. It is about 175 miles from San Angelo to Del Rio and another 75 miles from Del Rio to Allende. W. W. Colpitts, Kansas City, Mo., is chief engineer, Kansas City, Mexico & Orient Ry.

Gonzalez Trevino has begun the construction of a canal at Las Vacas that will be 26 miles long, with a storage dam, furnishing water to irrigate more than 30,000 acres of land. Las Vacas is on the Rio Grande river, just opposite Del Rio, Tex.

The Mayo River Power & Land Co. is planning to have construction work on the dams and hydro-electric plants upon the Mayo river in the states of Chihuahua and Sonora started soon after April 1. The first of these dams will be built near the line between the states of Chihuahua and Sonora, but in the latter state. Later two or more dams will be built across the river in the state of Chihuahua. Transmission lines will be built to all of the larger mining districts in that part of the country. W. O. Temple, Denver, Colo., is secretary.

The Compania Electrica e Irrigadora has over 2,000 laborers engaged in constructing its new canal near Pachuca, which is to afford power for its new hydro-electric plant to be erected at Tetepango. This canal will be about 25 miles long. It will be completed in about eight months. This company is furnishing power for a number of mines and mills in the Pachuca district. It is now operating two hydro-electric plants, each of 6,000 H. P.

The Mexican Northern Power Co., the Canadian concern which is arranging to erect hydro-electric plants in the state of Chihuahua, has obtained a new concession from the Mexican government, giving it authority to build two dams and hydro-electric plants upon the Conchas river. The site of one of these dams is at Boquilla, 17 miles above Santa Rosalia, and the other at La Joya. The construction of the dam at Boquilla is already in progress. The company is also building a railroad from Santa Rosalia to the site of the dam. This first dam will have a water supply sufficient to generate about 30,000 H. P. The plant at La Joya will have a capacity of about 40,000 H. P.

The Atlantic Coast Line R. R., E. B. Pleasants, chief engineer, Wilmington, N. C., has surveys underway for a branch line from Springhope to Raleigh, N. C., 30 miles.

BIDS ASKED.

Bids are asked on following work, the notes being arranged alphabetically by states:

Bridges.

Salinas, Cal.—Until 2 p. m., Feb. 8, by T. P. Joy, Clerk of the Board of Supervisors, for repairs to the Carmel bridge and the construction of small bridge near Carmel bridge in Carmel and San Road Districts.

Palatka, Fla.—Until 11 a. m., Feb. 12, by Board of Trustees, for the construction of a highway bridge across Etoniat Creek at Banana Mills. S. Worden is Clerk of the Board. R. S. Ensey is County Engineer.

Topeka, Kan.—Until Feb. 7, by C. B. Burg, City Clerk, for the construction of a bridge over the Shunganunga Creek on Fillmore St.

Topeka, Kan.—Until Mar. 7, by City Clerk, for the construction of an extension to the Melan bridge.

Fergus Falls, Minn.—Until Feb. 7, by City Clerk, for the construction of the proposed bridge on Mt. Faith Ave. The structure as planned will be 80 ft. in length with 20 ft. roadway.

Minden, Neb.—Until 2 p. m., Feb. 23, by J. H. Jensen, County Clerk, for the construction of all bridges of wood or steel to be built by Kearny County for the year of 1910.

Reading, Pa.—Until 10 a. m., Feb. 10, by A. L. Rhoads, County Controller, for the construction of a reinforced concrete arch bridge over the Wyomissing Creek in Cumru Township, Berks County, Pa., to be known as Ruth's Bridge.

Washington, Pa.—Until Feb. 23, by Board of County Commissioners, for the construction of a bridge over Ackley Creek. The structure will be 99 ft. in length connecting Rich Hill and West Finley Townships. J. H. Moffit, Washington, Pa., is County Surveyor.

Yankton, S. Dak.—Until 10 a. m., Feb. 3, by David M. Finnegan, County Auditor, for the construction of all bridges to be built by the County of Yankton, S. Dak., during the year of 1910.

Bristol, Tenn.—Until Feb. 8, by Street Committee, for the construction of a steel or concrete bridge over Beaver Creek. J. W. Mort is Chairman of the Committee.

Everett, Wash.—Until 10 a. m., Feb. 28, for the construction of a new draw span for the river bridge at Snohomish, Wash.

Tacoma, Wash.—Until 11 a. m., Feb. 14, by H. J. McGregor, Commissioner of Public Works, for the construction of a reinforced concrete bridge across Buckley Gulch between Oakes and Fife Sts. on the line of North 23d St.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Heber, Ark.—Until noon, Mar. 2, by Jail Commissioners, for the construction of a county jail for Cleburne County, Arkansas. W. C. Watkins is one of the commissioners.

Sacramento, Cal.—Until 3 p. m., Mar. 24, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, gas-piping, heating apparatus, electric conduits, and wiring and standard clock system, of and extension, remodeling, etc., to the United States Post Office and Court House at Sacramento, Cal.

Fort Logan, Colo.—Until 10 a. m., Feb. 21, by Capt. Chase Doster, Constructing Quartermaster, for the construction of a laundry building and the installation of plumbing, electric wiring, laundry machinery and equipment.

Washington, D. C.—Until noon, Feb. 3, by District Commissioners, for the construction of additions and making alterations to the Western High School, located at 35th St., between R. and Reservoir Sts., N. W.

Chicago, Ill.—Until 1:30 p. m., Feb. 7, by Board of County Commissioners, for fire escapes and alterations at the Cook County Hospital at Wood and Harrison Sts.

Frankfort, Ky.—Until 3 p. m., Mar. 14, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the extension, remodeling, etc., including plumbing, gas piping, heating apparatus, electric conduits and wiring and standard clock system, of the United States Post Office and Court House at Frankfort, Ky.

Duluth, Minn.—Until 3 p. m., March 10, by James Knox Taylor, Supervising Architect, Treasury Department, for the painting and decorating of the United States Post Office, Court House and Custom House at Duluth, Minn.

New York, N. Y.—Until 3 p. m., Feb. 23, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the installation of a double pneumatic tube service between the U. S. Custom House and the U. S. Appraisers' Warehouse, New York, N. Y.

Wards Island, N. Y.—Until 3 p. m., Feb. 16, by T. E. McGarr, Secretary of the State Commission in Lunacy, Albany, N. Y., for the construction of four cottages, including heating, plumbing and electric work at Manhattan State Hospital, Wards Island, N. Y.

Fort Wood, Bedloe's Island, N. Y. H.—Until 10:30, Feb. 26, by William W. Bessell, Constructing Quartermaster, for the construction of a cable store house at Fort Wood, N. Y. H.

Umatilla, Ore.—Until 2 p. m., Feb. 28, by Department of Interior at Office of Indian Affairs, Washington, D. C., for the construction, including materials, of one barn at the Umatilla School, Ore.

Danville, Va.—Until 3 p. m., March 16, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the extension, remodeling, etc., including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the U. S. Post Office and Court House at Danville, Va.

Richmond, Va.—Until noon, Feb. 7, by Charles M. Robinson, 10th and Main Sts., Richmond, Va., for the heating and ventilating for the church, parsonage and Sunday school room of the new church buildings at Monument Ave. and Lombardy Sts.

Montpelier, Vt.—Until noon, Feb. 7, by Sergeant at Arms, Montpelier Vt., for building, ventilating, plumbing and alterations of the toilet rooms of the State capitol. Charles H. Ferrin is Sergeant at Arms, Montpelier, Vt.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Atlanta, Ga.—Until 3 p. m., Feb. 7, by City Clerk, J. P. Foste, for furnishing and setting granite curbing, furnishing material and laying concrete curbing, furnishing material and laying brick sidewalks, furnishing material and laying tile sidewalks, furnishing material and laying sheet cement sidewalks, for constructing such sewers as may be authorized by Council during the year 1910. R. M. Clayton is City Engineer.

Atlantic, Ia.—Until Feb. 14, by City Clerk, for the construction of brick and asphalt pavement estimated to cost $60,000. Charles P. Chase, Clinton, Ia., is Engineer.

Pekin, Ill.—Until 2 p. m., Feb. 3, by Board of Local Improvements, for the improvement of portions of Capitol, Elizabeth, St. Mary and Sabella Sts. The work includes the following approximate quantities: 15,000 sq. yds. of vitrified paving brick; 1,060 lin. ft.; 6,500 lin. ft. of removing, resetting stone curb; 1,000 lin. ft. concrete protection stone curb; 5,000 cu. yds. of excavation.

Peoria, Ill.—Until 2 p. m., Feb. 7, by Board of Local Improvements, George F. Simmons, President, for furnishing labor and material for the following: 860 cu. yds. of excavation of old asphalt pavement (cushion and surface coat) down to the present concrete; 207 cu. yds. of excavation of old foundation; 1,245 sq. yds. of new concrete to replace disintegrated concrete in the present foundation; 12,455 sq. yds. of binder course 1 in. thick; 12,455 sq. yds. of wearing course 1½ ins.; 14 barrels of natural cement swept in.

Marion, Ind.—Until 2 p. m., Feb. 17, by Board of County Commissioners, for the construction of a stone road on the line between Monroe and Jefferson townships, 12,292 ft. in length.

Mount Pleasant, Mich.—Until 8 p. m., Feb. 7, by H. H. Hunter, City Clerk, for grading and paving with brick on concrete foundation portions of Broadway and Main St.

Gibson, N. C.—Until Feb. 7, by County Road Commission for the construction of 2.6 miles of sand and clay roads. J. C. Mason is Chairman.

Toms River, N. J.—Until noon, Feb. 14, by Board of County Chosen Freeholders, for resurfacing with stone, a road in Township of Brick, known as the Western Section of Lakewood and Point Pleasant County Road, beginning at the intersection of the roads at Burrsville and extending westward toward Lakewood, a distance of 15,532 ft.

Tom's River, N. J.—Until noon, Feb. 14, by County Board of Chosen Freeholders, for resurfacing a gravel road in Township of Brick, known as the Eastern Section of Lakewood and Point Pleasant County Road from Westpoint Pleasant and extending westward to the intersection of the roads at Burrsville, a distance of 19,505 ft. James E. Otis is Director.

Albany, N. Y.—Until 1 p. m., Feb. 18, by State Highway Commissioners, for the improvement of the following highways:

County.	Road No.	Approx Length. Miles.
Dutchess	5009	1.50
Orange	5007	3.28
Suffolk	5008	1.56
Albany	5010	2.00

New York, N. Y.—Until 11 a. m., Feb. 9, by Alfred E. Steers, President of the Borough of Brooklyn, for regulating, grading and paving various streets in Brooklyn, also for delivering binder stone, Portland cement, gravel, flagstone, pitch, sand, tar melting and gravel heating trucks, hardwood road oil, refined asphalt, etc.

Norfolk, Va.—Until noon, Feb. 15 (extension of date from Feb. 8), by Board of Control, for regulating and repaving with some smooth materials part of Granby and Chapel Sts. W. T. Brooke is City Engineer.

Sewers.

Bids are asked on following work, the notes being arranged alphabetically by states:

Perry, Fla.—Until noon, Feb. 8, by Board of Bond Trustees of the city, for the construction of a sanitary sewer system. The work will include 3 miles of 8-15 in. pipe, manholes, flush tanks, etc. John C. Calhoun is Secretary of the Board. Wm. W. Lyon, 205 Duval Bldg., Jacksonville, Fla., is Consulting Engineer.

St. Louis, Mo.—Until noon, Feb. 11, by Board of Public Improvements, for the construction of various sewers. W. B. Dryden is Clerk.

Washington, N. J.—Until noon, Feb. 14, by A. J. Craft, Borough Clerk, for the construction of 8 miles of vitrified pipe sewer 8-18 ins., with Y branches, flush tanks and sewage disposal works.

Hudson, N. Y.—Until 1 p. m., Feb. 12, by Charles H. Strong, President of the Board of Managers of the State Training School for Catskill Aqueduct at Mt. Vernon. contract beds for sewage disposal plant at the school. Franklin B. Ware, Albany, N. Y., is State Architect.

Youngstown, O.—Until noon, Feb. 4, by Director of Public Service, for furnishing necessary labor and material for the construction of sewers in Sycamore St. and Andrews Ave.

Charleston, S. C.—Until 11 a. m., Feb. 19, Bureau of Yards & Docks, Navy Department, Washington, D. C., for the construction of an intersecting drain at the navy yard, Charleston, S. C.

Houston, Tex.—Until noon, Feb. 7, by Dan. C. Smith, City Controller, for labor and material for the construction of sanitary sewers in the Fourth Ward. The work includes the following approximate quantities: 5,580 lin. ft. of 12-in. pipe, with necessary manholes, flush tanks, Y's, etc.

Salt Lake City, Utah.—Until Feb. 4, by Board of Public Works, for the construction of pipe sewers in sewer extensions Nos. 220, 249, 253 and 254. H. G. McMillan is Chairman of the Board and George O. Chaney is City Engineer.

Water Supply.

Bids are asked on following work, the notes being arranged alphabetically by states:

Milford, Ia.—Until Feb. 28, by City Clerk, for the construction of a water works, estimated to cost $11,000. Charles P. Chase, Clinton, Ia., is Engineer.

The Septic Tank—Its Place in Sewage Disposal Works.

At the Cairo meeting of the Illinois Society of Engineers and Surveyors, January 26-28, there was a discussion on sewage purification, during which it developed that there still exist strange ideas about septic tanks.

In some municipalities septic tanks have been built without means being provided for after treatment of the effluent, which is discharged raw into nearby water courses. The city engineers cannot induce their councilmen to provide filter beds or contact beds because when the septic tanks were built they were told that the tanks thoroughly purified the sewage.

As usual, the failure of the tanks to meet expectations leads the duped city officials to discredit engineers because engineers believe the septic tank a good thing. They refuse to acknowledge that the tank may be a good adjunct to a sewage disposal plant, but insist upon the engineer trying to make the tank do impossible things. It is one of the many cases in which scientific men are discredited by psuedo scientific promoters.

The septic tank merely lessens the production of sludge. The action is almost, if not quite, entirely anaerobic and aerobic treatment must be had on properly made filter or contact beds. A complete sewage disposal plant would properly consist of grit chambers to catch and hold suspended inorganic matter; a septic tank, in which organic matter may be broken up; and filter or contact beds on which the liquid from the septic tank may be rendered non-putrescible

Percentage Bidding on Public Works.

In our Letters to the Editor will be found a communication from the Secretary of the General Contractors' Association of New York city, commenting on an editorial in Engineering-Contracting, on the subject of percentage bidding. In a letter from the Aberthaw Construction Company some comments are also made on the same subject.

In reading the communications it seems plain that the contractor's objections are based principally upon the inability of engineers to state in advance the exact quantities. In building work it is hard to apply the percentage bidding system and to apply it to structures in which it is possible to compute quantities exactly if time enough is taken, is a case of overdoing a good thing. Such work can therefore be eliminated from the discussion.

In all public work where structures are buried much uncertainty must exist as to underground conditions. This uncertainty therefore, puts the engineer and contractor in the position of players in a game of chance. The engineer believing he possesses sufficient knowledge of conditions to prepare an estimate, prepares it and the contractor is given an opportunity to bid a certain per cent higher or lower than the engineer's estimate. Suppose the engineer believes a certain piece of work contains 100,000 yards of rock and this is estimated at $250,000. If the contractor believes it contains 200,000 yards and makes his bid 100 per cent higher than the estimate of the engineer, some attention will certainly be attracted to that item. In all likelihood all bids will be rejected and further examinations ordered by the council. Under an itemized system the engineer might make an estimate "Rock, est. 100,000 cu. yds. at $2.50 = $250,000." He might estimate on another item: "Earth, est. 300,000 cu. yds. at 75 cts. = $225,000." The contractor believing there will be much more rock and less earth bids $2.25 per cubic yard for rock and 80 cts. for earth. Based on the estimated quantities the city will have the work done below the estimated cost. The engineer is patted on the back because his unit costs were so close to those of the contractor, and everyone is satisfied.

When the work is completed the payments to the contractor read as follows: "Rock, 300,000 cu. yds. at $2.25 = $675,000;" "Earth, 100,000 cu. yds. at 80 cts. = $80,000." In this instance the engineer may have a very good idea of unit costs but a vague idea as to quantities. His total estimate for the work was $475,000, and the actual cost was $755,000. His ignorance of quantities cost his employers just $280,000, besides leaving a suspicion in the mind of the public that he stood in with the contractor. He is believed to be incompetent and doubt is thrown on his honesty. In the amounts involved the example may be extreme. As an instance, however, of how the percentage system might guard the people and put the contractor on the defensive, it is not overdrawn. Suppose the contractor had made his unit bid on earth only 50 cts., and on rock $1.75 per. cu. yd. His total payments on the final estimates would have been $525,000, or $50,000 in excess of the estimates of the engineer. The Council might have stood for a 12 to 15 per cent increase above the figures of the engineer, while the contractor would hope that the final estimates would show such an arrangement of quantities that no loss would be encountered by him.

The contractors object to the quantities estimated upon by the engineers as a basis for the engineer's estimate. This has always been something engineers have been unable to control. Public officials are notoriously averse to spending money on test pits and bore holes for testing. It has proven in many cases costly economy. Recently in Chicago the lack of the few dollars necessary to make proper investigations led to the payment of nearly $46,000 in extras; since claimed to have been unlawfully paid and which has led to the ruining of several reputations, the indictment of prominent men by the Grand Jury and the casting of a dark cloud of suspicion over every employe in the public works departments.

Since the general argument of the contractors seems to be directed against the engineer's lack of knowledge of underground conditions, have we not here a basis on which agreement may be reached and discussion ended? The obvious thing to do is for the engineers to make at least as careful borings and examinations as the contractors would make. Upon the result of this preliminary study base estimates and call them 100 per cent estimates. Contractors then who have different ideas on the subject of quantities, or who accept the quantities and differ on unit costs, may then bid a per cent above or below the engineer. No one will pretend that examinations, no matter how careful, will reveal exact conditions, so the percentage system might be held to even when apparently exact knowledge might be an argument for a return to unit bids. When a number of bids are read before a body of public officials who have little, or no real knowledge of the subject, the percentage bids are intelligible to them where unit bids would be wearisome

Plenty of good arguments may be presented for and against present methods of bidding. The letter referred to has not exhausted the case for the contractors and these editorial remarks are to be taken as intended to assist both sides to arrive at a mutual understanding.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

A Novel Method of Striking Steel Centers for 150 ft. Concrete Arch Spans.

Steel arch centers having a wholly unique arrangement for lowering them away from the concrete arch ring are being used in constructing the Delaware River bridge for the new Slateford-Hopatcong cut-off for the Delaware, Lackawanna & Western Ry. This bridge consists of seven skew arch main spans, two end spans of 120 ft. and five intermediate spans of 150 ft. It carries a double track railway line, is 1,452 ft. long, 25 ft. wide between parapets, and contains 51,000 cu. yds. of concrete. The arches are solid ring arches supporting spandrel arches, which carry the roadway platform. The centers referred to are those for the 150-ft. spans; the 120-ft. spans and two 33-ft. approach arches were built on timber centers.

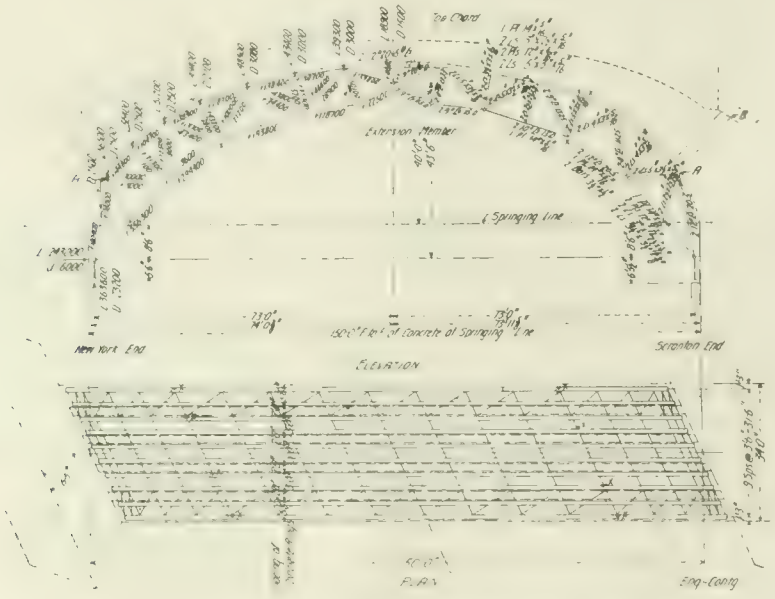

Fig. 1—Elevation and Plan of Steel Center for 150 Foot Arch.

Two sets of steel centers were built, each for a complete arch ring, and they are to be shifted from span to span. Each center (Fig. 1) consists of 10 parallel arch ribs connected by lateral bracing to form a rigid framework on which is laid the lagging forming the soffit of the arch. Each rib is a three-hinged arch, carried at its ends on reaction columns and having a peculiar arrangement of members about the crown hinge, as will be described later. The make up of the arch ribs is shown by Fig. 1. In designing the ribs concrete was assumed to weigh 150 lbs. per cu. ft., and the load at each panel point was considered to be the weight of the concrete vertically above. No allowance was made for initial arch action due to the setting of the concrete. The matter of the temperature stresses due to any rise in temperature after the arch concrete had taken its initial set was considered as follows: It was calculated that the steel would rise in temperature almost as fast as the surrounding air, while the larger mass of concrete would heat up very slowly. The result would be that the steel would expand and try to push up the concrete arch ring at the center and this up-thrust would be resisted by the initial set of the concrete, thus inducing stresses in the steel. The probable stresses so obtained were computed but are not shown on the drawing; the highest fell safely within the elastic limit of the steel and for this kind of stresses the elastic limit was taken as the limiting safe stress. The justification for this was found in the temporary nature of the construction and in the improbability of maximum temperature stresses being developed. For the stresses due to loads proper the safe stresses were taken at 16,000 per sq. in. in tension and 17,000 per sq. in. in compression. The computed deflections were as follows:

	Inches.
Live load (concrete) 150 lbs. per cu. ft.	1 11/32
Dead load, (steel, lugging, etc.)	3/32
Temperature change of 40° F.	17/32

It is stated that observation of the centers so far erected confirms these computed deflections very closely.

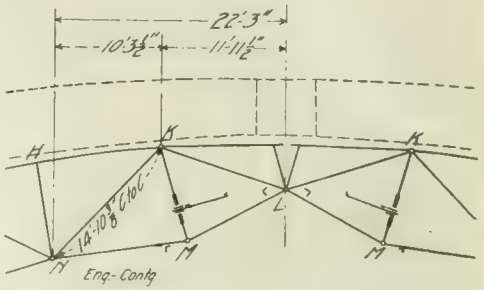

Fig. 3—Diagram Showing Arrangement of Extension Members at Crown.

Returning now to the construction of the centers, Fig. 2 shows the details of the end supports. In molding the piers a projecting step was left at ground level the full length of the pier. On this step was placed a grillage of 4 I beams and on this rested a post or column, into the top of which the end hinge of the arch rib connected as shown. Just back of this hinge connection for each rib there was molded in the concrete face of the pier a cerbel and between this cerbel and the post is inserted a wooden block to take the horizontal component of the thrust. The loads on the centers, as will be seen, are taken directly by the completed bridge piers.

The construction at the crown of the center is more intricate, it being the means by which the center is struck when the arch is completed. Figures 3, 4 and 5 illustrate the construction. Referring to Fig. 3 it will be seen that the first web member on each side of the center hinge is so built that it can be length-

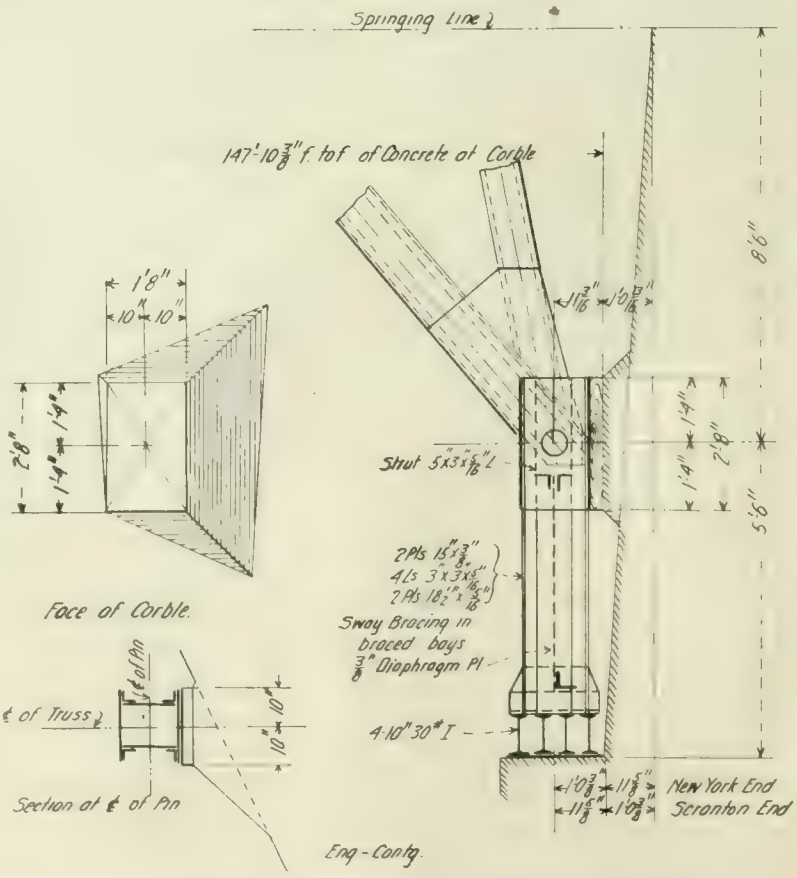

Fig. 2—Details of Support of Ends of Centers at Piers.

ened or shortened. It consists of a built up column, Fig. 4, carrying at its middle a double ended screw, Fig. 5. The connections of the member with the top and bottom chord members is a pin connection, as are also the connections of the next succeeding lower

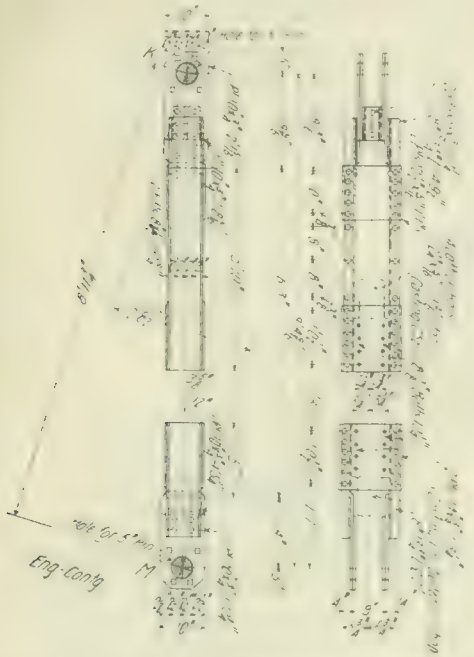

Fig. 4—Details of Extension Members at Crown.

chord panel points toward the end of the arch and, of course, the crown hinge. In effect there is formed a double toggle joint, operated by two levers, in each rib. Details of the operating lever are shown by Fig. 6. By lengthening or shortening the adjustable member the crown pin drops or rises.

In operation the arch ribs are erected and brought to uniform and exact elevation by the toggles. The lateral bracing and lagging are then placed and the arch built. To strike the centers the crown is dropped by simultaneously manipulating all the toggles. In the three arches so far constructed no difficulty whatever was experienced in slacking off the centers. The contractors state: "All ten ribs were slacked off simultaneously, thus obtaining no jar or unequal settlement, but a uniform receipt of the load by every portion of the concrete arch."

The arches so far built have been concreted, working from the skewbacks toward the crown simultaneously on both sides and for the full width of the arch, leaving a key space at the crown to be filled about a week later. The centers have been removed in 30 days.

The centers as described were designed and built by the McClintic-Marshall Construction Co., Pittsburg, Pa., to which we are indebted for information. The general contractors for the bridge are Smith & McCormick, of Easton, Pa.

Surveys are being made at Athens, Ga., for a new trolley line in that city.

New Concrete Trunk Sewer at Cario, Ill.*

The system of sewers consists of a main trunk sewer lying lengthwise with the city and 35 miles of vitrified pipe laterals. The main sewer is 9,700 ft. in length, varying in diameter from 4 to 6 ft., circular in section, and constructed of concrete of the proportions of 1 part cement, 2 parts sand and 4 parts limestone. This sewer was constructed in open cut with the exception of 100 ft. through the Ohio levee, which was tunneled. The interesting features of the sewer are a reduced submerged out-fall, a 72-in. automatic flap valve to protect against a back flow of river water and the difficulties encountered during construction, which were largely due to quicksand in the trench. So bad was this that in certain portions of the work the ordinary methods of plank sheathing had to be supplanted with steel piling and it was with difficulty that no buildings were damaged apparently along the building line 30 ft. away. The method of construction was as follows: The bottom of the trench was excavated and shaped to the required sub-grade and a layer of concrete was placed across the trench, the top of which was the flow line of the sewer; this course of concrete was allowed to set for 24 hours, then the forms for constructing the lower half set upon it. These forms were then filled and also allowed to set for 24 hours, after which the forms were pulled ahead and the arch forms set. After the arch had been turned and allowed to set for 24 hours these forms were pulled ahead for the same operation. Blaw steel centers were used and a Potter trench machine, the excavation and digging being done by hand. The best day's record for one gang was 74 ft. of 5½-ft. sewer.

The construction of this main sewer has

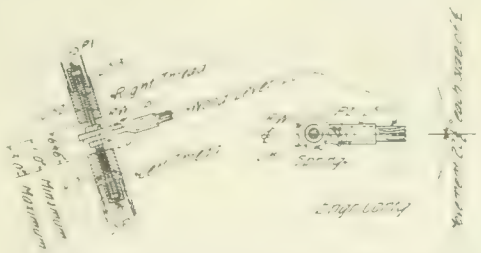

Fig. 5—General Arrangement of Extension Screw in Crown Members.

taken two and one-half years, 40 per cent of which time has been lost to work on account of the stage of water in the river. The various prices paid for the different sizes of concrete sewer were as follows:

6-ft. diameter, 9-in. shell, steel reinforced, $32 per foot.

6-ft. diameter, 9-in. shell, not reinforced, $12 per foot.

5½-ft. diameter, 8½-in. shell, not reinforced, $8.40 per foot.

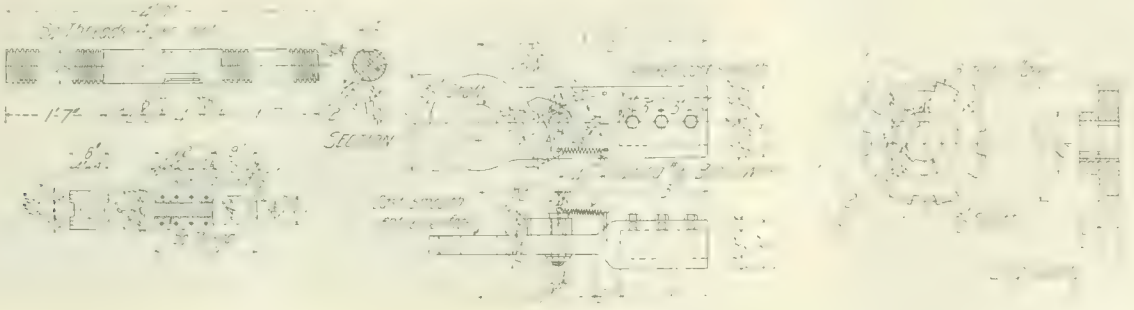

Fig. 6—Details of Extension Screw.

4½-ft. diameter, 7½-in. shell, $6.50 per foot.

4-ft. diameter, 7-in. shell, $5 to $6.50 per foot.

The total cost of the sewer was $108,813.

*Extract from a paper by W. B. Thistlewood, city engineer, Cairo, Ill., read at the annual convention of the Illinois Society of Engineers and Surveyors.

Some Records of Tests of Reinforced Concrete Girder Bridges of the Illinois Highway Commission's Standard Type.

The standard highway bridge of reinforced concrete girder type adopted by the Illinois Highway Commission was described in our issue of Feb. 2, in a paper by Mr. A. N. Johnson, state highway engineer. In the discussion following this paper Mr. Johnson gave an interesting account of tests made on a bridge constructed for the purpose. Everything was arranged in the most approved style for observing deflections and ascertaining the exact location of the neutral axis. When the bridge was loaded so the steel in the bottom of the girders was stressed to a point that would develop cracks in the bottom of the slab, no cracks appeared. The instru-

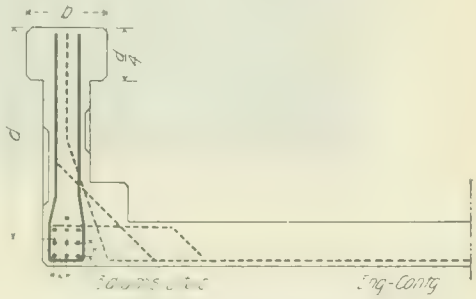

Fig. 1—Half Transverse Section of Standard Girder Highway Bridge, Illinois Highway Commission.

ments used indicated a position of the neutral axis far different from that used in the calculations. Mr. Johnson stated that the neutral axis was practically at the place it would be in a U beam of homogeneous material having the dimensions of the bridge. The factor of safety was therefore greater than had been assumed. The bridge when tested was over one year old.

This seems to confirm experiments of other men in testing slabs and beams. In studying a number of tests the writer has found that for concrete not over 60 days old a ratio of deformation between concrete and steel equal to 15 is best to use. On the four-month tests a ratio of 10 seemed to fit the case and at nine months 8 seemed to be about right, with a value near 6 for concrete 14 months old. Physical tests were made of the steel on test pieces cut from each end of the bars before making the slabs, so from the known strength of the steel the strength of the concrete was obtained after testing to destruction, and this was compared with crushing tests on pieces of concrete. Whether it would be wise to design these trough shaped highway bridges as U beams cannot be settled by these tests. It is likely the old concrete was pretty strong and the position of the neutral axis merely happened to be that of a beam with a ratio of deformation due to the age of the concrete. It is comforting to know that a bridge designed to carry certain loads after 30 days grows stronger as time goes on and is practically free from maintenance cost.

Methods of Constructing and Driving Combination Concrete and Timber Piles with Som e Results of Tests.

Piles made by rolling a timber pile in a blanket of concrete and steel mesh have recently been employed in a number of marine pile structures in waters infested by teredo and other marine borers. From information furnished us by the contractors for these piles we give the following description of the methods of constructing and driving them and also some results of tests made at the Watertown Arsenal to determine their strength.

Fig. 1—View Showing Concrete Covered Wooden Pile Being Rolled.

The plant required consists of a plank platform on which the rolling is done and a few carpenters' and plasterers' tools, besides the concrete mixing plant and such plant as may be necessary to handle the timber pile and the finished piles. The timber pile is placed along one edge of the platform and in front of it is spread the steel mesh. One edge of this mesh is nailed to the pile core and the other edge is anchored to cleats, as indicated by Fig. 1. The mesh used may be of any form, and it may be arranged to wrap the timber pile its full length or for any portion of its length, as also indicated by Fig. 1. With the timber pile and mesh in place, the next step is to cover the wire mesh with a thin blanket of concrete. The core is then rolled over the concrete and mesh blanket until two complete turns of the concrete and mesh are taken around the core. The outer edge of the mesh is then spiked to the core and the blanket is wound with two or three turns of wire. The final task is to cover the concrete and mesh envelope with a ⅛ to ¼-in. coat of cement mortar plaster. The pile is then rolled to one side to harden, being kept properly wetted during the process.

Turning to the illustrations, Fig. 2 shows the pile when the rolling is completed and the outer edge of the mesh is about to be brought up around it and fastened. In rolling the pile the free ends of the core are "held back" by ropes as the core is rolled forward, so that the concrete and mesh blanket is wrapped tight and close. This is shown by Fig. 2. In Fig. 1 the pile is completed and rolled forward out of the way and the mesh is stretched ready for rolling another pile. In some cases the mesh reinforcement is strengthened by steel rods, which are laid across the mesh parallel to the core and spaced so that they come at uniform intervals around the core when the wrapping is completed. In Fig. 1 the manner of beveling down the ends of the concrete covering to meet the core is clearly shown.

Regarding the cost of these piles, the makers state that until they have more data they cannot make definite statements, but say that "it will cost not less than $1 a foot, but how much less we cannot say."

The piles are driven like ordinary timber piles and it is stated that they have been driven until the wooden end was shattered without material injury to the concrete covering.

The following are results of tests made at the Watertown Arsenal. Two poles were tested as columns. The ends were cut off square through the concrete envelope and faced with plaster of Paris to secure even bearing in the testing machine. The dimensions of the tested piles and the crushing load at which they failed were as follows:

	Length.		Dimensions at small end. Max. diam.	Min. diam.	Sectional area at smaller end.		Ultimate strength. Lbs. per
	Ft.	Ins.	Ins.	Ins.	Conc.	Core.	sq. in.
1st Pile....	19	10.45	15	15 5-16	184.09	348,200	1,891
2nd Pile...	19	7.70	14.65	14	153.94	480,000	3,118

The first pile failed at the bottom end, opening oblique and longitudinal cracks in the concrete casing about 21 ins. up from the bottom end of pile. The second pile failed about 7½ ft. from the bottom end, opening oblique and longitudinal cracks in the concrete casing; also crushed fibers of wooden core at two 1-in. spikes.

The second test was made to determine the force necessary to push the core out of the concrete casing or to test the bond between the core and the casing. A 5-ft. section cut from the upper end of the first pile tested as a column was used and arranged as shown by Fig. 3.

Under a load of 145,000 lbs. applied to the wooden core, the bond between the core and concrete was disturbed, the core being forced along toward the larger end of the pile. The resistance increased to 159,000 lbs. when the core had been moved a distance of about 1½ ins. The core was pushed a distance of 8 ins. through the concrete sleeve, and test then discontinued. After the test the concrete was removed and sixteen ⅜-in. spikes were found driven into core to connect the wrapper.

Fig. 2—View Showing Completed Concrete Covered Wooden Pile.

This combination pile, as already stated, has been used in a number of works. In one job at Port au Prince, Hayti, 1,000 are being used for a pier nearly half a mile long. The deck of this pier will be concrete. The manufacture of this pile is controlled by the Robbins-Ripley Co., engineer and contractor, New York city.

Method of Making Watertight by Grouting the Yonkers Pressure Tunnel (Siphon) of the Catskill Aqueduct.

A number of pressure tunnels or siphons form parts of the Catskill Aqueduct for the new water supply of New York city. These siphons are at points in the line where topographical conditions require the conduit to be dropped far below the hydraulic gradient and they are therefore subjected to hydrostatic pressure of considerable intensity. Owing to this last condition particular attention has been devoted to means for securing water tightness and as the type of structure adopted for all heads exceeding 50 ft. is concrete lined tunnel in rock, the problem has been specifically to devise means for making concrete tunnel lining impervious. Broadly speaking, the means decided upon is grouting and the methods of doing this work have been worked out in considerable detail. They are described below for the Yonkers siphon.

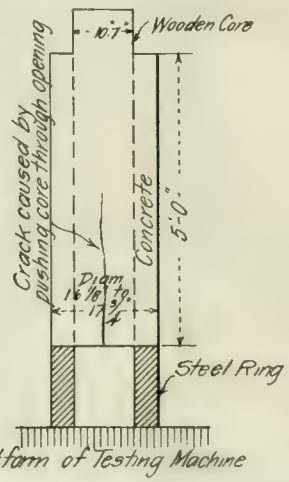

Fig. 3—Arrangement for Test of Bond of Concrete and Wood.

The Yonkers pressure tunnel connects at its north end with three steel pipe lines, which also form a part of the complete siphon, and at its south end it terminates in a vertical uptake shaft. This description refers to the pressure tunnel alone. This tunnel has an internal diameter of 16 ft. 7 ins., is circular in section and is concrete lined tunnel through rock. The total length between connections is 12,390 ft., of which about 11,800 ft. are full section tunnel and the remainder is bell mouth and special section to connect with the triple steel pipe line. The uptake shaft is 128 ft. deep. The grade of the tunnel is alternately level and 1 per cent. Several alternative sections of lining are permissible, depending on the nature of the rock and on other consid-

IN BRANCH TUNNELS

Fig. 1—Sections of Aqueduct Tunnel Showing Arrangement of Pipes for Grouting.

erations, but general idea of the construction is given by the drawings of Fig. 1.

Grouting will be done to fill all voids in dry packing or elsewhere over the tunnel arch, to close cracks, seams and fissures in the adjacent rock, and to increase the imperviousness of the concrete proper of the lining. To permit this thorough filling grouting pipes, vent pipes, pipes for weepers and collectors were designed to be built into the concrete lining. Typical arrangements of pipes are shown by Fig. 1. All this piping is entirely within the lining, the ends terminating ½ in. inside the surface and being fitted with plugs to prevent the concrete from covering them.

Referring to Fig. 1, it will be seen that the tunnel is divided into sections for grouting. Each section is limited to 50 ft. in length and may be shorter if deemed necessary, but no longer, the purpose being not to demand a travel exceeding 25 ft. for the grout. This division into sections refers only to construction where dry packing is used outside the concrete ring. Where concrete backing is employed the grouting consists of filling individual cavities as indicated at the left end of the longitudinal section in Fig. 1. The grouting sections as shown by the drawings are formed by thickening the concrete lining at intervals to form cut-off walls extending close against the walls of the excavation. Each section is independent and an independent piping system is employed for each. Other details of construction are best studied on the drawings. Explanation may be made, however, that the branch tunnel details shown refer to the three tunnels into which the main tunnel is divided to connect with the triple steel pipe portion of the siphon. The steel diaphragms shown are water stops.

The grouting will be done by special apparatus designed by the aqueduct engineers. This apparatus comprises air compressors, grouting machines and so called grouting pads.

The compressors called for are light portable machines, the specifications limiting their weight to 550 lbs. They will be operated by compressed air at pressures supplied to the drills and will be capable of taking suction from this low pressure air and of raising it to 300

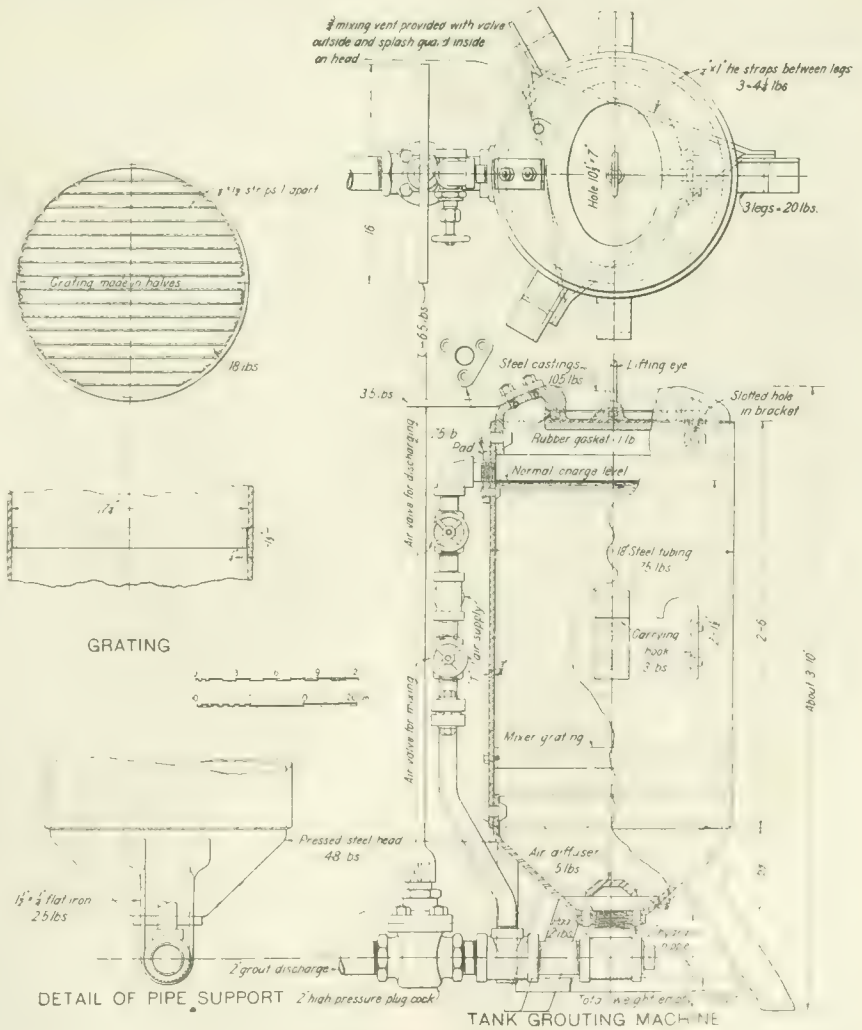

Fig. 2—Details of Grouting Machine.

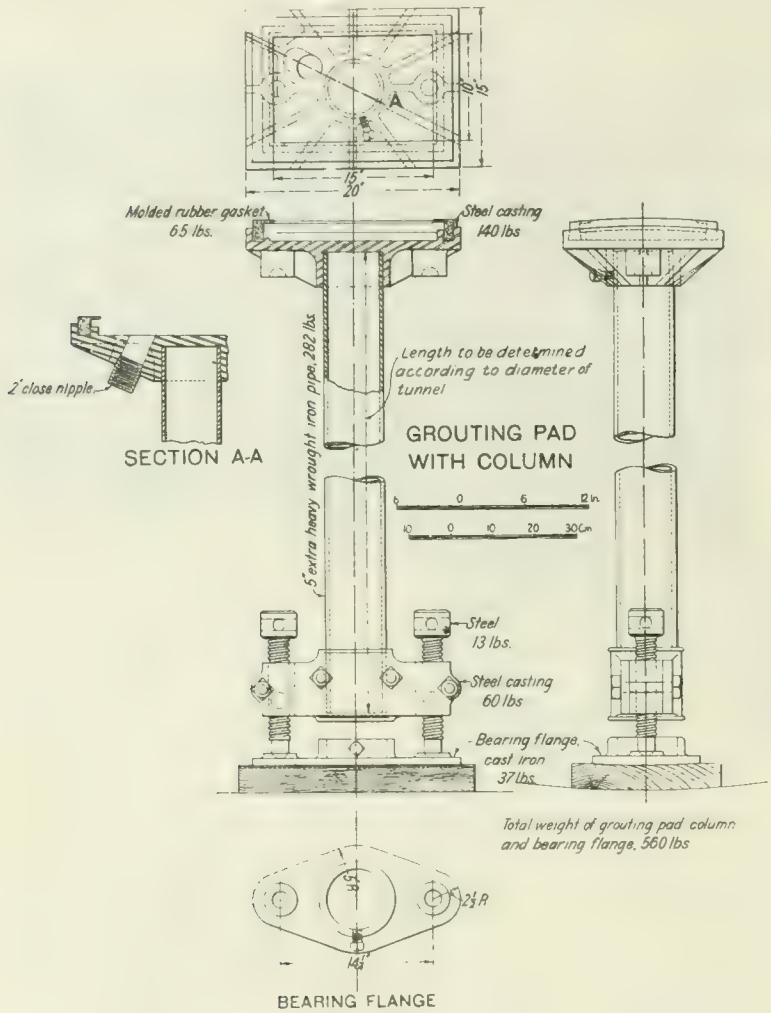
lbs. per sq. in. at the continuous rate of 2 cu. ft. of high pressure air per minute. The compressor is to have a bifurcated discharge so as to operate two grouting machines.

The general design of the proposed grouting machine is shown by Fig. 2. It consists of a cylindrical metal tank with hopper shaped bottom, charging door at the top, and suitable pipe connections all mounted on legs and capable of being carried by hand. The specified weight is 500 lbs. The grout materials are charged into the tank at the top and are mixed by admitting compressed air at the bottom and forcing it up through the liquid to escape from a vent at the top. Notice should be taken of the air diffuser and the mixer grating. The mixed grout is discharged from the bottom by admitting compressed air at the top of the tank above the grout surface. It is planned that the grout shall be ejected at a pressure of 300 lbs. per sq. in. The air supply connects with a Tee about mid length of a vertical U pipe, the ends of which enter the top and bottom of the tank. A valve above and one below the Tee permit the air to be diverted to the bottom for mixing the grout or to the top for ejecting it. The grout discharge pipe is provided with a separate valve operated by a wrench stem and cross handle as shown. It will be noted that all air pipes are not less than 1 in. and all grout pipes not less than 2 ins. Owing to the pressures, 300 lbs. per sq. in., strong construction is necessitated, and the machines will all be subjected to a hydrostatic test of 600 lbs. per sq. in. The number of machines used will depend on conditions, but the minimum number will be four.

For filling behind the lining direct connection by hose will be made between the grouting machines and the various grout pipes. To solidify the lining concrete proper a supplementary device called a grouting pad will be employed. The construction proposed for grouting pads is shown by Fig. 3. Each grouting pad consists of a heavy 5-in. steel pipe column with head and base of cast steel and a steel bearing flange to distribute the pressure to the wooden blocking on which the apparatus is mounted. The base casting has two steel jack screws for raising and lowering the column and head. The head is a rectangular dished casting carrying a molded gum rubber gasket around its top edge, and with a nipple connection for hose passing up through one side.



A
Molded rubber gasket 65 lbs.
Steel casting 140 lbs
2" close nipple
5" extra heavy wrought iron pipe, 282 lbs.

Steel casting 60 lbs
Bearing flange, cast iron 37 lbs.
Total weight of grouting pad, column and bearing flange, 560 lbs
BEARING FLANGE

Fig. 3—Details of Grouting Pad.

The purpose of this grouting pad is to solidify porous places in the concrete lining. The mouth of the rubber gasket is brought over the porous spot and the column is screwed up until the gasket bears tightly against the concrete to be repaired. Grout from the grouting tank is then forced into the head and penetrates the pores in the concrete and fills them. It is intended that the possible pressures of grouting with these pads shall be 300 lbs. per sq. in., and that the grouting shall continue in each case until at this pressure no more grout is ejected, when the cock next to the pad shall be closed and the pad left in place until the grout has set. The number of pads to be used will depend on the conditions developing, but the minimum shall be twelve.

The grout used is intended to be a 1:1½ mixture or a richer mixture. The sand is specified to be of such fineness that 100 per cent shall pass a 64 mesh sieve and 45 per cent shall pass a 1,600 mesh sieve. If considered desirable it is intended to waterproof the grout by an admixture of commercial sulphate of alumina. This chemical will be added to the mixing water in the proportion of 2 lbs. of sulphate to 100 lbs. of water. It is intended that the grout shall be made as thick as can be counted upon to flow so as to fill completely the voids.

The general procedure to be followed in grouting will be as follows: In grouting behind the lining it is the purpose to make the operation continuous for each grouting section and to have the grout delivered uniformly and steadily and not in violent spurts or blasts. No grout is to be called upon to travel more than 25 ft. and the machines are to be shifted and other means taken to ensure this limit. In grouting a section or even individual cavities the work shall proceed upward; the bottom pipes will be connected first and the filling proceed until the pipes next above begin to discharge grout, then these will be connected and so on. Grouting will be considered completed in each section when no more material can be forced into the space under 300 lbs. per sq. in. pressure.

The preceding description outlines, we believe, the most carefully planned scheme for rendering tunnel lining impervious to water that has ever been undertaken and it should interest hydraulic engineers generally. One of the devices described, the grouting pad, is, so far as we are aware, unique.

A Formula for Determining Crown Thickness of Arches.

The design of an arch is tedious and an assumption must be made of the crown thickness as a trial. A number of formulas are in use, the one best known being the Weld formula. It is intended only for arches in which the rise is 1/10 to ⅛ per cent of the span. Mr. Ernest McCullough, one of the editors of this journal, while in private practice, developed a formula which gives very close results for all ratios of rise to span, for bending moments increase as the radii of the arches decrease. The formula is as follows:

$$t = \frac{(20-r)}{10} \div \frac{S}{5} + \frac{75}{2S}$$

in which

t = crown thickness in inches.
S = clear span in feet.
R = rise in feet.

$$r = \frac{S}{R}$$

(Note. When t is in inches and fractions, take the next larger inch.)

The loading conditions assumed were 2-ft. earth fill on crown with a 15-ton steam roller of standard dimensions, but a live load of 200 lbs. per sq. ft., when the effect would be greater than that of the roller.

The formula was derived after a study of a number of designs and of over 150 bridges built, of which details were published. It must be borne in mind that a general arch crown formula can never be used to supplant exact methods of calculation. The formulas for arch crown thickness are only closely approximate and intended by the authors to be merely guides, so trial thicknesses may be assumed in beginning the work of designing an arch.

Uniform Paving Specifications.—A movement has been started to hold from Feb. 21 to 26, during the Cement Show at Chicago, a convention of city officials to consider action looking toward the acception of uniform paving specifications. A committee has been organized and headquarters will be at the La Salle Hotel. All city officials interested are urged to take the matter up. The following letter has been sent to the Mayor of every city in the United States having a population of more than 100,000 (48 cities).

Dear Sir: The Board of Local Improvements, which has in charge the construction of pavements, suggests that a convention of city officials and engineers to be held here Feb. 21 to 26 inclusive for the purpose of standardizing specifications for asphalt, brick and creosoted block pavements. It is believed that a more prompt delivery and lower prices for these pavements will result.

I am heartily in favor of the plan and trust that you will delegate representatives from your city to be present at the convention. Please have your representatives advise Mr. Frank T. Fowler, temporary chairman, 302 City Hall, of their assignment as such.

Yours very truly,
FRED A. BUSSE, Mayor.

Chicago, Ill., Feb. 1, 1910.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Formulas for Sidewalk Construction Used by the Bureau of Sidewalks of Chicago, Ill.

In a paper presented at the last annual convention of the Illinois Society of Engineers and Surveyors, at Cairo, Ill., Mr. N. E. Murray, superintendent Bureau of Sidewalks of the Board of Local Improvements of Chicago, gave many data regarding the construction of sidewalks in Chicago. That portion of his paper relating to the methods and costs of constructing cinder and cement walks was given in our Feb. 2 issue. In his paper Mr. Murray gave the following formulas which are used in the Bureau of Sidewalks in field practice and in estimating cost of construction. The maximum grade or slope allowed for walks in Chicago is 6 per cent, and preferably not over 4 per cent. Where the sidewalk grade exceeds 6 per cent it is broken by using steps of wide tread.

The following formula for excessive slope is used when the grade exceeds 6 per cent, or $\frac{h}{L} = 0.06$:

$$S = \frac{L\ (Sp + R)}{h} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (1)$$

in which

S = width or tread of step (not less than 6 ft.).

R = height or riser of step (6 ins. to 9 ins.)

p = per cent of slope, given S (from .02 to .04).

h = difference in grade between points.

L = distance between points (all in feet).

It is customary to assume values for R and p and solve for S.

Difference of elevation of top of steps $= R + Sp$ ..... (2)

In determining the cut and fill on a plat where it is proposed to construct cinder walks under city contract, surface elevations are taken over the line of the proposed walk. These elevations are properly equated according to certain adopted rules to the calculated inside grade, which is usually the established grade plus 6 ins. The total in lineal feet of average cut and average fill, including the 3-in. crown of fine cinders, is placed on the plat in a signed certificate. This average cut and fill, which includes the walk cross section, is advertised as the gross cut and fill. The following formula is useful in determining the probable cost of the construction.

The cross section of the complete cinder walk consists of a base of coarse cinders or slag 9 ins. thick and an upper course of fine cinders 3 ins. thick. After the walk is completed to grade a crown of fine cinders 3 ins. thick is spread. The total thickness of the walk below the grade of the top of the cut or fill (the top of the curbing) is 1 ft. The top of the curbing of cinder walk is set 0.2 ft. below inside grade.

Formula for cut or fill for a cinder walk with 6-in. or ½-ft. berm on each side and sides sloping 1 to 1:

Cu. yds. per lin. ft. of walk = 0.037 × width of walk in feet ..... (3)

Cu. yds. of cut or fill per lin. ft. of walk $= \frac{(\text{cut or fill})^2 + (\text{cut or fill}) \times (\text{width of walk} + 1)}{27}$ ..... (4)

Cut equals difference between natural surface and inside grade + 2/10. Fill equals difference between natural surface and inside grade — 2/10.

(a) Net fill per lineal foot of walk = formula (4) minus formula (3).

(b) Net cut per lineal foot of walk = formula (4) plus formula (3).

The cost of a cinder walk 6 ft. wide, properly constructed, is given in the following formula:

Cost per lineal foot equals net fill or cut (in cu. yds. per lin. ft.) × cost of (filling or cutting) per cu. yd. + 30 cts ..... (5)

The cross section of a complete cement walk consists of a foundation of cinders 9 ins. thick, a base 4¼ ins. thick of 1—2½—5 concrete, and a top or wearing course ¾ in. thick of 1 to 1½ mortar. The total thickness = 14 ins., or 1.17 ft.

Formula for cut or fill for cement walk with 1-ft. berm on each side and sides sloping 1 to 1½ horizontal:

Cu. yds. per lin. ft. of walk = .043 × width of walk in feet ..... (6)

Cu. yds. of cut or fill per lin. ft. of walk $= \frac{1.5\ (\text{cut or fill})^2 + (\text{width of walk} + 2) \times (\text{cut or fill})}{27}$ ..... (7)

Cut or fill equals difference between inside grade and natural surface of the ground.

(a) *Net* fill per lin. ft. of walk = formula (7) minus formula (6).

(b) *Net* cut per lin. ft. of walk = formula (7) plus formula (6).

The cost of a cement walk 6 ft. wide, properly constructed, is given in formula (8):

Cost per lineal foot = *net* fill or cut (in cu. yds. per lin. ft.) × cost of (filling or cutting) per cu. yd. + 81 cts ..... (8)

Paving Along Street Railway Tracks.*

The pavement in street railway tracks is subject to additional destructive conditions besides those encountered on ordinary streets. The concentrated wheel loads of the modern cars distort and deflect the rail. This breaks any contact the pavement may have with the rail and provides entrance for water into the body of the paving. Heavy, stiff rail with good fastenings and solid ballast reduce deterioration of the paving but do not prevent the vibration of the rail. This cannot be eliminated.

During the past year in Indianapolis several features in track paving have been studied. The reconstruction of track in the business center of the city presented opportunity for improving the track construction. Two blocks of track on Pennsylvania St. between Washington and Ohio Sts. were rebuilt, using every care to make the work as permanent as possible.

The 9-in. girder tram rail, 90 lbs. to the yard, was laid on 6x8-in. by 8-ft. white oak ties, spaced 2 ft. The subgrade was excavated to a depth of 10 ins. below the bottom of the ties and rolled till compact. The track was raised on blocking to the proper grade and line and the excavation filled with Portland cement concrete to within 5 ins. of the top of the rail and allowed to set for 10 days. Brick surface was applied on a sand cushion. At the street intersections where traffic could not be kept off, the brick was filled with asphaltum filler. The balance of the paving was grouted with Portland cement, every effort being made to fill the joints completely with grout.

The new features of this track construction are the increased thickness of Portland concrete base under the ties, and the use of the beveled edge Nelsonville stretcher brick outside of the track.

*From a paper read by Thos. D. McMath, chief engineer, Indianapolis Traction & Terminal Co., Indianapolis, Ind., at the Columbus, O., convention of the Central Electric Railway Association, Jan. 27, 1910.

Objection may be made to the use of the stretcher brick outside the rail, as this may start a rut along the rail. The bevel stretcher in combination with the wood strip under the head of the rail is intended to keep the rail from direct contact with the brick and to reduce the effect of vibration and prevent the paving being crushed by wide tread wheels.

Asphaltum filler has been used on brick paving in Indianapolis and has its advantages in cases where traffic cannot be kept off the paving or tracks for sufficient time to permit cement grout to fully set. Several makes of asphaltum filler have been tried, as well as coal tar pitch. Later we will have some data as to their relative merits.

About 8,000 sq. yds. of brick paving was filled with asphaltum filler during 1908. This paving is subjected to heavy traffic and great effort was made to do as good a job as possible. The work was done with every precaution suggested by the representative of the asphaltum, the city engineer, and the engineering department of the street railway to make it first class. Two blocks of the same stretch of track are grouted with Portland cement. A direct comparison of results can be made. At present both stretches of paving are in fine shape.

The wear on brick paving starts from the breaking of the edges of the brick at the joints, rounding the edges till the brick resemble cobble stones. This is noticed especially when the wear is from the shoes of the animals, the wear from wheels being practically uniform across the face of the brick. The round edge commonly used is a mistake. Brick should have as little rounding as possible on the edges.

The greatest possible effort should be made to fill the joints full with the best grout. Ordinary grouting is the ruin of a brick. Five cents a square yard spent on good grouting is the best investment on the job. In going over pavement it will be seen that the best paving is that in which the grouting is best. The city engineer and myself have seen parts of brick pavement that have kept smooth under heavy traffic when the balance of the paving was worn rough; the only explanation for the different condition was the grouting.

The following method is suggested for grouting: Mix 1 to 1 cement and sand in a box, using always a measured amount of sand, cement and water. Mix thoroughly and dump the box. Sweep the grout on diagonal lines and use a rubber squilgee instead of a broom, after the grout has settled down in the joint go over it again, repeating until the joint is full and flush after the initial set.

The price paid for brick is probably too low; a smaller brick more uniform in structure and burn is preferable. Such brick should be very closely inspected; possibly 40 per cent of the brick now classed as No. 1 should be rejected. If the size were smaller these brick would be used in building, thus providing against loss to the maker. The manufacturer should grade his product to give the customer the qualities needed and himself reject the poor brick.

Inspection for quality as the brick are laid is unjust to both parties. As the eye can only decide shape, color and possibly absorption of water, many brick that would be satisfactory are rejected and unsatisfactory brick are scattered throughout the paving. The inspector should have the advantage of judging the brick from their position in the kiln. A better market for second class brick will have to be found before the manufacturer can be expected to grade closer or else the price must be better. Both the manufacturer and his customer should be insured against the expense of freight, unloading, hauling and storage on rejected brick.

Up to the present time no granite or stone block pavement has been used in Indianapolis. The traffic, however, on several streets now paved with brick is so heavy that a block pavement is needed. The street railway has 8,000 sq. yds. of block pavement under construction on Kentucky Ave. south of White River.

The block selected is from quarries 60 miles east of Pittsburg and known as Ligonier

block. This is a very tough limestone. The block is laid on concrete foundation and the joints filled with pitch. The pitch to be used will be hydrolene 80 per cent and residuum oil 20 per cent. The stone blocks are smoothly cut and the pavement will not be materially rougher than brick. The block does not glaze nor get slippery under traffic. Block will eventually cobble where exposed only to horse travel, but if laid smooth will remain so under wheel traffic if fully grouted. The secret of a good block pavement is in the cutting of the blocks with smooth faces and square edges; the block must be laid close with the joints filled with filler. If the pavement be as smooth as brick the noise would be obviated largely and the pavement would continue smooth even when worn by traffic.

For railway track paving, stone block has the great advantage that the paving can be replaced after track repairs at small expense and the general condition of the street is not impaired as in asphalt or brick surface.

The maintenance of track and paving always presents the difficulty that a minor repair to track cannot be made without a large paving expense. In other cases reconstruction of the paving cannot be made because the condition of the track will not justify it and enough money to rebuild both is not at hand. In other words, a worn out pavement on a street with a two-thirds worn out track presents a difficult financial problem. There should be some cheap pavement invented to use for such short time work. This problem is frequently presented on interurban lines in small towns in which ordinary tee-rail construction should be paved.

The success of pavements of the bitulithic class seems to indicate that something can be expected in this direction. Assuming that the track roadbed is good enough for a foundation, if a 4 or 5-in. layer of bitumionus macadam could be cheaply laid and cheaply and easily be repaired by ordinary section men it would solve this trouble. The patents seem to tend to prevent the use of the usual forms of such pavements under these conditions.

One proposition of this kind is presented by an asphalt contractor. He suggests a layer of clean macadam laid and rolled in place with a light roller, then poured with a hot asphalt. This is to be followed with a layer of ¼-in. stone also poured with hot asphalt, then coated with sand and cement and rolled with a heavy roller.

For this proposition no great plant would be required. A closed heating kettle of two tons capacity with a hand agitator can be purchased for $700. The grading of the macadam can be cheaply done. It has been estimated that such a pavement could be laid at 50 cents per sq. yd., and subsequent patching could be done by section men at the same cost. This would give a pavement suitable for light traveled streets where the traffic largely avoids the car tracks. The cost of maintenance would be so small that it would not be neglected.

The need of today for small towns is a cheap yet reasonably durable pavement that can be repaired when necessary by ordinary labor with a small expenditure for plant. The macadam country road fails under automobile traffic. The need is now for a cheap cementing material.

Notes on the Construction of Macadam Pavements and a Table Showing the Amount of Stone Required.

BY GEORGE B. PIKE.*

Engineers and inspectors in charge of the construction of macadam pavements, by contract or otherwise, should not require the excavation to be carried down to the theoretical line dividing the pavement from the subgrade, but should allow the excavation to stop a certain distance above that line. This distance depends upon the amount of penetration of the stone into the subgrade and, perhaps, upon a further settlement of the soil under the weight of the roller and the influence of the water used in the construction of the pavement. No precise figures can be stated for the amount of this penetration and settlement, for it varies with different soils and depends upon the hardness of the subgrade. In most ordinary soils, however, it is perfectly safe to allow at least 1 in.

In the writer's opinion it is good practice in sandy soil to allow from 1 to 2 ins. to cover penetration of the stone and compression of the soil, and in addition to cover the subgrade with a layer of marsh hay to prevent as much as possible the intermingling of the stone and sand.

In clay soil, dry and hard, one might think that 1 in. would be entirely too much to allow, but after the stone is deposited and graded, comes the rolling and wetting, and the subgrade at the beginning of this operation certainly receives a share of the water used, thereby being softened, and there will be, it is safe to say, at least 1 in. of penetration of the stone into the subgrade.

On the other hand, if a contractor be required to excavate to this theoretical line of separation of pavement and subgrade, he certainly will have to furnish more stone to complete the pavement than would be necessary to complete a pavement of the thickness required by the plans and specifications. In other words, the contractor will actually build a pavement thicker than the plans and specifications require.

TABLE I.—MAXIMUM AMOUNT OF STONE REQUIRED, MACADAM PAVEMENT CONSTRUCTION.

Thickness of compacted macadam in ins.	Coarse Stone. Amt. required for each sq. yd. pavement, cu. yds.	Thickness of loose stone in ins.	Per cent of total.	Screenings. Amt. required for each sq. yd. pavement, cu. yds.	Thickness of loose stone in ins.	Per cent of total.	Total stone required for each sq. yd. pav't in cu. yds.	Number of sq. yds. laid with 1 cu. yd.
3	0.1083	3.9	78.25	0.0301	1.	21.75	0.1384	7.23
4	0.1445	5.2	79.61	0.0370	1.3	20.39	0.1815	5.51
5	0.1806	6.5	80.41	0.0440	1.6	19.59	0.2246	4.45
6	0.2167	7.8	80.98	0.0509	1.8	19.02	0.2676	3.74
7	0.2528	9.1	81.37	0.0579	2.1	18.63	0.3107	3.22
8	0.2889	10.4	81.68	0.0648	2.3	18.32	0.3537	2.83
9	0.3250	11.7	81.91	0.0718	2.6	18.09	0.3968	2.52
10	0.3611	13.	82.11	0.0787	2.8	17.89	0.4398	2.27
11	0.3972	14.3	82.25	0.0857	3.1	17.75	0.4829	2.07
12	0.4333	15.6	82.39	0.0926	3.3	17.61	0.5259	1.90

Of course these remarks apply particularly to macadam pavement constructed in connection with curbing or combined curb and gutter where the elevations of the surface of the pavement and gutters are definitely fixed, for in this case any loss of paving material at the bottom must be made good at the top.

It may be said the true thickness of a macadam pavement is shown by the amount of stone used in its construction. In this connection the writer presents the accompanying Table I, showing the maximum amount of stone required in macadam pavement construction. This table is based on data taken from page 139 of "Gillette's Handbook of Cost Data," from the section entitled "Quantity of Stone and Binder Required."

Without knowledge of these data the writer had previously deduced, from personal experience in the construction of macadam pavements, practically the same results as here shown for pavements varying from 6 to 10 ins. in thickness. The table is figured to include thicknesses from 3 ins. to 12 ins. The table itself will readily suggest its various uses to those interested.

*City Surveyor, Manistee, Mich.

Notes on State Highway Work in 1909.

In our issue of Feb. 2, 1910, we gave some data as to the highway work accomplished in 1909 under the direction of various state highway commissioners. We have since received the following additional information:

ILLINOIS.

The mileage of roads completed in 1909 under the direction of the State Highway Commission was as follows:

Kind.	Total miles built.	Av. width paved, feet.	Av. thickness of completed pavement, ins.	Av. cost per mile.
Macadam	55	10 to 30	8	$3,500*
Bituminous binder.	47	12 to 30	8	5,000*
Oiled earth	12	12	6	1,800

*Estimated on basis of 12-ft. width.

The average unit price for broken stone in place was 50 cts. per cu. yd. The crushed stone for road work is furnished from the penitentiaries, where it is crushed by convict labor and the cost of the roads, as given above, does not include any charge for this stone, which is furnished f. o. b. the cars at the penitentiary for road purposes.

The prevailing daily wages were as follows:

Common labor.....17½ cts. per hour
Two-horse team and driver.....$3.50 per day

The length of the working day was 9 hours. During the past year the Illinois Highway Commission has carried on some extensive experiments with bituminous binders for macadam and expects to continue the work. A complete record of every detail of the construction of each experiment and a complete analysis of the tar or asphalt binder that was used has been made. The roads will be inspected frequently and their condition compared with the analysis of the oil or tar to see if it is possible in this way to settle upon some standard specification for bituminous binder.

The road work projected for 1910 includes the construction of 80 miles of macadam road and 15 miles of road with bituminous binder. Mr. A. N. Johnson, Springfield, Ill., is state highway engineer.

MAINE.

The total length of state road of all classes constructed during 1909 was 424,373 ft., or 80.37 miles, this amount including 10,671 ft. of road not classified as to surfacing material. The following tabulation shows the amount and kind of work done during the past year:

No. of towns.	Nature of Improvement.	Square yards.	Length, in feet.	Total cost.	State aid.
1	Block paving	1,356	714	$ 2,197	$ 910
34	Macadam	107,480	11,411	62,515	18,580
9	Bituminous macadam*	20,110	5,065	23,045	6,980
335	Gravel	.....	290,385	150,970	69,743
84	Earth and drainage	.....	71,220	34,224	16,588
4	Earth and gravel	.....	4,907	1,686	854
8	Abutments and culverts	.....	.....	1,519	852
6	Bridges	.....	.....	2,344	701
477	Total	.....	113,702	$278,500	$115,208

*Not including Westbrook. Including 224 lin. ft. of granite block on Hassam base.

The average cost per mile of all types of road, including the cost of the bridge and culvert jobs, was $3,465. The average cost of the various types of paving was as follows:

	Per sq. yd.
Block paving	$1.62
Macadam	.818
Bituminous macadam	1.115

There were 55 miles of gravel road, the graved surface varying from 12 ft. to 21 ft. The average cost of construction was $2,474.90 per mile. The average cost of earth roads and drainage, a total of 13.49 miles being built, was $2,536 per mile.

The figures in the tabulation cover the work

done under the 1909 joint fund. Besides these completed jobs 24 other applications for state aid were received. Fifteen towns applied to the department to have their joint fund laid over to 1910 and in 9 towns work started in 1909 had not been completed and accepted at the end of 1909 and consequently no aid has been paid. It should also be noted that 7 jobs begun in 1908 were completed during 1909 at a gross expense of $9,983, and of this amount there has been paid $3,317 of 1908 aid.

Plans for the coming year, besides the regular state aid, which will be materially increased on account of the larger appropriations made by the last legislature, contemplate the reconstruction of several sections of main thoroughfare or trunk line. Surveys have been completed for 14 miles of this work and 5.4 miles located on the Rockland and Bangor trunk line will be prepared for letting early in March. The other trunk line work for the present year will be principally on the route leading from Portsmouth, N. H., to Portland, Me. The State Highway Department has available this year for general state aid $228,000, which will be supplemented by nearly an equal amount by the towns. The department also has for trunk line construction during 1910 about $120,000. Subscriptions have been made for this work and placed at the disposal of the department increasing this amount about $21,000, so that there will be available for both state aid and trunk line construction during 1910 approximately $500,000.

The only new form of construction tried during the year has been bituminous macadam, using the mixing method. For bituminous binder 50 per cent of refined coal tar and 50 per cent of asphalt, grade "J," from the Texas Co. have been used. The cost of the bituminous work has been from 35 cts. to 40 cts. additional per square yard over and above the price of plain macadam. The cost given in the table figures out $1.14, but this includes all grading, drainage, engineering, advertising and incidental expense in connection with the work. Wherever this work has been put in it has proved satisfactory. Paul D. Sargent, Augusta, Me., is state highway commissioner.

PENNSYLVANIA.

The total mileage of macadam and other improved roads completed in 1909 under the direction of the State Highway Department was 144.3 miles. The average width paved was 16 ft. and the average thickness of the completed pavement was 9 ins. The average cost per lineal foot on a 16-ft. wide basis was $2.37. There were 59,942 sq. yds. of brick pavement completed in 1909, the average width paved being 14 ft. and the average thickness of the completed pavement being 10 ins. The average cost on the basis of a 16-ft. wide road was $18,773.33 per mile. The average cost of all roads, including bridges, was $2.34 per foot. The cost of bridges completed in 1909 was $174,564.73. The average cost of all roads, without bridges, was $2.18 per lineal foot.

Some of the average unit prices for 1909 were as follows:

Telford, per cu. yd., in place, including excavation	$2.60
Brick pavement, per sq. yd.	2.00
Earth excavation, per cu. yd.	32 cts to 75 cts.
Concrete masonry, per cu. yd.	$6.25 to $10
Stone masonry, per cu. yd.	$5.50 to $7.00

The average prevailing daily wages for 1909 were as follows:

Common labor	$1.60
Two-horse teams and driver	$3.50 to $5.00

The length of the working day was 10 hours.

Joseph W. Hunter, Harrisburg, Pa., is state highway commissioner.

The newly elected directors of the Frederick R. R. Co., formed by the merging of the Frederick & Middletown, Braddock Heights and Jefferson and Washington, Frederick and Gettysburg roads, organized Feb. 2 at Frederick, Md., by the election of the following officers: President, Emory L. Coblentz; vice presidents, Dr. Franklin B. Smith, Harry E. Clark, Walter S. Taylor; secretary, Charles C. Waters; treasurer, Thomas H. Haller. Walter S. Taylor was made general manager, George F. F. Anderson superintendent and S. H. Bennett auditor.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Some Costs of the New Water Purification Works at Columbus, Ohio.*

The Scioto River pumping station and water purification works are located on the high ground on the north bank of the Scioto River about 4.5 miles below the storage dam and about 1 mile above the old West Side Pumping Station. The raw water is drawn from the river through an intake and intake conduit to a raw-water suction well just south of the pumping station. From this well the water is pumped by low-lift pumps to the purification works where it is softened and filtered, passing finally through the filtered-water reservoirs and back to a filtered-water suction well just north of the pumping station. From this well the water is pumped by direct-service pumping machinery through two lines of 36-in. cast-iron pipe, about 4,900 ft. in length, to a point opposite the old West Side Pumping Station where connections are made with the existing distributing system.

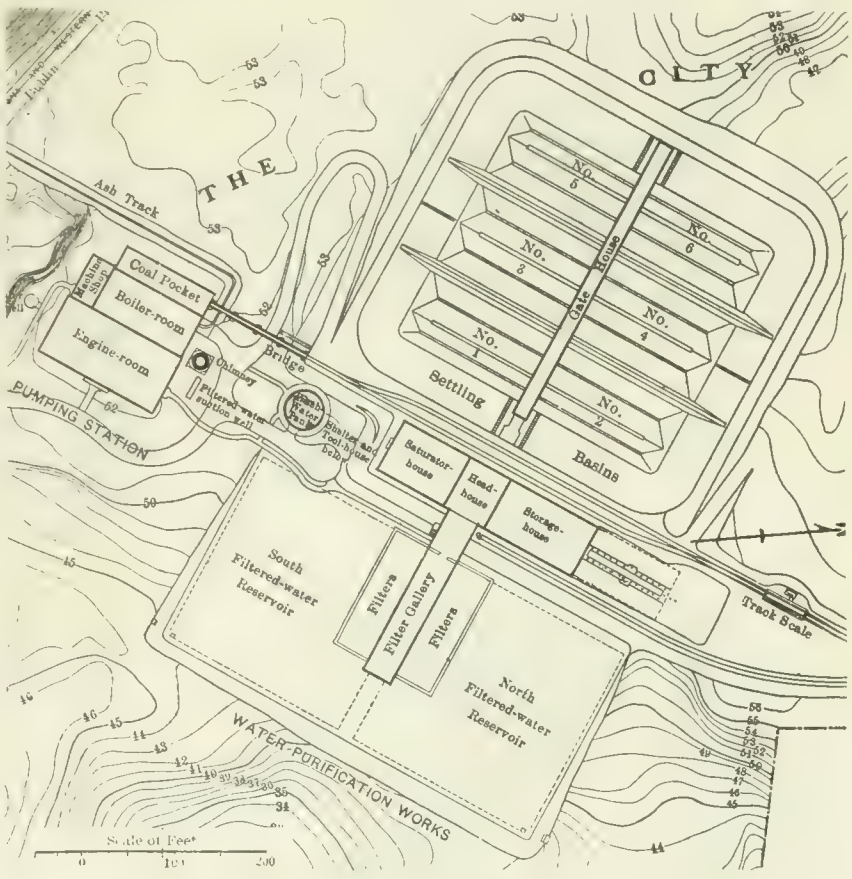

Fig. 1—General Plan of Water Purification Works at Columbus, Ohio.

The pumping station and purification works are designed for extension to an ultimate net normal capacity of 40,000,000 gals. per 24 hours. At present the pumping station has a net normal capacity of 20,000,000 gals. per 24 hours, but the building is of sufficient size for equipment having the ultimate net normal capacity. The purification works at present have a net normal capacity of 30,000,000 gals. per 24 hours, but have been arranged so that extensions may readily be made.

A small sewage disposal works consisting of a septic tank and two intermittant sand filters was installed to care for the sewage from the pumping station and water purification works. The unusually high flood in the winter of 1908-9 led to the abandonment of this plan and in lieu of operating the filters it is now proposed to sterilize the effluent from the tank before discharging it into the river.

Figure 1 is a general plan of the works and Fig. 2 shows sections of the head house giving an idea of the character of the buildings. All walls are of brick covered with red pressed brick; floors, stairways, etc., are of reinforced concrete. Roof trusses are steel, the covering being of slate laid on 3-in. hollow terra-cotta tile. The buildings are all electrically lighted throughout and the main building is heated with steam.

In the construction of the work, concrete, both plain and reinforced, was used extensively, the total quantity in the pumping station, purification works and adjacent structures amounting to 39,560 cu. yds. The average price paid for the above amount was $7.27 per cu. yd. The relative volumes of cement, sand and ballast in each mixture of concrete, and the corresponding character of work in which the mixture was used, were as follows:

1:2:4.—Water-tables, belt-courses, window-sills, lintels, etc.; filter, solution, dissolving, and wash-water tanks; reinforced floors, roofs, stairways, and steps.

1:2½:5½.—Columns in buildings and piers of wash-water tank; filtered-water reservoirs, lime saturators, mixing tanks, and substructure of head-house; settling basins, except lateral dividing and baffle walls; walls in general, conduits, and miscellaneous small structures.

1:3:7.—Lateral dividing and baffle walls of settling basins; footings, and foundations for machinery and chimney.

*Extracted from a paper by John H. Gregory in Proceedings American Society of Civil Engineers, Vol. XXXVI, p. 2.

TABLE IV.—UNIT COST OF MAIN FEATURES OF WORK.

Work.	Capacity.	Total cost.	Unit cost.
*Pumping station building, per cu. ft.	1,273,300 cu. ft.	$128,490	$ 0.10.1
†Main buildings, water purification works, per cu. ft.	534,000 cu. ft.	49,070	0.09.2
Settling basins, per 1,000,000 gals.	15,000,000 gals.	168,770	11.250
Lime saturators, per 1,000,000 gals. per 24 hrs.	6,750,000 gals. per 24 hrs.	24,410	3.620
Mixing tanks, per 1,000,000 gals.	1,270,000 gals.	44,230	34.800
Filtered-water reservoirs, per 1,000,000 gals.	10,000,000 gals.	98,300	9.830
Water Purification Works:			
Settling basins, per 1,000,000 gals per 24 hrs.		$168,770	$5.630
Head-house, per 1,000,000 gals. per 24 hrs.		39,660	1.320
Air-wash equipment, per 1,000,000 gals. per 24 hrs.		3,470	0.120
Lime-saturator house, per 1,000,000 gals. per 24 hrs.		32,550	1.080
Mixing tanks, per 1,000,000 gals. per 24 hrs.		44,230	1.470
Storage house, per 1,000,000 gals. per 24 hrs.		12,880	0.430
Office and laboratory, per 1,000,000 gals. per 24 hrs.	30,000,000 gals. per 24 hrs.	15,280	0.510
Filter gallery, per 1,000,000 gals. per 24 hrs.		102,710	3.420
Filtered-water reservoirs, per 1,000,000 gals. per 24 hrs.		98,300	3.280
Wash-water tank, pipe, and shelter, per 1,000,000 gals. per 24 hrs.		13,150	0.440
Supplies for preliminary operation, per 1,000,000 gals. per 24 hrs.		460	0.20
Expenses unclassified, per 1,000,000 gals. per 24 hrs.		1,020	0.30
Total		$532,480	$17.750

*Includes superstructure and substructure of building.
†Includes superstructure of head-house, saturator house, storage house, office and laboratory, and filter gallery.

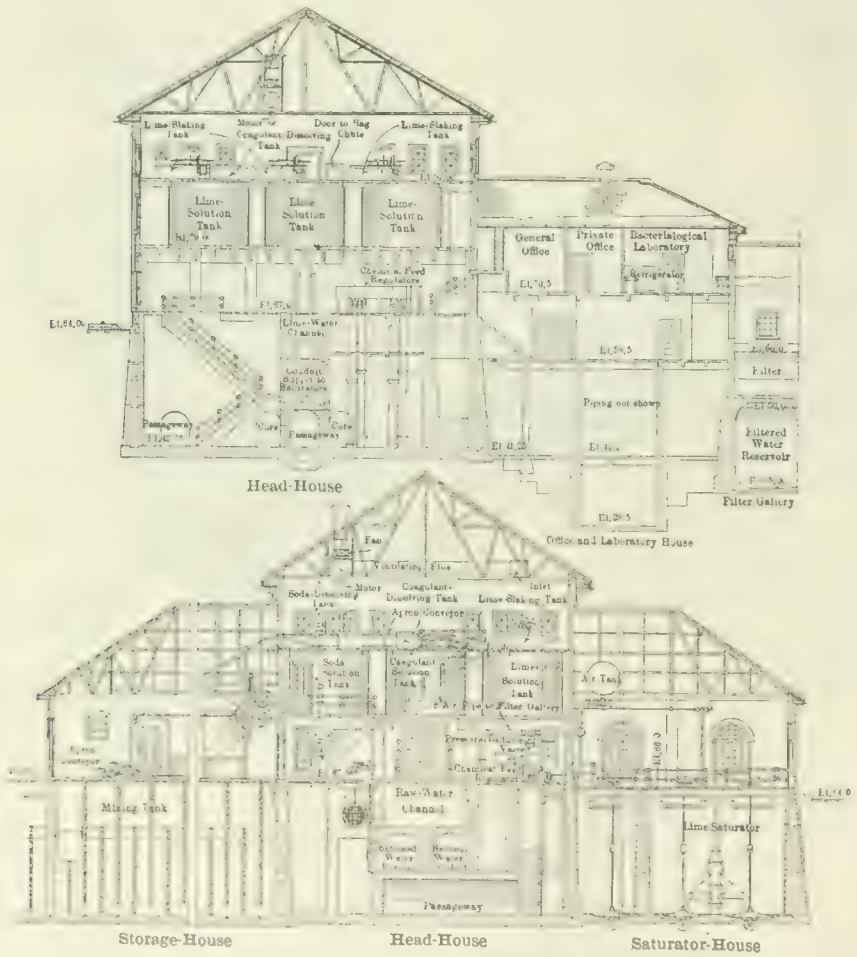

Fig. 2—Details of Headhouse for Water Purification Works at Columbus, Ohio.

The specifications permitted the engineer to change the relative volumes of the sand and ballast in each mixture, while keeping the aggregate of the two the same, and this was sometimes done, but in general the proportions as given above were used. Ordinarily, the concrete was mixed very wet.

The ballast was screened into three sizes: No. 1, ¼ to ¾-in; No. 2, ¾ to 1½-in., and No. 3, 1½ to 3-in. In ordinary work a mixture of the three sizes was used, but, in a considerable amount of the reinforced work the No. 3 ballast was omitted, and frequently only the No. 1 ballast was used, particularly in thin vertical work and in the lower parts of beams and horizontal reinforced work, in order to insure a good bedding of the square, twisted-steel rods.

Expansion joints were built throughout the work where necessary, Fig. 3. Where subject to the action of water which had been treated with lime and soda, the expansion joint consisted of a tongue and groove in the concrete, with a steel plate bedded and anchored on one side of the joint and greased on the other; in other places the tongue and groove only was used.

The filter gallery is in the wing of the main building east of the head-house, with the filter tanks ranged on either side of the gallery and supported on the roof of the filtered-water reservoirs. Between the filters there is a reinforced concrete operating floor, below which, and between the walls of the filtered-water reservoirs, is the pipe gallery.

The present installation includes ten filters, each having a normal capacity of 3,000,000 gals. per 24 hours. The filter tanks are of concrete heavily reinforced, each being constructed as a monolith. Their inside dimensions are 26 ft. 2 ins. wide, 46 ft. 8 ins. long, 8 ft. 10½ ins. deep at the center. Each has a net filtering area of 1,088.9 sq. ft., or 0.025 acre. The filters are designed on the basis of a normal rate of filtration of 2 gals. per sq. ft. per min., but can be operated at a rate 50 per cent greater than the normal, if desired.

The filter gravel, which was screened and washed, is placed in four layers, graded in size, the coarsest, No. 1, being at the bottom. The sizes and thicknesses of the layers of gravel are given in Table I. The material was brought from Cape May, N. J.

TABLE I.—FILTER GRAVEL.

	Size.	Thickness.
No. 1	½ in. to 1 in	2 in.
No. 2	¼ in. to ½ in	2 in.
No. 3	⅛ in. to ¼ in	3 in.
No. 4	1/16 in. to ⅛ in.	3 in.

The filter sand, which is supported by the filter gravel, has a total thickness of 2 ft. 6 ins. The material is a crushed sandstone, screened and washed, and was obtained from the Millwood White Sand Co., of Millwood, O. The analysis of the sand is given in Table II.

Total cost of works, exclusive of connections to city and exclusive of engineering	$1,056,620
Connections to city	181,000
Total cost, exclusive of engineering	$1,237,620
Engineering	95,950
Total cost	$1,333,570

Design and Construction of the Improved Sewage Works at Columbus, Ohio With Unit Costs.*

Sewerage System.—The topography of Columbus is such that, in the collection of the storm-water and dry-weather sewage, the city is divided naturally into three districts: the East Side Sewer District, the Intercepting Sewer District and the West Side Sewer District.

The East Side District is sewered on the combined system, with an outlet sewer in East Main street emptying into Alum Creek, which in turn discharges into the Scioto River a few miles below Columbus.

The Intercepting Sewer District is sewered largely on the combined system, the outlets of the numerous main sewers being along the east bank of the Olentangy and Scioto Rivers. The dry-weather flow in the combined system, however, is intercepted and discharged into an intercepting sewer which starts at the north end of the city and runs south along the east bank of the two rivers, the outlet formerly being on the east bank of the Scioto River about 2¼ miles below the center of the city.

The West Side District is sewered largely on the separate system, the sewer outlets being along the west bank of the Scioto River. The dry-weather flow in the combined sewers, however, is intercepted and discharged into the sanitary system.

In the West Side District a portion of the ground is low, and, in the past, during periods of high water in the river, some of the sewers have overflowed, flooding certain of the streets and numerous cellars. The discharge of sewage into Alum Creek and the Scioto River during periods of low water had been the cause of offensive conditions.

Outline of Sewage Problem.—No public water supply is taken from the Scioto River below Columbus. At Portsmouth, O., 100 miles from Columbus, where the Scioto discharges into the Ohio River, however, the water supply is taken from the Ohio, but at a point some distance above the junction of the two rivers.

The sewage problem resolved itself first into the elimination of the direct discharge of sewage into Alum Creek and the Scioto River, which could be accomplished by the construction of purification works at one or more points, in which the treatment of the sewage would be such that the effluent, discharged into either Alum Creek or the Scioto River, would at all times be non-putrescible, and, second, the prevention of the overflowing of the sewers on the west side.

Preliminary Investigations.—A joint investigation was made by Julian Griggs and John W. Alvord and a report made in May, 1898.

Their recommendation, in brief, besides extensions and improvements to the sewerage system and the construction of pumping stations necessary to deliver the dry-weather sewage at the purification works, was the screening of the sewage and its double filtration through coke at a net rate of 500,000 gals. per acre per 24 hours. The works proposed were to treat 20,000,000 gals. of sewage per 24 hours, but it was advised that only 2 acres of the coke beds, practically contact filters, be built at the start, and that these beds be then operated for a year under expert supervision, after which, from the practical experience gained, the remaining beds were to be constructed.

In 1901 Mr. Rudolph Hering as Consulting Engineer, reported in favor of septic tanks followed by intermittent filtration through sand, endorsing the previous recommendation that a portion only of the works be constructed and operated for a year before designing and constructing the remainder. He also endorsed the recommendations relative to pumping stations and the revisions and extensions of the sewerage system. In November, 1903, the first funds were provided. After further thought and study it was decided first to make extended experiments for a period of at least one year, in order to determine the most efficient and economical method, and then to design the purification works accordingly. The City Council appropriated $46,000, a sewage testing station was built and operated from Aug. 16, 1904, to July 30, 1905, and the Report on Sewage Purification at Columbus, Ohio, 1905, by George A. Johnson, Assoc. M. Am. Soc. C. E., is now a classic.

The indications of the experimental work, namely, that, under the local conditions, the Columbus sewage could be treated most satisfactorily and economically in a purification works comprising septic tanks, sprinkling filters and settling basins, and this method was therefore adopted. While the investigation showed that satisfactory results could be obtained by preliminary clarification and subsequent filtration through sand, it also showed, for the first time in the United States, that sprinkling filters could be operated in a northern climate and produce a satisfactory effluent at less cost than any other type of filter.

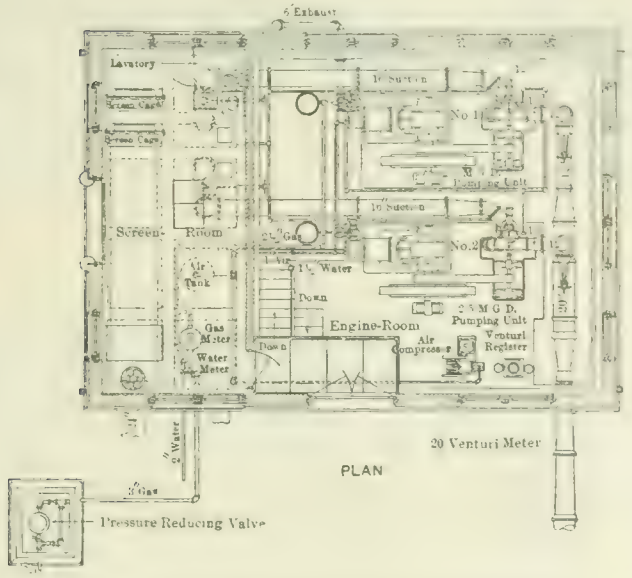

Fig. 1—Plans of East Side Pumping Station.

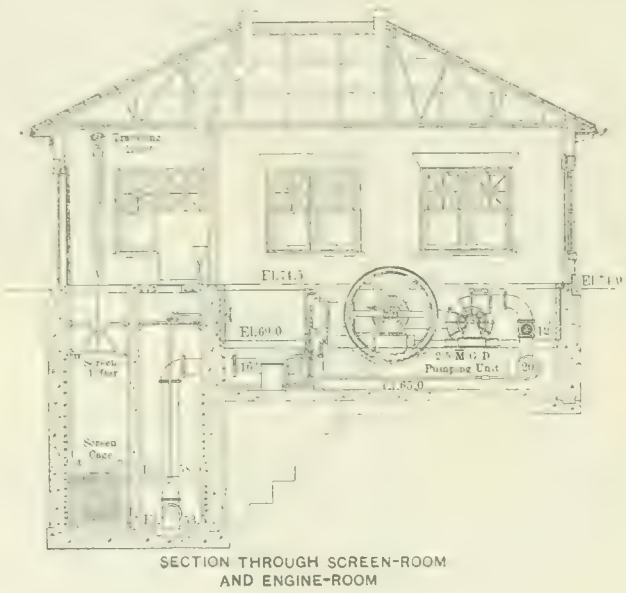

Fig. 2—Section Through Screen Room and Engine Room of East Side Station.

The river water is an unusually difficult one to handle. The problem of softening and filtering the Scioto River water is an exceedingly complex one, as the water is subject at times to rapid fluctuations in turbidity, color, alkalinity and incrustants, and in the portion of magnesia serving as a coagulant. Following heavy rains the turbidity rapidly increases while the hardness correspondingly decreases. Further, some of the turbidity in the settling basins is undoubtedly due to precipitates coming from the applied chemicals.

Table V is a summary of monthly averages of the plant in operation for the first eight months of operation during the year 1909.

The cost of engineering work, Table III, was $95,950, divided as follows: Pay roll, $84,340; supplies, $6,120; expenses, $5,490, amounting to 7.75 per cent of the cost.

The Pascagoula Northern R. R. Co., which has completed its new line from Pascagoula, Miss., northward to the crossing in Greene county of the Mobile, Jackson and Kansas City, is said to be considering changing its route and making its northern terminal at Laurel instead of Meridian, Miss. This would mean a swerving of the course of the road westward for several miles, and would shorten the total length of the line by 50 miles or more. The road now runs to Evanston, a distance of about 40 miles from Pascagoula, and the distance from there to Laurel would be about twice that distance.

*Abstracts from a paper by John H. Gregory, M. Am. Soc. C. E., published in the Proceedings of the American Society of Civil Engineers, Vol. XXXVI, p. 1.

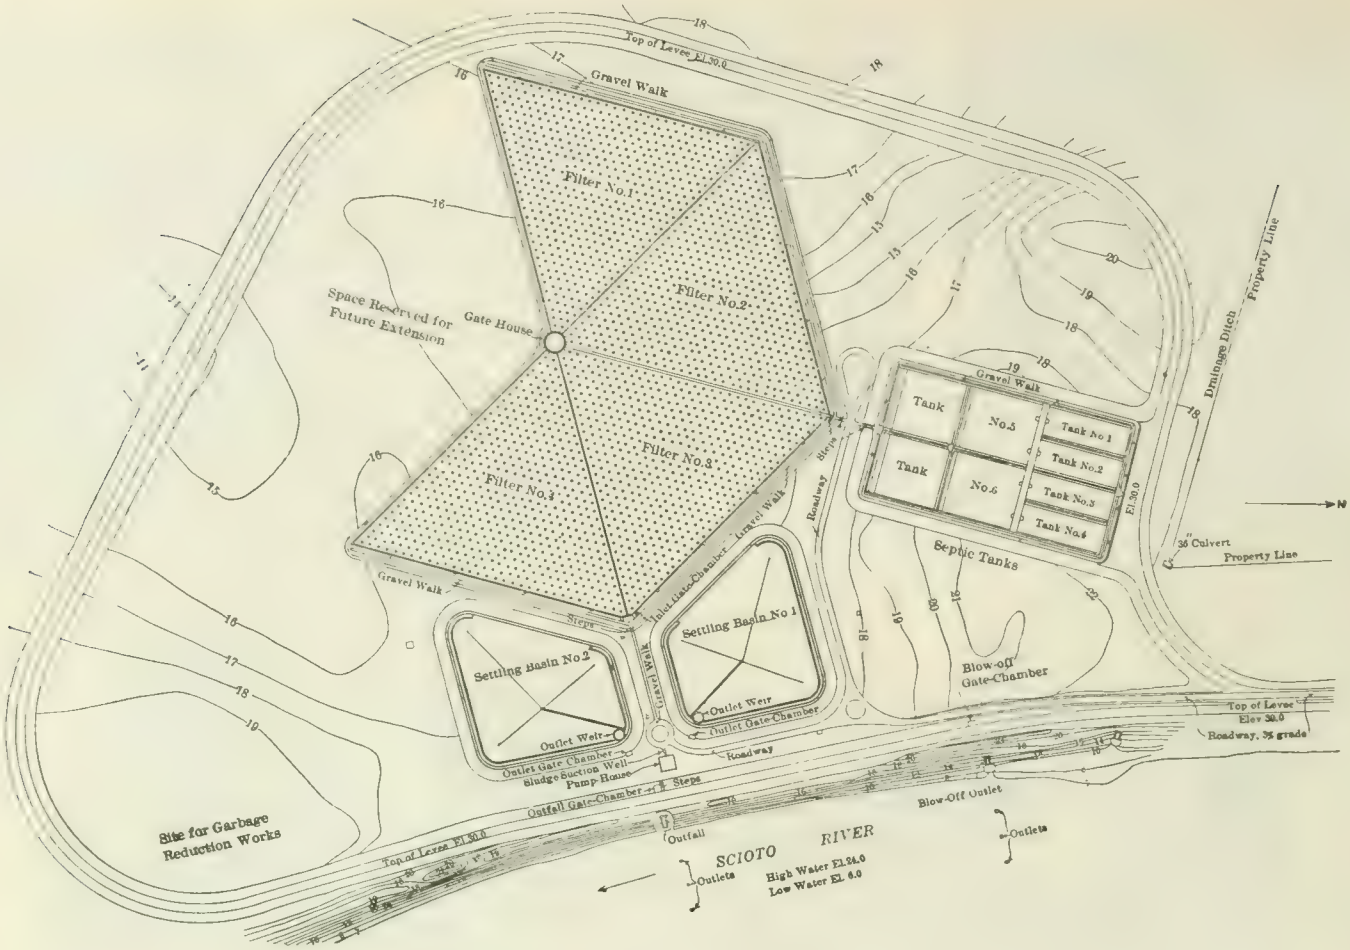

Fig. 3—General Plan of Sewage Purification Works.

Brief Outline of Works.—The preliminary investigations made by Messrs. Griggs, Alvord and Hering, and subsequent ones made by the engineering organization, indicated that it would be most advisable and economical to build and operate one purification works rather than two, and that the most feasible site for the works was on the Scioto River south of the city.

Briefly stated, the dry-weather flow of the whole city is brought to one point, where a pumping station, known as the Main Sewage Pumping Station, has been built. To accomplish this result, it has required the construction of a small pumping station near Alum Creek, known as the East Side Sewage Pumping Station, where the sewage from the East Side Sewer District is intercepted and pumped through a force main discharging into the upper end of one of the main sewers in the Intercepting Sewer District, the extension of the intercepting sewer across the Scioto River, and the construction of a new sanitary sewer connecting with the West Side Sewer District, and the reconstruction of a portion of the sewerage system in that district. From the Main Sewage Pumping Station the sewage is pumped through a force main to sewage purification works where the sewage is treated, the effluent from the works passing into the Scioto River. The Main Sewage Pumping Station is also arranged to pump storm-water from the West Side, one of the storm-water sewers having been extended to the pumping station. In addition, the work has included about 2.55 miles of levee construction, a railroad spur, 1.85 miles in length, and a single-track railroad bridge across the Scioto River.

The East Side Pumping Station is shown in plan in Fig. 1 and in section in Fig. 2.

A 9-ft. combined sewer passes in front of the building, serving as an outfall sewer for

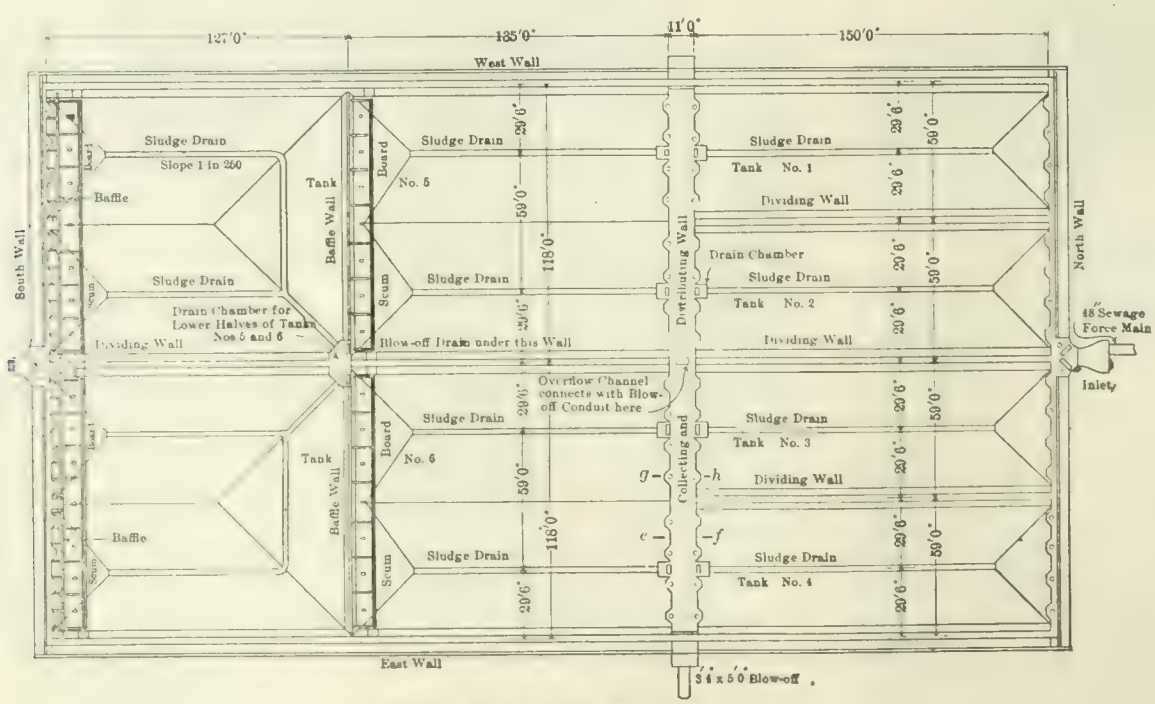

Fig. 4—Plan of Septic Tanks.

the East Side Sewer District. A low dam in the bottom intercepts and diverts into a 24-in. pipe the dry weather flow and first wash of the storm flow, taking them to a connection with the sub-structure of the pumping station. The sewage is screened before going into the suction well, the screen chamber acting as a sand-catcher. The substructure is of concrete, reinforced at various points, and the walls of the substructure of the engine room are lined with hard vitrified pressed brick. The walls of the superstructure are of brick, faced outside with red pressed brick. The engine room walls are lined with light-buff speckled pressed brick, and the screen room walls with hard red brick. The ceilings in both rooms are of plaster on metal lath fastened to the lower chords of the roof trusses. The roof is of 3-in. hollow terra cotta tile and slate carried by steel trusses and intermediate framing. The pumping machinery is in duplicate and shown in Figs. 1 and 2.

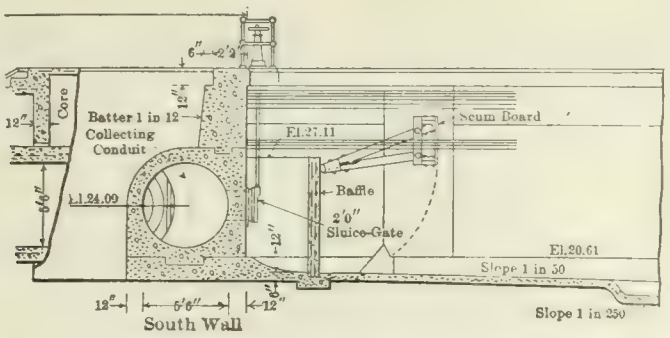

Fig. 5—Detail of South Wall of Septic Tanks.

The intercepting sewer has been extended across under the river, a distance of about 540 ft. to a sand catcher connected with the Main Sewage Pumping Station. The extension consists of a 48-in. cast-iron pipe surrounded by concrete. To bring the dry weather flow of sewage from the west part of the city to the pumping station, a new sewer, 1.85 miles in length, has been built. For a portion of the way it is brick and concrete and the remainder is concrete. At the upper end the diameter is 3 ft., enlarging to 3 ft. 6 ins. and the concrete section is 3 ft. 6 ins. by 3 ft. 6 ins. with vertical side walls. The Renick Run storm-water sewer has been extended 3,050 ft. to the pumping station and river. It is of concrete, with vertical side walls, 8 ft. by 7 ft. 4 ins., enlarging to 10 ft. by 9 ft. 3 ins. A 10-in. water main 2.05 miles in length has been laid, and also 1.65 miles of 2-in. high-pressure gas main.

The main sewage pumping station is of the same high class construction as the West Side pumping station and contains three 11,000,000-gallon daily capacity pumps. The station has a levee around it, although it is protected also by the new river levee. The chimney is 130 ft. high, 5-ft. diameter, radial hollow brick, with foundation carried by timber piles. The coal pocket has a capacity of 380 tons, about 40 days' supply at the present rate of consumption. High water in the river is about 6 ft. above the engine room floor, and in case of a break which would flood the pumping station lot the station itself would be flooded. To care for this emergency, stop plank grooves have been built in all the window and door openings, and a full set of stop-planks provided.

SEWAGE PURIFICATION WORKS.

The sewage purification works are on the west bank of the Scioto River, the upper end being about 1.2 miles below the Main Sewage Pumping Station and about 3.5 miles south of the center of the city.

Type and Capacity.—As previously mentioned, the purification works comprise septic tanks, sprinkling filters, and settling basins, the present installation having a net normal capacity of 20,000,000 gals. per 24 hours. The arrangement of the works, however, is such that they may be extended to an ultimate capacity of 30,000,000 gals. per 24 hours, and the main conduits will carry 45,000,000 gals. per 24 hours. A general plan of the works is given in Fig. 3.

Certain of the details, especially in the sprinkling filters, are somewhat different from what might be said to be current practice. The Columbus sewage purification works were the first designed, and at present are the largest of their type now under operation in the United States. When the works were designed in 1905 the only precedent was English practice, where the sewage treated was much stronger than is that at Columbus, and, while excellent results had been obtained from the English works, many of the details adopted there would hardly have been, and still would not be, suitable for works subject to periods of severe winter weather, as in Columbus.

During the last four years much thought and study have been given to improving the details of construction and operation of sprinkling filters in the United States, and while somewhat different details have been adopted in some of the more recent works, an examination of the designs seems to indicate that the details adopted and the experience obtained at Columbus have served as a basis from which to work.

Levee.—For protection from floods the works are surrounded by a levee about 6,100 ft. long, its top being 6 ft. above the highest recorded water level in the river and from 10 to 15 ft. above the ground. The levee is 16 ft. wide on top, and has side slopes of 1½ horizontal to 1 vertical, the inner slope being dressed with loam and seeded.

SEPTIC TANKS.

There are six septic tanks, four so-called primary tanks and two secondary tanks. They are shown in plan in Fig. 4, and some of the details are shown in Figs. 5, 6, 7, 8.

The primary tanks are 56 ft. 6 in. by 150 ft., and the secondary tanks are 115 ft. 6 in. by 262 ft. The tanks, throughout, are of concrete, are not covered, and are approximately 12 ft. deep to the high-water line. Each primary tank has a capacity of 710,000 gals. and each secondary tank 2,590,000 gals. The four primary tanks have a total capacity of 2,840,000 gals. and the two secondary tanks a total of 5,180,000 gals., making a grand total of 8,020,000 gals.

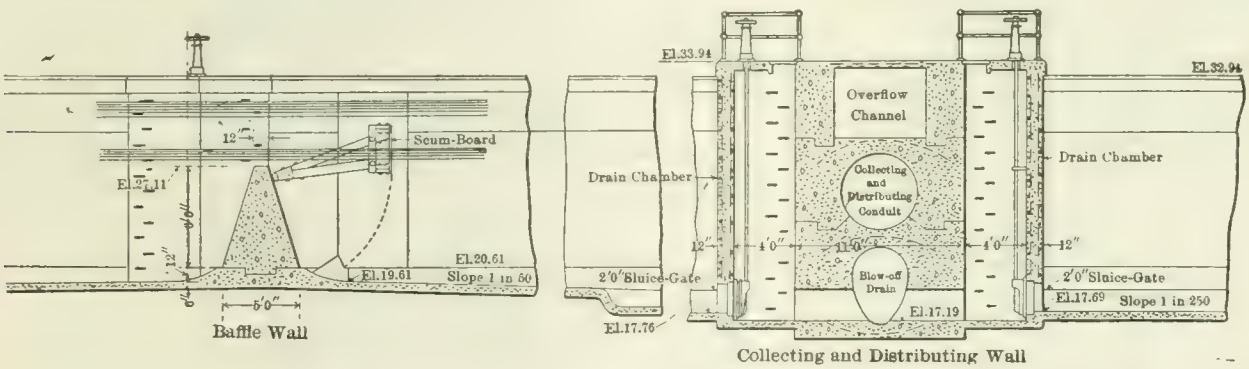

Fig. 6—Section Through Tanks Nos. 4 and 6.

Design.—The tanks were designed with the object of not only placing the outlets as far as possible from the inlets, but also of keeping the sludge as much as possible away from the outlets, this being accomplished by dividing the tanks longitudinally by transverse walls

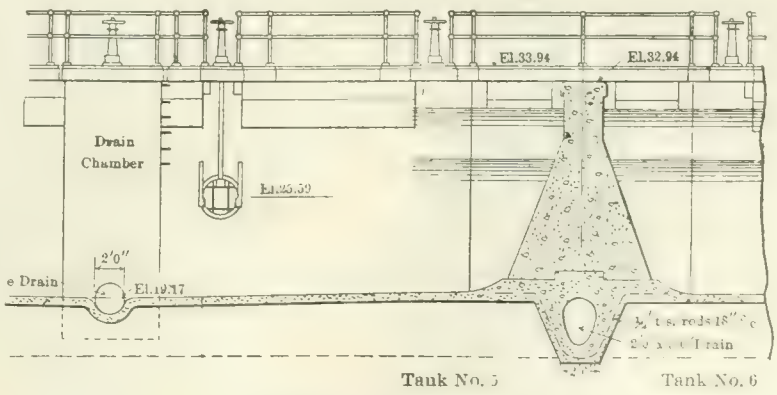

Fig. 7—Section Through Tank No. 5.

into three sections. To meet varying conditions in the character of the sewage and in the quantity treated, the design was made very flexible, it being possible to use any combination of one or more primary tanks with either or both secondary tanks.

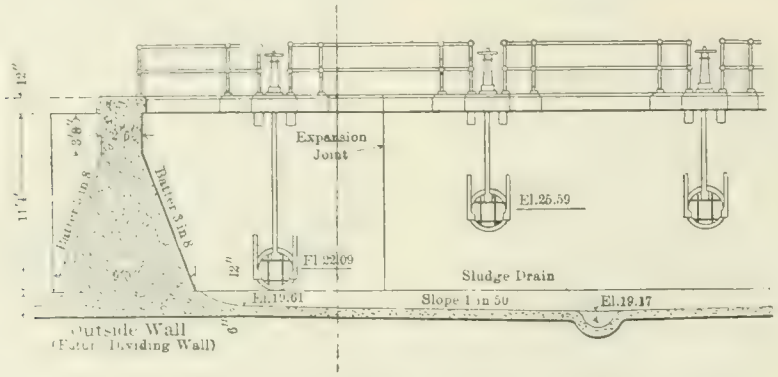

Fig. 8—Section Through Tank No. 1.

Operation.—As designed, the tanks were to be operated so that the rate of discharge from them would be practically constant during the 24 hours, the rate to be adjusted so that the total quantity drawn out would be as nearly as possible equal to the total quantity pumped in. As the rate of pumping varies from hour to hour, the surface level in the tanks, of course, fluctuates. With the mean hourly variation in the dry-weather flow, as determined during the experiments at the testing station, with the tanks all in service, and with a total flow of 20,000,000 gals. in 24 hours, the fluctuation would amount to about 3.1 ft., giving a minimum depth of about 8.9 ft. and a maximum depth of about 12 ft. in the tanks. On this basis, the average period of flow through the tanks would be about 8½ hours. In the operation of the works, however, it has been found that satisfactory results have been obtained by maintaining a constant level in the tanks, and the tanks are now operated in this way.

North Wall.—The 48-in. sewage force main terminates in a bell-mouth at the center of the north wall. The north wall is of a combined construction, consisting of a 5 ft. 6-in. reinforced distributing conduit carrying a small retaining wall above. Sewage is admitted into each primary tank from the top of the conduit portion through four 2-ft. sluice-gates, the center of the gates being about 2 ft. 8 in. below the low-water line in the tanks. By means of grooves and movable stop-planks, the distributing conduit may be divided into two sections, so that either half may be drained for inspection while the other half is in service.

Collecting and Distributing Wall.—The primary tanks are separated from the secondary tanks by a heavy wall of cored construction, called the collecting and distributing wall. In the middle of this wall there is a 5-ft. collecting and distributing conduit, sewage from each primary tank flowing into the conduit through four 2-ft. sluice-gates, and passing out into each secondary tank through eight 2-ft. sluice-gates. In the bottom of the wall there is a 3 ft. 4-ins. by 5-ft. blow-off conduit, and in the top there is an overflow channel which connects with the blow-off conduit below, sewage from the primary and secondary tanks flowing into the overflow channel over numerous weirs ranged along each side of the channel. These weirs would come into play only to prevent overflowing the outside walls of the tanks.

The sludge drains, in the primary tanks and in the upper section of each secondary tank, discharge, through small drain chambers, directly into the blow-off conduit in the collecting and distributing wall. In the lower section of each secondary tank the sludge drains discharge into a drain chamber located in the line of the dividing wall between the secondary tanks, and thence through a 2 by 3-ft. blow-off drain under the dividing wall into the blow-off conduit in the collecting and distributing wall. The arrangement of the sludge drains permits each primary tank and each section of each secondary tank to be drained independently.

Baffle Wall.—Each secondary tank is divided into two sections by a low baffle wall, to hold back the sludge at the bottom of the upper half of the tank, the top of the wall being about 1 ft. below low-water level. On the up-stream side of the wall, and hinged to it, there is a floating scum-board, of cypress, to hold back any scum which might form in the upper half of the tank.

Dividing Walls and Floors.—All the dividing walls have a gravity section. The east and west outside walls have the same section as the dividing walls, as they will become dividing walls when the tanks are extended. The floors are all 6 in. in thickness, and no special attempt was made to make them watertight, as it was thought that the joints between the floor-blocks would rapidly silt up and become tight.

Blow-off.—From the east end of the collecting and distributing wall a 3 ft. 4-ins. by 5-ft. blow-off conduit extends to a blow-off gate-chamber in the levee on the east side of the works, from which two blow-offs run to the river, the larger one, 4 ft. in diameter, having its outlet at the edge of the river. The smaller one, 16 ins. in diameter, extends out farther, and has three outlets in the center of and at the bottom of the river. All the outlets are protected by flap-gates, and in the gate-chamber each blow-off is fitted with a sluice-gate. The 4-ft. blow-off was provided to care for a large volume of sewage which might pass over the overflow weirs in the collecting and distributing wall, and the 16-in. blow-off is for use when the tanks are drained. For the present the sludge is disposed of in the river when the river rises and the dilution is sufficiently great, but the city has acquired a large tract of land, adjoining the works, and remote from buildings, which can be used for sludge disposal should this be found desirable or necessary at a later date.

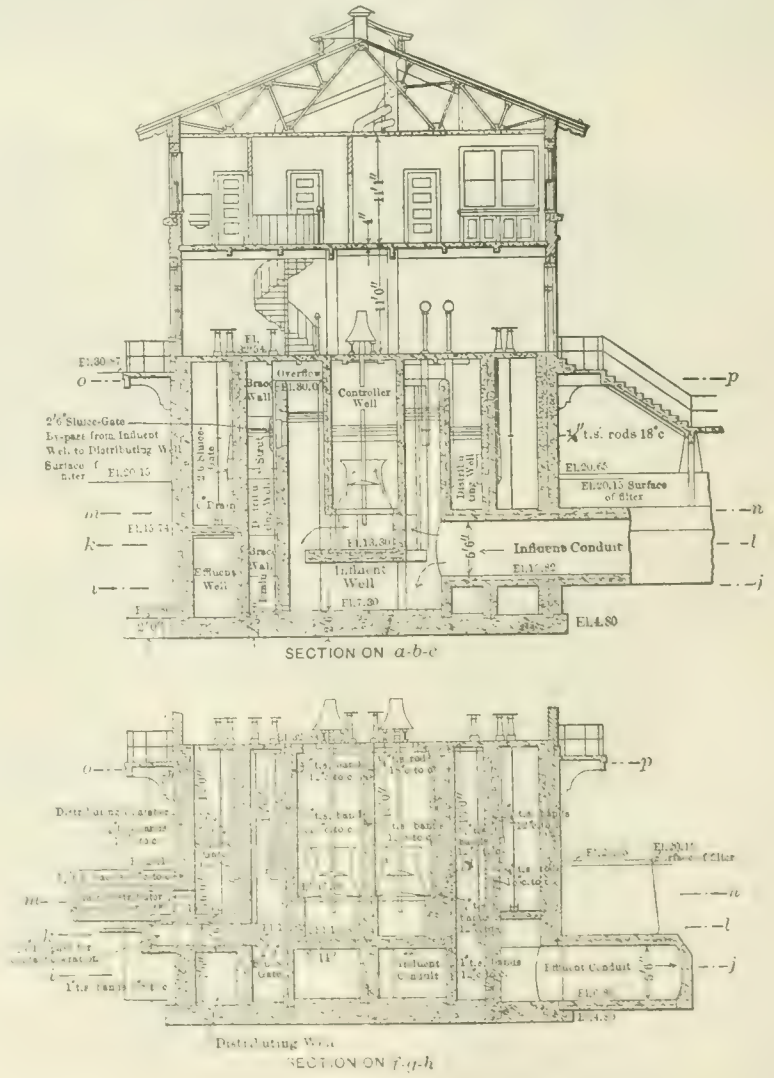

Fig. 9—Vertical Sections Through Gate House.

South Wall.—The south wall is similar in construction to the north wall, but the collecting conduit is not reinforced. The effluent from each secondary tank is drawn off through eight 2-ft. sluice-gates, a reinforced concrete baffle and a floating scum-board holding back the sludge and any scum which might possibly form.

GATE-HOUSE.

From the center of the south wall of the septic tanks the sewage flows through a so-called influent conduit to the gate-house. This conduit, 5 ft. 6 ins. in diameter, of reinforced concrete, is located under the dividing wall

between Filters Nos. 2 and 3. The flow from the septic tanks and to and from the sprinkling filters is controlled at the gate-house, some details of which are shown in Figs. 9, 10 and 11.

Substructure.—The substructure of the gate-house is of concrete, heavily reinforced, and its outside diameter is 38 ft. Sewage is first admitted from the influent conduit into an influent well, 15 ft. in diameter and 25 ft. 3 in. deep, located in the center of the substructure. The influent well encloses two controller wells, approximately elliptical in plan, each 6 ft. 6 ins. wide and 7 ft. long, through which the sewage flows out into an annular distributing well, 3 ft. in width, enclosing the influent well. From the distributing well the sewage passes into a series of distributing chambers connecting with the distribution systems in the filters. These distributing chambers are built in the upper portion of the outer annular well of the substructure, the lower portion being termed the effluent well, into which the effluent from the filters flow.

Fig. 10—Longitudinal Section Through Gate House.

Each controller well contains a specially designed controller, adjustable from a minimum capacity of 10,000,000 gals. to a maximum capacity of 22,500,000 gals. per 24 hours, and operating under a minimum loss of head of about 0.75 ft.

These controllers were installed to care for the fluctuating head in the septic tanks, but, on account of the change in the method of operating these tanks, with a constant level, the controllers are not at present in use. A description of them and their action, however, may be of interest.

The controller consists of a flaring tube in which a pressure disk, attached to a vertical stem, moves up and down. The rate of flow between the controller, therefore, is dependent on the annular area between the pressure disk and the flaring tube, and on the difference in head between the two sides of the disk. The upper end of the vertical stem is shouldered, and picks up successively, as it rises, a series of weights until the difference in head on the pressure disk is balanced. With a given position of the vertical stem relative to the nest of weights above, the controller maintains automatically a practically constant rate of flow, the pressure disk and stem rising as the level in the septic tanks rises, and falling as the level in the tanks falls. The rate of flow through the controller is varied by adjusting the position of the stem relative to the nest of weights.

With the quantity of sewage at present treated, only one controller ordinarily would be in service, it being set to discharge in 24 hours, as nearly as possible, the estimated quantity which would be pumped into the septic tanks during the 24 hours, but, in case the controller should be set too low and the septic tanks should fill up to the high-water line, and the rate of flow into the tanks should then continue in excess of the quantity discharged by the controller, this excess would pass over an overflow on the influent well into the distributing well and out to the sprinkling filters, by building up a greater head on the distribution systems. This overflow is set at a lower elevation than the overflows in the septic tanks, and would come into play before sewage would pass over the overflows in the tanks and out to the river.

In case of long-continued and excessively

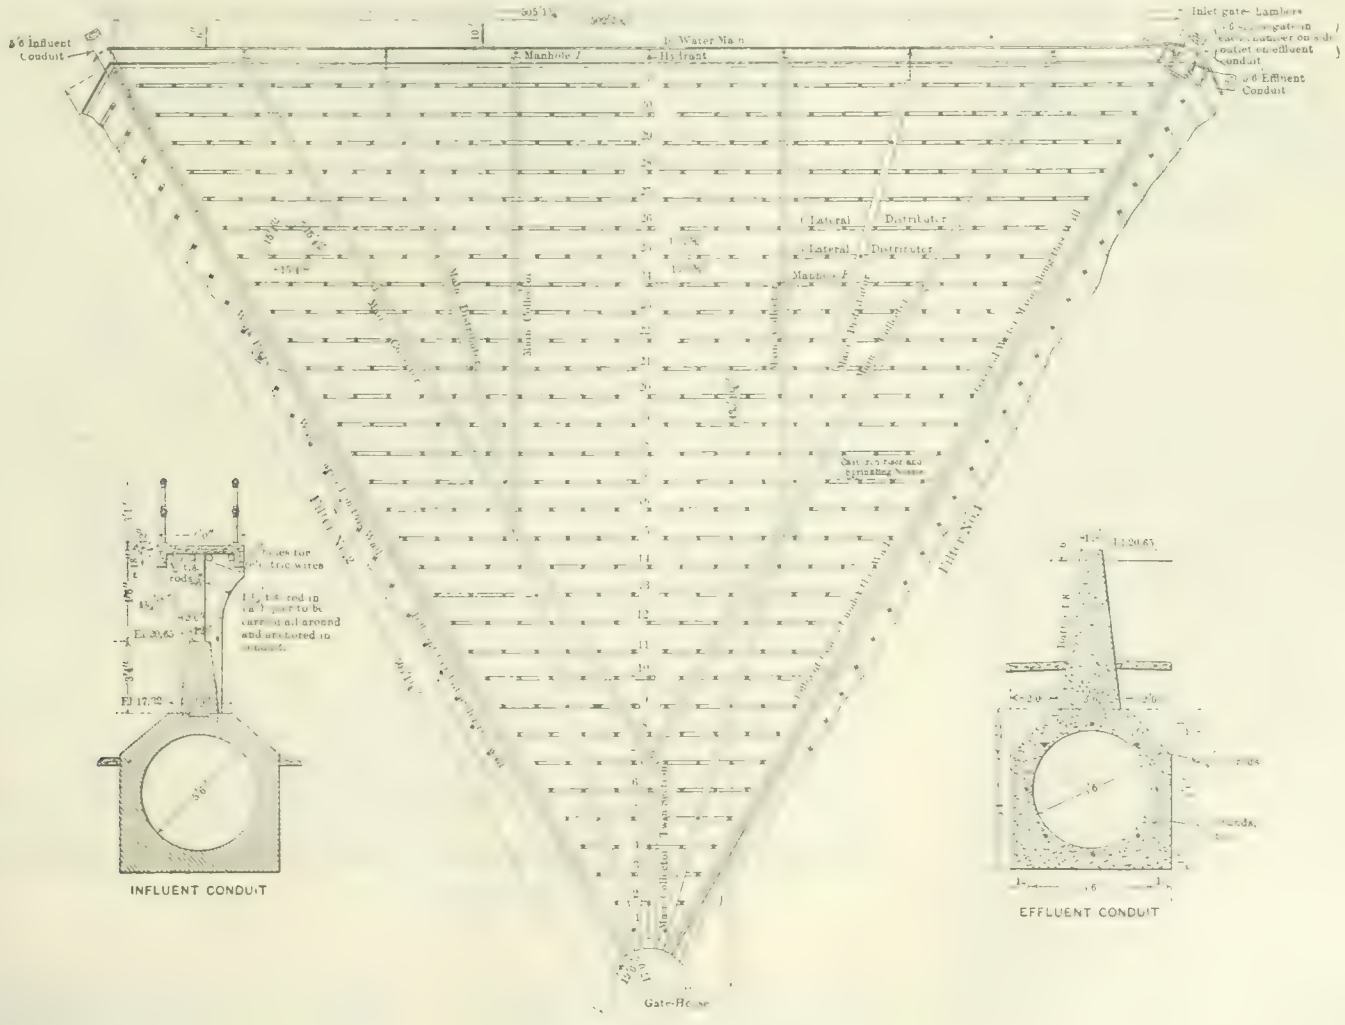

Fig. 11—Plan of Sprinkling Filter No. 3.

cold weather, provision has been made to operate the sprinkling filters as contact filters, if so desired. Under such conditions, the distribution systems would be shut off and drained, and the filters would be filled from below through by-pass gates and pipes leading from the distributing well. The main effluent gate of each filter, of course, would be closed while the filter was filling, and opened slowly during the period of draining. It is also possible to by-pass the filters entirely by shutting the outlet gates from the distributing well and opening the gates connecting the distributing well directly with the effluent well.

Superstructure.—The superstructure of the gate-house is also circular in plan, and is two stories in height. In the lower story are located the various stands for operating the sluice-gates and controllers, a chart recorder for showing the level in the septic tanks, an indicator for showing the head on the sprinkling nozzles in the filters, and a secondary indicator and chart recorder for giving the rate of flow through the 48-in. Venturi meter at the main sewage pumping station and thus through the force main into the septic tanks. The second story is divided into an office, chemical and bacteriological laboratories, a locker-room, and a lavatory containing a shower bath and sanitary conveniences. The character of the construction of the superstructure is similar to that of the superstructure of the main building at the water purification works, previously described.

SPRINKLING FILTERS.

There are four sprinkling filters, radiating from the gate-house, each being an equilateral

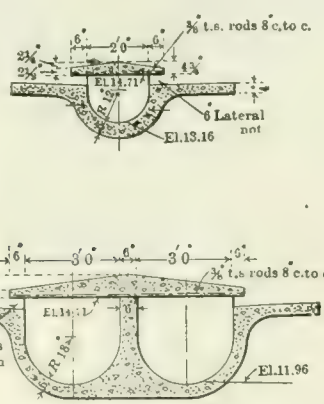

Fig. 13—Maximum Section of Main Collectors.

triangle in plan, 505 ft. 1¼ ins. on a side. With the construction of two additional filters, space for which has been reserved, they will form a hexagon with the gate-house at the center. Each filter has a net area of 2½ acres, making a total of 10 acres for all four, but as the distribution system in each filter has been designed so that one-half of the filter can be operated independently of the other half, the present installation, from the standpoint of operation, may be considered as consisting of eight filters of 1¼ acres each.

The filters are designed to yield normally 2,000,000 gals. per acre per 24 hours, resting one-half of the time, requiring therefore a rate of 4,000,000 gals. per acre per 24 hours when in service. It is possible, however, to operate them at somewhat higher rates. The details of the filters are shown in Fig. 11 to Fig. 15, inclusive.

Walls.—The outside and dividing walls were of concrete, and were designed simply as light retaining walls and not to resist water pressure on one side with no filtering material on the other. To provide access to the gate-house so that it can be reached when the two additional filters are constructed, without having to walk across the surface of the filters, an elevated reinforced concrete walk has been built above and is supported on the dividing wall between Filters Nos. 2 and 3.

Distributing System.—In order to provide protection from the frost, the distribution system is built below the surface of the filters, and consists of main distributors, lateral distributors, vertical risers and sprinkling nozzles. The main distributors, of which there are two in each filter, are of reinforced concrete, 2 ft. 6 ins. in diameter, and radiate from the gate-house. Connecting with the main distributors are the lateral distributors, which consist of lines of 5-in. and 6-in. vitrified sewer pipe supported by and bedded in the upper part of small concrete walls. From outlets in the top of the main distributor, and from sewer pipe branches set vertically in the later distributors, 3-in. cast-iron risers extend to the surface of the filters, the sprinkling nozzles being screwed into the upper ends of the risers. The joint at the base of each riser is made with lead caulked into the vitrified pipe socket. The distribution system in each filter is designed so that when shut off it can be drained out back to the gate-house.

The sprinkling nozzles are 15 ft. 4 ins. from center to center, and the arrangement being such that the straight lines connecting three adjacent nozzles from the sides of an equilateral triangle. The nozzle, Fig. 16, is of brass, and consists of a single orifice, 9/16 in. in diameter, with rounded edges, above which, held by two thin arms, there is an inverted 90° cone, the axis of the cone coinciding with the axis of the orifice. The jet on leaving the orifice impinges against the cone and is transformed into a thin sheet, spreading out radially and breaking into a shower of fine drops At the points where the sheet strikes the arms the latter are ground down to sharp edges on each side in order to permit the sheet to heal up after passing them. When the filters are operating at a rate of 4,000,000 gals. per acre per 24 hours each nozzle will discharge approximately 13.1 gals. per minute under a head of 5 ft. available at the nozzle. There are 2,108 nozzles in the 10 acres of filter surface, about 211 nozzles per acre, the area tributary to each nozle being 206.0 sq. ft.

The experimental investigation at the testing station demonstrated that satisfactory results could be obtained when operating nozzles under a constant head, and the works were designed with this in view. It has since been found that better results are obtained if the head is allowed to fluctuate, and the filters are now operated in that manner, the head on the nozzles being varied from hour to hour by hand, by throttling the sluice-gates in the gate chamber. Modifications in the gate-house are being contemplated whereby the head will be made to fluctuate automatically.

Filtering Material.—The filtering material consists of broken stone having a total average depth of about 5 ft. 4 ins., the lower 10 ins. being from 3 to 4 ins. in size. In Filters Nos. 1 and 2 the material above the lower course has a nominal size of from 1½ to 3 ins. The material was sampled carefully from time to time, and mechanical analyses were made from which it was found that the effective size was 1.4 in. and the uniformity coefficient 1.4, and that the average size of the stone was 1.7 ins., that being the diameter of a sphere of equal volume. In Filters Nos.

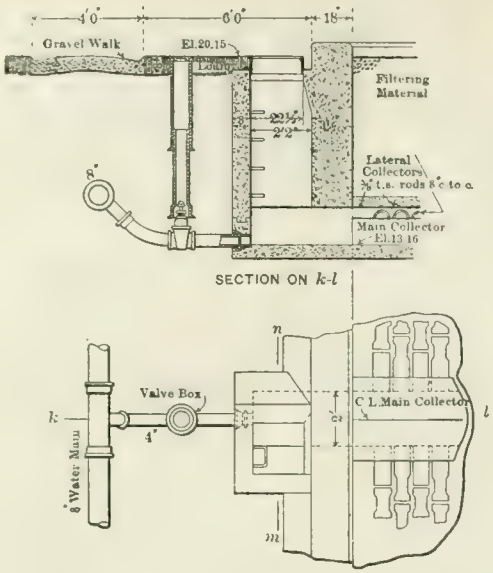

Fig. 12—Detail of Main Collector.

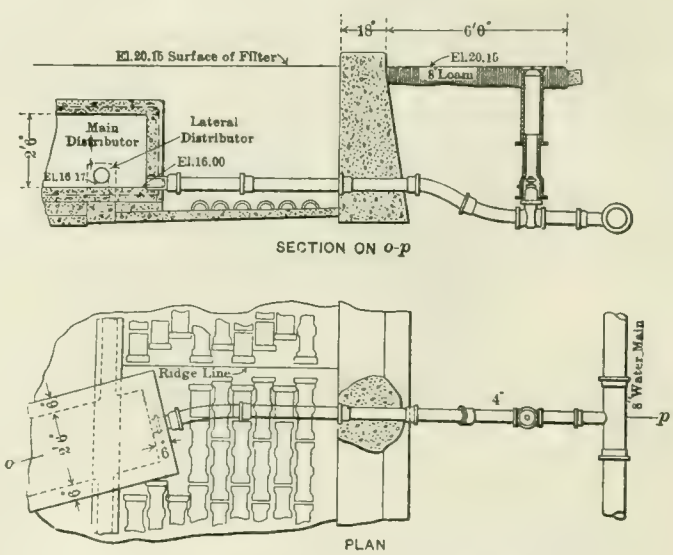

Fig. 14—Detail at End of Main Distributor.

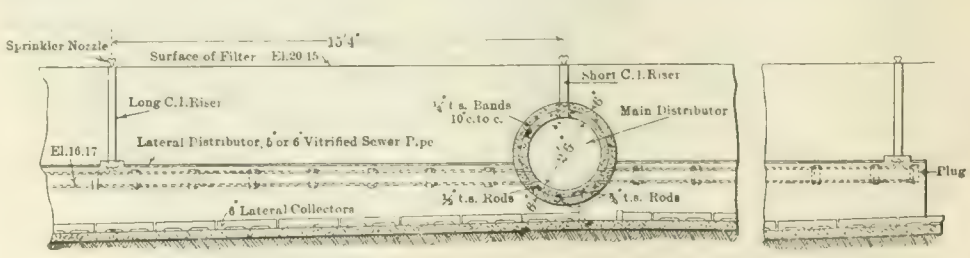

Fig. 15—Section Through Main Distributor.

3 and 4 the material has a nominal size of from 1 to 3 ins., an effective size of 1.1 ins., a uniformity coefficient of 1.6 in. and an average size of 1.5 ins. The material is all limestone, obtained partly from quarries near Columbus and partly from Marion, Ohio, and was screened at the quarries to remove the dust and fine particles and to obtain material of the right size.

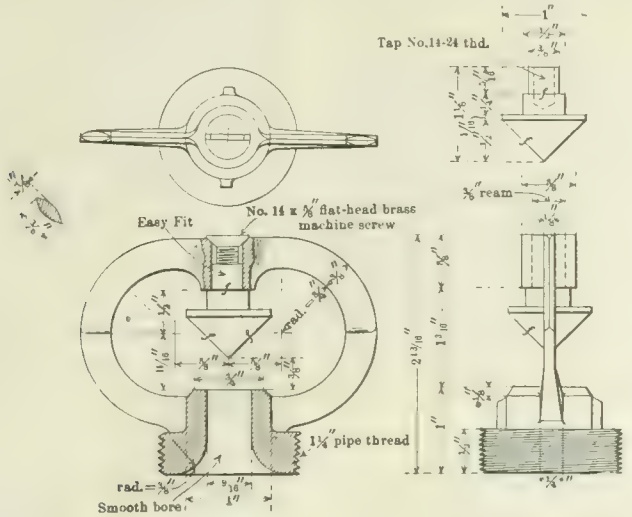

Fig. 16—Columbus Sprinkling Nozzle.

Collection System.—For removing the effluent from the filters, a very free-draining bottom has been provided, consisting of lateral collectors discharging directly into main collectors. The lateral collectors are 6-in. vitrified channel pipe, with the sockets left off, notched on both edges, and laid in parallel lines, a space of ¾ in. being left between each two pipes longitudinally. The floors of the filters, which slope to the main collectors, are of concrete, 4 ins. thick, the edges of the lateral collectors being bedded on the floor before the concrete had obtained its initial set.

The main collectors, which are of concrete, below the level of the floor of the filters, have a semicircular invert with vertical sides above and gradually increase in section toward the gate-house. The flow line is below the level of the filter floor, so that the ends of the lateral collectors will not be submerged. The main collectors in each filter discharge into a common sump and thence into the effluent well in the gate-house, the flow line in the sump being below the level of the invert of the lower end of the main collectors, so that when a main collector is not in use it will drain out completely. Manholes furnish access to the main collectors, for inspection.

SETTLING BASINS AND OUTFALL.

From the substructure of the gate-house the effluent from the sprinkling filters flows through a so-called effluent conduit, to an inlet gate-chamber, then through the gate-chamber and through two inlet conduits to the settling basins. The effluent conduit is of reinforced concrete, is 5 ft. 6 ins. in diameter, and is located under the dividing wall between Filters Nos. 3 and 4.

Inlet Gate-Chamber and Conduits.—The inlet gate-chamber is of concrete, and is all below the surface of the ground; that part in connection with the effluent conduit is heavily reinforced. The flow from the effluent conduit is controlled by two 5½-ft. sluice-gates. The inlet conduits are also 5½ ft. in diameter, and are of concrete but are not reinforced. The sewage is admitted from the inlet conduit into each settling basin through fifteen 21-in. vitrified sewer pipe inlets terminating in a low wall.

Settling Basins.—The effluent from the sprinkling filters is not perfectly clear, and, to remove the heavier particles in suspension, it is at times allowed to flow through one or both settling basins before passing out to the river. Each settling basin has a capacity of 2,000,000 gals. and, with one basin in use, and when handling 20,000,000 gals. of sewage per 24 hours, the average period of flow through the basin would be a little less than 2½ hours. The basins are from 4 to 4½ ft. deep, the water line being about 5 ft. above mean low water in the river.

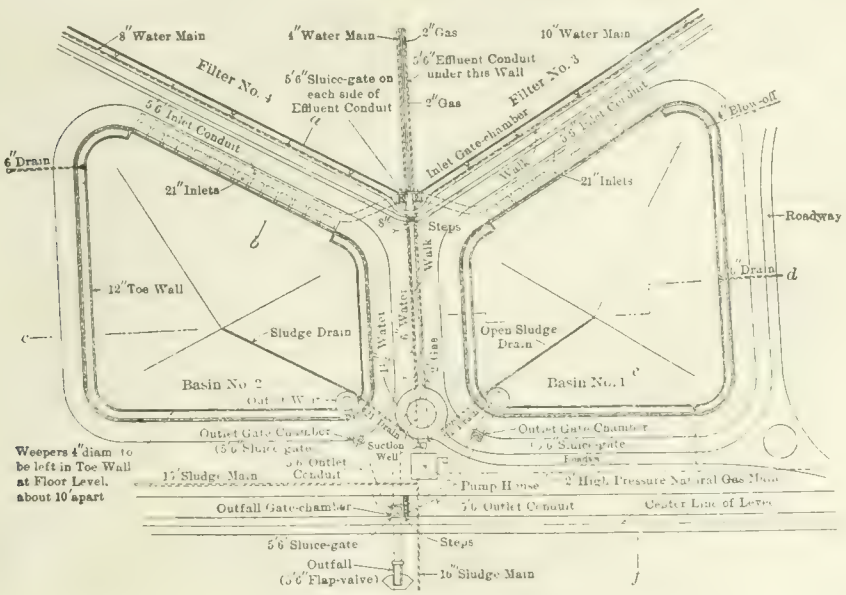

Fig. 17—Plan of Settling Basins.

The basins are not covered, and are all in excavation. As originally built, the side slopes were 3 horizontal to 1 vertical, and were not paved or otherwise protected, except that above the water line the slope was grassed; the berm at the foot terminated at a low toe-wall, 12 in. high. On account of lack of funds, when the works were designed, it was decided to omit retaining walls around the sides of the basins, but, funds having become available since the works were completed, the retaining walls were built during the summer of 1909. The floors are of concrete, 4 ins. thick, and simply provide a suitable surface for the flushing out of sludge. No attempt has been, or will be, made to exclude ground-water, on the contrary, weep-holes, 4 ins. in diameter and 10 ft. apart, have been left in the toe-wall, so as to admit ground-water and prevent an upward water pressure on the floor.

The effluent from each settling basin flows off in a thin sheet over a circular outlet weir, 19 ft. in diameter, floating matter being held back by an easily removable sheet-steel scum-board. Some details of the settling basins are shown in Figs. 17, 18 and 19.

Outlet Conduits and Outfall.—From the outlet weirs the effluent from the settling basins flows through the outlet conduits to the outfall gate-chamber and thence to the outfall on the bank of the river. The outlet conduits are 5½ ft. in diameter, and are of reinforced concrete. On each of these conduits

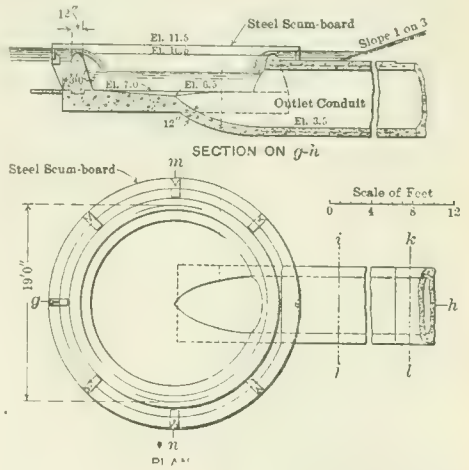

Fig. 18—Outlet Wier for Settling Basins.

there is an outlet gate-chamber containing a 5½-ft. sluice-gate, so that either or both basins may be shut off when desired. At the outfall a 5½-ft. flap-gate has been provided, and, in the outfall gate-chamber, there is a sluice-gate of the same size, for use in case the flap-gate should fail to seat tightly during high water in the river, when it might be desired to shut down the works. From the inlet gate-chamber the effluent conduit is extended to the outfall gate-chamber, and serves as a by-pass around the settling basins, by closing the gates in the inlet and outlet gate-chambers.

PUMP HOUSE AND CONNECTIONS.

A small suction well and pump house have been built to discharge the sludge accumulating in the settling basins. The pump is a horizontal, volute, with 12-in. suction and 10-in. discharge. The capacity is 3,000 gals. per minute against a head of 14 ft., and 2,000 gals. per minute against a head of 26 ft. when pumping a mixture weighing 75 lbs. per cu. ft. The well and the substructure of the house are of concrete, the superstructure being of the same first class construction as the gate-house. One 15-in. sludge main terminates at present at the site of the garbage reduction house. The other sludge main is 16 in. in diameter and extends out into the river.

Loss of Head.—The total loss of head through the works, from high-water line in the primary septic tanks to mean low water in the river, is 25.34 ft., and, without giving all

the individual losses through gates, conduits, etc., may be summarized as given in Table I. It should be stated that the losses are computed on the basis of the works handling a maximum quantity of 45,000,000 gals. per 24 hours.

TABLE I.—LOSS OF HEAD THROUGH WORKS.

Location.	Elevation, in feet above city datum.	Loss of head, in feet.
High-water line, primary septic tanks	31.34	....
Low-water line, primary septic tanks	28.24	3.10
Hydraulic grade at sprinkling nozzles	25.15	3.09
Surface of filter	20.15	5.00
Hydraulic grade, lower end of main collector	13.77	6.38
Hydraulic grade, effluent well in gate house	11.96	1.81
Water line, settling basins	11.00	0.96
Mean low water in river	6.00	5.00
Total		25.34

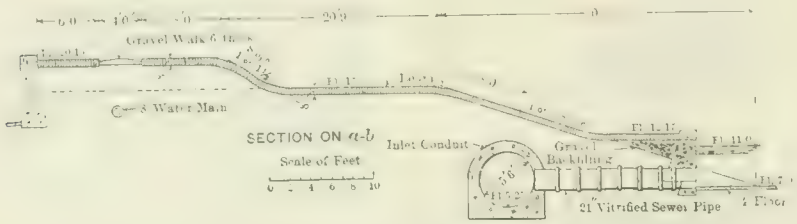

Fig. 19—Section Through Part of Settling Basin.

Operation During Freshets.—With a 5-ft. rise in the river, the settling basins would be shut off, but the filters could still be operated under normal conditions. With a total rise of 7 ft. in the river the filters would cease to be free-draining at the bottom, and would probable be shut off. It would be possible, however, still to operate the filters with a greater rise than 7 ft. in the river by allowing them to fill up with sewage sprayed on from the sprinkling nozzles until the filters were full up to the surface. Whether or not this method of operation would be satisfactory can only be determined by trial. At the best, however, operation at such times would require the most careful supervision, as the river may easily rise at the rate of 0.75 ft. per hour, and, unless the filters were shut off at the proper time, the outside walls would be overflowed. Again, if, for any reason, the flap-gate at the main outfall should become deranged at such a time, the river, which is highly turbid during freshets, might back up into the filters and deposit a large amount of mud, a result which would be simply disastrous, as in all probability the stone would have to be removed from the filters and washed, and the filters themselves would have to be cleaned and washed out. Assuming, however, that the filters are shut off with a 7-ft. rise in the river, the septic tanks can still be operated, even up to maximum high water in the river, the effluent from the tanks flowing to the gate-house, through the by-pass between the influent and effluent wells, and then out through the effluent conduit directly to the river.

CONCRETE.

In the construction of the sewage purification works, concrete, both plain and reinforced, was used extensively. The relative volumes of cement, sand and ballast in the several classes of work were as follows:

Mean low water in river..... 6.00 5.00

1 : 2 : 4.—Water-tables, belt courses, window-sills, lintels, etc.; sub-structure of gate-house (except foundation floor), and walk over influent conduit wall; reinforced floors, columns, stairways, and steps.

1 : 2½ : 5½.—Sprinkling filters, settling basins, collecting and distributing, and north and south walls of septic tanks; conduits and blow-offs, foundations and miscellaneous small structures.

1 : 3 : 7.—East and west outside walls, baffle walls, and dividing walls of septic tanks (except collecting and distributing wall).

The specifications for the concrete were similar to those for the water purification works, and the method of mixing and placing the material was practically the same. The expansion joints, which were built where necessary, consisted, however, only of a tongue and groove in the concrete, no steel plates being used. The tongues and the grooves were well reinforced, both vertically and horizontally, with twisted steel rods.

TABLE II.—UNIT COSTS OF MAIN FEATURES OF WORK.

Work.	Capacity.	Total cost.	Unit costs.
Buildings.			
East Side Sewage Pumping Station.			
Superstructure	25,700 cu. ft.	$ 5,480	21.3 cts. per cu. ft.
Main Sewage Pumping Station.			
Substructure	110,200 cu. ft.	25,710	23.4 cts. per cu. ft.
Superstructure	248,600 cu. ft.	29,010	11.7 cts. per cu. ft.
Total	358,800 cu. ft.	54,720	15.3 cts. per cu. ft.
Gate-House, Sewage Purification Works.			
Substructure	31,700 cu. ft.	23,439	73.9 cts. per cu. ft.
Superstructure	29,800 cu. ft.	7,620	25.6 cts. per cu. ft.
Total	61,500 cu. ft.	31,050	50.5 cts. per cu. ft.
Pump House, Sewage Purification Works.			
Superstructure	9,900 cu ft.	1,990	20.1 cts. per cu. ft.
Septic tanks	8,020,000 gals.	$66,730	$8,320 per mil.gals
Sprinkling filters	10 acres	240,400	24,040 per acre.
Settling basins	4,000,000 gals.	37,920	9,480 per mil. gals
Sewage Purification Works.			
Levee, railroad spurs and culvert		$15,530	$ 780
Roads, walks, grading and drainage of grounds		3,590	180
Water and gas mains		6,510	330
Septic tanks		66,730	3,340
Blow-off from septic tanks		6,710	340
Walk on influent conduit wall		1,620	80
Influent conduit		5,890	290
Gate-house		32,910	1,640
Sprinkling filters	20,000,000 gals. per 24 hrs.	240,400	12,020 per million gals. per 24 hrs.
Effluent conduit		14,380	720
Inlet and outlets to settling basins		14,030	700
Settling basins		37,920	1,900
Pump-house and suction well		7,660	380
Sludge force mains		1,610	80
Engineering and Incidental		860	40

PROGRESS OF WORK.

The first bond issue was authorized in November, 1903, and the preparation of the first drawings and specifications began early in 1904. The first work placed under contract was the testing station, in May, 1904. Additional contracts were let during 1904 and 1905, and in November, 1905, the purification works were placed under contract. The work was all practically completed by the fall of 1908, although the last contract, for the concrete walls around the settling basins, at the purification works, was not let until April, 1909. Sewage was first pumped regularly to the purification works on November 28, 1908.

The total cost, including the experimental investigation and all engineering, was $1,351,020. The cost of engineering was as follows: Pay roll, $90,280; supplies, $6,450; expenses, $10,280; total, $107,550; equivalent to 8.98 per cent of the cost.

Mr. Gregory was in direct charge of the design and construction of the work, with the titles, successively, of Engineer of Design, Principal Assistant Engineer and Engineer in Charge. Messrs. Rudolph Hering and George W. Fuller acted throughout as Consulting Engineers.

Water Service Costs.—The following figures are given in the Report of the Louisville, Ky., Water Co.: The average cost of ⅝-in. services in 1907 prior to May 1 was $18.23; at present the same services are being installed at an average cost of $11.05. Formerly the water company installed these services at its own expense, but since Jan. 1, 1908, the consumers have been charged with this cost, resulting in a saving to the company of $35,014.22. On the basis of material at the same price, in 1907 prior to May 1, the cost of laying 6-in. pipe was $1.07 per foot; the cost at the present time is 70 cts. per foot. The cost of labor and fuel per million gallons for pumping at the river station in 1907 was $5.56; in 1909 it was $2.45. At Crescent Hill station, which was a modern plant just started, it cost $4.20 per million gallons in 1907 and $2.35 in 1909.

The prairie section of the Grand Trunk Pacific, which extends from Winnipeg to Wolfe Creek, a distance of 917 miles with its branches, serves a large grain-growing and mixed farming country. In addition the railway's route is over the interior plain or plateau of northern British Columbia, between Fort George, on the Fraser River, and Prince Rupert; the entire area, with but few exceptions, being suitable for either farming or ranching to a distanc of within about 100 miles of Prince Rupert. The interior plateau referred to is approximately 400 miles long and stretches north to the Peace River and south an approximate distance of 75 miles, containing about 50,000 square miles of territory, 25 per cent of which is suitable for grain growing and the production of the hardier fruits. There are in this section also considerable mineral deposits and much coal of bituminous and some of anthracite character. The cost of the prairie section has been about $35,000 per mile (figures furnished by the Grand Trunk Pacific officials). There is $2,000,000 worth of heavy bridge work yet to be done in order to preserve the low grades throughout. The Grand Trunk Pacific claims that it will save approximately 500 miles, operating from Prince Rupert to Yokohama, over the present grain-carrying route to the Orient via the Suez canal.

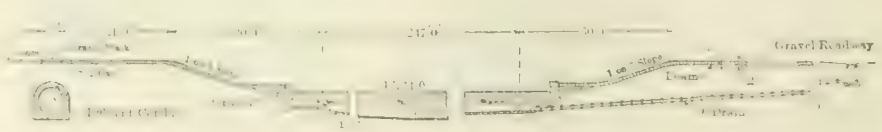

Fig. 20—Section Through Part of Settling Basin.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Panama Canal Excavation for the Calendar Year 1909.

From figures given in the "Canal Record," the grand total of excavation on the Panama Canal for the calendar year 1909 was 35,096,166 cu. yds. This was 2,020,569 cu. yds. less than the grand total of 1908, for the reason that the field of operations in dry excavation had been narrowed by the completion of the work in certain sections, and because in wet excavation the dredges encountered more difficult conditions. While 1908 will stand in the record of canal work as the banner year, the highest point touched in a single month was that of March, 1909, when for the first and only time the 4,000,000 cu. yd. limit was reached and passed with a total of 4,062,632 cu. yds., including 182,295 cu. yds. of "plant" excavation.

The falling off in excavation from the total of 1908 was 1,241,467 cu. yds. in dry excavation work, and 779,102 cu. yds. in dredging.

Of the total dry excavation in 1909, there were taken out in the territory of the Central Division, which includes Culebra Cut and the Gatun Lake region, 18,299,526 cu. yds. The increase in the effectiveness of the steam shovel work is seen from the following comparison of the excavation per shovel day in 1908 and 1909:

Month.	—1908— No. shovels at work.	Cu. yds. per shovel day.	—1909— No. shovels at work.	Cu. yds. per shovel day.
January ..	51.53	1,040	51.80	1,183
February ..	54.00	1,112	56.05	1,260
March	53.65	1,159	56.93	1,328
April	53.04	1,191	55.40	1,284
May	53.24	905	50.60	1,185
June	53.15	1,011	45.65	1,243
July	52.58	1,071	45.08	1,207
August ...	52.58	1,123	46.73	1,133
September..	49.68	1,180	46.60	1,248
October	49.55	1,185	47.23	1,230
November..	50.91	1,155	41.75	1,161
December...	50.73	1,210	43.15	1,123

The work is affected by the rainy season from May to December.

In Culebra Cut, where the excavation was continued on practically the same scale as in 1908, the amount excavated was 14,579,838 cu. yds. in 1909, as compared with 13,914,326 cu. yds. in 1908. Although it is considered that the maximum excavation in the cut is that of March, 1909, it is also expected that there will be little, if any, falling off in the total excavation in this part of the work during the present year. The work of widening the channel between Las Cascadas and Paraiso, a distance of 4½ miles, from 200 to 300 ft. at the bottom, was authorized in October, 1908, and during 1909 the excavation was carried on with this end in view. The consequent opening up of new banks caused a number of slides that were a source of inconvenience during the rainy season. The completion of the drainage system by opening the Obispo Diversion and installing pumps at Bas Obispo was another feature of the work in Culebra Cut during 1909.

At the Atlantic and Pacific entrances to the canal the dredges have made, but not completed, a channel over 5 miles into the land, and the Pacific entrance was so far advanced on Feb. 1 that steamships began to use that portion of the canal.

At Gatun Locks, the preparatory work of installing the concrete mixing and handling plant was completed, and the laying of concrete with the permanent plant was begun on Aug. 24. Since then there has been a steady increase in the amount of concrete laid each week, due to increasing effectiveness in the plant and in its operation. Up to the close of the year 116,186 cu. yds. of concrete had been laid, and the daily average had increased from 459 cu. yds. in September to 1,672 cu. yds. in December, while in one instance over 2,000 cu. yds. were placed in one day of 12 hours. The estimated amount of concrete necessary for completing these locks is 2,096,000 cu. yds.

The hydraulic fill between the rock toes of Gatun Dam was begun on Dec. 24, 1908, and the results accomplished in this work belong, therefore, to the year 1909. From one to three 20-in. suction dredges have been engaged and they have pumped 2,044,992 cu. yds. of selected material into the dam. The dry fill now amounts to 2,515,524 cu. yds., the total being 4,560,516 cu. yds. The estimated fill to be made by the hydraulic method is 20,000,000 cu. yds. On Feb. 17, 1909, by order of President Roosevelt, the proposed height of the dam was reduced from 135 ft. above sea level to 115 ft., which will make the top 35 ft. above the normal level of the water impounded in Gatun Lake.

One week after the laying of concrete, with the permanent plant, was begun at Gatun Locks, a temporary plant was put in operation at Pedro Miguel and the laying of concrete in the locks at that point was begun. This temporary plant laid 33,994 cu. yds. of concrete between Sept. 1 and Dec. 31. The estimated amount to be placed at this point is 922,600 cu. yds. Work on the cantilever cranes for the permanent handling plant is in progress. The construction of the earth dam at Pedro Miguel was continued during part of the year.

At Miraflores, excavation in the upper lock chamber was practically completed during the year; excavation in the lower lock chamber was continued, and the work of building storage trestles for the cantilever concrete mixing and handling plant was begun. A total of 557,587 cu. yds. of filling had been placed in the dam at Miraflores Locks up to Dec. 31.

LETTERS TO THE EDITOR.

Utilizing Natural Gas from Artesian Wells for Fuel for Boilers.

Sirs:—The state of South Dakota has just completed an artesian well on the state capitol grounds at this place and a large flow of water has been obtained. From measurements made by this Department, the flow has been found to be approximately 5 cu. ft. per second of water at a temperature of 95°. This water is under a pressure of about 165 lbs., equivalent to a head of 380 ft. The water coming from this well carries a large proportion of natural gas, estimated to be of about one-sixteenth of the total flow. The city of Pierre has been using natural gas from two wells for a number of years for heating, lighting and power purposes.

On account of the large volume of water and the heavy pressure of same, it has been proposed to utilize the flow for generating electric current for lighting the new capitol building. In the process of passing through impulse wheels, it is expected that the gas will be liberated from the water and collected in a gas holder. The quantity of water thus furnished will be considerable and it is proposed to utilize this gas under our boilers in boiler room of power house for generating steam to run our generators in the engine room, the exhaust steam being utilized for heating the building. I am looking around for some efficient method of applying the natural gas to the boilers for heating same, thus doing away with the use of coal, which is a very expensive item in this locality.

If you can furnish me any information concerning manufacturers or dealers handling appliances by which the gas can be used in the method above designated, it will be appreciated.

Thanking you in advance for the courtesy, I am,

Yours very truly,

SAMUEL H. LEA,
State Engineer.

Pierre, S. Dak., Feb. 2, 1910.

The Action on Concrete of Salts in Mixing Water.

Sirs:—In the voluminous discussion of concrete much is said of cement, sand, gravel and the grading of ingredients, but nothing of water other than an occasional statement as to quantity. Do minerals and salts in water affect concrete? What is the action of alkali water on concrete?

My experience on three or four occasions has shown that concrete will not set satisfactorily when alkali water is present. In one instance which admits of comparison, I built two manholes less than four hundred feet apart, one on high and the other on low ground. Hole No. 1 contained no water. In Hole No. 2 there was six inches of seepage water. For mixing concrete for the floor of hole No. 1 I hauled water from a city hydrant. For Hole No. 2 I mixed the concrete dry and used the water in the hole for wetting. This water was alkali.

Twenty-four hours later the floor of Hole No. 1 was set and in good condition. The concrete in Hole No. 2, however, was still very soft. After six days, inspection showed that this concrete had not set. It should be stated that the water in the hole was below the flow line of the sewer and hence there was no action tending to wash cement out of the concrete.

On another occasion when I was in charge of the construction of a large vitrified pipe sewer, we were filling the joints with oakum and cement mortar, using the alkali water from the trench for mixing. I demonstrated to the satisfaction of the engineer in charge that the mortar did not set properly and he authorized the use of gumbo mud for calking joints.

It is often necessary especially in the Western States to place concrete where alkali water is present. If alkali affects cement what can be used to counteract it?

Yours truly,

F. B. INGERSOLL.

Belle Fourche, S. D., Jan. 28, 1910.

(Our impression is that practically every treatise on concrete and every text book mentions the necessity of using clean water and many of them warn against the use of alkali water. Compounds of many elements in nature dissolved in water form a compound known generally as alkali having the property of neutralizing acids. Sulphates in water seemingly improve the concrete. An excess of calcium or magnesia apparently hurts the concrete. The general opinion seems to be that the process is one chiefly mechanical in nature, the dissolved compounds continuing to expand and thus interferring with the setting of the concrete, acting in this way as frost when thawing out of partially set concrete. Some authorities believe there may be a chemical action as well. It is wise to avoid entirely the use of alkali water, but if it cannot be avoided then use as little as possible and increase the amount of cement, tamping the concrete to make it dense. So far the result of experiments indicate that rich dense concrete is not affected or is affected very slightly. A very small amount of soda ash will make cement set rapidly and rapid setting cement should be used where alkali water is the only kind that can be had, even if it is necessary to add soda ash to obtain this result. An over limed cement might be most readily attacked by alkali water so an analysis of the cement would be desirable. There being several kinds of alkali, a competent chemist should pass on the water before use, for some alkali water is harmless if judiciously used. Pamphlets on the subject of effects of alkali water on concrete have been issued by the agricultural colleges at Bozeman, Mont., and at Fort Collins, Colo. It was reported some time ago that the United States Geological Survey intends investigating the subject. A summary of the latest discoveries and investigations of the effects of alkali waters on concrete will be found in ENGINEERING-CONTRACTING for Jan. 5, 1910. It might be added that the laying of concrete in a hole containing six inches of water, even if the water is clean, is not first class practice. A small sump should have been dug and the hole pumped out. The sump

should be kept bailed out for an hour or two after the concrete was placed, when it could be filled with a dry, rich, tamped concrete.—Editors.)

Percentage Bidding and Forms of Building Contracts.

Sirs:—The editorial on percentage bidding and the paper by Mr. Bamford in your issue of Jan. 12, 1910, raise several points of interest to contractors on which we should like to comment briefly.

First, as to percentage bidding and bidding on engineers' units or quantities. The great difficulty and the cause of many unbalanced bids appears to us to be the fact that the engineers' units of cost are not the contractor's units. Until engineers' quantities represent item by item the actual operations of the proposed work, it will not be possible for competing contractors to make bids which compare closely with one another. For instance, in bidding recently on a bridge, four different classes of concrete (Class A, Abutments; Class B, Center Piers; Class C, Arches; Class D, Parapet) were given, and the contractor's price on these had to include cofferdams, pumping, excavation in river bed, dry excavation for abutments, forms, and surface treatment. No doubt it saves trouble for the engineer to decree that concrete only should be measured, but the contractor is invited to gamble on whether Class A concrete (abutments) would necessitate close sheeting to its excavation and pumping; and in Class B (center piers), each foot in depth below water line would enormously increase the cost of the units. On the same job, Class D (measured in linear feet) included cast stone balusters, concrete pedestals and coping, and cast iron lamps and glass globes.

On another similar job before the writer, Class D, concrete, includes granolithic paving, iron manhole covers, and concrete parapet walls and balusters.

In the case of concrete walls of, say, 12 ins. in thickness, to be paid for by the cubic yard, including forms and finish. If the engineer elects to reduce the thickness of the wall to 8 ins., the contractor has to do just as much form work and finish although he gets paid for only two-thirds the amount.

We could multiply instances, but these are typical of unit prices on which contractors are continually being asked to bid, and it is small wonder that the range in bids is very marked. In the writer's experience it is generally necessary to take off fifteen to twenty items to make up a unit price on one of an engineer's units, and it requires much more time and trouble to bid on unit prices than on a lumpsum, and the results to the contractor are much less certain, by reason of the fact that a small increase in yardage of concrete or excavation, as the case may be, may necessitate expenditure on his part which could not be foreseen or calculated; or a decrease may deprive him of remuneration for work necessary to the completion of the contract but not itemized on the engineer's schedule.

It would seem that if the engineer also priced his units before sending to the contractor, a further speculative element would be introduced, as it would be impossible to reconcile the engineer's unit prices with the contractor's, and the contractor must base his plus or minus percentage bid on the assumption that the quantities will turn out exactly correct or else "take a chance" on certain items being in excess and bid accordingly. The alternative to this would be to bid a different percentage on each unit.

Even if the engineer were to prepare an accurate bill of quantities with all the items set out therein that a contractor would price in estimating contractors' prices vary so largely, owing to differences of method, of equipment, of cost keeping, and of judgment in estimating, that no two would be likely to bid in like proportion on every item, and the engineer's bid would still be of no use.

The percentage system of bidding has been tried in England, where quantities are certainly accurately prepared and go into an immense amount of minute detail, but the system has never found favor and is very seldom used. Two public bodies, the War Office and the London School Board, have priced schedules running into hundreds of pages and thousands of items, but their use has been limited to jobs not exceeding $500, as they are not found to work satisfactorily.

Secondly, as to lumpsum contracts, Mr. Bamford in his paper expresses his preference for the lumpsum contract, which is gradually being superseded by the other types of contract he mentions in the jobs of many of the best contractors and most progressive building owners of the country; and Mr. Bamford himself says: "Such a system presupposes that the contract (specification?) defines the work to be performed and that the contractor, therefore, can determine accurately what the execution of such work shall cost." It is the writer's experience that this is never the case, and, however clear the drawings and specification may be, and however accurately the conditions of the work may be predetermined, the business experience of this company during the last 16 years shows that neither in any item or on the sum total of any contract is it possible to determine accurately what the execution of a job will cost, and we believe that our system of cost-keeping and methods of estimating are considerably more accurate and careful than those usually employed. Any contractor who keeps an accurate record of costs will bear out the truth of this statement in their experience.

The result therefore of working under a lumpsum contract is that at the end of a job the contractor either finds that he has made more profit than he would have been willing to take the job for; or, as is more usual, the job has cost more than he thought and his profit is less than he estimated. It is obvious, therefore, that as far as the owner's interests are concerned, the lumpsum contracts are usually the most economical, as Mr. Bamford states.

There is a growing feeling among building owners of the better class that "the laborer is worthy of his hire," and a growing desire on the part of the better class of contractors to take only those contracts which insure a fair profit on their work; and this is leading to a more general adoption among private owners of the various percentage and fixed-profit contracts enumerated by Mr. Bamford. The monetary advantage of "catching a sucker" on a lumpsum contract is usually more than offset by the trouble of making him perform his contract, vexatious claims for extras, poor work, scamping, delays and disputes; and in looking up work which we have failed to get, many owners, who have accepted low bids, have afterwards expressed to us their wish that they had let their contract to a better contractor at a higher figure. The owner will, after all, get only what he is paying for, and we do not hesitate to tell owners that they can probably get reinforced concrete buildings more cheaply than we would be willing to build them, by taking bids in open competition; and with these statements we are securing more and more of the better class of business for the best class of manufacturers.

Thirdly, we wish to relate some of our experiences in regard to use of copies of quantities and adjustment of variations as provided for in Sections XVI, XVII and VIII of Mr. Bamford's paper. This is almost always done in England and works well, but the system is full of pitfalls for the unwary and should be adopted with caution. It has been the practice of this company to be unusually frank and open in the matter of showing estimates to owners and engineers. Recently, in taking a contract for some large concrete mill buildings, we deposited the estimate with the architect that he might copy it for use in adjusting any variations. In making the estimate, we had only sketch plans of a brick-and-timber structure to work from, and had to assume all details necessary to give the same accommodation in a concrete building with brick curtain walls, and guaranteed that cost of same should not exceed a certain figure. The architect gave a copy of the estimate to the owner and he discovered by measurement that the estimated quantity of brickwork was largely in excess of that actually laid, and thereupon asked for an adjustment. The reason for the discrepancy was that we had figured on smaller windows than had been put in and more brickwork, and the amount we had saved in brickwork we had lost in windows, but we could not succeed in satisfying the owner on the point, as the number of windows was the same. The terms of the contract did not permit of this being considered a variation, and though our legal position was clear, we preferred to give way and remain in good standing with the owner rather than fight it out.

Again on another job gained in competition by a narrow margin, we deposited a copy of the estimate with the engineer. When the job was nearly finished, the owner decided to build another building close by. The engineer made plans and figured it upon our estimated prices. We had found that through unforeseen circumstances and unexpected difficulty in one portion of the work, some of our prices had not been remunerative, and when the new plans came to us to estimate upon, we raised the prices of these items, with the result that our bid was higher than the engineer's estimate. He offered to place the job with us at his figure or to put it out to open competition again, when undoubtedly those who had bid before would use the same prices again and bid below us, and we were faced with the alternative of practically declining a job for owners who had a lot more building work coming on, or taking the job at a price which would barely insure any profit.

In another instance when showing an estimate to an architect just before signing the contract, he discovered that the price we had figured on skylights and roofing was a good deal higher than a figure he had obtained. He promptly proposed to take this item out of the contract altogether and let the owner pay it direct, regardless of the fact that other items might have been figured too low, and it was with difficulty that we were able to turn him from his purpose.

Obviously from our practice we do not find that it is always to our disadvantage to give information as to our estimates. We have very frequently found it of very great benefit in conducing towards that state of mutual confidence and respect which always should, but frequently does not, exist between owner, engineer, and contractor; and in the adjustment of extras, we have found that it has often saved a lot of dispute and secured to us and the owner a just and fair settlement. We do not suggest that all engineers or owners would act in the ways we have indicated if furnished with priced quantities, but as Mr. Bamford's suggested agreement, if adopted would be used by all alike, whether reasonable or unreasonable, partial or impartial, we wish to point out some of the difficulties we have met with in following this practice.

We think that the depositing of quantities should remain a matter optional to both the contractor and the engineer. It is largely a matter of judgment whether they will be an advantage or not in any particular set of circumstances.

We would also point out that it is even more easy for an unscrupulous contractor to submit an unbalanced price schedule than to submit an unbalanced bid, with far more advantage to himself and loss to the owner, and the writer could quote several instances within his personal knowledge of English practice which have resulted in unfair profits to the contractor with no redress for the owner.

Fourthly, as to damages for delay, Sections II and XXIII: It is only fair that if the contractor should pay for delays caused by him, the owner should reimburse the contractor for delays caused by himself or his engineer. Such delays often cost the contractor large sums in fixed charges, plant rental, foremen's time, etc., and he has no redress whatever.

In a rush job recently, a factory erected during the winter months, with heavy forfeiture clause for non-completion within the contract period, the engineer stopped our concreting for a whole week (a warm week when work would have gone fast) in order that he might test a sample of two bars of the steel reinforcement; and later, owing to a mistake he made in testing cement, condemned three or four cars of cement (which three independent laboratories reported as first-class) and caused us a lot of delay and expense. He refused to grant any extension of

time and we had to spend a lot of money in night work to make up our lost time.

Fifthly, Arbitration; the English arbitration system generally works well, and if the procedure in this country were standardized on similar lines, we think it would prove beneficial. In general the submission after the completion of the work is fair to all, but it will be realized that cases do arise when leaving big disputes undecided may work real injustice to one of the parties. It should be a matter for the arbitrators to decide whether the dispute should be adjudicated upon during the progress of the work, during a cessation of the work, or at its close.

We think that Mr. Bamford's effort to produce a contract which recognizes the rights of both sides is a step in the right direction, and the thanks of contractors are due to him for the thoughtful care with which he has dealt with the subject. It is to be remembered that it is impossible to foresee and provide for every contingency which will arise between the parties of any contract, and the aim of a contract should be to secure equitable dealing between the parties and a mutually fair interpretation of what was in their minds at the time the contract was made.

Yours faithfully,
ABERTHAW CONSTRUCTION CO.,
By Leslie H. Allen.

Boston, Mass., Jan. 26, 1910.

Percentage Bidding from the Contractor's Point of View.

Sirs: The editorial in your issue of Jan. 12, 1910, concerning percentage bidding speaks of the evils of unbalanced bids.

What is the cause of these evils? First and greatest, the fact that the estimated quantities are often very erroneous and, as stated in most contracts are approximate only, and should be verified by the contractor before bidding.

Upon examination the contractor discovers, perhaps, a discrepancy in the estimated quantites and submits a bid on his judgment of them; and since these quantities differ from the engineer's estimate, the resultant difference in cost must be distributed throughout the advertised quantities which are used for the comparison of bids and on which the work is awarded.

It is obvious that if the original quantities were accurate, and there was no substantial variation on completion of the work, an unbalanced bid would not be harmful to the contractee, and its only advantage to the contractor would be in enabling him to finance his work by putting the profit on the items to be done first. This has been objected to on the ground that a dishonest contractor could thus skim the cream off the job and then abandon it; but most contracts contain a provision for a percentage payment on items which are excessively overbalanced, and this safeguard, together with the customary retained percentage on the work, will amply secure the employer.

It is apparent, therefore, that the evil, if any, must be placed at the door of the engineer, not because of fraud but by reason of the impossibility to accurately determine, in advance, the quantities of the various classes of work involved, due to physical characteristics of the location or to the necessity for change of plan as the work progresses. Why, then, place the burden of responsibility on the contractor?

The courts have held that though the contractor, in making his bid, knew that the estimate misstated certain items, and with intent to profit by the ignorance of the engineer, made an unbalanced bid, he has a right to the benefit of his own knowledge, honestly acquired and without fraudulent collusion with the engineer. (Wait, Engineering and Architectural Jurisprudence, Sec. 54.)

Now, there is the meat in a nut shell. Is not the contractor entitled to pit his judgment, based on his experience and knowledge of cost, against that of the engineer? And should he be denied the right to use such knowledge, his stock in trade, in making a bid because it disagrees with that of the engineer?

There have been, and are today, many instances where the preliminary estimate has been made up by a thoroughly posted and broad gauge engineer whose figures of cost and quantities are borne out by the bids received; but to offset these there are hundreds of cases where the engineer's estimate is either ridiculously high or low, and in cases where the quantities are incorrect the contractor is justified in unbalancing his bid.

Perhaps the greatest source of contention lies in the classification of earth and rock, and to avoid disputes arising from measurements to determine the class of excavation many contractors prefer to bid a straight price for excavation of both or all kinds, based on information furnished by the engineer and supplemented by their own investigation. The Catskill Aqueduct contracts, under the Board of Water Supply, invite bids for open cut excavation, the classification of which is indicated on the plans by a record of borings. Such bids are, strictly speaking, unbalanced in that they offer a price for rock which is not its true value considered separately; but thus far no objection has been raised as to their legality or their fairness to both parties.

Within the writer's experience several bids for sewer contracts have been submitted in which the item for rock was bid at one cent per cubic yard and the value of the estimated quantity placed in the item of the sewer structure. This has the advantage for the contractor of obviating the delays attendant on the frequent presence of the engineer in order to measure rock before it is removed, and for the city in that the contractor will adhere more closely to the minimum width of trench than if he were receiving a good rock price, in which event he would exert an effort to get every yard possible. The ultimate cost was no greater by reason of this unbalancing; so where is the evil?

Now, to speak particularly of the percentage system of bidding, the objections to which as cited in a recent brief your editorial says are not adequately stated. Under this method the contractor has not the opportunity to submit a bid based upon his own judgment, both of cost and ultimate quantities. He must bid a percentage of the engineer's 100 per cent basis, which ratio will apply to all items of work, and if his costs are higher on some items and lower on others than the engineer's he must compare his total cost, plus his profit, with the engineer's 100 per cent base and bid the resulting percentage, which on being applied to the several items will oblige him to bid less on some items than in his judgment they are worth. This would work out to a charm provided the engineer's quantities were substantiated, but if the items on which the contractor is compelled to bid less than cost exceed the estimated quantity and those in which the bid ratio equals or excels his cost, are less than the estimate, where would he be then? This is not supposing an extreme case, but one which might readily happen, and a further illustration of the unfairness of the system is afforded in the following instance of two contracts recently completed in this city which were awarded on the percentage bid.

In one the estimated quantity of timber for sheeting was 3,000 ft. The final estimate was 15,000. In another the engineer's price of sheeting was $40 per M. ft., but the city refused to pay the contractor his percentage price on the ground that the eugineer's cost was too high. So the contractor is between the devil and the deep sea between the inaccurate estimate of quantities and the erroneous costs assumed by the engineer.

With all deference to the cost data collected by the department engineers, they are not sufficiently accurate or reliable to warrant their use as a basis of cost throughout and on which a contractor's percentage of total bid shall apply per item.

It would be foolish to deny that there have been cases of fraudulent collusion between the contractor and the engineer, but fortunately they are rare. When such a combination does exist no system of bidding is infallible and the owner is bound to suffer; but to draw contracts and devise methods on the assumption that all contractors are frauds and that every unbalanced bid contains a "nigger" is deplorable and unwarranted.

In a recent discussion on contracts before the American Society of Civil Engineers a writer stated: "It is safe to say that in no other business relation between men are such one-sided agreements customary." (Graduation of Railroads, by W. F. Dennis. Transactions American Society of Civil Engineers, Vol. LVIII, p. 349.)

Contracting today is a business representing an investment of millions of dollars, in which men of intelligence and practical training predominate, and to require a contract to be entered upon without the free use of his own judgment is not extending the square deal to the party of the second part.

Yours very truly,
C. A. CRANE,
Secretary The General Contractors' Association.

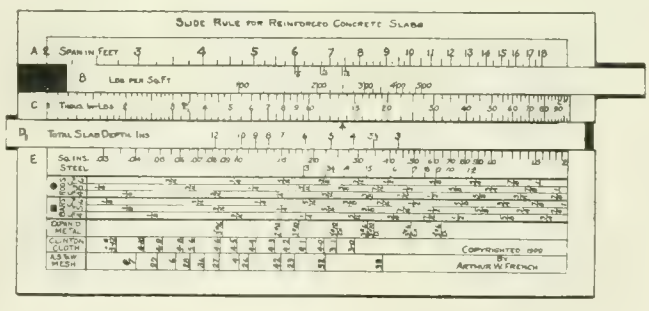
New York City, Jan. 24, 1910.

A Slide Rule for Reinforced Concrete Slabs.

A convenient slide rule for lessening the computations involved in the design of reinforced concrete slabs has been invented and copyrighted by Arthur W. French, Professor of Civil Engineering, Worcester Polytechnic Institute, Worcester, Mass.

The directions for use are as follows:

1. Under the span in feet, given on scale A, set ⅛ (if a simple span, or 1/10 or 1/12 if continuous spans) on scale *B*.
2. Under the line designating the total load per square foot on scale *B*, read on scale *C* the bending moment in inch pounds.
3. Set the arrow of scale D_1 under the given moment of scale *C*.



Slide Rule for Reinforced Concrete Slabs
A & Span in Feet
B Load per Sq. Ft.
C & Thickness of Slab
Total Slab Depth Ins
E Sq. Ins. Steel
Copyrighted 1909
Arthur W. French

Slide Rule for Reinforced Concrete Slabs.

4. Under the lines on D_1, designating the depth of slabs, read on E the cross section of steel required, in square inches.

NOTE.—Scale D_1 gives solution of the equation, $M = \ldots$, and should only be used when the ratio of steel area to concrete area is under .0068. When p exceeds .0068 the fact is indicated by the line of slab depth on scale D_1 passing to the right of the dotted line bearing the same number on scale *E*.

Steel area should *not* be taken off by use of *scale* D_1 when the line of depth on D_1 has passed to right of the corresponding line on *E*.

5. Should a thinner slab than allowed by scale D_1 be desired, turn up scale D_2 and set, under the bending moment on scale *C*, the same figure on scale D_2 (which scale reads from right to left).
6. The correct amount of steel is found on scale *E* under the slab depths on D_2.

On the lower lines of E are given three different spacings of round rods and square bars and also the trade numbers of three fabrics which may furnish the required areas. As areas are given on E, any make of cloth or mesh may be used and spacings of rods and bars altered to suit conditions. This slide rule was devised by Professor French for personal use, but it is now on the market on account of the publicity given it, the price being two dollars. The concrete fiber stress is 600 lbs., steel stress 16,000 lbs. per sq. in.; the ratio of deformation being 15.

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Institute of Mining Engineers.
March 1-5. Annual meeting at Pittsburg, Pa. Secy., R. W. Raymond, 29 West 39th St., New York City.

American Railway Engineering and Maintenance of Way Association.
March 15-17, 1910. Annual convention at Chicago, Ill. Secy., E. H. Fritch, 962 Monadnock Block, Chicago, Ill.

American Society of Engineering Contractors.
Feb. 24-26, 1910. Annual convention at Chicago, Ill. Secy., Daniel J. Hauer, Park Row Building, New York, N. Y.

Engineering Society of Wisconsin.
Feb. 23-25. Annual meeting at Milwaukee, Wis. Secy., W. G. Kirchoffer, 31 Vroman Bldg., Madison, Wis.

Illinois Association of Municipal Contractors.
Feb. 24-26. Annual meeting at Chicago, Ill. Secy., Orie T. Dunlap, Edwardsville, Ill.

Illinois Lumber Dealers' Association.
Feb. 16-18. Annual meeting at Chicago, Ill. Secy., Geo. K. Hotchkiss, 315 Dearborn St., Chicago.

Illinois Masons' Supply Association.
Feb. 16-18. Annual meeting at Chicago, Ill. Secy., Geo. K. Hotchkiss, 315 Dearborn St., Chicago.

Interstate Mantle and Tile Dealers' Association.
Feb. 15-19. Annual meeting at Chicago, Ill. Pres., Joseph W. Lantry, Wm. H. Jackson Co., Union Square, New York City.

Iowa Association of Cement Users.
March 9-11, 1910. Annual meeting in Cedar Rapids, Ia. Secy., Ira A. Williams, Iowa State College, Ames, Iowa.

Iowa Engineering Society.
Feb. 16-17, 1910. Annual convention at Cedar Rapids, Ia. Secy., A. H. Ford, Iowa City, Ia.

Missouri Highway Engineers' Association.
Feb. 17-18. Annual meeting at Kansas City, Mo. Secy., Curtis Hill, Columbia, Mo.

National Association of Cement Users.
Feb. 21-25, 1910. Annual meeting at Chicago, Ill. Secy., Geo. C. Wright. Address all communications to Edw. E. Krause, Asst. to the President, Harrison Bldg., Philadelphia, Pa.

Northwestern Cement Products Association.
Feb. 18-21, 1910. Annual meeting at Chicago, Ill. Chairman of Executive Committee, O. U. Miracle, Minneapolis, Minn.

Western Drainage Contractors' Association.
Feb. 17, 1910. Fort Dodge, Ia. Secy., S. F. Moeller, Knierim, Ia.

Notes from Technical Societies.

Connecticut Society of Civil Engineers.—The 26th annual meeting of the Connecticut Society of Civil Engineers will be held in New Haven, Conn., Feb. 8 and 9, at which the following papers will be presented: The Hammond Laboratory, Sheffield Scientific School, Louis D. Huntoon, Professor of Mining and Metallurgy, Yale University; "Water Resources of the Navajo Reservation, Arizona," Herbert E. Gregory, Professor of Geology, Yale University; "Problems Handled by the Test Department of a Large Corporation," by Benjamin L. Hinckley, Engineer of Tests, N. Y., N. H. & H. R. R. Co.; "Dams and Reservoirs Built in Connecticut Under Supervision of Nelson J. Welton," by Nelson J. Welton, Mem. Conn. Soc. C. E.; "The Sea Wall in Connection with Power Stations and Manufacturing Buildings," by George A. Orrok, Mem. Conn. Soc. C. E.; "Eight Weeks Civic Study Abroad," by Frederick L. Ford, Mem. Conn. Soc. C. E.; "Dams Approved by Henry F. Potter" (deceased), by Charles E. Chandler, Mem. Conn. Soc. C. E. Mr. Frederick J. Easterbrook is president and Mr. J. Frederick Jackson, secretary, New Haven, Conn.

Personals.

Mr. R. A. Klein has been appointed a Supervisor of Division No. 1 of the West Jersey & Seashore R. R., with headquarters at Haddonfield, N. J., succeeding Mr. G. M. Ball, Jr., promoted.

Mr. Wm. Woodhall, Jr., of Berwyn, Ill., formerly with the United States Crushed Stone Co. at McCook, Ill., has accepted the position of Manager of the Indiana Sand & Gravel Co., Attica, Ind.

Mr. W. C. Calvert has resigned his position as an Assistant Engineer with the Oregon Short Line R. R. and has opened offices at Burley, Idaho, where he will engage in private practice as a civil engineer.

Mr. Eric H. A. Nordin, a civil and hydraulic engineer of Marysville, Cal., has sailed for Barranquilla, Colombia, South America, where he is to build a power plant for the Guggenheims. He expects to be gone a year and a half.

Mr. A. W. Campbell, heretofore Deputy Minister of Public Works of the Province of Ontario, Canada, has been appointed Deputy Minister of Railways and Canals, with office at Ottawa, Ont., succeeding Mr. M. J. Butler, resigned.

John B. Clifford, a railroad contractor and a member of the P. T. Clifford Construction Co., which has all the Pennsylvania company contracts for elevating the tracks into Chicago, died Feb. 5 at Valparaiso, Ind. He was 60 years old.

Mr. Charles R. Vannemann, formerly Engineer Examiner in the New York State Civil Service Commission, has been appointed Steam Railroad Inspector by the New York Public Service Commission to succeed Mr. Jefferson D. Shultz, resigned.

E. A. Smith, a civil engineer of Kansas City, Kan., died suddenly last week at Las Vegas, N. Mex. He was engaged in railroad construction work for the L. J. Smith Construction Co., of Kansas City, Mo., Mr. L. J. Smith of that concern being his brother.

Mr. B. A. Wood, heretofore Resident Engineer of the Mobile & Ohio R. R. at Mobile, Ala., has been appointed Chief Engineer, with headquarters at Mobile. Mr. A. H. Nichols has been appointed Division Engineer with headquarters at Meridian, Miss., and Mr. E. G. Murphy has been appointed Division Engineer, with headquarters at Murphysboro, Ill.

The New York State Civil Service Commission, Albany, N. Y., has announced examinations to be held Feb. 26 to fill the following positions: Junior Railway Engineer, State Public Service Commission, $1,201 to $1,800 per year; Topographic Draftsman, Kings County Service, $1,200 per year. The last date for filling applications for the above positions is Feb. 19. Further information can be obtained by addressing the State Civil Service Commission, Albany, N. Y.

James Keys, Assistant Engineer in charge of the Bridge Department of the Union Pacific R. R., died Dec. 27 at Excelsior Springs, Mo. He was a graduate of Lehigh University and his first work was with the American Bridge Co. at Pencoyd, Pa. He left that company to enter the bridge department of the Great Northern at St. Paul, Minn. In March, 1901, he was a designer in the bridge department of the Union Pacific and had charge of that department at the time of his death.

As the result of the retirement on account of the age limit of Brigadier General John G. D. Knight, Corps of Engineers, U. S. Army, and Lieutenant Colonel H. M. Chittenden, Corps of Engineers, the following promotions in the Corps have been made: Henry C. Newcomer has been made lieutenant colonel; Capt. Wm. D. Connor has been made a major; First Lieut. Robert R. Ralston has been made a captain, and Second Lieut. E. D. Ardery has been advanced to the rank of first lieutenant.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Wire Rope. — Hazard Manufacturing Co., Wilkesbarre, Pa.

This company sends two booklets, each 3½x6 ins., describing iron and steel wire ropes with tables of strengths and other properties.

Johnston's Improved Reels and Tapes.—Paper, 3½x6 ins., 16 pp. Robert Johnston, 12 North Main St., Wilkesbarre, Pa.

This booklet gives descriptions with prices of steel tapes and reels for civil engineers and surveyors.

A Positive Feed Concrete Mixer.—Paper, 6x9 ins., 16 pp. Miracle Pressed Stone Company, Minneapolis, Minn.

The mixer described in this catalog proportions the material and also mixes it, the type being that known as "continuous." It is made by the Miracle Company as one of many tools for concrete workers.

Port Huron Road Work.—Paper, 9x12 ins. 32 pp. Port Huron Engine & Thresher Co., Port Huron, Mich.

This book describes roads constructed in many states with the aid of machinery made by this company, from rock crushers to road rollers and tar spreaders. Many handsome half-tones in the text.

Nitro Powders.—Paper, 5x7 ins. 16 pp. Nitro Powder Co., Kingston, N. Y.

This booklet describes blasting powders that do not freeze readily and are classed as a high power safety explosive. Full directions are given for use.

Coal Tar Products.—F. J. Lewis Mfg. Co., 1170 South Robey St., Chicago, Ill.

This firm sends in leaflets of envelope size describing coal tar products for tarring macadam roads and filling joints in block pavements. They announce that a large catalogue on good roads is almost ready for distribution.

Hauling Engines.—Paper, 7¾x10½ ins., 32 pp. The Russell & Co., Massillon, Ohio.

This handsome catalog is entitled "The General Utility Engine" and illustrates the engine of that name made by The Russell & Co., engaged in many different kinds of work for contractors.

Excavators and Conveyors.—Paper, 9x12 ins., 28 pp. The Potter Manufacturing Company, Indianapolis, Ind.

A catalog like this is a good manual for men engaged in trench excavation work. In addition to numerous illustrations there are valuable estimating tables for sewers.

Spiral Riveted Pipe.—Paper, 8x10 ins., 20 pp. American Spiral Pipe Works, Chicago, Ill.

Steel pipe is favored in many places because of the high tensile strength, combined with lightness, the latter affecting freight. This book illustrates some installations.

Second-Hand Contractors' Plant.—Paper, 3½ x6 ins., 24 pp. Willis Shaw Machinery Co., 171 LaSalle St., Chicago, Ill.

This booklet is issued monthly and contains a list of second-hand contractors' machinery and tools with prices.

The Hadsell Patented Slack-Cable Excavator.—Paper, 4x8 ins., 10 pp. The Hadsell Engineering Co., Scranton, Pa.

The principles involved in the design of this machine are a combination of those used in the scraper bucket and cableway. This circular illustrates a number of combinations.

The Lewis Ideal Tape Reel.—Kolesch & Co., 138 Fulton St., New York.

An envelope folder describing a tape reel containing high speed gear so a tape 100 ft. long can be wound up in 12 seconds. A practical thing for engineers and surveyors.

Ruggles-Coles Dryers.—Paper, 6x9 ins., 46 pp. Ruggles-Coles Engineering Co., Hudson Terminal, New York City.

This is Catalog G and describes dryers made for the drying of many kinds of materials in industrial works.

Concrete Waterproofing. — Harrison Waterproof Materials Co., Terminal Bldg., New York City.

This is a four-page small envelope folder describing a powder used for waterproofing concrete.

The History of Elaterite.—Paper, 6x9 ins., 32 pp. The Elaterite Paint and Manufacturing Co., Des Moines, Ia.

The common name of Elaterite is "mineral rubber." It is used principally for waterproofing purposes and this book describes its many uses.

No. 7 League Boots.—Paper, 3½x6 ins. 8 pp. Mulconroy Company, Inc., 722 Arch St., Philadelphia, Pa.

This is a new catalogue, No. 20, describing sewed leather soled rubber boots.

Spanish Clamp Booklet.—3½x6 ins. 16 pp. Batavia Clamp Co., Batavia, N. Y.

This book printed in Spanish contains the matter printed in English in a booklet noticed in these columns Oct. 27, 1909. It describes clamps for contractors and wood workers, and also illustrates wagon jacks sold by the same firm.

Sewer Pipe and Other Clay Products.—Paper, 3½x6 ins. 16 pp. Blackmer & Post Pipe Co., St. Louis, Mo.

This handy little pocket size book contains illustrations and list prices of all clay products made and sold by the company.

United Steel Sash.—Paper, 8x10 ins. 4 pp. Trussed Concrete Steel Co., Detroit, Mich.

This is a pamphlet that should be of considerable value to designers of fireproof buildings and industrial plants where wood should not be used in window openings.

Sanitation of Contractor's Camps.

The sanitation of contractors' camps is a matter of exceeding interest and importance. In the article in this issue many points are brought out on which discussion is invited. Only men, like the author of the article, who have handled men in construction camps can appreciate fully the difficulties involved, and many of our readers, no doubt, can add much of value. Betterment work in connection with contractors' camps has lately been a feature of the Young Men's Christian Association labor bureau. In many camps this organization provides comfortable rooms supplied with reading matter, billiard and pool tables and other amusements. Facilities are provided for writing letters and even classes in certain subjects are conducted. Bath rooms are included and on pay day all checks are cashed. The effects have been good and an extension of this work is contemplated. When the contractor does his part in selecting his camp sites with care and gives some attention to sanitation, much less will be heard of the difficulty of keeping men on a job. At present three gangs are busy, one coming, one working and one going. When the men are treated like men, the working gang will certainly be evidence of the survival of the fittest.

Hydraulic Filling of Low Lying Land.

What is claimed to be the longest line of pipe for filling with sand, low lying lands by the hydraulic process, is described in this issue. The fact that the filling material is sand is the main point of interest in the article for the use of earth, as mud, is common and practice is well established. The Cairo plant is practically without precedent in the use of a booster plant and the very long line of pipe to convey the sand to the point of disposal.

The method used to build up the levees enclosing the dredged material is unique, and shows how the practical man makes use of opportunities. As stated in the article, the tendency of the sand to settle in the bottom of the pipe permits the building of levees having any desired slope ranging from that assumed by moist sand to the slope of a semi-fluid. It was observed at Cairo that the gravel dropped from the openings nearest the pump, the material being progressively finer with the increase in distance. The method used in ordinary hydraulic fills, of placing boards as retainers on the slope was first used until the discovery was made, as the fact realized, that as sand was less inclined to hold moisture than clay, with which previous experience was had, the boards were not required; for the regulation of the gate openings controlled the solidity of the fill. This should be a valuable fact to remember in connection with embankments, when dredged sand can be obtained for the purpose. Two side levees of sand with an interior fill of earth would lessen construction costs in many cases and the sand side slopes may later be covered with earth from construction trains of side dumping cars.

It has been noted in hydraulic fills made with clay that the tendency to settle is not so marked as when sand alone is pumped. This would indicate that colloidal matter added to the water would largely decrease the cost of pumping as the velocity would be lower. The work might be done by having two pumping plants deliver to the booster one for sand and one for mud. The resulting fill would likewise be improved. This idea should be particularly valuable in the construction of dams by the hydraulic process, failures having occurred in such dams through slow drying of the clay due to lack of sand or material which would have aided in drainage.

If it is desired to keep the sand in suspension instead of traveling along the bottom of the pipe, the velocity may be increased, which would have the effect no doubt of increasing the abrasion. A suggestion has been made that, since the sand travels in waves or bars, the introduction of a length of corrugated pipe occasionally would tend to raise the sand by preventing the bar formation. Corrugated sheets are sold for road culverts, shipped nested, and such sheets might be used, the upper and lower halves being so bolted that the depressions would alternate. This may not be feasible for the sand might pocket in the bottom of depressions and the high places between would wear rapidly. The experiment might be tried, however, at small expense. The effect of the corrugations will be to lessen the diameter and increase the velocity, but these corrugated sections can be made slightly larger than the sections of smooth pipe and the ends be crimped for connecting.

Some of the companies selling corrugated metal road culverts are now making them of three sheets, the bottom sheet being smooth. It was found that corrugated bottoms filled to the top of the corrugations, leaving a narrow exposed rib which wore rapidly under the abrasive action of silt carried in flood periods. The conditions in road culverts, however, might be different from conditions in a pressure pipe in which nearly all the solids will be in suspension near the center. There are few published data on the life of pipes used for hydraulic filling and the general impression is that such pipes depreciate through rust from exposure rather than from abrasion, about two years' use being all that is usually expected. In the Cairo work the pipes did not seem to wear because of the sand, but the rivet heads were abraded and the rivets dropped out. Instructions were given the men to turn each length when shifting pipe, to insure uniform wear on the rivets.

Seven Months Work of the Permanent Finance Commission of Boston.

On Jan. 31, 1910, the Finance Commission of Boston submitted its first annual report to the State Legislature. To engineers and contractors the part of this report which is of particular interest is that part in which it reviews the improvements made in handling city work following the reforms recommended by the first Finance Commission. This first Finance Commission, as we have before stated, was a temporary commission and its work ended with the presentation of its final report disclosing its findings and submitting its recommendations for a new city government. This new form of city government, which was adopted by popular vote at the November, 1909, elections, provided among other things for a permanent Finance Commission, and it is the first report of this permanent commission to which we refer above. This commission was organized on June 23, 1909, so that its first report covers its work for a period of approximately seven months only. As summarizing the work of these seven months it may be noted that the commission has held 56 meetings, conducted 108 hearings on various subjects, examined 212 witnesses and published 12 reports and communications.

One of the most severe criticisms made of city work management by the first finance commission was the awarding of contracts without competition. By the state laws of

Copyright 1910, by the Myron C. Clark Publishing Co. All Rights of Republication Reserved.

1890 the city of Boston was required to advertise only contracts amounting to $2,000 or more and could award without advertising contracts for even greater amounts if the mayor in writing authorized such action. It was found by the finance commission engineers that these privileges had been taken advantage of to reward political services and to the considerable financial loss of the city. It was a common practice to subdivide a large piece of work forming one contract in all essentials, into a number of small contracts each less than $2,000 in amount and to give these contracts without competition to favored contractors. A somewhat extended discussion of the results of this gift contract system was published in our issue of Oct. 27, 1909, and we shall confine our remarks here to presenting the evidence of the permanent finance commission of improvement in this matter. The commission says in substance

There has been a vast improvement in the method of awarding contracts. The practice of evading the law by awarding contracts for $2,000 or more, without advertisement for bids, has been abandoned. Under chapter 418, section 4 of the Acts of 1899, all contracts of the City of Boston for $2,000 or more were required to be advertised unless the mayor in writing authorized the award without advertisement. In 1892-93 and 1895-96, 81 per cent of the number of such contracts were awarded after public advertisement. In all the other years between 1890 and 1908 the percentage has been less. On and after September 9, 1909, by virtue of section 30, chapter 486 of the Acts of 1909, all contracts for $1,000 and upwards are required to be advertised, and as the limit has thus been changed the computation as to contracts for $2,000 or more should be carried only to Sept. 9, 1909. Between February 1, 1909, and September 9, 1909, 90.8 per cent in number and 95.2 per cent in amount of such contracts have been awarded after advertisement, which is the highest percentage in any year since 1890. In 1906-07 and 1907-08 the number advertised was 46 per cent and 48 per cent respectively.*

From January 1, 1906, to January 31, 1908, $1,473,663, out of a total of $5,046,730, or 29.2 per cent, were awarded without advertisement. Whereas, from February 1, 1908, to September 9, 1909, only $200,406, out of a total of $4,213,602, or 4.8 per cent, were awarded without advertisement.

In the three departments in which the practice of awarding gift contracts to favorites prevailed most extensively in former years—the Street, Water and Supply Departments—practically all contracts in the last two years were awarded after public advertisements for bids. A comparison of the record of these three departments in the period between Jan. 1, 1906, and Jan. 31, 1908, with the record of the period between Jan. 31, 1908, and Sept. 9, 1909, shows that in the former period 189 such contracts were made of which 66, or 34.8 per cent, were advertised. In the latter period 196 such contracts were made, 183 of which, or 93.3 per cent, were advertised. In the former period, the total amount of such contracts was $2,027,326, of which $846,096, or only 41.7 per cent, were advertised. In the latter period, the amount of such contracts was $2,120,820, of which $2,043,260, or 96.3 per cent, were advertised. In other words, though the number and amount of contracts awarded was substantially the same in the two periods in question, nearly three times the number and more than twice the amount of such contracts were advertised in 1908 and 1909 than in the two preceding years.

*The amounts involved do not furnish as safe a guide as the number of contracts awarded in determining whether the administration is using the city's contracts to reward political supporters, as such favorites are not, as a rule, equipped adequately with plant or means to undertake large works, and, consequently, receive only the smaller contracts. Wherever political considerations influence the award of contracts they are generally given out in large numbers for relatively small amounts, so as to secure the support of the largest possible number of contractors.

The contracts of the Supply Department have been made with more regard to economy than in preceding years. Thus, flagstones were purchased at 33 cts. a square foot in 1908, and 34 cts. in 1909, as against 67 cts. in 1907. Greater care has been taken also in respect to coal purchases, and the city's interests have been better protected as to prices, weights and quality than in former years. The abandonment of the city's stone crushing operations and the purchase in the open market of the stone needed have been the means of saving large sums of money. The average cost of stone at the city crushers, exclusive of the cost of carting, but including interest and depreciation charges, was $1.60 a ton from 1897 to 1905 inclusive, $2.85 in 1906, and $3.24 in 1907. Allowing 40 cts. a ton for carting to the job, the prices in 1906 and 1907 were $3.25 and $3.64 respectively, whereas the average prices of stone delivered on the job in 1908 and 1909 were $1.39 and $1.16½ respectively. If the cost per ton in 1908 and 1909 had been the same as in 1907, the city would have expended for crushed stone in the last two years $250,251.52 more than it actually paid.

It will be remembered that the reports of the first finance commission showed a large proportion of the city work done by day labor at extravagant costs, and recommended a very general change from day labor work to contract work. These recommendations were in considerable measure adopted with results which we let the finance commission again present in its own words as follows:

The most notable improvement has been made in the Street Department. The contract system has been greatly extended and the department force considerably reduced. The efficiency of the force has also shown a marked increase; and the loss on day labor, as compared with contract work, though large, is not so great as it has been. Thus, the cost of resurfacing macadam roads by day labor, which was $1.07 a square yard in 1905-06, $1.19 in 1906-07, and 95 cts. in 1907-08, was reduced to 63.9 cts. in 1908-09. In 1907-08 it cost $373,036.50 to resurface 392,670 sq. yds., while in 1908-09 it cost only $259,713.88 for 406,438 sq. yds., or in the latter year $113,322.62 less for 13,768 sq. yds. more. If the prices of 1907-08 had obtained in 1908-09, it would have cost the city about $126,000 more than it actually paid. The total cost of maintenance over the entire area of macadam roads, including street cleaning by the Paving Division, was 11 cts. per sq. yd. in 1905-06 and 1906-07, 8 cts. in 1907-08, and 5.3 cts. in 1908-09.

The contracts for laying and repairing asphalt pavements have been made in 1908-09 and in 1909-10 at prices far less than those which obtained in former years. Thus, prior to 1908-09, the uniform price for laying or repairing asphalt, or bitulithic pavements, was $2.50 a sq. yd. for surface and binder. The contracts were awarded without competition, the city officials maintaining that competition could not be secured as the asphalt business was controlled by a trust, and the bitulithic pavements by a company which had a patent process. In the last two years, however, bids have been solicited by public advertisement, competition has been secured, and the cost has been greatly reduced. The price for laying the pavement ranged from $1.84 to $2 a sq. yd. in 1908-09, and $1.50 to $2.20 in 1909-10. In these two years 22,574 sq. yds. were laid at a cost of $38,407.75, the average cost being $1.70 a sq. yd., or 80 cts. less than the former price; and the city has saved in the last two years on this item alone the sum of $18,059.20. In the ten years from 1898-99 to 1907-08, inclusive, 327,286 yards were laid at a uniform price or $2.50 a square yard, or an excess of 80 cts. a square yard over the average prices of 1908-09 and 1909-10. If genuine competition had been secured in the ten years prior to 1908-09, as undoubtedly it could have been, prices as low as the average of the last two years could have been obtained and a loss of $261,828.80 on this item would have been prevented.

The repairing of asphalt pavements was likewise said to be in the control of the trust and the contracts were also awarded without competition at the uniform price of $2.50 a square yard. But in the last two years public advertisement secured bids at lower prices and the work was let in 1908-09 at $1.73 and in 1909-10 at $1.62 a square yard with resulting large savings to the city.

The abandonment of the city's stone crushing operations has effected a large saving, as previously stated.

The work of cleaning catch-basins, which in 1907-08 and in preceding years was done partly by day labor and partly by contract, was done by contract to a larger extent in 1908-09, and entirely by contract in 1909-10, with excellent results. In 1906-07 the cost of cleaning 7,922 basins, including the cost of examination and location, was $62,653.82, or $7.90 each; in 1907-08 8,630 cost $60,993.05, or $7.06 each; but in 1908-09 9,253 cost only $46,052.57, or $4.97 each, and in 1909-10 6,488 cost only $29,879.79, or $4.60 each. The saving in the last two years, as compared with the prices in 1907-08, was $35,199.10.

The cost of teaming has likewise been greatly reduced, partly because of the adoption of the system of hiring teams by contract after public advertisement for bids, and partly because of the discontinuance of the wasteful practice of furnishing and carting materials to city contractors. The cost, exclusive of snow removal, was $391,982 in 1907-08, $278,829.02 in 1908-09, and $116,355.77 in 1909-10. Much of the loss on the teaming account in 1907-08, and in preceding years, was due to the practice of hiring teams without competition, at excessive prices, from individuals who had political influence with the administration.

Many other improvements in the administration of the Street Department are worthy of mention, but the foregoing will serve as illustrations of the efficiency and economy which have been obtained under the present superintendent, who, though hampered at times by outside interference and always by the inefficiency of the old men in the service, has succeeded in accomplishing notable reforms.

Second only in importance to the commission's evidence of improvements made is its report on failures in administration. We quote again as follows:

The foregoing summary shows that many improvements in administration have been made, but side by side with notable achievements there have been serious failures.

The expenditure for the mayor's office, instead of being an example for the heads of departments, have indicated a disregard for economy.

The large appropriations of the year 1909-10, and the resulting high tax rate were caused partly by the meritorious practice of paying for "street improvements" and other current expenses out of taxes instead of loans, but mainly by the retention of unnecessary employes and the maintenance of an extravagant scale of salaries. A much larger saving than any which has been effected could have been made if the superfluous employes had been removed, and the excessive salaries had been reduced to a proper figure. Some employes in the lower grades, principally laborers, have been discharged, but practically no salaries have been reduced, while some have been unjustifiably increased. Many who were discharged have been reinstated, and some reductions in salary have been followed by restorations. The reduction in the number of city and county employes in the last two years is not a substantial one, as is shown by the following table:

Number of Persons Employed on April 30, of Each of the Following Years.

Year.	City.	County.	Total.
1905-06	12,558	536	13,094
1906-07	12,949	550	13,499
1907-08	13,174	579	13,753
1908-09	13,108	571	13,679
1909-10	12,645	577	13,222

From this it appears that in 1908-09 there were only 74 employes less than in 1907-08. In 1909-10 there were 531 less than in 1907-08 and 457 less than in 1908-09.

There has been a saving in the pay rolls of some of the departments in the last two years, as compared with those of 1907-08, but the total saving cannot be definitely ascertained until the close of the fiscal year. Whatever savings may have been made can be accounted for as follows:

1. By the discharge of some of the superfluous employes in the lower grades, such as laborers, mechanics, inspectors, etc., due in part to a creditable, though insufficient, extension of the contract system.

2. By the discharge or reduction in salary of a few in the higher grades.

The results are far below the reasonable expectations of those interested in reducing the city's expenditures. No good reason can be given for the failure to adopt the former Finance Commission's recommendations as to reductions in salaries in the Assessing, Collecting Treasury, City Clerk, Clerk of Common Council, Clerk of Committees, City Messenger,

Fig. 2—View of Chimney Being Jacketed With Concrete.

Soldiers' Relief, Weights and Measures and other departments.

Unnecessary appointments have also been made, as for example those of the two additional assessors, which, in effect, were nothing more nor less than deliberate gifts of $8,000 a year of the city's money. Moreover, the mayor's office has frequently interfered with the conduct of the departments in the making of appointments to subordinate offices, and in at least one case, that of the Penal Institutions Department, with demonstrated pernicious results.

We shall pass by the evidence afforded by this report of the manifest economy of contract work over day labor in constructing and maintaining city works. The contention of this journal from the first and persistently since is now being proved on so many hands that it needs but little argument. There is, however, another matter which we have urged that is worthy of further comment. This is the value of a review commission such as the finance commission of Boston in making known definitely to the people those responsible for failure of administration. Take for example the charges of failure in administration quoted above from the finance commission's report. Such charges repeated from year to year are bound to have effect on and ultimately to bring reform from even the most callous public sentiment. There should be a finance commission in every large city and that commission should be composed of a fair proportion of engineers

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Methods of Putting a Reinforced Concrete Jacket on a Cracked Chimney.

The work described consisted in molding a jacket 5-ins. thick of reinforced concrete around a cracked and leaky chimney at the plant of the Winchester Repeating Arms Co., at New Haven, Conn.

The original chimney was of reinforced concrete, but it had developed large vertical cracks which allowed the escape of smoke and at times the inflow of air—both of these actions being harmful to the efficiency of the draft. This chimney rested on a brick foundation which was part of the power house building. Above this foundation it was about 80 ft. high, with outside diameters of 8 ft. at the bottom, and 6 ft. at the top; it was 4 ft. in diameter, inside, and was unlined. The old concrete, forming a wall about 4 ins. thick in the cylindrical part of the chimney, had proved seriously defective, aside from developing cracks. It had been laid as a stiff, dry mortar, without stone, and by the time the contractors took hold of the job, the mortar had become so soft and "punky" that it crumbled easily under a blow, and came away from the reinforcing metal with dangerous readiness.

The new concrete jacket put about the old chimney was 5 ins. thick over the whole surface of the old structure. The vertical reinforcement consisted of four sets of square twisted steel bars with 32 in each set, equally spaced, and with the ends of the successive sets lapped. The lowest set of bars, ⅝ in. thick and 20 ft. long, were upset at their lower ends to ¾ in. diameter, and were screwed into an anchor ring 4 ins. wide by ½ in. thick sunk in the brick work at the base of the chimney. The other three sets of vertical bars were ½ in. square and 24 ft., 22 ft. and 20 ft. long, respectively. Outside this system of lapped vertical bars were placed horizontal hoops of 3.8-in. square twisted steel, spaced 6 ins. apart. The concrete of the shell was mixed 1:2:4, with the stone small.

Before the first section of the concrete jacket was applied the old chimney was carefully wrapped with asbestos felt. This served a double purpose, acting first as an expansion joint between the old and new structures, and serving also to protect the green jacket against too rapid drying by the heat of the inner shell, and against the drawing of moisture from the green concrete into the old chimney.

The aspect of the work, which is of especial practical value, was the ingenious construction and operation of the form used by the contractors on the cylindrical portion of the chimney. The form proper consisted of a cylinder of 16 gage iron, 5 ft. high, with an inside diameter of 5 ft. 8 ins. This was made in three equal sections divided vertically. The horizontal framing consisted of three 2x2x¼-in. angles rolled to a true circular arc. Each section of the form proper therefore constituted a cylindrical surface of 120° braced horizontally by the curved angle bars, one at the top, one at the bottom, and one midway between. Extending horizontally from the top of each of these sections was built a platform braced diagonally to the bottom of the form section with 2x2x¼-in. angles, and resting on horizontal angle bars running to the upper corners of each section of the form. These three sections of form and staging combined were fastened together by bolts running through angle bars on the vertical edges of each section of the form and through the pairs of adjacent angle iron supports under the platform. The form and the working platform were suspended by heavy ropes from three 12-in. single blocks, which were themselves hung from a heavy ring set on top of the overhang of the chimney. The cylindrical portion of the jacket, in which the form was involved, was made in the following manner. The asbestos having been applied over a height of about 5 ft. from the top of the cylindrical form, the form was then raised, and concrete was filled into the space between the form and the chimney, and closely tamped about the reinforcing steel. The next forenoon the asbestos and steel were extended farther up the

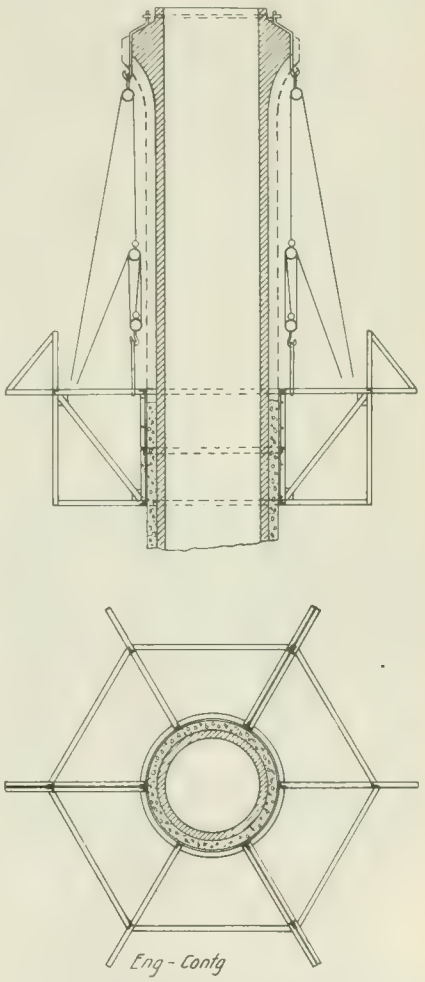

Fig. 1—Sketch Showing Method of Slinging Forms for Jacketing a Chimney With Concrete.

chimney, and the form was hoisted a distance of 4 ft. 10 ins., leaving a lap of 2 ins. on the concrete placed the day before. The concrete of the second day's work was placed in the afternoon, and was allowed to set until the next morning, when the form was again raised 4 ft. 10 ins., and a new ring of concrete was placed that afternoon. The form and platform were prepared for hoisting by loosening the bolts in the facing angle bars which formed the three joints. This allowed the form to swing a little free of the new concrete and permitting of easy movement.

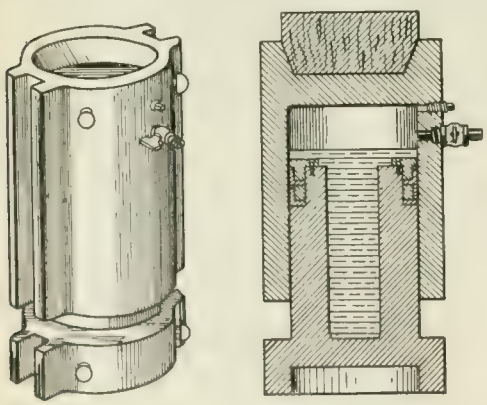
An interesting feature of the preparatory work was the method by which the steeplejack reached the top of the chimney. One of

the largest cracks in the old structure ran from the top to bottom, and this furnished a good place for driving in stout hooks. At the start, the steeple-jack climbed up a ladder resting on the roof of the power house, and reaching up on the chimney drove a stout hook into the big crack. From this hook he then hung a small block carrying a rope. This combination made it possible to hoist a second ladder, which was allowed to lap on the first ladder, to which it was lashed. Climbing to the top of the second ladder, the steeple-jack drove a second hook into the crack in the chimney, reaching up as far as possible. Putting a block and line on this second hook, he was able, after getting down to the power house roof, to raise another ladder, which was lashed to the second ladder. From the top of this third ladder he drove a third hook into the crack, and so extended his track another space upward, and so on. The ladders had hooks at the ends, which held them away from the chimney. They were held firmly in one direction by lashings to the hooks, and the combination was stayed by ropes carried round the chimney every 15 ft. The ladders were taken down by reversing the process of erection. The contractors for this work were the Aberthaw Construction Co., of Boston, Mass.

A Pneumatic Cushion Cap for Driving Reinforced Concrete Piles.

In driving reinforced concrete piles by hammers some form of cushion cap is essential to prevent shattering of the pile head. Various forms of such cap have been devised and used from plain wooden pillow blocks to elaborately packed and cushioned caps of steel and iron. The accompanying cut shows a pneumatic cushion cap which has been tried out successfully in actual pile driving.

Referring to the drawing, it will be seen that this cap consists of an upper cylinder casting and a lower piston casting. The cylinder casting is hollowed out or dished on top to receive a block of wood, which receives the blow of the hammer, and also has on opposite sides flanges which engage the guides



Pneumatic Cushion Cap for Driving Concrete Piles.

of the pile driver. This casting also has bolt-like lugs for attaching hoisting rope and its shell near the top is pierced with two holes, the upper one closed by a screw plug and intended for admitting oil to the cylinder, and the lower one closed by a valve nipple and intended for the admission of compressed air to the cylinder above the oil.

The piston casting has a plunger portion which fits snugly into the cylinder casting and has packing rings around its top. The bottom part or base is cored out to engage the top of the pile being driven. It also has side flanges which engage the guides of the pile driver.

In operation the cap is assembled as shown and filled partly with oil through the upper opening in the cylinder shell. Then air is admitted through the lower valve and the valve is closed. In regard to the operation the inventor says:

We have a hand air pump on the pile driver, and two minutes before starting the hammer we attach the air hose of the pump to a stop cock of the air cushion, and a few strokes with the pump will charge the air chamber with sufficient air for a continuous hard day's driving. It is self-lubricating. The plunger is cored out, for two good reasons: First, to lengthen the casting, and second, it acts as a receptacle to hold the oil, which is very essential in keeping the two surfaces well lubricated under the constant hammering. On our various jobs we used, or rather the air in the chamber would compress, from ⅝ in. to ¾ in., according to the hardness of the ground. We used an Automatic No. 2 Vulcan Steam Hammer, weighing 85,000 lbs., striking a 5-ton blow, and about 70 strokes per minute.

The following further information is given by Mr. Lee Highley, assistant engineer, Missouri Pacific Ry., St. Louis, Mo.:

I witnessed the test driving done at Main and Dorcas streets, this city, for the Manufacturers' Ry. on June 15, by the McCully Construction Co. In this test a corrugated reinforced concrete pile and an ordinary cypress pile were driven with a steam hammer using the DeWitt Patented Compressed Air Cushion Block. The piles were about 30 ft. long and both were followed below the ground surface. The corrugated concrete pile in question was one of a number made by the McCully Construction Co. for this particular work and had been three days in the form and seven days in the air. The piles were driven in made ground, containing much rubbish and drift, near the Mississippi River, and the driving was particularly difficult. The concrete pile was put down in an hour, penetrating less than 0.01 ft. at each blow of the hammer, which was 5-ton. The pile withstood the blows in good manner and showed but very slight abrasion at the top corners when the hood was removed.

The cypress pile, somewhat smaller than the concrete one, was driven under the same conditions in 11 minutes. It penetrated 0.05 ft. per blow, showing much less frictional resistance than the other pile. So successfully did the air cushion work that this pile was scarcely bruised by the hood.

This demonstration along with the work done for the Manufacturers' Ry. affords good evidence that the reinforced concrete pile and compressed air cushion are a practical success.

The cushion cap described is the invention of F. L. Aymond and C. C. De Witt of St. Louis, Mo. The above description has been prepared from information furnished by the inventors and others and obtained from the patent specifications.

Reinforced Concrete Bridges for Track Elevation, in Evanston, Ill., of the Chicago, Milwaukee & St. Paul Railway.*

The Bridge and Building Department of the Chicago, Milwaukee & St. Paul Ry. Co., under the direction of Mr. C. F. Loweth, Engineer and Superintendent, is completing some interesting construction work in connection with grade separation in Evanston, Ill. The work presented a number of difficult problems and a description of the solutions proposed and of those adopted, together with a discussion of the reasons for the choice made, will probably be of interest.

The City of Evanston extends about four miles along the shore of Lake Michigan just north of the city limits of Chicago. It has a population of nearly 30,000, and is almost exclusively a residence town; its inhabitants go to Chicago for their shopping, amusements, and daily vocations. The Chicago & Evanston Division of the Chicago, Milwaukee & St. Paul Ry. runs from the Union Depot, Chicago, northward through the North Shore suburbs of the city, through Evanston and into the town of Wilmette, just north of Evanston, a total distance of about 14 miles. This line handles a considerable freight traffic from the north branch of the Chicago River and some from Evanston, and formerly took care of a certain amount of suburban passenger traffic along the North Shore. The Chicago terminal of the C. M. & St. P. Ry. is, however, not very convenient to the main business, shopping, and theater center which lies within the "Union Loop" made by the elevated railroads of the city.

The Northwestern Elevated R. R. originally extended from the Union Loop to Wilson Ave., a distance of 6½ miles, and its terminal was at Wilson Ave. Station on the line of the Chicago & Evanston Division of the C. M. & St. P. Ry. The Northwestern Elevated had long desired an extension to Evanston and the growing suburbs north, and in August, 1907, it obtained a lease from the C. M. & St. P. Ry., which allowed it to run its trains on the latter company's right of way from Wilson Ave. to Central St., a distance of 7.2 miles. This part of the St. Paul line was modified for electric traffic and, on May 16, 1908, trains were run from the Union Loop to the north end of Evanston; a distance of about 13.7 miles. The St. Paul tracks north of Central St. are used by the Chicago & Milwaukee Electric R. R. which parallels the Northwestern Elevated down to Church St.

The right of way of the Chicago & Northwestern Ry. adjoins that of the Chicago, Milwaukee & St. Paul Ry. from a point near the southern boundary of Evanston to Davis St., which is one block south of the limit of the track elevation. The very heavy traffic on the Chicago & Northwestern Ry. Co.'s line and the frequency of the electric trains on the St. Paul Co.'s tracks made it difficult to prevent accidents at the numerous street crossings. The unusual condition brought about by the proximity of the railways led the city and the two railway companies to agree upon grade separation. An ordinance was passed in March, 1907, by the general terms of which the Chicago, Milwaukee & St. Paul Ry. Co. was required to elevate its tracks for that part of the line extending from the southern boundary of the city to Church St., which is at the north end of the business district. According to the ordinance, the top of rail was to be above specified elevations at each subway; the embankment to be as wide as desired by the company, but retained within the right of way by suitable walls.

The bridges which carry the elevated tracks over the streets are, from an engineering standpoint, the most important features of track elevation work for the reason that they control the elevation of base of rail and consequently the profile of the line, that they furnish the largest separate items of cost in such work, and that they are practically the only features of the work which are constantly before the eyes of the public and which affect the public most directly. These three matters were considered when the question of the type of structure for the Evanston subways was taken up, and it was endeavored to design bridges which would have (1) floors as thin as practicable, to make the elevation of the tracks a minimum; (2) initial costs as small as possible consistent with durability and economy in maintenance, and (3) a good appearance and qualities which would render them noiseless and as nearly waterproof as possible.

The ordinance relating to subway bridges mentioned metal bridges and masonry bridges, the idea being to eliminate wooden or temporary construction and non-continuous floors. A study was therefore made of several types proposed, either of which would comply with the spirit of the ordinance.

Under the ordinance fourteen subways were required and they came under two general classes:

Class *A*—Seven subways whose greatest span is 26 ft., or less. All but one of these subways have the roadway divided into two spans by a pier in the middle of the street.

Class *B*—Seven subways whose greatest spans vary from about 30 ft. to about 36 ft. None of these subways have piers in the middle of the roadway.

In making the preliminary estimates, these two classes were considered separately, because structures that were satisfactory for

*Abstracts, with comments and discussion, from a paper by Mr. E. O. Griefenhagen, Office Engineer, Bridge and Building Department, C., M. & St. P. Ry., read before the Western Society of Engineers, Feb. 9, 1910.

one class were not necessarily best for the other class on account of the difference in length of span. As representing the Class *A* subways, Grove St. was chosen, which was to have two sidewalks 10 ft. wide and a 46-ft. roadway, with piers allowed at the curb lines and at the middle of of the street, making a four-span crossing. As representing class *B* subways, Greenwood St. was chosen, which was to have sidewalks 10 ft. wide and a 36-ft. roadway, with piers allowed at the curb lines only, making a three span bridge.

There were five schemes drawn up and estimated for the Grove St. subway, as follows:

Scheme *A-1*—Reinforced concrete slabs, 13 ft. wide, supported by reinforced concrete piers, each pier having four columns. (See Fig. 1).

Scheme *A-2*—I-beams d ck spans (eight 20-in. I-beams per track for roadway spans) with a reinforced concrete ballast deck supported by structural steel bents or piers of two columns per bent.

Scheme *A-3*—I-beam deck spans (four 24-in. I-beams per track for roadway spans) with solid reinforced concrete ballast deck and ornamental reinforced concrete parapets or facia girders; supported by structural steel bents or piers of two columns per bent.

Sceheme *A-4*—Through plate girder spans with solid floor composed of 15-in. I-beams spaced about 18 ins. c. to c. and covered with a solid reinforced concrete ballast deck; girders supported by structural steel bents or piers of three columns per bent.

Scheme *A-5*—Through plate girder spans with I-beam floor, similar in design to scheme *A-3*, except that the curb piers are omitted and the girders span from the abutments to the middle pier.

There were six designs drawn up and estimated for the Greenwood St. Subway as follows:

Scheme *B-1*—Reinforced concrete through girder bridge composed of heavy reinforced concrete girders, with a solid continuous concrete ballast floor spanning between them, supported by reinforced concrete piers; each pier having three columns.

Scheme *B-2*—Through plate girder spans with I-beams floor composed of 12-in. I-beams spaced 15 ins. c. to c. with a continuous reinforced concrete ballast deck; girders supported by structural steel bents or piers of three columns per bent.

Scheme *B-3*—Through plate girder spans with regular steel cross floor beam and stringer floor system, with a continuous reinforced concrete ballast deck; girders supported by structural steel bents or piers of three columns per bent.

Scheme *B-4*—Bethlehem girder beam deck spans (six 26-in. beams per track for roadway spans) with a reinforced concrete ballast deck; supported by structural steel bents or piers of two columns per bent.

Scheme *B-5*—Similar to scheme *B-4* except for the additions of ornamental concrete parapets or facia girders.

Scheme *B-6*—Span made up of two 30-in. Bethlehem girder beams per rail; rails set down between pairs of beams and supported by a concrete floor; spans supported by structural steel bents or piers of two columns per bent. This scheme has since been used by the C. B. & Q. Ry. Co. on track elevation work.

All the above schemes were estimated for a double track bridge exclusive of track, abutments, falsework, depression of street, paving, and all other items which were common, of every type considered, and which, therefore, would not affect their relative costs. Natural foundations were assumed in all cases. It was found that pile foundations would add about 10 per cent to the estimates. The following table shows the relative costs and depths from base of rail to low bridge for each structure estimated—(the cost of Scheme *A-1* being the lowest, is called 100).

Scheme.	Depth of floor.	Cost.
A-1	4 ft. 0 ins.	100
A-2	3 ft. 8 ins.	112
A-3	4 ft. 0 ins.	108
A-4	3 ft. 5½ ins.	146
A-5	3 ft. 5½ ins.	149
B-1	2 ft. 10½ ins.	104
B-2	2 ft. 10¾ ins.	150
B-3	3 ft. 9½ ins.	134
B-4	4 ft. 2 ins.	134
B-5	4 ft. 2 ins.	136
B-6	2 ft. 0 ins.	132

The depths of the floors for the schemes are second only to the first cost of the bridge in their bearing on the total cost of the track elevation work and they were fully considered in the choice of the final types.

Scheme *A-3* was considered a less satisfactory design than scheme *A-2*, because of its greater depth and because the permanence of the false concrete facia girders under the action of deflection and vibration was questioned. Schemes *A-4*, *A-5*, and *B-3* were discarded because their heavy first cost was not compensated for by a shallow floor and because the girders projecting above the track level were considered undesirable. Scheme *B-5* was replaced by scheme *B-4* in the final estimates because there was little difference in the two designs. Scheme *B-6* was ruled out because of its non-continuous floor and because of the unsatisfactory roadbed which it provided.

This left five schemes for final consideration; two schemes for the Class *A* subways and three schemes for the Class *B* subways. Relative costs and depths of floor for the schemes are given below:

Scheme.	Depth of floor.	Cost.
A-1	4 ft. 0 ins.	100
A-2	3 ft. 8 ins.	112
B-1	2 ft. 10 ins.	104
B-2	2 ft. 10¾ ins.	150
B-4	4 ft. 2 ins.	134

Since the depth of the floor controlled the gradient of the track and the amount of fill required, it was necessary to figure this effect in dollars and cents before the cheapest combination of schemes for the two classes of crossings could be ascertained. Accordingly, calculations were made to determine the amount of fill and the yardage in retaining walls as well as the effect on the gradients, for several combinations. The combination of all-concrete bridges, Schemes *A-1* and *B-1*, required from 4,500 to 13,000 cu. yds. of fill and from 320 to 540 cu. yds. of concrete less than any other combination. These facts, together with the figures given in the table of costs, showed conclusively that reinforced concrete bridges for all subways had the least first cost from all points of view. The advantages for the concrete bridges, exclusive of first cost, as compared with the structural steel bridges were tabulated as follows:

Advantages Claimed for Concrete Bridges.

(1) Greater economy.
(2) Greater rigidity and freedom from vibration; noiseless.
(3) Durability, practically permanent.
(4) Require almost no maintenance.
(5) Of good appearance, as befits bridges in a residence town.
(6) Built entirely of the same materials;

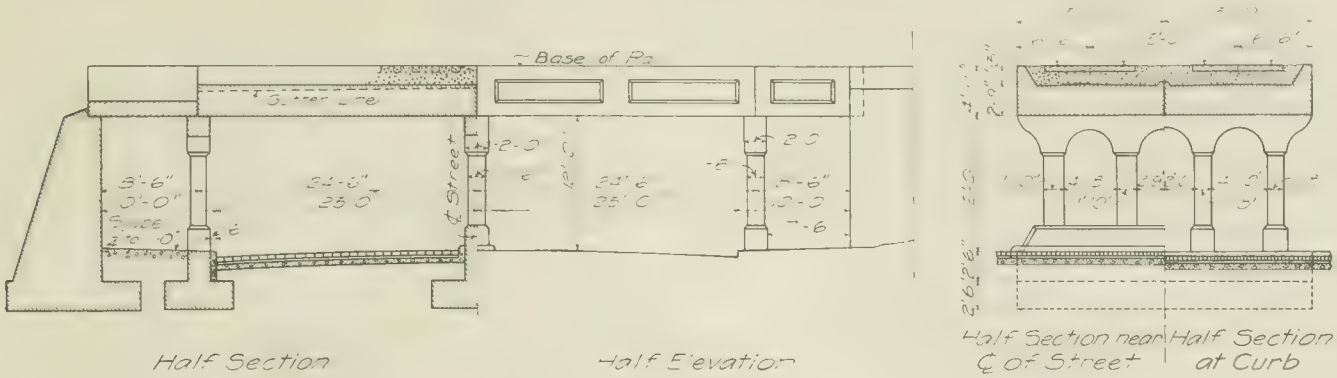


Fig. 1—Proposed Scheme A.

Fig. 2—View of Lake Street Subway Bridge.

footings, abutments and piers can be put in by the same forces, with the same plant.

(7) All work can be done by the company.

Advantages Claimed for Steel Bridges.

(1) The strength of the structures can be definitely determined by a field examination in case the plans are destroyed.

(2) Ordinary errors of workmanship will not affect the stability of the structure.

(3) Alterations not impossible.

(4) Bridges will always have some salvage value.

(5) Ordinance need not be amended, as some cases. On the basis of this information, natural footings were used at 1¾ to 2 tons per sq. ft. for the bridges at Greenleaf St. and all streets south, and pile foundations were used at all points north of this crossing. A bearing on piles of from 12 to 16 tons was allowed. The question of carrying columns down to bed rock or into firm clay on concrete cylinders was considered, and found to be unwarranted by the conditions.

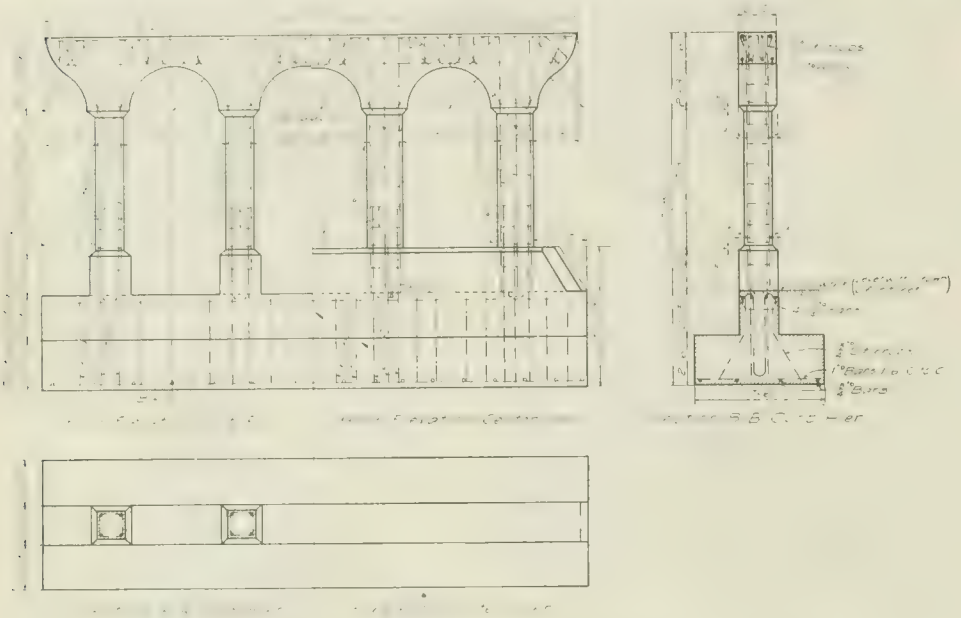

Fig. 3—Details of Piers Chicago Avenue Subway Bridge.

would probably be the case if concrete superstructure were adopted.

(6) A disadvantage of the proposed concrete through girders which steel bridges do not have is that the former require the spreading of the tracks to clear the middle girder.

It was decided to use concrete bridges. A sentiment had developed in the city in favor of wider subways and this, of course, permitted shorter spans, as piers would now be permitted in the middle of the streets. The railroad company agreed to the change for the investigation had shown the great economy of short spans, and the ordinance was amended, permitting the use of reinforced concrete bridges and containing the following revised schedule of subways:

Name of subway.	Total width between abutments.	Width of sidewalk.	Width of roadway	No. of roadway spans.	Head-room.	Skew.
	ft.	ft.	feet.		ft.ins.	
Chicago Ave.	60	10	20 & 20	2	13 0	18°34′
Mulford St.	40	10	20 & 20	1	12 0	17°40′
Rinn St.	60	10	20 & 20	2	12 0	8°29′
Madison St.	60	10	20 & 20	2	13 0	10°0′
Washington St.	60	10	20 & 20	2	12 0	10°20′
Main St.	66	13	20 & 20	2	12 0	21°13′
Greenleaf St.	60	10	20 & 20	2	12 0	10°36′
Dempster St.	66	13	20 & 20	2	12 0	10°36′
Greenwood St.	66	13	20 & 20	2	12 0	11°53′
Lake St.	66	13	20 & 20	2	12 0	15°19′
Grove St.	66	13	20 & 20	2	13 0	20°38′
Davis St.	80	14	26 & 26	2	12 0	8°28′
Church St.	68	14	20 & 20	2	12 6	0°02′

The standard loading for permanent work on the C. M. & St. P. Ry., east of the Missouri River, is Cooper's E-50. A study was made of a typical subway bridge for three probable loadings and comparative costs estimated with the following results:

Cooper's E-50	100
Cooper's E-40	96
100-ton electric locomotive	96

As a result of this study, all work was designed for Cooper's E-50 loading, the saving being too small on the lighter loadings and future changes in rolling stock could not be foretold.

To fix foundation loadings, pits and wash borings were made at each crossing, the wash borings being made to a depth of 50 ft. in

The Chicago Ave. subway is typical and a description of the bridge at this street will apply to the bridges throughout the track ele-

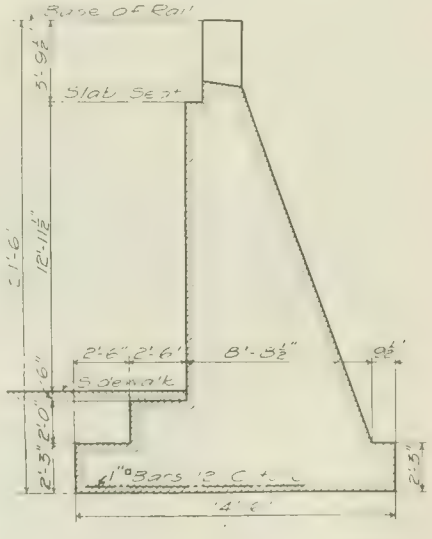

Fig. 4—Section of Abutment Chicago Avenue Subway Bridge.

vation. This subway is on an 18° 34′ skew and has two 10-ft. sidewalks and a 40-ft. roadway. Curb piers are allowed within the sidewalk space. A similar pier divides the road-

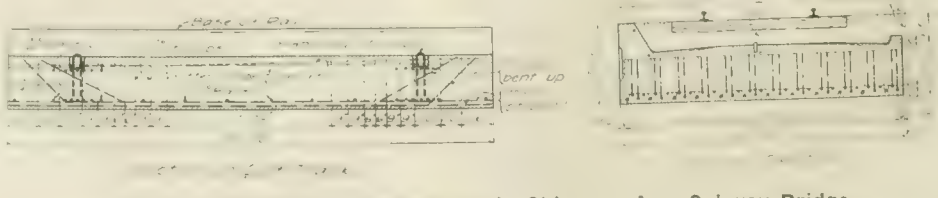

Fig. 5—Details of Roadway Slab Chicago Ave. Subway Bridge.

way into two channels. The face of the abutments and wing walls is on the street line. A clear head room of 13 ft. above the crown of the street is provided according to the ordinance. The elevation of the sidewalks at the curb line is the same as that of the crown of the street and the sidewalks are sloped upward toward the abutment at the rate of one quarter of an inch to the foot.

The requisite massiveness of the bridge, due to the heavy loading and the nature of the material employed, limited the architectural treatment to the simplest lines. The slabs which carry the tracks over the various openings between the abutments and piers are provided with a parapet of uniform depth and width over the entire crossing. The bare surface of this parapet is relieved by simple rectangular recessed panels. The abutments are of heavy construction and give the effect of solidity to the end supports. The composition of the piers was worked out to provide the necessary size of sections and at the same time create an impression of lightness and gracefulness which would relieve any tendency toward a tunnel-like appearance in the subways. The widening of the piers below and above the columns, and the introduction of the curved brackets have an advantage from a structural as well as from an aesthetic standpoint.

The general appearance of the completed subway bridges may be seen from Fig. 2, which is a view at Lake St.

There are three piers for each subway, except at Mulford St., which has only one span over the roadway. The side or curb piers are placed with the outer face 6 in. behind the curb line, and the middle piers are placed on the center line of the roadway.

The appearance of the piers as constructed may be seen from Fig. 2, which is a view of the Lake St. subway bridge. The details of the Chicago Ave. piers are shown on Fig. 3. In general, each pier consists of four columns supporting a cross girder and carried by a footing girder which distributes the load to a footing slab.

The top girder, capping the columns, is given an arched form and figured as a continuous beam. The arches provide curved brackets which stiffen the columns laterally and which give depth to the beam at the points of greatest shear. There are two 1-in. bars in the top of the girder running the full length of the pier, and an additional pair of 1-in. bars over each column, bent down to assist in taking care of web stresses. There are four 1-in. bars in the bottom of the beam run ning the full length of the pier. Six to eight ½-in. square stirrups bent in the shape of a *W* are placed in the beams between columns, and three such stirrups in each side cantilever. The curved brackets are reinforced by pairs of 1-in. diagonal bars. The top girders are made 6 ins. wider than the columns; this makes their width 24 ins. in all cases except the middle pier at Davis St., where they are 30 ins. wide. The depth of the beam at the crown of the arch varies from 18 ins. to 24 ins. The ends of the cantilevers are cut off perpendicular to the center line of the pier and the concrete slabs are allowed to project beyond the extreme corner, which gives a better appearance and a more satisfactory detail than would be obtained if the ends were made parallel and flush with the slab parapets, because the arrangement adopted eliminates the sharp corner and warped surface.

The column shafts from the springing line of the top arches to the top of the base or pedestal vary in height from 6 ft. to 7 ft. 3 ins. The top of the so-called base or ped-

Engineering-Contracting Monthly Review Index of Civil Engineering Literature.

A classified index and review of the civil engineering papers, articles, reports, pamphlets and books published during the month just passed is given in the succeeding pages. The literature indexed and reviewed—with the exception of books—relates solely to civil engineering. In the section devoted to Book Reviews all books in all branches of engineering are listed as received and such of them as seem worthy are reviewed as fully as due regard for conciseness will permit. In choosing books for review rigid selection is exercised. Next to careful choice of books for review timeliness of review is sought. All books are reviewed within a month of their receipt. The same statement is true of the articles and papers that are indexed. Also, as in choosing books for review, the choice of articles and papers for indexing is based on merit. Numerical strength in "titles indexed" is not sought; excellence of selection is sought.

The purposes of the Monthly Review Index are: First, to inform civil engineers and contractors of the articles and papers of merit that are published each month, in such a way as will give a clear idea of their character and scope; second, to supply the user with the date and place of publication, the length of each article and the cost at which it can be secured. The name, adopted abbreviations, place of publication and price per number of each periodical examined for civil engineering articles are given in the list immediately following. The other information is given in the index proper for each article separately.

Books reviewed will be sent post paid on receipt of price by the Book Department of ENGINEERING CONTRACTING; periodicals, etc., containing articles indexed should be ordered direct from the publishers.

ROADS AND STREETS.

The Use of Tar for Road-Making and Repairs.—By Wm. Wade. Surveyor, Jan. 21, 1910. 1½ pp.

This is a paper read at a recent meeting of the Institution of Municipal Engineers, England, giving personal experiences. He concludes that the cost of tar grouting is no more than that of repairing a road by the old water-bound method. He divides tar treatment into: Tar painting or waterproofing the surface; Tar-macadam, or mixing tar with the stone previous to its being laid in the road; and, Tar-grouting, or grouting the stone with tar and pitch when the road is being coated.

Notes on Street Paving.—By Thos. B. McMath. El. Tr. Wkly., Jan. 29, 1910. 1½ pp.

This is an article read by the chief engineer of the Indianapolis Traction & Terminal Company at the January convention of the Central Electric Railway Association. From the point of view of the engineer, whose work is of a somewhat special nature in street paving, this paper is instructive.

Gutter Culverts.—Mun. Jl. & Eng., Jan. 5, 1910. 3 pp.

Detail drawings and half-tone views are presented, illustrating present practice in Chattanooga, Tenn. Comparisons are made between pipes and box culverts of masonry.

Concrete Paving at Memphis. — By J. H Weatherford. Mun. Jl. & Eng., Jan. 5, 1910. 2½ pp.

A very good description of concrete pavements in a city where this pavement is in successful use.

Street Crossings and Driveways.—Mun. Jl. & Eng., Jan. 12, 1910. 2 pp.

An article illustrating private driveways across sidewalks, alley crossings, etc.

Washington Street Lighting.—El. Wld., Jan. 6, 1910. 2 pp.

This is a digest of a report by W. C. Allen, Electrical Engineer for the city of Washington, D. C. Tests were made on typical street lighting installations to enable a comparison to be made of relative efficiencies. A table gives comparison of lighting and another table gives costs of lighting.

Concrete Pavement Construction at Boise, Ida.—Eng.-Contg., Jan. 19, 1910. ½ p.

Describes methods of construction and gives general costs.

Data on Street Work at New Bedford, Mass.—Eng.-Contg., Jan. 19, 1910. ½ p.

Gives various cost data on street work covering, curbing, oiling macadam and pavement construction of several kinds.

Economics of Street Pavements.—Eng.-Contg., Jan. 12, 1910, 1 2-3 pp.

Presents estimates and discussion comparing the economics of various forms of pavement, including granite block, sheet asphalt and macadam. Summarizes conclusions as to pavements most economic for various classes of streets. A valuable paper.

Notes on Road and Street Work.—Eng.-Contg., Jan. 5, 1910, 1½ pp.

Gives results of observations on the effect of automobile traffic on roads of various surfaces; also illustrates and describes a card for recording street maintenance work.

The Possibilities of Portland Cement as a Road Material.—Eng.-Contg., Jan. 5, 1910, 1 p.

Describes a method of concrete road construction which it is believed will do away with cracking and spalling and should not cost more than 10 to 15 cts. per square yard more than ordinary macadam. Also discusses possibilities of securing a more elastic concrete by admixture with mineral oils.

SEWERS.

Modern Methods of Sewage Disposal.—By T. Aird Murray. App. Sci., January, 1910. 10 pp.

A paper read before the Engineering Society, University of Toronto. A very good review of the subject.

Disposal of Manufactural Wastes and Sewage at Gloversville. Part I.—Eng. Rec., Jan. 22, 1910. 2⅝ pp. Part II.—Jan 29, 1910. 3 pp.

Describes experiments made to dispose of sewage and factory wastes in a city of about 20,000 inhabitants, containing 26 tanneries in addition to other factories.

Sewage Disposal Works, Grand Canyon, Arizona. Eng. Rec., Jan. 29, 1910. 1¼ pp.

Describes a plant designed by the Cameron Septic Tank Co. in operation for four years past in disposing of the sewage of two large tourist hotels.

The Principles Involved in the Purification of Sewage.—Eng. Dig., Jan., 1910. 2 pp.

Abstract of an article read by Dr. L. W. Hignett before the Institution of Municipal Engineers (England). A concise analysis of sewage is given.

Tank Treatment of Sewage.—Mun. Jl. & Eng., Jan. 5, 1910. 2 pp.

A digest of a paper read in England by Mr. A. P. I. Cotterell giving a general review of the treatment of sewage in tanks.

Oriental Sanitary Engineering.—By C. T. Evennette. Dom. Eng., Jan. 1, 1910. 5 pp.

An interesting paper dealing with the peculiar conditions existing in India and complicating the work of the sanitarian, whether engineer or medical man.

Sewage Disposal for Institutions and Small Communities. — By Theodore Horton. Dom. Eng., Jan. 1, 1910. 3½ pp.

The author is chief engineer of the New York State Board of Health and this article is a reprint of a paper read before a recent conference of sanitary officers of New York. The article, while not of value to the designing engineer, will be useful for an engineer trying to interest a community in sewage disposal.

Ocean Grove Sewage Disposal Plant. — By Clyde Potts. Eng. Rec., Jan. 8, 1910. 1½ pp.

The total cost of this work was $20,400. The summer sewage flow is a maximum of 1,200,000 gallons per day and the winter consumption only 300,000 gallons. Describes construction of septic tanks to care for this great variation.

Sewage Disposal Plant at the Danville (Pa.) State Hospital.—Eng. Rec., Jan. 15, 1910. 1½ pp.

Gives a good description of a plant for the disposal of about 350,000 gallons of sewage in 24 hours. The works comprise primary sedimentation tanks, a sludge bed, sprinkling filter, and secondary sedimentation tanks.

The Disinfection of Water and Sewage Filter Effluents.—Eng. Rec., Jan. 15, 1910. 1½ pp.

Gives abstract of paper read by Prof. Earle B. Phelps at the last meeting of the Sanitary Section of the Boston Society of Civil Engineers and discussion on same.

Standards for Sewage Effluents.—Eng.-Contg., Jan. 5, 1910. 1 1-3 pp.

Describes the difference between a good and a bad effluent, describes a sample test for quality of effluent, and discusses various questions relating to both. A valuable paper.

WATERWORKS AND HYDRAULICS

The Deep Well System of Water Supply for South Bend, Ind.—By Alonzo T. Hammond. Eng. News, Jan. 27, 1910. 1 p. Eng. Rec., Jan. 29, 1910. ¾ p.

Abstract of a paper read at the 1910 annual meeting of the Indiana Engineering Society.

The Design of Pressure Tunnels of the Catskill Aqueduct. Part I.—Eng. Rec., Jan. 29, 1910. 2½ pp.

These tunnels are a part of the aqueduct system for the supply of water to New York City. They have no counterpart in tunnels now in operation and are located at a depth of about 200 feet below the surface. They are to be lined with concrete and the article describes the design and reasons for it; being an abstract of a paper read by Mr. Thomas H. Wiggin, senior designing engineer, before the Society of Municipal Engineers of New York City.

Depth of Water Pipe.—Mun. Jl. & Eng., Jan. 5, 1910. 3 pp.

Gives data from 87 cities collected by the N. E. W. W. Assoc. on depths at which water pipe should be laid to prevent freezing.

Damages by Electrolysis.—Mun. Jl. & Eng., Jan. 5, 1910. 1 p.

A digest of data furnished by the Consular Service of the United States on methods used in ten leading European cities to guard against danger of electrolysis in underground water mains and metallic conduits.

Iron Lime Coagulation at St. Louis.—Mun. Jl & Eng., Jan. 5, 1910. 4¾ pp.

This is a general descriptive article of the purification plant at St. Louis. The water is cleared in large basins without filtration by the addition of lime and iron. Some costs are given.

The Great Chaudiere Dam, Ottawa, Ont.—By Douglas L. McLean. Can. Eng., Jan. 21, 1910. 7 pp.

This dam raises the level of the water in Nepean Bay, Ottawa River, from 8 to 10 feet, thereby giving Ottawa power plants, including the water works, that much more effective working head. The dam is constructed of reinforced concrete piers with 22-ft. openings for stop logs, there being 15 ft. of water on the sills. There are 51 piers and 50 sluice openings in the arc of a circle having a radius of 567 ft. and a length of 1,300 ft. The work cost $225,000.

The Multiple Arch Dam.—Jl. El. P. & G., Jan. 1, 1910. ¾ p.

Two letters referring to the multiple arch dam built near Hume, Calif., under the patents of John S. Eastwood, and described in an earlier issue of the Journal with later comments by C. E. Grunsky. One of these letters gives the economic angle for radii of arches. The second letter is from Mr. E. Wegmann, showing that this form of dam is not new and was used in India in 1800 and in New South Wales in 1898. Also refers to Trans. Am. Soc. C. E., Dec., 1897, and Dec., 1902, where this type of dam was discussed mathematically.

A Multiple Arch Dam.—Eng. Rec., Jan. 15, 1910. ¾ p.

This is a description of the Hume, Cal., dam patented by John S. Eastwood and described by him in the Journal of Electricity, Power & Gas, from which the notes for this article were taken.

Cut and Cover Construction on the Catskill Aqueduct.—Eng. Rec., Jan. 8, 1910. 3½ pp.

This aqueduct is of concrete with elliptical sides and dished bottom, the extreme width being 17 ft. 6 ins. and the height 17 ft. The article describes the handling of forms and mixing and placing of concrete as well as the excavation and filling.

Hydroelectric Development of the Minidoka Project.—Eng. Rec., Jan. 8, 1910. 3¾ pp.

A general description of a 6,000-k.w. power plant to pump water on the Minidoka Project in Idaho for irrigation.

The Water Purification Works at Carson City, Colo.—Eng. Rec., Jan. 15, 1910. 2 pp.

Describes a plant consisting of a settling basin, two slow sand filters and two clear water reservoirs, each reservoir having a capacity of 2,000,000 gallons.

RIVERS, HARBORS AND CANALS.

The Royal Commission's Report on Waterways.—Eng. Rec., Jan. 22, 1910. 2⅓ pp.

A commission was appointed in 1906 in Great Britain to study artificial waterways. A report was published in December, 1909, on canals in Great Britain and in Continental Europe. The committee was divided on the proper policy to pursue to restore canals to their former place. The article is merely a short digest of a long document.

Substructure of Pier 4, Boston Terminal, Boston & Albany R. R.—Eng. Rec., Jan. 29, 1910. 3½ pp.

This pier is 776 feet long and 240 feet wide, with a solid earth core about 400 feet long, with pile construction on both sides. About 6,000 piles from 30 to 80 feet long were required. Part of the construction is reinforced concrete. Detail drawings are given for the principal portions of the work.

The Reservoir Possibilities of the Sources of the Mississippi and Tributaries of the Upper Mississippi River with Reference to the Improvement of Navigation.—By Charles W. Durham. Eng. News, Jan. 20, 1910. 4¾ pp.

The author is an Assistant U. S. Engineer, and this article is written to show the greatest practicable extent to which flow regulation may be obtained by constructing reservoirs to impound surplus water in time of flood, and its effect upon navigation. A good review by a man who has had access to, and examined, all data on the subject collected by government engineers.

A Large Wood and Steel Floating Dry Dock.—Eng. Rec., Jan. 8, 1910. 2¼ pp.

Description of a floating dock, 364 ft. 9 ins. long and 100 ft. wide over all with a lifting

capacity of 6,500 tons recently built for service at Brooklyn, N. Y.

RAILWAYS.

Relining a Railroad Tunnel With Cast-Iron Segments.—Eng. Rec., Jan. 1, 1910. 1⅓ pp.

Abstract of a paper by Mr. William Clewer before the Institution of Civil Engineers of England describing the substitution of cast iron segmental lining for brick in a horseshoe shaped Welsh railway tunnel. Views are given showing methods and results.

Evanston Track Elevation, Chicago, Milwaukee & St. Paul Ry.—By E. O. Griefenhagen. Eng. Rec., Jan. 22, 1910. 2½ pp.

This article describes the general route and discusses the several types suggested for bridges over streets, showing why reinforced concrete was decided upon.

Rerunning Curves.—By Geo. L. Jensen. Eng. Rec., Jan. 22, 1910.

The writer points out the differences between the location and the rerunning of curves and gives practical methods for the latter problem.

Track on German Railways.—Eng. Rec., Jan. 29, 1910. 2⅓ pp.

Abstract of Bulletin 115 of the American Railway Engineering and Maintenance of Way Association.

The Tractive Power of Simple and Compound Locomotives.—By Sidney C. Carpenter. Ry. Age-Gaz., Jan. 28, 1910. 1 p.

In this article five diagrams are given by means of which the tractive power of locomotives may be closely approximated without calculation. Several examples are given.

The Design of the Evanston Subway Bridges, Chicago, Milwaukee & St. Paul Ry.—By E. O. Griefhagen. Eng. Rec., Jan. 29, 1910. 2⅓ pp.

This article describes the design of reinforced concrete girder bridges to carry a railroad over city streets; gives load assumptions; sketch details and half-tone illustration of a completed structure.

The Unit System of Organization.—By Major Charles Hine. Ry. Age-Gaz., Jan. 21, 1910. 3½ pp.

A great deal has been heard lately in regard to the present unit system of organization on the Union Pacific System. This paper, read before the Western Railway Club, Chicago, Jan. 18, by the man who introduced the system, gives a full account of it. The discussion is printed in the Jan. 28th issue. 1¼ pp.

Maintenance Regulation Cards.—By R. W. Burnett. Ry. & Marine Wld., Jan., 1910. 4 pp.

The author is General Master Car Builder, C. P. R., and describes his card system for keeping complete track of his work scattered all over the railway system.

Locomotive Terminals.—Am. Eng. & R. R. Jl., Jan., 1910. 12½ pp.

The first installment of a series of articles discussing the arrangement, design, construction and operation of locomotive terminal facilities to obtain the greatest efficiency.

Some Questions of Passenger Station Design.—W. W. Finley. Ry. & Eng. Rev., Jan. 8, 1910. 1½ pp.

An address by the president of the Southern Railway at the annual banquet of the American Institute of Architects. Brings out the fact that capital invested in passenger stations in excess of the amount necessary to provide adequate and proper facilities for doing passenger business is unproductive.

A Railway Ditching Machine for Small Cuts and Fills.—Eng. News, Jan. 20, 1910. 3 pp.

Describes the Bowman ditcher used on the Southern Pacific Railway to do the work that is too small to require a steam shovel and on which manual labor would be too expensive. The machine is mounted on a flat car and plows and scrapes either or both sides of a right-of-way.

A Method of Determining Relative Economy, with Rules and Tables for Practical Computation.—Eng.-Contg., Jan. 19, 1910, 2¾ pp.

A presentation of formulas and tables for figuring relative values. A useful article to railway engineers.

Appraised Value of the Steam Railways of Wisconsin.—Eng.-Contg., Jan. 19, 1910, 2-3 p.

Gives tables of valuation for new and in depreciated condition of Wisconsin railways and itemized values per mile.

Original Cost and Cost of Reproduction of the Northern Pacific Railway (1,645 Miles) in the State of Washington.—Eng.-Contg., Jan. 12, 1910, 6 pp.

Gives the detailed costs obtained by the engineers of the Washington State Railway Commission in the work of valuing the railways of that state. A unique set of figures.

BRIDGES, BUILDINGS AND FOUNDATIONS.

The Construction of the Substructure of the McKinley Bridge Across the Mississippi River at St. Louis, Mo.—By F. E. Washburn. Eng. News, Jan. 6, 1910. 7⅓ pp.

This is a very good article for bridge designers and contractors, as it is highly practical and gives details of caissons, etc., and describes difficulties encountered in sinking the caisson.

Tests on Steel I-Beams.—Eng. News, Jan. 6, 1910. 1 p.

Two letters are given, one by Prof. Marburg and one by Edward Godfrey, discussing recent tests on I-beams and effect of tests on the webs of the beams.

A Composite Sand and Rock Foundation for a Tall Building.—Eng. News, Jan. 6, 1910. 1½ pp.

Describes methods used for the foundation of the New York City Municipal Building, 25 stories high and capped with a tower rising 560 feet above street level. About two-thirds of the building is over solid rock and the remainder over deep sand.

Approximate Cost of Mill Buildings.—By Chas. T. Main. Eng. News, Jan. 27, 1910. 1½ pp. Eng Rec., Jan. 29, 1910. 1½ pp.

Abstract of a paper presented before the New England Cotton Manufacturers' Association, April, 1904, revised to conform to prices prevailing about January, 1910. Contains six diagrams and three tables in the text.

A Large Steel Frame Rolling Mill Building.—Eng. Rec., Jan. 29, 1910. 3⅓ pp., ill.

This building encloses a rectangle of about 240 ft. by 491 ft. The principal reason for describing the structure arises because of the special details of the columns, girders and trusses caused by heavy concentrated loads on crane runways, and also runway connections.

A New Moment Table.—By C. R. Young. Can. Eng., Jan. 7, 1910. 2 pp. App. Sci., Jan., 1910. 3 pp. and inset.

A moment table for railway bridges is given wherein moments are given about successive points 1 ft. apart. The loadings are for the Dominion Government Specifications, 1908, but by applying the ratio for other classes the table can be used generally. Directions for use accompany the table.

Dry Rot in Wooden Posts.—Ins. Eng., Dec., 1909. 9 pp.

A recent fire in a factory building in New York city showed the timbers to have been badly attacked by dry rot, causing a collapse of the building just as the fire was under control. The report of Prof. Woolsen forms a part of this article.

Modern Steel Caissons.—By A. J. Springer. Ir. Tr. Rev., Jan. 6, 1910. 11 pp.

This is a remarkably complete description of the development and application of steel caissons in subaqueous work for various purposes.

A Girder Bridge With Structural Steel Reinforcement.—Conc. Eng., January, 1910. 5 pp.

A bridge in Cowley County, Kas., is described, consisting of three 50-ft. spans and one 32-ft. span. The floor is 26 ft. above low water. The reinforcement was so designed that it is in the shape of a very light truss, merely heavy enough to carry the forms and concrete, as frequent and high rises in the river made centering difficult and expensive. A full description is given of forms and construction.

Rapid Deterioration of Steel Work From the Corrosive Action of Locomotive Gas, McCallie Avenue Bridge, Chattanooga, Tenn.—Eng. News, Jan. 20, 1910. ⅔ p.

Extracts from a report by the City Engineer on a steel bridge built in 1905 and now deteriorated at least 75 per cent because of gases from locomotives. The paint on the floor system and lower chords seems to have been removed by the heat, coupled with the abrasive action of cinders forced against it. Recom-

JOHN WILEY & SONS

43 and 45 E. 19th Street
NEW YORK

mends protection of such members with concrete.

Replacing a German Railroad Bridge.—Eng Rec., Jan. 8, 1910. 1 p.

Describes methods whereby a four-track railroad bridge was removed by traveling cranes and a new bridge put in its place. A remarkably interesting piece of work.

Calculation of Stresses in Suspension Bridges.—Eng. Rec., Jan. 8, 1910. ⅔ p.

This consists of two appendices to the report of Ralph Modjeski on the Manhattan bridge; one on Stresses in Towers and Cables; the other on Stresses in the Lower Floor Beams and Lateral Systems.

The Lethbridge Railroad Viaduct.—Eng. Rec., Jan. 8, 1910. 1¾ pp.

This article is an abstract of a paper by C. M. Monsarratt before the Canadian Society of Civil Engineers. Describes erection work on a viaduct 5,327 feet long and 314 feet high from the bed of the river to the base of rail.

Computing Stresses in Highway Bridges With Inclined Chords.—By W. H. Hoffman. Eng. Rec., Jan. 8, 1910. ½ p.

A letter to the editor giving a clear method of computation for bridge trusses.

The Grand Stand at the Minnesota State Fair Grounds.—Eng. Rec., Jan. 15, 1910. 3⅔ pp.

This is a combined exposition building and grand stand built of reinforced concrete in 80 days. The description is good and well illustrated. The formula for obtaining riser heights for seats is given.

Launching the Reventazon Bridge, Costa Rica.—Eng. Rec., Jan. 15, 1910. 1⅔ pp.

This bridge has a single track 400-ft. span with pin-connected trusses 53 ft. deep, 20 ft. apart on centers with 28.57 ft. panels. On account of torrential floods in the river, which would interfere with false work, a temporary pier was placed in the middle of the river, the bridge erected on shore and launched horizontally to position over this pier to afford an auxiliary bearing at midstream. The work is described in this article.

A Suggested Form of Building Contract Designed to Secure Justice and Equity to Both Owner and Contractor.—Eng.-Contg., Jan. 12, 1910, pp.

Discusses building contracts and presents a form of contract designed to secure equity to both owner and contractor.

A New Method of Sinking Cylinder Foundation in Underpinning the Cambridge Building, New York City.—Eng.-Contg., Jan. 12, 1910, 2 1-3 pp.

Describes an interesting job of underpinning a building foundation which was endangered by a tunnel excavation. A new method of sinking steel cylinder piers is described.

CONCRETE AND REINFORCED CONCRETE.

Efficiency of Compounds for Waterproofing Concrete.—Eng. Rec., Jan. 15, 1910. ⅔ p.

Abstract of a bulletin recently issued by the University of Wisconsin at Madison describing experiments on waterproofing compounds.

Long-Span Reinforced Concrete Girder Bridges.—By F. W. Scheidenhelm. Eng. News, Jan. 27, 1910. 5¾ pp.

Describes the design and construction of reinforced concrete girder bridges having 75 ft. spans for interurban traffic. Gives costs and details of forms.

The Construction of the Rocky River Bridge.—Eng. Rec., Jan. 1, 1910. 4 pp.

Describes the contractor's part in the building of a reinforced concrete arch bridge. The total length is 708 ft., embracing an arch of 280 ft. over the river, three 44-ft. arches at one end and two of the same size at the other end. Steel centering was used.

A Unique Type of Reinforced Concrete Construction. — By Theodore L. Condron. Eng. News, Jan. 27, 1910. 3 pp. Eng. Rec., Jan. 22, [illegible] pp.

Abstract of a paper read before the Western Society of Civil Engineers and printed in the December number of the "Societies" journal. This paper describes a flat panel floor construc- [illegible] analyzed pre-

NOW READY

Cost Keeping and Management Engineering

By HALBERT P. GILLETTE and RICHARD T. DANA

This is the first book ever published on the subject of cost keeping on contract work. Its authors are pioneers in the field, and, although they have written much that has appeared in the form of articles—particularly in the pages of *Engineering-Contracting*—this book is the first presentation on the subject in a complete and logical sequence.

In the opening chapter the authors endeavor to reduce the **management of men** to a science, by laying down **ten fundamental laws of management,** each of which is fully discussed.

The second chapter contains 17 **fundamental rules for securing minimum cost.** These two chapters are wholly novel and of far reaching importance to all men who are, or hope to be, in charge of other men.

The authors then proceed to describe and illustrate their own systems of cost keeping, which they have developed on their own contract work and have also been installed on the work of other contractors, giving both the **punch card reports**—a form of report which they were the first to devise and the more common blanks to be filled in with pencil.

The last chapter contains numerous systems of cost keeping developed by other engineers and contractors, and is a **veritable mine of suggestive hints** as well as of examples of excellenet blanks for special purposes.

The following is the list of chapters:

CHAPTER I—The Ten Laws of Management.
CHAPTER II—Rules for Securing Minimum Cost.
CHAPTER III—Piece Rate, Bonus and Other Systems of Payment.
CHAPTER IV—Measuring the Output of Workmen.
CHAPTER V—Cost Keeping.
CHAPTER VI—Office Appliances and Methods.
CHAPTER VII—Bookkeeping for Small Contractors.
CHAPTER VIII—Miscellaneous Cost Report Blanks and Systems of Cost Keeping.

Cloth, 6x9 inches, 360 pages. Price $3.50 net, postpaid.

SPECIAL OFFER—"Cost Keeping and Management Engineering" and One Year's Subscription to Engineering-Contracting—$5.00.

The Myron C. Clark Publishing Co.

13-21 Park Row, New York 355 Dearborn Street, Chicago

sessing all the advantages of the "mushroom" and other plate slab floors.

Possible Uses of Mineral Oils Mixed With Concrete.—By Albert Moyer. Eng. Rec., Jan. 1, 1910. 1⅓ pp.

Gives the results of tests and suggests the possibilities of concrete containing oil.

A New Type of U-Abutment.—Eng. Rec., Jan 22, 1910. ½ p.

Describes, with detail drawings, a new type of U-abutment having a reinforced concrete deck so that the inside fill is on a slope and it is not necessary to design the walls to retain earth pressure.

Notes on Concrete.—Eng. Rec., Jan. 29, 1910. 1 p.

Abstract of an informal discussion on concrete and cement at a meeting of the Boston Society of Civil Engineers. This discussion was printed in full in the Journal of the Association of Engineering Societies, November, 1909, occupying 28 pages.

A Unique Type of Reinforced Concrete Construction.—By Theodore L. Condron. Jl. W. Soc. Eng., Dec., 1909. 40 pp.

This is a paper read before the Western Society of Engineers, Dec. 15, 1909, together with the discussion. An excellent review of types and methods with description of a method for girderless floors evolved by Messrs. Condron and Sinks which can be mathematically analyzed.

The Use of Chain for Concrete Reinforcement.—By Theodore H. Skinner. Conc. Eng., January, 1910. 5 pp.

Mr. Skinner is engineer for the Oneida Community and has originated a method for using chains as reinforcement for concrete. This paper gives results of tests and presents Mr. Skinner's conclusions. He assumes that the slabs really became trussed beams in which the concrete forms a strut. This is of course practically the assumption made by manufacturers of expanded metal and wire fabric in continuous slab construction.

Plans of Concrete Bridge on Southern Ry.—Ry. Eng. Rev., Jan. 8, 1910. 2 pp.

In this, the first of a series of articles on construction work on the Southern Ry., illustrated a reinforced concrete bridge on a light curve. There are four 5 centered arches, each 70-ft. span. Reproductions are given of all essential details, together with details of the lightened abutments.

The Failure of a Concrete Dam at Dansville, N. Y.—Eng. News, Jan. 13, 1910. 1⅓ pp.

The dam was 123 ft. long by 9 ft. 6 ins. high, with flash board to increase the height to 11 ft. 6 ins., and design was made on a basis of a flood level giving a depth of 12 ft. 6 ins. The cause for failure was given as being inferior workmanship, but there is room for a reasonable belief that the face slab was too nearly vertical and the resultant pressure created quite a bending moment on the flat bottom slab which was not reinforced as a thin deep beam.

Tapering Concrete Chimneys. — Eng. News, Jan. 13, 1910. 2 pp.

Nearly all concrete chimneys heretofore built have been cylindrical in form and reductions in diameter have been made by offsets. The objections structurally and aesthetically to such chimneys led to the design of forms whereby tapering chimneys may be erected in concrete. This article describes, with line drawings and half-tones, tapering concrete chimneys lately built at Chillicothe, O., and at Muncie, Ind.

Concrete Shell Casings for Protecting Wooden Piles Against the Teredo.—Eng. News, Jan. 13, 1910. 1½ pp.

This article consists of abstracts from a paper before the American Society of Civil Engineers by T. Howard Barnes, Sept., 1909, entitled, "The Reinforced Concrete Wharf of the United Fruit Company at Bocas La Toro, Panama."

The Mulberry Street Reinforced Concrete Viaduct, Harrisburg, Pa.—Eng. News, Jan. 13, 1910. 5 pp.

A well illustrated description of one of the longest reinforced concrete viaducts in the world. It is 1,841 ft. long, 78 ft. above the ground at its highest point, and carries on 19 arches a 28-ft. roadway and two 8-ft. sidewalks. Many details are given.

Continuity in Reinforced Concrete Beams.—Eng. News, Jan. 13, 1910. 3 pp.

Letters to the editor discussing an article in Eng. News of Sept. 30, 1909, and comments on same. These letters are written by Prof. R. E. Spaulding, Mr. Sanford E. Thompson and Mr. R. E. W. Hagarty.

The Economy of Plain and Reinforced Concrete Columns.—By Charles W. Hall. Eng. Rec., Jan. 8, 1910. 1⅔ pp.

This writer presents diagrams to illustrate comparative costs of concrete columns, plain and reinforced, showing the reinforced concrete to be the cheaper, contrary to usual ideas.

Pressure of Concrete on Forms.—Eng. Rec., Jan. 15, 1910. 1 p.

Abstract of an article by Maj. Francis R. Shunk in Professional Memoirs of the Engineer Corps, U. S. A., describing experiments made by him to determine the pressure of concrete on forms.

Comparative Cost of Constructing Two Identical Reinforced Concrete Buildings—One of Separately Molded Members and One of Members Molded in Place.—Eng.-Contg., Jan. 19, 1910, 1 p.

Describes construction of two identical reinforced concrete car barns, one of concrete molded in place and one of separately molded concrete members, and gives itemized comparative costs.

Economical Selection and Proportion of Aggregates for Portland Cement Concrete.—Eng.-Contg., Jan. 19, 1910. 3½ pp.

Describing a practical method of proportioning concrete to secure the most economical use of materials. Selection of large aggregates, mortar for concrete, selection of Portland cement and correct proportioning are some of the subjects discussed.

Reducing Contraction and Absorption of Concrete by Mixing It with Mineral Oil.—Eng.-Contg., Jan. 12, 1910, 1¼ pp.

Describes tests made on cement briquettes mixed with oil to determine the effect. Clinking and cracking seemed to be wholly eliminated by the oil addition. The paper discusses these results and considers the possibilities of reducing the contraction and absorption of concrete by the admixture of oil.

Reinforced Concrete Girder Bridge, Bexar County, Texas.—Eng.-Contg., Jan. 26, 1910, 1 p.

Illustrates structural details and describes construction of a bridge of 14 50-ft. reinforced concrete girder spans. Some unusually thin reinforced concrete abutment walls are shown.

Some Data and Records of Experience Regarding the Disintegration of Concrete by Alkali.—Eng.-Contg., Jan. 5, 1910. 2⅓ pp.

This is a summary and critical discussion of the various more important studies that have been made on the effect of alkali water on concrete. As a review and summary the article is valuable.

Method and Cost of Constructing Concrete Boundary Monuments.—Eng.-Contg., Jan. 5, 1910, 1-3 p.

Illustrates form of monument and describes construction and gives costs averaged from 103 monuments.

Tests to Determine the Efficiency of Various Commercial Waterproofing Compounds for Concrete.—Eng.-Contg., Jan. 5, 1910, 3¼ pp.

Describes procedure of tests and apparatus and gives results obtained with some 12 to 14 materials. Strength tests as well as tests for water tightness were made on all samples.

EARTH AND ROCK EXCAVATION.

Setting Out Inclined Shaft Timbers.—By D. J. Browne. Min. Sci., Jan. 27, 1910. 3 pp.

This is an article dealing with the setting of timbers in an inclined air shaft and describing the methods of survey.

Cableways for Deep Fills.—By William Hewitt. Eng. Dig., Jan., 1910. 5½ pp.

This is an interesting description with a number of illustrations of cableways placed across hollows to be filled and suspended from them cradle bridges on which cars are run. These outfits are used to make fills without falsework.

A Device for Washing Sand and Gravel.—By Sam G. Porter. Eng. Rec., Jan. 29, 1910. ½ p.

Gives description with detail drawing of plant which will wash 10 cu. yds. per hour. Can be made on the job.

NOW READY

CONCRETE-STEEL CONSTRUCTION

(Der Eisenbetonbau)

BY

PROF. EMIL MÖRSCH

of the Zurich Polytechnic

Authorized Translation of the Third (1908) Edition

By E. P. GOODRICH, C. E.

Mörsch's "Eisenbetonbau" is the clearest exposition of European methods of Reinforced Concrete Construction that has yet been published and is a recognized standard in Europe. It also has had an extensive sale in this country, but the comparatively limited usefulness of the German edition has prompted its translation and publication in English. It contains much information not given in any other book in the English language, and we highly recommend it as a necessary work for every engineer dealing with reinforced concrete design and construction.

Cloth; 6½ x 9½ inches; 364 pages and 350 illustrations. Price, $5.00 net.

INSPECTORS' HANDBOOK OF REINFORCED CONCRETE

BY

BALLINGER AND PERROT

Flexible cloth; 4½x6½ in.; 64 pp.; 6 Folding Plates, and an Appendix of Formulas and Tables. Price, $1.00 net.

NOW READY

BRIDGE AND STRUCTURAL DESIGN

BY

W. CHASE THOMSON,

Mem. Can. Soc. C. E.

Asst. Eng. Dominion Bridge Co., Montreal, Can.

Second Edition, Entirely Re-written and Every Illustration Re-drawn.

The first edition of this work, published in 1905, was originally developed from lectures given by the author under the auspices of the Dominion Bridge Co. The aim throughout has been to set forth the elements of bridge and structural design in a simple and practical manner, so that the man unacquainted with the higher mathematics may be led to understand the principles involved in the design of simple structures.

The first edition met considerable favor among the class for whom it was principally intended, viz., students and draughtsmen; and as that edition has become exhausted, at the request of the publishers the author undertook to revise it for a new edition. This revision has resulted in an entirely new book; every line has been re-written and every illustration re-drawn; while much new material has been added, making the volume more than double the size of the first edition.

ORDER NOW.

Cloth; 6x9 inches; 192 pages; 82 illustrations, including 4 folding plates.

Price $2.00 net.

ENGINEERING NEWS BOOK DEPARTMENT

220 Broadway New York

Firing Shots by Electricity.—By Sydney F. Walker. Eng. & Min. Jl., Jan. 22, 1910. 2 pp.

A discussion of the causes leading to misfires and suggestions with respect to the selection of high and low tension fuses.

Woodford Haulage System in Earth Moving Operations.—Ry. & Eng. Rev., Jan. 22, 1910. 1 p.

Describes an electric haulage system in a quarry in which the output is handled in motor dump cars which traverse a circular track adjacent to the quarry face. The cost of handling rock by this method is said to be 3.4 cents per cu. yd., as against 5.5 cents with locomotives.

Circular vs. Rectangular Shaft Sinking.—By Henry M. Payne. Eng. & Min. Jl., Jan. 22, 1910. 1⅔ pp.

The writer claims the cost of lining circular shafts is less and that besides being safer the circular form is more permanent.

Modern Shaft Sinking.—By F. Donaldson. Min. & Min., Jan., 1910. 3 pp.

In the November, 1909, issue of Mines and Minerals was commenced a series of articles on "Modern Shaft Sinking," of which this is the second installment, to be continued. This one describes the Knid-Chandron boring process and cementation of water bearing strata.

Locomotives vs. Stationary Hoisting Engines for Raising Material in Open Cut Mines.—By J. F. Jackson. Eng. News, Jan. 13, 1910. 1 p.

Contains many suggestive data for contractors engaged on heavy open cuts.

A New Explosives Ordinance for the City of Chicago.—Eng. News, Jan. 13, 1910. 2 pp.

Gives in full an ordinance passed Dec. 20, 1909, to regulate the storage, conveying and use of explosives within the limits of the city of Chicago, Ill.

Excavating Submerged Rock With a Drill Boat.—Eng. Rec., Jan. 8, 1910. 1⅔ pp.

A practical article on the methods adopted for the removal of about 25,000 cu. yds. of rock having its original surface from 5 ft. to 20 ft. below mean low tide, to secure a depth of 29 ft. below mean low tide.

Inclined Diamond Drill Borings Under the Hudson River.—Eng. Rec., Jan. 15, 1910. 2 pp.

The holes must go to a vertical depth of 1,400 ft. to locate the position of a ledge of rock in which the aqueduct tunnel for New York City is to be built. This article describes the work of boring the holes and the methods used to obtain the angle of the bore at different depths below the surface.

Gravel Washing Plants.—Eng. Rec., Jan. 15, 1910. 2 pp.

A general description of a plant for screening and washing 750 cu. yds. of gravel per 10-hour day.

Data on the Storage and Handling of Explosives.—Eng.-Contg., Jan. 5, 1910, 5½ pp.

This is a useful summary of data and instruction on the storage and handling of explosives in blasting and mining. Details of thaw houses and magazines are shown and also diagrams showing manner of loading holes, fixing primers and fuses, locating holes, etc.

Cost of Boring Five Test Wells for a Double Track Railway Bridge in California.—Eng.-Contg., Jan. 5, 1910, 1 p.

Describes methods of work and shows special chart for recording progress and character of test borings. Itemized costs are given, including all expenses.

Method of Making a Blast Displacing 180,000 Tons of Rock, with Some Costs.—Eng.-Contg., Jan. 19, 1910, 1 p.

Shows diagram of tunnel, describes method of charging, tamping and firing and gives results and costs, with some comments on the handling of large blasts.

A Special Hand Auger for Test Borings and Method of Using It in Prospecting for Coal.—Eng.-Contg., Jan. 19, 1910, 1 p.

Describes and illustrates simple and economical hand auger for making test borings and methods of using it, with some costs.

Cost of Stripping a Gravel Pit.—Eng.-Contg., Jan. 19, 1910, ½ p.

Gives methods and costs of stripping a gravel pit, using elevating graders and wheeled scrapers.

Earth and Rock Fill Dam with Concrete Core

Examine These Ten Concrete Books Free

At the Chicago Cement Show, Feb. 18-26

Our exhibit will include the following ten books on cement and concrete; all of which are published by us and are strictly up to date.

Concrete Bridges and Culverts
(TYRRELL)

Data directly required in the design and construction of concrete or masonry arches.

Flexible leather—272 pages.

Price, $3.00 net, postpaid.

Concrete Construction Methods and Cost
(GILLETTE and HILL)

Devoted exclusively to methods and costs of Concrete Construction.

Cloth, 6x9 inches—700 pages.

Price, $5.00 net, postpaid.

Engineers' Pocketbook of Reinforced Concrete
(HEIDENREICH)

Contains tables and data on the design and construction of concrete structures.

Leather, 4½x6¾ inches—374 pages.

Price, $3.00 net, postpaid.

Cements, Mortars and Concretes
(FALK)

Contains a complete report of the results of tests made during the past fifteen years.

Cloth, 6x9 inches—184 pages.

Price, $2.50 net, postpaid.

Theory and Design of Reinforced Concrete Arches
(REUTERDAHL)

The book for the engineer who designs concrete bridges, and for every student of the theory and practice of concrete bridge design.

Cloth, 6x9 inches—132 pages.

Price, $2.00 net, postpaid.

Concrete Inspection
(HILL)

A manual of information and instructions for inspectors of concrete work.

Cloth, 3½x6 inches—186 pages.

Price, $1.00 net, postpaid.

Concrete and Reinforced Concrete Construction.
(REID)

The most complete and comprehensive book ever written on the subject.

Cloth, 6½x9 inches—906 pages.

Price, $5.00 net, postpaid.

Reinforced Concrete A Manual of Practice
(McCULLOUGH)

It presents the theory of the design of reinforced concrete structures in a clear and simple manner.

Cloth, 5x8 inches—128 pages.

Price, $1.50 net, postpaid.

Practical Cement Testing
(TAYLOR)

The first practical and exhaustive treatise on this important subject.

Cloth, 6x9 inches—330 pages.

Price, $3.00 net, postpaid.

Diagrams for Designing Reinforced Concrete Structures
(DODGE)

This book is the outgrowth of diagrams prepared by the author for his own use while serving as a designing engineer for a reinforcing company.

Half cloth, 12x15 inches—112 pages.

Price, $4.00 net, postpaid

Send for 32-page booklet—listing the above books in detail.

You can secure one year's domestic subscription to ENGINEERING-CONTRACTING for $1.50 when this amount is added to the price of any one of the above books.

The Myron C. Clark Publishing Co.

Publication Office,
355 Dearborn St., Chicago

Eastern Office:
13-21 Park Row, New York

Wall, Patillas Irrigation Project, Porto Rico.—Eng.-Contg., Jan. 19, 1910, 1½ pp.

Describes and illustrates earth fill dam of interesting construction and gives methods of depositing materials. A good general article.

SURVEYING AND DRAFTING.

Colliery Surveys.—By David Harrington. Min. & Min., Jan., 1910. 2¾ pp.

Continued from the December, 1909, issue. To be continued. A very practical article on the subject.

Surveying Helps.—Min. Sci., Jan. 20, 1910. 2 pp.

One article gives 20 illustrations of signals used in surveying by instrumentmen and their helpers and another article describes and illustrates apparatus used in Europe for surveying a bore hole.

MISCELLANEOUS.

Iron and Steel Prices for Fifteen Years.—Iron Tr. Rev., Jan. 6, 1910.

The information is given in a chart issued as an annual supplement to the Iron Trade Review. This same issue contains several valuable reviews on the iron and steel industry with prices in different years.

A New Process in Iron Metallurgy—Slow Rusting Iron Produced in the Open Hearth Furnace.—Eng. News, Jan. 6, 1910. 3 pp.

American ingot iron is the trade name of a material used for road culverts and widely advertised as rust proof. It is an almost pure iron made in the open hearth furnace, and this article describes the process very clearly.

Relative Cost of Municipal Work Done by Day Labor and Contract in Boston, Mass.—By Harrison P. Eddy. Eng. News, Jan. 27, 1910. 3 pp.

A paper read in December, 1909, before Section 1 of the American Association for the Advancement of Science.

Economical Wood Preservation.—By Robert Hays. Ry. Age-Gaz., Jan. 28, 1910. 2 pp.

Considerable valuable information is given on the subject of wood preservation by creosote and crude petroleum. The author objects to specifications calling for absorption in pounds of oil per cubic feet and gives reasons why the absorption should be governed by the square feet of surface of the wood treated.

Wire Ropes in Colliery Practice.—By R. H Rowland. Eng. & Min. Jour., Jan. 20, 1910. 3 pp.

Illustrates the various arrangements of pulleys and discusses the benefits of lubricating both winding and hauling ropes. Lubrication properly applied preserves the interior hemp core and lessens the friction of the internal wires as the loaded rope passes over the pulleys. It is believed also that non-lubrication induces fatigue in the steel.

Cold Bending of Large Iron Conduit. — By George H. Westermann. El. Wld., Jan. 20, 1910. 1½ pp.

Describes home-made apparatus for bending wrought iron pipe conduit with diameters up to 3½ ins. without the aid of heat.

The Referencing of Engineering Literature.—By A. L. Menzin. Eng. Rec., Jan. 29, 1910. 1¼ pp.

The author compares present lengthy methods of indexing in use by technical men and advocates the use of legal methods as being concise. Examples are given. Briefly the method is to give first the volume number, followed by an abbreviation of the name of the publication and then the page number. An article ordinarily indexed, for example, as being in "The Journ. West. Soc. Engs.—Oct. 1907," would be indexed under the lawyers' method as in "12 J. W. S. E. 661." Other examples are given with reference to indexing professional papers, magazine articles, text books, catalogs, bulletins, drawings.

Municipal Waste, Its Collection and Disposal.—By Wm. Calder. Surveyor, Jan. 7, 1910, 3 pp. Jan. 14, 1½ pp.

This is an article by the City Engineer of Prahran, Victoria, read before the Australian Health Society. It is an able review of the subject with special reference to conditions in Australia.

On Computing.—By Russell Tracy Crawford. Cal. Jl. Tech., Jan., 1910. 7 pp.

An article of considerable value to students giving short cuts and methods seldom found in print.

Installation Cost of a Modern Steam Turbine Plant.—El. Wld., Jan. 20, 1910. 1 p.

The name of the plant is not given, but costs are given in detail. The plant is a 2,500-k.w. central station in a building to have an ultimate equipment of 10,000 k.w. Total cost per kilowatt, initial equipment, $91.98.

Advanced and Simplified Plumbing.—By Wm. Paul Gerhard. Dom. Eng., Jan. 8, 1910. 1½ pp.

This is a reprint of a paper read before the Massachusetts Society of Sanitary Officers. In it the well known author gives the essentials of modern plumbing, thus making the article of value to men who have to write or enforce plumbing ordinances.

The Carquinez Span.—Jl. El. P. & G., Jan. 22, 1910. 5¼ pp.

This article appeared in the May and October, 1901, numbers of the Journal of Electricity, Power and Gas and is here reprinted by request. It is an excellent description of the details in the work of spanning Carquinez Straits, California, with heavy high tension cables operating at 60,000 volts. The clear span is 4,427 ft., and a minimum clearance of 200 feet had to be provided above the water so full rigged ships could go under.

Valuation of Public Service Corporations.—By W. H. Williams. El. Ry. Jl., Jan. 8, 1910. 2 pp.

This is an abstract of a paper presented at a joint session of the American Economic Association and American Political Science Association, New York, Dec. 30, 1909. It deals entirely with railway lines and the effect of valuations on rate-making. The full address has been published in pamphlet form and may be obtained from the author, who is third vice-president of the Delaware & Hudson Co., New York.

The Design and Operation of Refuse Destructors.—Eng. Rec., Jan. 8, 1910. 1 p.

A very good general article digested from a paper read by Wm. F. Loveday before the Institution of Municipal Engineers and Surveyors, Great Britain.

Logarithmic Diagrams Based on Isoplethe Points.—By H. A. Gehring. Eng. Rec., Jan. 15, 1910. 2½ pp.

The title describes the character of the paper. Diagrams are drawn upon the principle of the slide rule to simplify calculations. In many ways these diagrams are preferable to those drawn on common cross section paper, but are not always superior to diagrams drawn on logarithmic ruled paper.

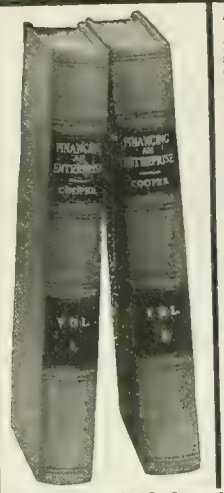
Methods of Filing Books, Pamphlets, Trade Catalogs and Periodicals for Small Private Libraries or Information Departments.—Eng.-Contg., Jan. 19, 1910, 1 p.

Describes a system of filing information of various sorts in small private libraries.

Processes for the Preservative Treatment of Timber and Approximate Costs of Treatment.—Eng.-Contg., Jan. 19, 1910. 1 p.

Describes several methods of treatment, gives time required for each stage of process and compares costs of the several processes.

FINANCING AN ENTERPRISE
By FRANCIS COOPER



TWO volumes that have helped hundreds of men win fortunes by showing them how to successfully finance and promote their business or their discoveries. Highly endorsed. Only successful work on promotion.
VOL. 1 describes conditions necessary for successful financing; how to investigate, protect and capitalize an enterprise; experimental work and model making.
VOL. 2 tells best methods for securing money, privately, or publicly, by advertising; how to advertise; how to write a winning prospectus. Important chapters on stock, bonds, incorporation, etc., etc. Invaluable knowledge gathered from fifteen years' experience. Save you hundred times its cost. Full descriptive circular if you want it.
500 pp. 1909 ed. Buckram binding. Two vols., $4.00 prepaid. Either vol. separately, $2.00 prepaid.
THE RONALD PRESS CO., Rooms 30-36, 229 Broadway, New York

CONTRACTORS AND ENGINEERS
SAVE LABOR — SAVE TIME
USE
Nash's Expeditious Measurer
A book of 200 pages of indexed tables, showing at a glance the cubic contents of any stone or package according to its length, breadth and depth. Used by Contractors, Quarrymen and Engineers everywhere. Order of your bookseller or from the publisher.
$2.00 Postpaid.

FRED. BROOKS, Secretary, 31 Milk Street, BOSTON MASS.

The Study of Engineering-Contracting in Engineering Colleges.—Eng.-Contg., Jan. 12, 1910, ¾ p.

An argument contending the possibilities of college courses in engineering contracting and a discussion of methods.

Refuse Disposal, and the New Refuse Incineration Plant for Milwaukee.—Eng.-Contg., Jan. 12, 1910, 2¾ pp.

A general description with illustrations of the new refuse incineration plant for the city of Milwaukee. A good general descriptive article.

Formulas for the Capacity of Tile Drains.—Eng.-Contg., Jan. 12, 1910, ½ p.

Analyzes various formulas for computing capacity of drainage tile and presents an argument for the use of the Kutler and Chezy formulas.

Suggestions on the Design and Selection of Traction Engines.—Eng.-Contg., Jan. 12, 1910, 1⅔ pp.

Gives the requirements of an ideal traction engine, discusses relative merits of steam and internal combustion engine power, gives formulas for determining horse-power for both and gives several useful tables of horsepowers.

Comparative Methods and Costs of Underground Conduit Construction.—Eng.-Contg., Jan. 5, 1910, 3 pp.

Describes various methods of construction, compares their advantages and gives comparative detailed costs of two types of conduits.

PUBLICATIONS RECEIVED.

Report on The Result of Certain Efficiency Tests of Centrifugal Pumps.—By Arthur L. Adams. The American Well Works, Aurora, Ill. Paper 6x9 ins. 12 pp. illustrated. Trade publication. Free.

Water Resources of the Blue Grass Region, Kentucky.—By George Charlton Matson; with a Chapter on the Quality of the Waters. By Chase Palmer. U. S. Geological Survey. Water Supply Bulletin 233. Washington, D. C. Paper 6x9 ins. 224 pp. illustrated.

Tests of Run-of-Mine and Briquetted Coal.—U. S. Geological Survey, Washington, D. C. Two bulletins:

Bulletin 403, Tests on the Torpedo Boat Biddle. By Walter T. Ray and Henry Kreisinger, with collaboration of Lieut. Com. Kenneth McAlpine, U. S. N. and Ensign J. W. Hayward, U. S. N. Paper 6x9 ins. 49 pp. illustrated.

Bulletin 412, Tests in a Locomotive Boiler. By Walter T. Ray and Henry Kreisinger. Paper 6x9 ins. 32 pp. illustrated.

Commercial Deductions from Comparisons of Gasoline and Alcohol Tests on Internal Combustion Engines.—By Robert M. Strong. U. S. Geological Survey, Bulletin No. 392. Government Printing Office, Washington, D. C. Paper 6x9 ins. 38 pp.

Incidental Problems in Gas-Producer Tests.—By R. H. Fernald, C. D. Smith, J. K. Clement and H. A. Grine. U. S. Geological Survey, Bulletin No. 393. Government Printing Office, Washington, D. C. Paper 6x9 ins. 29 pp. illustrated.

The Utilization of Fuel in Locomotive Practice.—By W. F. M. Goss. U. S. Geological Survey, Bulletin No. 402. Government Printing Office, Washington, D. C. Paper 6x9 ins. 28 pp. illustrated.

Report of Michigan Board of State Tax Commissioners and State Board of Assessors, 1907-8.—Secretary of State, Lansing, Mich. Cloth. 6x9 ins. 391 pp.

A Primer on Explosives for Coal Mines.—By Charles E. Munroe and Clarence Hall. U. S. Geological Survey, Washington, D. C. Bulletin 42[illegible]

This well written bulletin contains a great deal of information valuable to all users of explosives for blasting purposes.

Veneers, 1908.—Forest Products Bulletin 5. Bureau of the Census, Washington, D. C. Paper 6x9 ins. 13 pp.

Report Upon the Maintenance and Repair of the Washington Aqueduct, District of Columbia, and Washington Aqueduct Filtration Plant.—By J. J. Morrow, Major, Corps of Engineers, U. S. A. Benig Appendix D. D. D. Annual Report of Chief of Engineers 1909. Washington, D. C. Paper 6x9 ins. 28 pp. illustrated.

This report contains matter of value and interest to men in charge of filter plants for city

Twelve Important Books for Engineers and Contractors

Cost Keeping and Management Engineering
(GILLETTE and DANA)
The first book ever published on the subject of cost keeping on contract work.
Cloth, 6x9 inches—360 pages.
Price $3.50 net, postpaid.

Bricklaying System
(GILBRETH)
Illustrates and describes the underlying principles of performing this work economically. Invaluable to every contractor's foreman.
Cloth, 6x9 inches—330 pages.
Price, $3.00 net, postpaid.

Five Place Tables of Squares and Logarithms of Feet, Inches and 32nds of Ins.
(INSKIP)
The only book giving these values to 100 feet.
Flexible leather, 5½x7½ inches.
Price, $3.00 net, postpaid.

Railroad Location, Surveys and Estimates
(LAVIS)
Explains various operations in sufficient detail to be understood by students entirely unfamiliar with location surveys.
Cloth, 6x9 inches—270 pages.
Price, $3.00 net, postpaid.

Rock Excavation Methods and Costs
(GILLETTE)
Shows how to reduce cost of drilling and blasting of rock.
Cloth, 5½x7 inches—384 pages.
Price, $3.00 net, postpaid.

Solid Bitumens, Their Physical and Chemical Analysis together with a Treatise on the Chemical Technology of Bituminous Pavements
(PECKHAM)
Cloth, 6x9 inches—330 pages.
Price, $5.00 net, postpaid.

A Text Book on Graphic Statics
(MALCOLM)
Gives proofs together with full explanations of constructions. Easy reference.
Cloth, 6x9 inches—330 pages.
Price, $3.00 net, postpaid.

Field System
(GILBRETH)
The outgrowth of over 20 years of experience in the contracting business.
Flexible leather—200 pages.
Price, $3.00 net, postpaid.

Engineering Work in Towns and Cities
(McCULLOUGH)
Should be on the desk of every Mayor, Councilman, City Clerk, Commissioner and City Engineer.
Cloth, 5x7½ inches—527 pages.
Price, $3.00 net, postpaid.

Surveyors' Hand Book
(TAYLOR)
Describes instruments, their care and adjustment; and the methods practiced in making surveys of all kinds.
Flexible leather—328 pages.
Price, $2.00 net, postpaid.

Tables for Structural Engineers
(GODFREY)
This book is a compilation of tables and data for use in structural designing.
Flexible leather—218 pages.
Price, $2.50 net, postpaid.

Telephone Line Construction Methods and Costs
(MAYER)
The book describes Methods and Costs of Pole Line Construction, of Cable Construction, of Cable Splicing, of Removing Old Line and [illegible] Underground Conduit, Detailed Cost of Constructing 824,862 Duct Feet of Underground Conduit and 318 Vaults in One Job, Miscellaneous Costs and Special Data, etc., etc.
Cloth, 6x9 inches—300 pages.
Price, $4.00 net, postpaid.

Send for 32 page booklet—listing the above books in detail.

You can secure one year's domestic subscription to ENGINEERING-CONTRACTING for $1.50 when this amount is added to the price of any one of the above books.

The Myron C. Clark Publishing Co.

Eastern Office:
13-21 Park Row, New York

water works. Cost of operation and bacterial and chemical results are given.

Concrete Garages.—The Atlas Portland Cement Co., 30 Broad St., New York. Paper 6½x9 ins. 36 pp. illustrated. Trade publication.

This book is one of a series of valuable books on the use of cement issued by the Atlas Portland Cement Co. For garages and similar buildings it is seldom the case that an architect is employed, the owner employing a contractor to erect a shed for the machine. The hints and illustrations in this book are therefore of great value to men who want fireproof buildings in which to house their automobiles.

The Development of the Downflow Boiler.—By J. C. Parker. Parker Boiler Co., Philadelphia, Pa. Paper 6x9 ins. 26 pp. illustrated. Trade publication.

This is an authorized reprint from the January 1909 Proceedings of the Engineers Club of Philadelphia and describes in an interesting way the development of a boiler that is attracting much attention in power engineering circles.

BOOK REVIEWS.

Simplified Mechanical Perspective.—By Frank Forrest Frederick, Peoria, Ill. The Manual Arts Press. Cloth, 7x10 ins. 544 pp., illustrated. 75 cts.

This is a thoroughly good little book. The subject is presented in a plain, practical manner, and considerable attention is paid to the perspective of interiors of rooms, thus making it an excellent reference manual for engineers and architects.

A Treatise on Masonry Construction.—By Ira Osborn Baker, C. E., D. Eng. Professor of Civil Engineering, University of Illinois. Tenth edition, rewritten and enlarged. New York, John Wiley & Sons; London, Chapman & Hall, Ltd. Cloth, 6x9 ins. 745 pp., 244 illustrations. $5.

This is the best work on masonry in the English language, and no engineer or contractor can afford not to own it. The first edition appeared in 1889 and was immediately popular. In 1899 it was revised and this present edition has been rewritten to bring the subject fully to date. The size of the volume has been increased by adding to the number of pages. There are three new chapters on Reinforced Concrete, Concrete Building Blocks and Elastic Arch. The best oractice of leading engineers has been illustrated. Materials used in masonry construction are first fully described, followed by a discussion of foundations on land and under water, after which the design and construction of masonry structures are fully dealt with. A remarkably full index of 13 pages makes of the book an ideal work for reference. Copious references are made to original sources of information. The publishers have aided fully in making the book pleasing to the eye. The paper, type, illustrations and binding are excellent.

The Theory of Structures.—By R. J. Woods, M. Inst. C. E. London, Edwin Arnold; New York, Longmans, Green & Co. Cloth, 5½x8¾ ins., 276 pp., 157 illustrations in the text. $3.

The first thing that attracts the attention of the reader of this book is the large number of numerical examples to test the knowledge of the student. This gives it considerable value as a reference book. The first chapter takes up the subjects of compound stresses and principal stresses; the second chapter earth pressure, and the third chapter stresses due to eccentric loads. A number of worked numerical examples are given to illustrate eccentric stresses in steel details. The greater portion of these three chapters relates to earth pressure and the stability of masonry walls, buttresses and dams.

The author is very clear in his methods, but takes it for granted that his readers are able to integrate and differentiate, so that the book is intended, as he states in the preface, "for advanced students and draughtsmen engaged in structural design." It is not ideally arranged as a full text book because of a lack of balance in the contents. As a desk help for a designer and as a reference text in schools it is good.

Chapter IV, 15 pages, deals with working stresses and cross-sectional areas, and stresses in girders with parallel chords by method of coefficients. Chapter V, 10 pages, deals with the general method for girders with parallel chords. Chapter VI, 8 pages, is on parabolic girders, and Chapter VII, 16 pages, on curved girders not parabolic. Chapter VIII, 17 pages, takes up the subjects of wind pressure, portal bracing, high steel trestles. Chapter IX, 19 pages, continuous girders. Chapter X, 10 pages, cantilever girders, suspension and stiffening girders. Chapter XI, 17 pages, design of riveted joints. Chapter XII, 15 pages, plate girders, in which a design for a single track plate girder of 60 ft. span is worked out. Chapter XIII, 12 pages, columns and struts. Chapter XIV, 25 pages, arched ribs and braced arches. Chapter XV, 30 pages, reinforced concrete. This chapter is based on the well known American work of Turneaure & Maurer.

American users of the book must remember the British ton is 2,240 pounds, for the author gives stresses in terms of "tons per sq. in.," customary in British engineering practice, instead of using "lbs. per sq. in.," as is customary in America.

How to Use Concrete.—Compiled by Walter C. Boynton and R. Marshall. Detroit, Mich., Concrete Publishing Co. Cloth, 6x9 ins., 233 pp., illustrated. $1.

The compilers of this book are the editor and associate editor, respectively, of the monthly journal "Concrete." It is practically a scrapbook of articles and fillers of more or less value clipped largely from semi-popular trade publications. It is not intended for and is of slight value to engineers. It has a 12-page index.

Diagrams for Designing Reinforced Concrete Structures, Including Diagrams for Reactions and Strengths of Steel Beams.—By G. F. Dodge, M. West. Soc. Eng. Chicago and New York. The Myron C. Clark Publishing Co., London, E. & F. N. Spon, Ltd. Cloth. 12x15 ins. 109 pp. 4 tables; 65 illustrations in the text; 36 full-page diagrams, $4.

Because of the number of variables entering into reinforced concrete design no satisfactory books of tables, similar to the steel hand books have appeared to assist men who design in this composite material. It is a question whether such books will appear until authorities come closer together on the many present points of difference. Diagrams, however, are in common use and many are very ingenious. Each designer, has prepared his personal diagrams with reference to a particular building ordinance or his own idea. The only diagrams so far published have been partial only.

In this book Mr. Dodge shows the possibilities that lie in diagrammatic computation. Every diagram is complete and the pencil in tracing a problem never leaves the paper. He recommends a strip of tracing cloth with a light line ruled on it instead of a pencil. An example of the simplicity of the use of one of his diagrams is as follows: Diagram No. 1 is for slabs. At the top in the upper left hand corner the vertical lines indicate percentages of steel. Starting at an assumed per cent of steel drop vertically to intersecting diagonal lines giving, respectively, the steel and concrete stresses, then to the right to an intersection with the loading conditions (W1 8-10-12-16-20-24 as required), then down to the span. From this point to the right for safe live load, then up or down vertically to the steel percentage. From this point a line to the edge of the diagram gives the steel area and in the upper right hand corner an auxiliary diagram starts from the area drops vertically to any size rod or bar wanted and to the right is found the spacing c. to c. between the rods or bars. In connection with the live load lines a pretty solution is given. When the live load line is reached drop vertically to the bottom of the diagram to the slab thickness. This slab thickness is the thickness above steel, but allows for 0.8 in. covering of concrete for the steel. It will be seen therefore that no preliminary assumptions are made for total load. The lines are curves for total load but the author has done all the figuring and made the proper deductions. Instead of assuming a total load and obtaining the depth to center of steel the designer uses only the live load and gets his total slab thickness together with reinforcing area, sizes and spacing of steel.

From the foregoing the reader may see how simple a matter the calculation of a slab becomes. The range of steel and concrete stresses is as great as any designer will be called upon to deal with and the same is true of spans, live loads and percentages of steel. Five slab diagrams are given for values of the ratio between

The Journal OF Western Society OF Engineers

is a high grade bi-monthly illustrated magazine of about one hundred pages in each number, and contains the original papers of engineering interest that have been presented to the society, with the discussion of the same. These papers treat of subjects in all lines of engineering, are well illustrated and should be of value to engineers, chemists, scientific and business men everywhere.

The Subscription Price is $3.00 a Year

The circulation is about 1,600 copies of each issue, six times a year.

The JOURNAL is a valuable advertising medium, as it goes all over the world and to a high class of technical readers. Advertisements, if of interest to engineers, may be published in the JOURNAL.

For rates or other information concerning the JOURNAL of the Western Society of Engineers address or call upon the Secretary, **1735 Monadnock Block, Chicago.**

The October Number Contains

"Clay Products"

By A. V. BLEININGER,
Ceramic Chemist with the Clay Products Section of the U. S. Geological Survey.

An extensive paper on the work of the Section, giving results of tests on clay products used in construction work.

"Contracts for Structural Steel Work"

An extensive discussion by Attorneys, Architects, Engineers and Contract Managers, covering "Liabilities;" "Penalties," "Damages," "Arbitration," "Relations of Parties in a Contract," and "Payments." Forms of Contracts of unusual merit are given.

"Possibilities of Commercial Automobiles"

By W. W. MACFARREN,
Mechanical Engineer.

An illustrated paper with discussion covering commercial problems of transportation with data on costs per ton-mile, mechanical considerations, etc.

Proceedings

The Engineers' Society of Western Pennsylvania

50 cents per copy. $5 per year.

ELMER K. HILES, Secretary,
803 Fulton Building, PITTSBURGH

moduli of elasticity = 12, 15, 18, 20 and 30, the last for cinder concrete. Every diagram being on one sheet the designer can start from any assumption as to load, fiber stresses, steel area or slab thickness and trace lines to obtain the other data. The value of the diagrams for the purpose of reviewing designs and checking calculations may be thus seen.

The diagrams mentioned use the straight line theory of variation of stress. To make the book complete every straight line diagram has a parabolic stress diagram duplicate. The diagrams cover the design of rectangular beams, both straight line and parabolic; T-beams, straight line theory; beams with compressive reinforcement. Diagrams are given for longitudinally reinforced columns and for hooped columns for ultimate loads as well as for working loads.

The best treatment the reviewer has read on the subject of shear and diagonal tension is given here with diagrams to proportion web reinforcement. Deflection is also considered and a diagram given so the probable deflection under any load may be ascertained. The question of deflection has not been deemed of enough importance to be mentioned in concrete text books until the past year. The subject of impact is also discussed and a diagram given to ascertain the allowance to be made for it. Two diagrams give more data on steel beams than many hand books contain in numerous tables; and to supplement these diagrams four tables are presented giving moments of resistance for standard steel beams and Bethlehem sections. The concrete designer must so often use steel beams in connection with his other work that these tables and diagrams possess peculiar value. The author presents 33 cases of bending moments, reactions and shears for different loadings, together with the maximum deflections in most cases. From an inspection of the figures the designer may select the loading condition to be considered in using the proper diagram. Two familiar diagrams, one for reactions, the other for bending moments are given, computed in accordance with the "Theorem of Three Moments" for continuous beams.

Diagrams are also given for bending moments and are duplicated where convenience dictates so the user of the book is not required to turn pages but may, in nearly every case, find all required information on facing pages. Each diagram is accompanied by a page of instructions for use containing a worked example.

The author has had an extremely good experience in reinforced concrete design and the data presented were developed by him to obtain the greatest possible saving in the detail work of designing with exact formulas. It is based on the published results of the tests of Professor Talbot and the standard work of Turneaure & Maurer. The nomenclature is the same as that of these eminent authorities so the user is not confused by the introduction of new letters and does not have to give new meanings to letters in common use in formulas. While the diagrams and the descriptions of their use are so plain that men with a very slight knowledge can use them, the author has placed in the book a discussion on reinforced concrete of great value and scientific enough to satisfy the most captious engineer. The collection of formulas is complete so results from the diagrams may be checked by designers who prefer arithmetical work. Men who prefer tables may readily compute extended tables from the data here presented. Instead of using ordinary cross section paper in which all curves converge, logarithmic ruled paper is used in which the curves are straight parallel lines in nearly every case. A real need has been supplied and the office man is at last given a book he has wanted.

PRODUCTS OR DIVIDENDS is a *book* (implemen really) that

CALCULATES

without mental gymnastics and better than any machine. Costs $3. Request description from the inventor.

G. A. CHRISTENSEN, Civil Engr.,
Box 22-C, San Francisco, Cal

CONCRETE CONSTRUCTION
METHODS AND COST

By
Halbert P. Gillette
M. Am. Soc. C. E., M. Inst M. E.,
Managing Editor, Engineering-Contracting
and
Charles S. Hill, C. E.,
Associate Editor, Engineering-Contracting.

THIS book handles the subject of concrete construction entirely from the view-point of the ***builder*** of concrete structures. The testing of cement, the physical properties of cements and concrete, and the design of concrete structures are not considered. The aim of the authors has been to eliminate all matter not germane to the constructing end of their subject. By doing this it has been possible to crowd a vast amount of detailed information on methods and cost of concrete construction into a volume of moderate size. The book is a treatise on the ***methods and cost*** of building in ***concrete.***

WHILE concrete design is not considered, no designer of concrete can be a really good designer without having a profound knowledge of costs and of practical methods of construction. This book will be of interest therefore to every engineer and architect who is engaged in designing concrete structures. It should be of particular assistance, however, to the contractor or engineer engaged in the actual work of making and placing concrete.

THE methods given are practical methods and they are so given that the practical man can use them. The costs given are actual costs, itemized, analyzed and reduced to units. Costs of material, costs of transporting, costs of mixing, costs of placing, costs of tamping, costs of finishing, costs of forms, costs of bending and placing reinforcement, costs of waterproofing, costs of superintendence, costs of plant, interest charges, depreciation charges are all given, and to make these costs useful, the conditions and the methods of doing the work are stated in each case.

Cloth, 6 x 9 inches, 700 pages, 306 illustrations, $5 net, postpaid.

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

Several large railroad construction contracts have been let recently, among them the following: Grading, tunneling and masonry work for the Durango-Llano Grande line of the National Railways of Mexico. This line is to be 100 kilometers long and the contracts were secured by John Phillips and the Cia Bancariade Fomento, both of the city of Mexico. Contracts for 83.3 miles of double track work on the Coast Lines of the Atchison, Topeka & Santa Fe Ry. have also been let, the successful contractors being the C. H. Sharp Contracting Co., Kansas City, Mo.: Mishou & Millard, Pueblo, Colo.; L. J. Smith Contracting Co., Kansas City, Mo.; and the Sharp-Hauser Contracting Co., Los Angeles. ——One of the largest drainage contracts for several weeks is now being advertised by the auditor of Marshall County, at Warren, Minn. The work calls for the construction of ditches requiring the excavation of 5,539,578 cu. yds. of material. Bids are to be opened March 1. ——Two large dam contracts were let during the past week. One of these called for the construction of a dam and power house on the Cedar River at Cedar Falls, Wis., the contract being secured by the Ambursen Hydraulic Construction Co. of Boston, Mass. The other contract was for the construction of the power development on the Etowah River near Creighton, Ga., this work being secured by Frank B. Gilbreth, Inc., New York.——George W. Jackson, Inc., New York and Chicago, has secured the contract for constructing the Yonkers siphon for the Board of Water Supply of New York city, the contract price being $1,479,425. This deep pressure tunnel is designed for a pressure of 300 lbs. and an interesting method of grouting will be employed to make it water tight. A description of this method will be found elsewhere in this issue. ——Preliminary matters for a 300,000 acre irrigation system between Canon City, Colo., and Pueblo, Colo., are shaping up so that bids for its construction will be asked within the next two months. The system will iinclude the construction of about 150 miles of main canals, 300 or 400 miles of laterals, 10 reservoir dams, etc. The Arnold Co., Chicago, Ill., is the engineer.——The Norfolk & Western Ry. has asked bids for constructing a 4,700 ft. tunnel at the head of Beech Fork in Virginia, and also the low grade connecting lines, about 8.9 miles long, at Petersburg, Va.——Shanty house talk was evidently responsible for the report that the Atlantic Coast Line R. R. was to build a branch line from Springhope to Raleigh, N. C., for officials of the road write that they have no information of any such extension.——The Soo is planning to build two cut offs on its subsidiary line, the Wisconsin Central, and it looks as though these contracts would be let this month or early in March.

Back to the Farm and Return.

We have a friend who was a sincere believer in the "back to the farm" movement so vigorously advocated at this present time by those who wish to sell their farms. We say was, for he is no longer a sincere believer; he tried it. This man had a very nice contracting business and was making much money; somehow he got the idea that the farmer's life was the "life for him." That he has changed his view is shown by a recent letter, extracts from which are given below: "——— ———. As you know, a couple of years ago I got tired of the dirt moving business and decided to buy a farm. So I sold my graders and scrapers and bought a nice little 150-acre place. I moved on to my farm in the winter, so as to begin getting my crops in the ground as early in the spring as possible. I didn't know much about farming, but I had a hired man who did, or fooled me into thinking he did. Just as soon as the snow went off and the ground was right we put in the crop and it came up fine. Then came a hard frost, the hardest ever known in that vicinity, and killed off all my green stuff. So we started all over again. This time the corn had hardly come out of the ground before a wet spell came. It rained for two weeks and the second planting was spoiled. In addition, the river came up and washed off about 10 acres of my land, swept away a hay shed, and drowned two cows. We finally put in the third crop, and this time it took. At the end of the year when I settled up my account I found that I hadn't made a cent. The next year I had about the same luck, and I found that my profits were practically the same as they were the first year. That was enough for me and I'm going back to the good old contracting business, where a man only has to work 12 hours a day, seven days a week. There's money in my farm; I put in $6,000 myself, and it is still put. But now that I have succeeded in making one blade of grass grow where two grew before, I'm going to beat it while my wind is good."

Placing the Blame.

The city of Paris is beginning to recover from the recent disastrous flood in the Seine and some of the Parisians are now engaged in a bitter attack on the French engineering profession, which they hold responsible for the invasion of the city by the floods. One member of the French Academy discussing the question of which was most to blame, the members of parliament or the engineers declares that the latter were, and goes on to say that the presumptuous and arrogant confidence of the engineers in their dry formulae prevented them seeing the plain fact, which the veriest ignoramus would take cognizance of, is that the windows open on the Seine only a few feet above its ordinary level all along the railway subway that skirts its left bank invite disaster. He further predicts that when the city has resumed its normal condition, the engineers will sketch plans of restoration whose chief feature will be that they will merely afford another stupendous opportunity for political jobbers and corrupt contractors to make colossal fortunes. Another eminent Parisian asserts that the city is the victim of the "pseudo science" of engineering, and says: "The dry rot of formal technology has done the harm. These engineers in their fatuous conceit commanded nature, as did King Canute, to pause at a certain point, and nature refused to pause, simply because their modern constructions which were to have restrained it proved much feebler and much less the creations of common sense and honest workmanship than those of the modest engineers who worked under Valois kings and Bourbons."

News from New York City.

Associated press dispatches of the past week contained two news items which interested us very much. One of these referred to an old timer whom we had thought had been lost in the shuffle of time. It will be seen, however, from the following news note that he is still doing business at his old stand: "Patrick Diskin, a carpenter, is in the Lebanon hospital because he deliberately sawed off the end of a log on which he was seated six stories above the ground. The man apparently is not injured seriously. Diskin had been ordered to saw off the end of the log, which projected from a window over the street. He went up, got out on the end of the beam and carefully sawed it in two between himself and the window. The beam was bruised at one corner and Patrick was unconscious. Asked today why he had done such a thing, Diskin replied: 'Sure, them was my orders.'" The other item refers to the duties of a water register. It seems that the mayor of New York city asked several of the officials of the city to make personal reports on their duties. The following report was said to have been made by a $3.000 a year water register; it is given verbatim: "Generenll Busnes off Water Rejeter: Seen that all clorks rive on tim. Seen that they doo doty evey day. Seen all permit too tak out meter. Seen that send out billes. Seen that constuchers pay billes. Every day too setle all disputes. Seen all billes complaints look after. Seen Joe Mole and Malor every day.'

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ARKANSAS.

The Memphis, Paris & Gulf R. R. has preliminary lines run from Ashdown, Ark., to Terrell, Tex., 154 miles, and the locating engineer, G. H. Cravens, and two men are now at Nashville laying the proposed locating line on the map. The company intends to run preliminary lines from Murfreesboro, Ark., via Arkadelphia, Pine Bluff, Marianna and into Memphis. The line from Memphis to Dallas is 112 miles shorter than any other line. H. C. McCluer, Nashville, Ark., is chief engineer, Memphis, Paris & Gulf R. R.

CALIFORNIA.

Contracts for double track work on the Coast Lines of the Atchison, Topeka & Santa Fe Ry. have been let by H. C. Phillips, chief engineer of the A., T. & S. F. Coast Lines, Los Angeles, Cal., as follows: For double tracking Rio Puerco to Suwanee, a distance of 13.1 miles, El Rita to Laguna, 6.4 miles. McCartys to Horace, 6 miles, to the C. H. Sharp Contracting Co., Kansas City, Mo.; all of this work is in New Mexico, on the Albuquerque division. Winslow to Dennison, a distance of 12.6 miles, let to Mishou & Millard of Pueblo, Colo.; this work is on the Albuquerque division in Arizona. Flagstaff to Williams, let to L. J. Smith Contracting Co. of Kansas City, Mo., a distance of 34 miles, on the Albuquerque division in Arizona. Daggett to Barstow, on the Arizona division in California, a distance of 9.4 miles, and Barstow to Cottonwood, on the Los Angeles division in California, a distance of 11.8 miles, to the Sharp-Hauser Contracting Co. of Los Angeles. This up to the present time covers all second track work awarded on the Coast Lines.

IOWA.

The Iowa & Illinois Ry. Co. has asked the city council of Davenport for a franchise for a track along the river front. The company has not completed its plans for the track as yet. P. P. Crafts, Clinton, Ia., is general manager.

The Railroad Promotion & Construction Co. of Des Moines is projecting the construction of an 80 mile interurban line from Des Moines through Dallas, Columbia, Russell and Centerville. Surveys have not been made and the project as yet is in the promotion stage. H. H. Polk, Des Moines, is president and B. Schreiner, Des Moines, is chief engineer.

KANSAS.

The Hutchinson Interurban Ry. Co., W. A. Scothorn, general manager, Hutchinson, Kas., is planning an extension of about one-half mile to the fair grounds. Surveys have not been made as yet.

NORTH DAKOTA.

The Wahpeton-Breckenridge Street Ry. Co. now has under construction a one mile street railway line on the Main streets of Wahpeton and Breckenridge. F. L. Strum, Wahpeton, N. D., is chief engineer and Mathias Braun, Wahpeton, is president.

OKLAHOMA.

The Oklahoma Union Traction Co. is projecting a 30 mile line from Tulsa to Sapulpa and Tulsa to Broken Arrow. Surveys have been partially made, the construction capital has been secured in part and a portion of the line is now under construction. G. B. Small, Tulsa, Okla., is chief engineer and A. A. Small, Tulsa, is president.

OREGON.

We are advised that the Oregon Electric Street Ry. Co. has not as yet reached any definite decision as to its extensions proposed for this year. Press reports state that the company has had surveys completed for extensions aggregating 65 miles. Guy W. Talbot, Portland, Ore., is vice president and general manager.

The Mount Hood R. R. Co. is projecting the construction of a 75 mile line to connect with the Oregon Railroad & Navigation Co.'s line. Surveys have not been made as yet. W. H. Eccles, Dee, Ore., is president and Jas. W. West, Dee, Ore., is chief engineer.

TEXAS.

M. J. Healy, railroad promoter, Mineola, Tex., writes us that he has a $500,000 or $600,000 job for the construction of the Texas, New Mexico & Pacific Ry. from McKinney to Bridgeport, Tex. He writes that it is a good opening for a contractor or construction company that can take an interest of $50,000 in stock. Estimates, profiles, etc., can be seen at McKinney.

The Brownwood North & South Ry. Co., of Brownwood, Tex., has effected its organization, and on Feb. 2 elected the following officers: Brook Smith, President; Will H. Mayes, Vice President; D. F. Johnson, Secretary, and Ward McConnell, Treasurer. John Meade, Chief Engineer, will have matters in shape within a few days, and it is believed that contracts can be let between Feb. 20 and March 1. Contracts and bids will likely be made through Secretary D. F. Johnson, Brownwood, and passed on by the Board of Directors. The first construction work will be on a 20-mile line to Mav.

VIRGINIA

The Chesapeake & Ohio Ry. has a corps of engineers in the field making surveys between Charlottesville and Orange. No decision, however, has been reached as to what work, if any, will be undertaken. H. Pierce, Richmond, Va., is engineer of construction, Chesapeake & Ohio Ry.

The Norfolk & Western Ry., James R. Schick, engineer, branch lines, Roanoke, Va., has issued invitations for bids for the construction of a 4,700 ft. tunnel at the head of Beech Fork of Dry Fork on a 15.5 mile connection between the Dry Fork branch of the Norfolk and Western and the Indian Creek waters of Clinch River, about six miles north of Cedar Bluff. The tunnel is located in Tazewell County, Virginia. The balance of work is not to be let at present. Invitations are also out for the construction of the Petersburg low grade connecting lines, about 8.9 miles, lying south of the city of Petersburg, Va., between Poe and Addison.

WASHINGTON

As previously stated in these columns, the Lorimer & Gallagher Co., 217 La Salle St., Chicago, Ill., has the contract for filling in the bridges on the line of the Chicago, Milwaukee & Puget Sound Ry. east of the Columbia River in Washington. The contract includes 1,000,000 cu. yds. of earth excavation. The Lorimer & Gallagher Co. has 75,000 cu. yds. of team work, which it will sublet at once.

WISCONSIN.

The Minneapolis, St. Paul & Sault Ste. Marie Ry. has surveys in progress for two cutoffs on the Wisconsin Central, one of 17 miles, New Richmond to Withrow, and one of 19 miles, Spencer to Owen. Construction contracts will be let the latter part of February or the first of March. Thomas Greene, Minneapolis, Minn., is chief engineer.

CANADA.

The Edmonton Radial Ry., Chas. E. Taylor, superintendent, Edmonton, Alberta, will let construction contracts in April or May for five miles of line. Surveys have not been made as yet.

MEXICO.

Bids were opened Jan. 11 by James M. Reid, chief engineer, National Railways of Mexico, for the grading, tunnel and masonry work on the 100 kilometer line from Durango to Llano Grande, Durango, the contracts being let as follows: John Phillips, Fundicion de las Delicias, 3a. Calle de las Delicias, Mexico, D. F.; Cia. Bancaria de Fomento, Obras y Bienes Raices, S. A. Ave. del 5 de Mayo, Mexico, D. F.

Power Developments, Levees, Drainage and Irrigation Works.

COLORADO.

Contracts are to be let within the next two months for the construction of an irrigation system between Canon City, Colo., and Pueblo, Colo., which will irrigate 300,000 acres of land lying on both sides of the Arkansas River. In general these contracts will cover about 150 miles of main canals and between 300 and 400 miles of laterals and smaller canals, the total yardage amounting to approximately 700,000 yds. of rock and 3,000,000 yds. of earth, 10 reservoir dams amounting to about 5,000,000 yds. of earth and 100,000 yds. of masonry; also several masonry diversion dams, ranging in height from 20 to 50 ft., and several miles of concrete siphon. W. H. Rosecrans of the Arnold Co., 181 La Salle St., Chicago, Ill., is chief engineer, and H. G. Raschbacher, Canon City, Colo., is resident engineer.

GEORGIA.

The contract for the construction of the power development on the Etowah River, near Creighton, Ga., for the Blue Ridge Power Co., has been secured by Frank B. Gilbreth, Inc., 60 Broadway, New York. This work will include the construction of a Ransom hollow dam 42 ft. high and 600 ft. long, and a reinforced concrete power house sufficient for 4,000 h. p. installed.

ILLINOIS.

As noted in a previous issue, bids will be received until 10 a. m., Feb. 23, by Major Thos. H. Rees, U. S. Engineers, 508 Federal Bldg., Chicago, for dredging and rock excavation in the Chicago River. The work to be done consists in the excavation of rock and non-dredgable hard pan from a point in the north branch of the Chicago River about 520 ft. below Fullerton Ave. bridge and up to that bridge, in Chicago. The total estimated quantity of material to be removed to complete the work is 5,000 cu. yds., place measurement. The materials to be removed consist generally of impure limestone rock, covered in scattered sections with irregular strata of hard pan varying in thickness between 1 in. and 1 ft. and somewhat more in a few places. The southerly 250 ft. contains only a comparatively thin layer of hard pan above grade (averaging not more than about ½ ft. in thickness) and this is to be classed with soft material if it is found that it can be removed by means of an ordinary dredge; otherwise, that is to say, if blasting must be done, it will be classed as rock. The cuts will average about as follows: From the bridge southwardly about 300 ft., 3 ft.; thence sloping gradually to zero. The rock and hard pan will be excavated to 21 ft. below Chicago city datum.

IOWA.

O. P. Herrick, Observatory Bldg., Des Moines, Ia., has been awarded the contract for constructing a levee in Drainage District No. 9, in Allen Township, Polk County. Bids for the work were opened Feb. 1 and it includes the moving and placing of about 89,505 cu. yds. of earth. The contract price was 20.7 cts. per cubic yard.

LOUISIANA.

Plans are under way for the drainage of 50,000 acres of land in the vicinity of Bayou La Fourche, by means of canals, levees, lateral ditches and pumping plans. Engineering details of the work have not been completed, but the following information as to what is to be done is available: The work for the most part will consist of the construction of drainage ditches, the total yardage of which will approximate 1,000,000 cu. yds. Seventy-five per cent of this will be in large canals of 40-ft. bottom and less, the remaining 25 per cent being in small lateral ditches. This material should be moved in ten months after signing of contract. In addition thereto there will be two central stations developing electricity for the operation of direct connected, electrically driven pumps, of which there will be in the neighborhood of 15, each of a capacity of 36,000 gallons per minute. The Arnold Co., C. E. Freeman, assistant chief engineer, hydraulic department, 181 La Salle St., Chicago, Ill., is the engineer for the work.

MINNESOTA.

Bids are asked by J. L. Johnson, county auditor, Oliva, Minn., until 10 a. m., March 1, for constructing County Ditch No. 45. The open ditch work includes the following:

	Width of Bottom. Ft.	Average Depth. Ft.	Cubic Yards.	Estimated Cost.
A. Main	8	6.7	85,370	$ 5,976.00
B. Main	10	6.2	103,535	7,247.00
C. Lateral	6	5.5	21,602	1,512.17
Total			210,507	$14,735.17

Can be dug with one dredge without rebuilding.

	Width of Bottom. Ft.	Average Depth. Ft.	Cubic Yards.	Estimated Cost.
A. Lateral	4	6.	29,289	$ 2,343.00
B. Lateral	6	6.3	32,659	3,265.00
C. Lateral	6	5.5	3,300	350.00
Total			65,448	$ 5,958.00

Can be dug with a walking machine or small dredge without rebuilding.

	Width of Bottom. Ft.	Cubic Yards.	Estimated Cost.
A. Lateral	cleaning	...	$ 90.00
B. Lateral	2	868	131.00
C. Lateral	4	1,476	147.62
Total		2,344	$368.62

Can be done with teams and scrapers.

The tile work includes the following materials for construction of about 14.3 miles of tile drains:

Tile to be of hard burned clay and sizes ranging from 5 ins. to 24 ins. in diameter, estimated of furnishing all materials on the ground	$9,726.35
Estimated cost of construction work	6,626.35
Total estimated cost of tile work complete	$16,389.10
Also one 14-in., one 10-in. and one 18-in. iron R. R. culvert, in place, estimated to cost	$ 378.64
And lowering present 3-ft. culvert	144.00
Total	$ 522.64
Grand total for the drainage system of	$37,973.53

Bids will be opened at the office of A. G. Lundgren, auditor of Marshall County, at Warren, Minn., at 10 a. m., March 1, for the construction of Judicial Ditch No. 11 of Marshall and Beltrami counties. The work includes the excavation of 5,539,578 cu. yds. of main ditch and branches, the estimated cost being $529,963; also the leveling of 550 miles of road work along the ditch. W. R. Hoag, 1320 Seventh St., southeast, Minneapolis, Minn., is the engineer. The official advertisement will be found elsewhere in this issue.

NEW YORK.

George W. Jackson, Inc., 46 Wall St., New York, and Chicago, Ill., has been awarded Contract 54, for constructing the Yonkers siphon, etc., for the Board of Water Supply of New York city. Bids for this work were opened Jan. 25. The contract price was $1,479,425 and the work includes the construction of a portion of the Yonkers siphon, a deep pressure tunnel 16 ft. 7 ins. inside diameter, and about 2 miles long, reached through three shafts from 100 to 150 ft. in depth, and a connection chamber with appurtenant works The work is located in the city of Yonkers, about 1½ miles northwest of the Mt. Vernon station on the Harlem division of the New York Central & Hudson River R. R.

OHIO.

W. H. Garretson, 705 Delta Ave., Cincinnati, O., has 20,000 cu. yds. of grading to sublet. The material is good and a good price will be paid.

TEXAS.

The Grand Falls Drainage District has postponed the date for opening bids for constructing a drainage system from Jan. 22 to 2 p. m., Feb. 23. Bids will be received by H. V. Carr, secretary of the district, at Grand Falls, Tex. Bonds in the sum of $33,000 have been issued for the work. A. H. Dunlap is the engineer.

WEST VIRGINIA.

The White Rock Sand Co., of Corinth, W. Va., which has been for three years past producing 100 tons of crushed and washed white rock sand of a superior quality, is now in the market for improved machinery, and will at once build a modern plant for mining, crushing and loading not less than 500 tons per day. The company is located on the main line of the B. & O. R. R., between Grafton, W. Va., and Cumberland, Md. The rock is hard, and the new plant will be of the heaviest and most modern machinery, which has not yet been decided on. Contracts for new machinery will be given within a month or two, for probably $50,000. H. L. Moore is General Manager and E. F. Hartley is President.

The Chicago, Milwaukee & St. Paul Ry. has men at work on the proposed new S. Dak. line from Wakapala to Bell Fourche. The contract for the grade to Horse Butte in Meade County has been let.

Rails and ties for the Northern Parks branch lines both north and south out of Mandan, N. Dak., have been ordered for delivery in the city March 1, and as soon thereafter as the weather will permit, work will be started.

The Coastwise Dredging Co., of Norfolk, Va., has been awarded the contract by the U. S. Government for blowing up the sunken barge John McNally, which lies at the bottom near Buch Bluff Light, Va. The contract price was $2,300.

The Norfolk & Western Ry., C. S. Churchill, chief engineer, Roanoke, Va., is reported to have awarded a contract for a 20-mile cut-off from Canebreak, W. Va., to Tip Top, Va.

The Arizona & Eastern R. R. Co. has filed its articles of incorporation in Phoenix, Ariz. The company is capitalized for $40,000,000, divided into 400,000 shares. The new company is to take over all the Arizona properties of the Southern Pacific and to add further mileage. The incorporators are Robert S. Lovett, president of the Southern Pacific; Epes Randolph, Eugene S. Ives, Charles E. Walker and Gibson Taylor of Tucson; Benjamin Titus, D. H. Kedzie, M. M. Crocker and O. S. Lordsburg. The properties to be taken over are the Arizona Eastern R. R. Co., Maricopa & Phoenix R. R. Co., Arizona & Eastern R. R. Co. and the Gila Valley, Globe & Northern Co.

The Atchison, Topeka & Santa Fe Ry. is reported to be planning to construct an extension from Oakdale, La., the present terminus of the Gulf, Colorado & Santa Fe, to New Orleans, La. Frank Merritt, Galveston, Tex., is chief engineer, G. C. & S. F. Ry.

The Baltimore & Ohio R. R. is reported to be considering double tracking what is known as Flushing Hill on the C., L. & W. division this spring. The hill is between Flushing and Holloway, 27 miles west of Bridgeport, W. Va., and is a heavy grade, with two large trestles, and while only a little over three miles would be double tracked, the company would have to make many fills. It is understood that it intends to fill in the two trestles which are of steel, and one is 65 ft. high and over 400 ft. long.

The Belle Fourche Valley R. R. Co., a branch of the Chicago & Northwestern Ry., has filed a petition with the secretary of state of South Dakota providing for the construction of a 63-mile extension through Stoneville to a point about 6 miles north of White Owl, S. Dak. The line will probably be extended to Phillip later. It will be a feeder to the Pierre main line and will be connected with the Dallas line giving the Northwestern a straight line from Omaha, Sioux City and southern points with the northwestern section of South Dakota and southwestern Montana.

Advices from Chester, S. C., state that a company has been formed for the purpose of constructing an electric railway from that city to Great Falls, the seat of one of the Southern Power Co.'s big hydro-electric developments on Catawba River, which is to be the site of the Republic Cotton Mill.

The Minneapolis & St. Louis R. R., W. D. Taylor Chief Engineer, Chicago, Ill., is reported to have a gang of surveyors working out of Onaka, S. Dak., in the expectation of building a new line north and south through the town during the coming summer.

W. T. Carey & Bro., New Orleans, La., have been awarded the contract for constructing the new Dumser wharf for the Board of Port Commissioners of New Orleans. The contract price was $25,409, and the work is to be completed in 130 days.

Advices from Water Valley, Miss., state that it is believed there that the proposed Water Valley & Southeastern R. R. will be completed from Water Valley to Pittsboro, Calhoun county, during the present year. The distance is about 30 miles.

The original bill chartering the Baltimore & Washington Transit Co. to do business in Washington, D. C., is to be amended to allow the establishment of a cross-town line. The cars will be run by gasoline as a motive power. If the amendment goes through, the line will be made operative from Kennedy St. northwest, down 13th St. to Ohio Ave.

The Virginia & Carolina Southern R. R., C. N. Blue, General Manager, Aberdeen, N. C., is said to be planning to extend its line from St. Paul's to Elizabethtown, in Bladen County, N. C.

A bill has been introduced in the State Legislature in South Carolina authorizing an election to be held in each township in Orangeburg County upon the question of issuing township bonds to aid in building an electric road in Orangeburg and extending to North, Springfield, Bowman, Elloree, Branchville and other places. William C. Wolfe, Orangeburg, S. C., is interested.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

H. W. Eurcher, C. E., has started preliminary surveys from Cotton Plant, Ark., to Cache river for the construction of a railroad for the purpose mainly of transporting logs from White and Cache river bottoms to Cotton Plant mills for manufacturing into lumber.

The stockholders of the Fort Smith Light & Traction Co., of Fort Smith, have decided to increase the company's capital stock from $1,600,000 to $6,500,000. It was also decided to increase the bonded indebtedness to $650,000. The company plans to make extensive improvements, particularly that of entering Van Buren.

Right of way is being cleared for the Van Buren Interurban Ry. and two grading gangs are now at work. T. A. Bayley, Fort Smith, Ark., is interested.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Atchison, Topeka & Santa Fe Ry., H. C. Phillips, Chief Engineer, Los Angeles, Cal., has contracted with Evans & Chapelle, Los Angeles, for approximately 350,000 tons of crushed granite to be used in ballasting parts of its valley line between Los Angeles and San Francisco. The granite will be quarried and crushed at points on the Merced river and will be transported over the Yosemite Valley Railway to Merced, where it will be delivered to the Santa Fe. Extensive crushing plants will be installed. Delivery will be begun as soon as spring opens, and will be at the rate of not less than 20 cars daily.

George West of San Bernardino has received a rush contract from the Sharp-Hauser Construction Co., on the Santa Fe double track work between Cottonwood and Daggett, and has already started work at Cottonwood. He expects to put about 150 head of stock and a large number of men on the job.

Willitts & Burr of San Francisco, who had the railroad construction cut-off work under Erickson & Petterson, west of Auburn, have finished their work and have moved their outfit to Eureka, for work for the California Northwestern between there and Willitts.

The Southern Pacific is to build another track between Indio and Coachella in the near future. The main spur at Coachella is also to be extended as far as the ice plant and the necessary grading work will be commenced soon.

Capt. A. E. Anderson of the California Transportation Committee has asked the Board of Trustees of Sacramento for permission to build an 80-ft. extension to the present city wharf. The work is to be done under the direction of and the plans are to be approved by the City Engineer of Sacramento.

Resolution is to come before the City Council of Long Beach for permanent improvements to the city wharf. The Board of Public Works will bring in estimates on various methods of improvement, including cement piling, cured in the sun and then jetted into position; rock breakwater and piling, rock filling under the wharf, and cast iron cylinders not less than 18 in. in diameter filled with concrete.

Application is to be made to the supervisors of San Francisco for a franchise for an extension of the Masonic Ave. line along K St. to Ninth or Tenth Ave., and south to O St., to be built by private capital with the assistance of the United Railroads. W. W. Allen, President of the Sunset Merchants' Association, San Francisco, is interested.

A committee of business men of Eureka, of which E. E. Skinner is chairman, are investigating a proposition for construction of an electric railroad between Eureka and Redding or Red Bluff, at an estimated cost of $7,000,000. It will probably be March before the committee is ready to make its final report and recommendations.

The Sacramento Valley Irrigation Co., according to advices from Willows, is calling for bids, to be opened about Feb. 15, for excavating laterals and the main canal requiring the removing of 1,500,000 cu. yds. of earth.

The Southern Pacific Ry. has set aside $600,000 for betterments in the Shasta division between Red Bluff and Ashland, Ore. This money is to be expended during the present fiscal year and will go for improvements in the way of building depots, lengthening side tracks and improving grounds.

The East Shore & Suburban Ry. Co. has applied to the city trustees of Albany for a new franchise for an extension of the company's line from Point Richmond, which is its southern terminus at the northern boundary of Albany known as the County Line south along San Pablo, then west and south to connect with the northern end of the Southern Pacific Co.'s loop extending out from Berkeley.

The Russian River Light & Power Co. has been incorporated with a capital stock of $300,000 and headquarters at San Francisco. The incorporators are as follows: J. E. Bennett of San Mateo; H. C. Eastman of Los Gatos; N. M. Twomey of San Francisco; E. R. Hough of Kentfield; L. R. Dickey of Alameda.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Palmer Estate has filed with the County Clerk at Colorado Springs a plat showing a proposed reservoir and system of ditches for irrigating a large tract of land east of Colorado Springs. The reservoir will cost about $500,000, but will not be built for some time, it is said. E. C. Van Diest, Colorado Springs, is the engineer.

The Otero Canal Co. of La Junta has arranged to sell $150,000 of bonds and has made arrangements to let contracts for the removal of wood frames at headgates, to be replaced by concrete; concrete siphons will be put in and the canal will be enlarged to carry 500 cu. feet per second. Of the amount to be realized by the sale of the bonds, $50,000 will be used for improvements to the reservoirs of the Otero system.

Kilpatrick Bros. & Collins, Beatrice, Neb., have begun work on their contract for the extension of the Union Pacific extension of the Denver-LaSalle line from Bent Junction to Fort Collins. The extension will be 40 miles long, and will involve much heavy work.

The San Luis Southern Ry. has tracklaying well under way for its line from Blanca.

The Cedar Grove Reservoir and Cedar Grove Canal, according to a report filed with the County Clerk at Pueblo, will cost $134,000, and will bring 22,000 acres of land under irrigation. E. F. Rizer, Pueblo, is the engineer.

The construction of a reservoir in Morgan county, to have a capacity of nearly 1,000,000 cu. feet, is proposed. It will be known as the San Arroyo irrigation project, and will water 10,000 acres. The bonds recently sold for $225,000, and $50,000 is ready to use. W. S. Abbott, Greeley, is engineer is charge of the construction work.

The directors of the Platte Valley Municipal Irrigation District, Henry F. Roeschlaub, Secretary, Fort Lupton, opened bids Feb. 7, for the sale of $600,000 of bonds of this district.

The Denver, Laramie & Northwestern R. R. is making efforts to materially improve its road bed between Milliken and Denver, Colo., and W. E. Green, Vice President of the road has a steam shovel at work taking out gravel for ballast.

Carmon Layton, the promoter of the Paradox R. R. project has been negotiating with a big construction company in Pueblo, Colo., and it is expected that the company will be given the contract for the construction of the proposed railroad and work will be started about April 1. Location surveys will be continued as soon as spring opens up and the project rushed to completion. The company has opened headquarters at the office of R. G. Trotter & Co., Montrose, Colo.

Business men of Lamar, Colo., have succeeded in raising a $55,000 cash bonus for the Denver & Gulf R. R. to be paid upon the completion of the road which is now constructed within 25 miles of that city. The company of which Frederick A. Umsted is President, is constructing a line from Texhoma, Tex., to a connection with the Union Pacific at Limon, Colo., and under the present arrangements Lamar will be a division point on the line. According to a statement reported to have been made by the president, the company has financed a line from Texhoma east to Canadian City, Tex., a distance of 74 miles, which will eventually extend south to Dallas.

David Heaton of Salida has obtained a lease on the Calumet branch of the Denver & Rio Grande R. R. and will begin work as soon as the weather will permit in rebuilding and extending the line to handle the large granite deposits northwest of Salida. It is announced that $100,000 will be spent in the work and that a large force will be put on the line early this spring.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Rockford & Interurban Ry. Co., T. M. Ellis, Vice President and General Manager, Rockford, Ill., has set aside about $250,000 which will be spent in Rockford the coming season in adding to and improving the present system. A considerable part of the above sum will be spent in replacing the present rails with 70 lb. steel.

The Chicago & Elmhurst Ry. Co. has been chartered with a capital stock of $5,000, and proposes to build a road from the east line of Oak Park to Addison, Dupage county. The directors and incorporators are: H. D. Williford, Jr., Henry L. Fearing, F. D. Kilmer, Alfred J. Parker, Frederick W. Pringle, William A. Rawson, all of Chicago.

The Chicago, Burlington & Quincy R. R. is to increase its switching facilities at Galesburg

A petition requesting the board of Forest Park, Ill., to pass an ordinance permitting the extension of the Chicago and Oak Park elevated road through the village has been before the village trustees.

An ordinance has been before the City Council of Springfield to grant a right to the Springfield Consolidated Street Ry. Co. to lay a single track in Lawrence Ave. from Amos Ave. to the western limits of the city.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Petitions are being circulated in Warwick County asking the County Commissioners to dredge Pigeon Creek. As proposed the dredging will begin at the county line between Gibson and Warrick counties and end at a point near the Vanderburg county line. The estimated cost of the project is close to $100,000. Louis Meyer, Boonville, is County Surveyor.

The Cleveland, Cincinnati, Chicago & St. Louis Ry. started engineers at work Jan. 26 between Muncie and Indianapolis, platting for a double track.

The Burns Construction Co., Isabella Bldg., Chicago, Ill., is stated to have been awarded the contract for building the Evansville, Mt. Carmel & Olney traction line. As proposed the line will be sixty-four miles long, extending from Evansville through Darmstadt, Cynthiana, Owensville, Mt. Carmel, Friendsville,

Lancaster and Berryville to Olney. E. Q. Lockyear, Evansville, Ind., is secretary of the traction company.

The city officials of Fort Wayne are stated to be taking steps preparatory to having track elevation work begun in that city. Frank M. Randall is City Engineer.

H. H. Knife, Robinson, Ill., is promoting a project in the construction of an ore carrying railroad from Terre Haute to Mississippi river.

The Hammond, Whiting & East Chicago Street Ry. Co. has plans to extend its system from its southernmost point at the Standard Steel Car plant, Hammond, north into East Chicago, over Forsythe Ave., and from there via 141st St. to Indiana Harbor.

The Chicago & Indiana Air Line Ry. Co. has filed a notice of change of name to the Chicago Lake Shore & South Bend Ry Co., also an amendment to its articles of incorporation to fix the directorate at from 5 to 13 members.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chicago & Northwestern Ry. is said to be planning a number of improvements at Belle Plaine this year. These include the erection of an 80-stall roundhouse, the construction of additional sidetrack facilities in that city, and the laying of a third track to Tama, 16 miles westward.

A preliminary survey of the Des Moines River between Ottumwa and Eldon, with a view to ascertaining the practicability of building a dam whereby water power will be furnished, will be made shortly by Engineer Dobson, of the Iowa Construction Commission. The commission was created last year.

The construction of a subway under the C., B. & Q. Ry. tracks at either North Clinton or North Main st., at Albia, is proposed. This work would cost about $45,000.

The Omaha & Council Bluffs Street Railway & Bridge Co., operating a street railway at Council Bluffs, has made a proposition to the City Council of that city whereby it proposes to construct this year a line on First Ave. from Pearl St. to Main St., and thence on Main St. to Broadway; a line on North Eighth St. from Broadway to Avenue H.

Advices from Charles City state that C. W. Hart, of that city, president of the Hart-Parr Co., has offered to give from the Hart-Parr Co. $100,000 toward a street car and interurban line for Charles City if the people there will give the same amount. This will be enough to start the line. It is intended to have the interurban line extend about 40 miles, connecting with at least six or seven railroads. This line will carry freight, and a new bridge is planned across the Cedar River for this traffic.

The county supervisors at Sioux City have been petitioned to appoint an engineer to make survey for a new ditch, which is to be known as the Little Sioux ditch. Its proposed course will be from Miller township, running through Oto and Little Sioux townships.

About 115 men are now engaged in the preliminary construction work for the large power development on the Des Moines river at Keokuk. Hugh L. Cooper, 50 Wall St., New York, is the promoter of the project.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

An election is to be held in Finney County on Feb. 28 to vote on issuing $30,000 of bonds for the Garden City, Gulf & Northern R. R. If the bonds are voted the provision will be that the Garden City, Gulf & Northern Railroad must have completed a stretch of track between Garden City and Liberal by Dec. 31, 1910.

The Chicago, Rock Island & Pacific Ry., J. B. Berry, Chief Engineer, Chicago, Ill., is buying a strip of right of way along its line from Topeka to Herington, 82 miles, so that it can put in a double track this season.

The first contract for excavating at the turns of Soldier creek at Topeka has been let by the North Side drainage board to Hamil & Yencer, of Topeka, who have begun work The contract was let for making the cut at what is known as the Robinson bend near the Sam Harper farm. The price set by the contract was 16 cts. per cu. yd. and it is estimated that there are 10,000 cu. yds. of earth to be moved at this place. This is the first work in connection with the attempt on the part of the North Side drainage board to straighten the bed of Soldier creek. There are two other cuts being planned by the board.

The construction of an electric railway from Baxter to the Mission mines and possibly to Hattonville is proposed. As projected the line would be about 13 miles long. Attorney E. B. Morgan, Baxter, is interested.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Lake Superior & Ishpeming Ry. Co., R. C. Young, Chief Engineer, Marquette, is preparing to extend its line to the Cleveland-Cliffs Iron Company's North Lake property, at Marquette. As proposed the line will branch out from the main track at a point a trifle north of the Lake Superior dump, at the western end of Division St., and will cross both the Northwestern and South Shore tracks, also West Division St., by a steel trestle.

The Boyne City, Gaylord & Alpena R. R., W. H. White, President and General Manager, Boyne, has placed contracts for the ties to be used in the extension of the road from Gaylord east to Hillman, where a connection will be made with the Detroit & Mackinac.

The Kalamazoo, Gull Lake & Northern Electric R. R. Co., with offices at Battle Creek, is reported to have received offers to finance the projected line. Col. W. V. Jacobs is interested.

The Grand Trunk Ry. is said to be planning to extend its coal mine spur through the coal fields north of Corunna and to New Lothrop. The necessary right of way has been secured up to within about 3 miles of New Lothrop. The proposed line is directly north from Kerby, for a distance of about 8 or 9 miles, and then takes an easterly course. H. G. Kelley, Montreal, Que., is Ass't Engineer.

The Oak Park Power Co., of Flint, Mich., has increased its capital stock from $60,000 to $200,000.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A mass meeting was held Feb. 5 in Pleasant Hill township and plans were outlined to have the Chicago Great Western Ry. build a branch from St. Charles to Fremont and thence east to LaCrosse. If this plan fails then steps will be taken to organize an electric railroad company. William Burke, Witoka, Minn., is interested.

The City Council of Virginia, Minn., has granted a franchise for the proposed street railway connecting Virginia, Eveleth and Gilbert. It is expected that the promoters of the interurban line, represented by E. G. Chapman of Chicago and W. M. Prindle of Duluth, will begin construction work on the proposed line early in the spring.

Barnett & Record, contractors, Minneapolis, will put 150 men at work about Feb. 15 on rebuilding Ore Dock No. 2 at Two Harbors.

A. B. Randall, Artonville, Minn., auditor of Big Stone County, will sell on March 1, bonds amounting to $20,000 for the construction of ditches.

The horse dealers at the Midway Horse Market at Minneapolis report excellent business for 1909. Nearly 1,000 more horses were sold than during any previous year since the market was established by Barrett & Zimmerman some 20 years ago. This heavy movement was caused by the big demand for horses and mules for railroad work early in the summer and the large orders placed by the big lumbering interests all during September, October, November and December. There had been very little railroading or logging during 1907 and 1908 on account of the money stringency, with the result that both railroad and logging contractors had allowed their supply of horses and mules to become depleted, with the result that they had to buy heavily in order to carry on unusually heavy operations. Horses have been high and indications are that values will hold steady the coming year about on a level with 1909 prices. The heaviest shipments were made to the lumbering interests in northern California, Washington, western Montana, Minnesota and Wisconsin, to railroad contractors in Dakota, Montana and Canada and to contractors who are working on big irrigation projects in Idaho, Wyoming and other western states; the big icing and transfer companies in the eastern cities were liberal buyers. The big Wednesday auction sales will begin shortly, which will bring heavy consignments of all classes of horses on the market, and the offerings will include from 500 to 600 head of horses and mules constantly during February, March and April.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Mexico, Santa Fe & Perry Traction Co. is reported to have had work started on the erection of its power plant at Mexico, Mo. Right of way for the line has been secured and it is said that construction work on the north and south divisions will be started soon, and that the line will eventually be built between Mexico and Hannibal via Perry, Senter and New London. Judge M. Crum, Mexico, Mo., is President. The J. J. Burns Construction Co., Isabella Bldg., Chicago, Ill., has the contract.

The Kansas City Terminal Ry. Co. has given notice to the City Council of Kansas City, that it proposes to build the new Union Station and terminals on the larger of two plans provided in the ordinance. This means that the company will spend in Kansas City in the next 5 years approximately $30,000,000 instead of $15,000,000. John V. Hanna is Chief Engineer of the Terminal Ry. Co.

According to a statement, reported to have been made by H. U. Mudge, president of the Chicago, Rock Island & Pacific R. R., the company is seriously considering the improvement of the Kansas City terminals and double tracking the line between Kansas City and Cameron Junction. The company is also contemplating double tracking the line between Topeka, Kan., and Herington.

St. Louis Items.

BY A. B. KOENIG.

E. A. Smith died suddenly in Las Vegas, N. M., last Tuesday. His body was brought to Kansas City for burial. Smith had only been married recently to Miss Emma Borden of Malvern, Ark.

Reese & Nagel secured the contract for paving the river front at Hannibal, Mo.

Mike Conroy returned from Buffalo, N. Y., and has resumed work on the Burlington extension near Marion, Ill.

Wm. Nuttall, representing M. C. Connors of Chicago, spent a couple of days in town. Nuttall informs us that they have the reservoir that they are building for the Burlington R. R. at Centralia, Ill., about half finished. Barcus & Jennings are doing this work for Mr. Connors.

Harrington Bros. are still on the double track work of the Burlington R. R. near Hanover, Ill.

Gus. Landberg has his steam shovel plant on the Burlington R. R. at Galena Junction, Ill.

Alex. McGavock & Son are at Savanna, Ill., on the Burlington R. R. with their steam shovel and car plant.

Chas. Van Wormer is grading side tracks for the Burlington R. R. at Virden, Ill.

The Board of Public Improvements has approved the drafts of ordinances for the construction of sidewalks on these streets: Michigan Ave., between Meramec St. and Gasconade St.; Rebecca St., from Grand Ave. west 554 ft.; 21st St., between Chouteau Ave. and Pain St.; Allen Ave., between Longfellow Blvd. and Compton Ave. (north side); Bartmer Ave., between Hodiamont Ave. and city limits; Bertha Ave., between Hamilton Ave. and

Hodiamont Ave.; Blackstone Ave., between Page Blvd. and Easton Ave.; Ella Ave., Hodiamont Ave. and city limits; Etzel Ave., between Hamilton Ave. and Hodiamont Ave.; Hodiamont Ave., between Wells Ave. and Elston Ave. (east side); Laurel St. between Wells Ave. and Easton Ave.; Nebraska Ave. between Meramec St. and Dakota St. (west side); Shawmut Pl., between Julian Ave. and Wells Ave.; Wells Ave., between Hodiamont Ave. and city limits; Alabama Ave., Loughborough Ave. and Iron St.; Alabama Ave., between River des Peres and Ivory St.; Belt Ave., between De Giverville Ave. and Waterman Ave.; Gasconade St., between Oregon Ave. and Pennsylvania Ave.; Grand Ave., between Neosho St. and Montana St.; Humphrey St., between Oak Hill Ave. and Morgan Ford Rd.; Ivory Ave., between Alabama Ave. and Primm St.; Itaska St., between Broadway and Compton St.; Itaska St., between Compton and Virginia Aves.; Idaho Ave., between Loughborough Ave. and Kansas St.; Koelm Ave., between Pennsylvania Ave. and Virginia Ave.; Keokuk St., between Minnesota Ave. and Grand Ave.; Loughborough Ave., between Alabama Ave. and Colorado Ave.; Michigan Ave., between Dover St. and Bates St.; Michigan Ave., between Neosho St. and South Dakota St.; Michigan Ave., between Fillmore St. and Wilmington Rd. (west side); Minnesota Ave., between Itaska St. and Neosho St. (east side); Minnesota Ave., between Neosho St. and Dakota St. (west side); Neosho St., between Michigan Ave. and Virginia Ave.; President St., between Lemp Ave. and Wisconsin Ave. (north side); Virginia Ave., between Main St. and Bates St.; Wilmington Rd., between Michigan Ave. and Colorado Ave.; Indiana Ave., from Chippewa St. south as far as open; Geyer Ave., between Longfellow and Compton Aves. (north side).

Stockholders of the St. Louis, Iron Mountain & Southern Ry. on Feb. 2 voted to increase the capital stock to $190,000,000. The increase is $60,000,000. The absorption of 23 auxiliary lines and an increase of $25,000,000 in the bonded indebtedness, out of which the lines will be improved, were voted on favorably. The auxiliary lines which were acquired are Arkansas & Louisiana, Arkansas Midland, Arkansas Southwestern, Brinkley, Helena & Indian Bay, Coal Belt, Eldorado & Bastrop, Farmerville & Southern, Garland Western, Gurdon & Fort Smith, Gurdon & Fort Smith Northern, Herrin Ry., Herrin & Johnston City, Kansas & Arkansas Valley, Little Rock & Hot Springs Western, Little Rock & Monroe, Little Rock Junction Ry., Mississippi River, Hamburg & Western, Natchez & Western, New Orleans & Northwestern, Pine Bluff & Western, Springfield Southwestern, St. Louis, Watkins & Gulf, and Wabash Southern.

Nebraska Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Nebraska Transportation Co., incorporated under the South Dakota laws, has petitioned the City Council of Fremont, Neb., for right of way over several streets for an interurban electric line that the company proposes to build from Omaha to Fremont. The company asks a 50-year franchise and a 3-year limit in which to complete the line.

The Union Pacific R. R., E. D. Schermerhorn, Omaha, Neb., Supervisor of Bridges and Buildings, is to expend $100,000 for a new coaling station at Kearney, and much of the material is already on the ground. Other improvements at Kearney are contemplated.

A movement is on foot in Hastings, Neb., to raise a fund amounting to $10,000 for the construction of the Nebraska, Kansas and Southern R. R. extension to that city.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Commissioners appointed to decide as to whether the proposed Lexington Ave. subway route in New York City should be modified to make it a double-deck subway, with the express and local trains on different levels, between Houston St. and 103d St. and 119th St. and the Hudson River, have reported in favor of the double-deck plan. According to the testimony of Henry B. Seaman, chief engineer of the public service commission, the proposed double-decked route could be constructed by tunneling, whereas it would sometimes be required to make an open cut for a four-track subway. He said that the double-deck scheme would require less property to be purchased for stations.

The Pennsylvania R. R., J. T. Richards, Chief Engineer Maintenance of Way, Philadelphia, Pa., is said to be planning to double track its line this spring between Hinsdale and Franklinville, thus completing the double track to Olean. If laid as recently surveyed the road bed will be changed through Ischua and will cross the Farwell and Cline farms to avoid a double crossing of Ischua Creek.

A bill has been introduced in the State Legislature to appropriate $100,000 for improving the Black River Canal from Boonville to Lyons Falls. The canal will be improved in three sections, from Rome to Boonville, Boonville to Lyons Falls and Lyons Falls to Carthage. The first mentioned section was improved last year and next year it is expected that an appropriation will be made for the improvement of the Lyons Falls-Carthage section. It is also probable that the state engineer will be asked to prepare an estimate of the cost of the construction of a canal from Carthage to Dexter. The work will be done by contract under the direction of the State Superintendent of Public Works, Albany.

Alex. Sturgeon, of Kingston, has been awarded a contract to build a 200-foot dock and considerable cribbing at Stockport for Joseph McLean of Kingston. He will also build about 300 feet of docking for the Tomkins Cove Stone Co.

The State Public Service Commission, second district, has authorized the Rockland Railroad Co. to execute a mortgage upon all its property for $3,000,000, securing an issue of 5 per cent 50-year gold bonds of $3,000,000, and allowing the issuance at present of $2,350,000 of common stock; $415,700 of the stock is to pay for all services and expenses in organizing and promoting the enterprise and providing for all engineering and legal expenses until the road is put into operation. The proceeds of the balance of the stock and the bonds authorized are to be used for construction and equipment. The rest of the bonds and authorized stock shall not be issued except upon further order of the commission.

The public service commission has asked the Legislature for an appropriation of $600,000 to be spent for the elimination of grade crossings within the city limits of New York. In the act passed by the Legislature for the doing away of these crossings, most of which are in Brooklyn and Queens, it is provided that when such changes are made in the grade crossings, 50 per cent of the cost shall be borne by the company, 25 per cent by the city and the remaining 25 per cent by the state.

A bill is before the State Legislature providing for the acquisition of a site and for the construction and equipment of a power house, coal pockets and conduits, to furnish heat, light and power for the state capitol and the new state education building. The bill authorizes an expenditure of $500,000.

The State Public Service Commission began a rehearing on Feb. 2, at Albany, on the application of the Buffalo, Rochester & Eastern R. R. Co. for permission to build a double track railroad from Buffalo to Troy.

The construction of an electric railway between Athens and Towanda is proposed and franchises have already been secured in Towanda. Citizens of that place have also subscribed $250,000 for the line. Mial Lilley, Towanda, is interested.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The directors of the Norfolk & Western Ry. on Jan. 27 authorized the construction of 13 miles of additional double track in West Virginia and about 48 miles in Ohio. Authority also was given for the construction of a low grade belt line around the city of Petersburg, Va., for contracts for new equipment involving an outlay of $3,700,000. Further information regarding some of this work is given under Confirmed Reports in this issue. J. R. Schick, Roanoke, Va., is Engineer of Branch Lines, Norfolk & Western.

John H. Francisco has commenced work on the grading for the new double tracking for the N. & W. R. R. between Hanging Rock and Wheelersburg.

The Pennsylvania R. R. is planning to construct several subways in Alliance this year. R. Trimble, Pittsburg, Pa., is Chief Engineer Maintenance of Ways.

The Cleveland Short Line Ry. of Cleveland, has completed the first section of its belt line at Cleveland from the southerly city limits —Marcelline Ave. west to the junction of the Lake Shore Ry., Rockport. This section has been completed at a cost of $6,000,000. The part from Marcelline Ave. to Collinwood is now under construction and cannot be completed for 2 or 3 years. The sum of $10,000,000 has been appropriated for this section. Ben T. Hopkins and W. R. Hopkins, Cleveland, O., are interested.

The Ohio Electric Ry. Co. is said to have made plans to extend the Lima-Defiance division from its present terminus near the plant of the Pressed Steel Co., at Defiance, about 2 miles from the city over Greenler St. and East Second St. to the Second St. Auglaize river bridge, 3 blocks from the court house and business section. In making the extension it will be necessary to cross the Baltimore & Ohio R. R.

The Cleveland Electric Illuminating Co., of Cleveland, is to begin work in the spring at the foot of East 71st St., upon the large power house and the tunnel and bulkhead in the lake, to supply water for the condensing engines.

Bids are reported to have been opened Feb. 1 at the office of C. F. Losh, assistant engineer, Norfolk & Western Ry., at Portsmouth, O., for improvements to the Columbus District of the N. & W., which will involve the expenditure of $1,500,000. The improvements include double tracking between Davis station, 10 miles north of Portsmouth, to Piketon, change of line from Chillicothe to Delano, extensions of culverts, etc., along the entire district. Among the contractors who bid on the work are said to be the following: M. C. Boxley, of the Mason-Hanger Co., of Salem, Va.; Ryan and Walsh Construction Cos.; J. H. Vaughn, of Roanoke; J. R. Sarpell, Thomas A. King, of Louisville; P. J. Millett and E. R. Keller, of Roanoke.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys are reported to have been completed for the proposed Webbers Falls-Warner R. R., and an excellent route found. The distance between the two places is 14 miles and the line will require the construction of but one bridge. Chas. Hagerty, Muskogee, Okla., is engineer.

A bonus of $50,000 has been promised by Waurika to the Henrietta & Southwestern Ry. Co., which proposes to build a road from Henrietta, Tex., to Waurika by way of Byars, Tex. Work is expected to start in 60 days.

The Caddo Development Co. has submitted a proposition to the Commercial Club of El Reno, for the building of an extension line to Chickasha and Anadarko.

It is reported in the vicinity of Muskogee, Okla., that the Missouri, Oklahoma & Gulf, will, upon its completion of the line to Sherman, Tex., take steps toward extending the line from Rex, where a connection is made with the Iron Mountain, to Kansas City, Mo. J. J. Harrison, Calvin, Okla., is Chief Engineer of the company.

The annual meeting of the stockholders of the Oklahoma & Golden City R. R. was recently held in Pawhuska, Okla. The company was chartered 2 years ago with a capital stock of $12,000,000 to construct a line through Jefferson City, Golden City and Carthage, Mo.; and Pawhuska, Bartlesville and Miami, Okla. It is reported that Canadian capitalists have financed the road. The officers of the

company are as follows: E. M. Dempsy, Pawhuska, president; J. A. Wimberly, Pawhuska, and L. C. Lohman, Jefferson City, vice presidents; W. H. Reed, Golden City, Mo., secretary; W. B. Burns, Golden City, treasurer; W. S. Hawkins, Pawhuska, chief engineer; E. E. Grinstead, general attorney, and J. A. Grisel, Golden City, general manager.

A company has been organized at Woodward, and proposes the construction of an interurban line from that city to Fort Supply.

Ground was broken at Guthrie, Jan. 29 on the grade of the Mountain, Valley & Plains R. R., to be constructed from Guthrie to Cimarron, N. M. Ten teams under the direction of Chief Engineer J. E. Conlin were placed at work on the grade, and other men and teams were on the way from western Oklahoma. The Robberts Construction Co. of Philadelphia, which has the contract for the construction work on the new road, is said to have experienced great difficulty in getting men or teams here on account of the large amount of public improvement work which is now going on. The construction company will make its headquarters at Guthrie and make this the supply point for the various crews. The first section of the line to be completed will be between Guthrie and Kingfisher.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Commercial Club, of Mist, has appointed committees to ascertain the cost of surveying a route for an electric railroad to Clatskanie. If the estimated cost of construction is not placed too high, the citizens of the valley, assisted by those of Clatskanie, will endeavor to build the road.

John R. Allen has applied to the City Council of Ashland for a franchise for the entrance of his projected Rogue River Valley electric road into Ashland.

The holdings of the Three Sisters Irrigation Co. have been taken over by the Columbia Southern Irrigation Co., a survey has been made and plans perfected for the construction of a reservior system. By building a dam 70 ft. high in a narrow gorge flood waters can be impounded sufficient to water at least 25,000 acres of land. To build the dam and remake the canals and laterals will cost about $400,000, it is estimated. Surveys of the project have been made by Frank C. Kelsey of Portland, Ore.

The Baker City Interurban Ry. Co. which proposes the construction of a street railway in Baker City, has placed an order for 7,000 railway ties and proposes to have 2½ miles of line in operation by July 1. The line is to be a link in an interurban belt line 45 miles in length operating in Baker Valley. The surveys for the city and interurban portion have been completed and all engineering features have been worked out and with the completion of the city line all the money for which has been put up and is now available, the interurban line which will form a comprehensive belt around Baker Valley will be undertaken and financed by a series of construction bonds. The security for the first 10 miles will consist of the completed 2½ miles in Baker City, together with franchise and other rights. Sections of 10 miles each will be built as rapidly as the work can be done thereafter. Anthony Mohr, Baker City, Ore., is Treasurer.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Westwater & Casey, Columbus, O., have completed their contract for the filtration plant for Pittsburg 154 days ahead of scheduled time, thereby earning a bonus of $100 per day.

The bondholders have approved the plan for the reorganization of the Trenton & New Brunswick R. R. and the New Jersey Short Line R. R., as prepared by the bondholders' committee, of which A. M. Taylor, of Philadelphia, is chairman. The bulk of the money that will be needed to complete the high-speed line through Trenton, N. J., to Elizabethport via New Brunswick will be raised by issuing bonds against the property acquired by the new company.

A bill is before the State Legislature of Maryland to incorporate the Baltimore and Pennsylvania Ry. Co., with James H. Wilson, Jacob H. Sherman, Jacob A. Frederick, Newton S. Watts, Jacob Pierce Burns, Frank L. Hancock, Daniel F. Reisenwehr and William T. Dietrich named as the incorporators. The capital stock is placed at $600,000, with the privilege of increasing it to any amount that may be deemed necessary. According to the bill the road is to run from Reisterstown "around or through Hampstead and Manchester and Carroll counties, to the Pennsylvania state line." Permission is given to the incorporators to acquire the Hampstead & Manchester R. R. franchise.

The Chambersburg, Greencastle & Waynesboro Street Railway Co., of Chambersburg, is considering extending its line from Pen Mar to Blue Ridge Summit next fall and also from Chambersburg to Shippensburg.

Final surveys have been made, the capital has been secured and construction contracts will be let early in the spring for the projected 31 mile line of the Clarion & East Brady Electric Ry. from the county seat of Clarion county through Reidsburg and Philipston to East Brady, Armstrong county. At Reidsburg connection is made with the Franklin & Clearfield branch of the New York Central lines and at East Brady the Allegheny Valley railroad is reached. George E. Arnold, Clarion, Pa., is president.

Improvement work on the Philadelphia & Reading Ry. is reported as being as follows: The grading for the double track on the East Penn between Blandon and Lyons is progressing rapidly, and it is expected that it will be finished within the next 30 days. Fehr & O'Rourke of Reading have the contract. Smith & Campion, Mahanoy City, received the contract to build the third track on the Harrisburg division between Myerstown and Prescott. It is expected that it will be ready for service early in the spring. The contract for the fourth track of the Reading company between Phœnixville and Perkiomen Junction was awarded to Charles F. King & Co. of Pottsville. The work will be started at an early date.

A merger has been effected whereby all the electric railways between Berwick and Pottsville as well as 20 electric light and four gas plants come under the control of one company. The electric railways absorbed are the Danville & Bloomsburg, Columbia & Montour, Northumberland Light, Heat and Railways, Shamokin & Edgewood, Shamokin & Mt. Carmel and the Skuylkill Railways Co. By the construction of 65 miles of electric railway the company will own 142 miles of road, the only remaining links necessary to connect Scranton and Wilkes-Barre with Philadelphia, via Pottsville. Twenty miles of railway will be constructed to connect the Columbia & Montour system with the Wyoming Valley lines, and the construction of 10 miles of road between Danville and Sunbury will complete the link as far as Sunbury, and other short links and extensions will be made. Meikleham & Dinsmore, 25 Broad St., New York city, are interested.

The East Pittsburg Board of Trade is asking the McKeesport & Highland Grove Street Ry. Co. to build a new short line from East Pittsburg to McKeesport.

The Wheeling & Lake Erie R. R., H. T. Douglas, chief engineer, Cleveland, O., is stated to have given orders for the immediate construction of some 93 miles of track east from the system's present terminus, New Haven, Pa., to Belington, W. Va.

According to reports from the vicinity of Harrisburg, Pa., the Potomac & Susquehanna R. R. Co. will soon ask for a charter to construct a new railroad that will start at a point near Williamsport, connecting with the New York Central lines and run south to Frederick, Md. Negotiations are now pending for the purchase of the trolley line under construction from Carlisle to Newville, the Chambersburg, Greencastle & Waynesboro St. Ry. With these lines and the construction of gaps between Newville and Chambersburg, Pen Mar and Thurmont and Thurmont and Gettysburg and the line north of Carlisle to the destination a through line will be had. The company is represented by a large Philadelphia contractor.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City of Denison has closed arrangements with the Missouri, Oklahoma & Gulf Ry., William Kenefick, President, Kansas City, Mo., for an entrance to that city. The Missouri, Oklahoma & Gulf Ry. is now built from Wagoner, Okla., to Durant. The contract for a bridge across Red River requires that it be completed by June 1. The contract involves distributing yards near Denison, and it is probable that all passenger trains will run into the new Union Station in Denison, when the latter is completed, though arrangements to that effect have not been completed. Mr. Kenefick has expressed the intention of building the road from Wagoner to Kansas City as soon as it is completed into Denison.

In a report from Dalhart, William R. Evans, Vice President of the Denver, Colorado & Gulf R. R., is quoted as stating that the road would be completed into Denver by the end of the year. The road is now being built out of Texhoma, Tex., northwest, and it is stated that steel laying is to begin in a few days southeast from Texhoma. The original survey of the road heads for Port Arthur, but there is now talk of diverting the route to Aransas Pass via San Antonio. The Denver, Colorado & Gulf is being largely financed by Kansas City and St. Louis capital, it is said.

Final surveys were started at De Leon on Jan. 22 to locate the Texas Central line from that place to Rising Star and Cross Plains, via Duster and Sipe Springs. C. Hamilton, Waco, Tex., is general manager.

A proposition has been submitted to the City Council of Austin, Tex., by Colonel A. B. Potter, W. M. Sturgis and T. W. Holland, of Scranton, Pa., for rebuilding the Austin dam. According to this proposition a dam is to be erected at a cost of $1,800,000, to be paid for by the city in 30 years, during which time its builders will furnish power to the city.

The Panhandle Construction Co., of Dalhart, has been incorporated with a capital stock of $10,000, the incorporators being Fred L. Bryant, W. D. Garwood and S. H. Madden.

The Chamber of Commerce of Quanah has raised the necessary $30,000 of stock subscriptions to guarantee the immediate construction of the Quanah & Gulf. Ry. from Quanah to a point in the Young County coal fields, the first link of the line between Quanah and Medicine Mound, Tex., on the Orient Ry. According to a statement of L. S. Walker, President of the railway, surveys will begin of the entire line via the Young County coal fields to Cleburne, Temple or Waco, and construction work will commence on the Quanah end of the line within the next few weeks, the road as far as Medicine Mound vicinity to be put in operation not later than Sept. 1 this year.

Permission of the U. S. Government is being sought by a syndicate which proposes to dig a channel from the town of Aransas Pass across Harbor Island to Aransas Pass. A. J. Bell, San Antonio, is interested.

The Bettison Fishing Pier Co., W. J. Chapman, Manager, Galveston, has had plans prepared for rebuilding its pier on the jetty seven miles from Galveston, which was destroyed by wind and waves last July. About $10,000 will be invested in the new pier and in a new boat. Reinforced concrete construction is proposed.

Residents of South Flores St., San Antonio, are asking that the San Antonio Traction Co. extend its line on that street.

A company is being organized at Brownsville by B. G. Stegman, for the purpose of building a street car line from that city to Matamoros.

The old charter for the Chicago, Weatherford & Brazos Valley Ry. has been renewed and a meeting is to be held Feb. 21 at Weatherford to discuss plans for building an interurban line from that city to a connection with the Rock Island at Paradise or Bridgeport. The line would be 35.62 miles long, running across the headwaters of the Trinity River. In

this distance no serious engineering problems have been encountered. The grades are slight and the curves few. The construction of only one truss bridge would be necessary, and it is thought that this might be avoided by the use of a part of the Rock Island tracks. This bridge would be over the Trinity, two miles south of Bridgeport, and would require a span of 125 ft. C. C. Littleton is secretary.

The Atchison, Topeka & Santa Fe Ry. has commenced the work of widening and raising its track between Temple and Coleman and relaying it with the heaviest steel rails in anticipation of the time when this piece of track will be the main line from California to the gulf. Between Temple and Lampasas Junction and from Zephyr to Brownwood the track will be rock ballasted. The sum of $380,000 is being expended in making the improvements named.

Bids were opened Jan. 28 at the office of Frank Merritt, chief engineer, Gulf, Colorado & Santa Fe Ry., Galveston, for the construction of about 100 miles of line from Lometa on the Gulf, Colorado & Santa Fe Ry., through the towns of San Saba and Brady and into the vicinity of Eden. There were in all seven or eight bids. Surveys for this new line of the Santa Fe have been completed, and it is likely the work of constructing the line will start soon and be prosecuted without delay. Connecting at Lometa with the San Angelo branch of the Santa Fe, the route of the new line will extend westward to San Saba, crossing the Colorado River at a point near Chadwick's mill, near the mouth of Elliott Creek. From San Saba the line will extend to Richland Springs and thence westward, passing through what was formerly the town of Rochelle. The line will also pass through the big Sellman ranch near Brady. From Brady it is proposed to build in a somewhat northwesterly direction to the vicinity of Eden. At the present time Eden will likely be the terminus of the line, but later it is possible the Santa Fe will build to Eldorado or, on the other hand, may extend the line to San Angelo to connect with the San Angelo branch. It was at one time contemplated to build in a southwesterly direction from Brady, but it was later decided to extend the road in the direction of Eden.

George Bryne of Houston has an outfit at work on the Flag Springs property, a mile east of Tyler, constructing a 17 acre reservoir for the International & Great Northern Ry.

The Commercial Club of Mineral Wells is raising a $20,000 bonus to be paid for the 18-mile extension of the Gulf, Texas & Western R. R. from Jacksboro to Oran. Knox Brothers of Jacksboro are thought to be behind the proposed line, which is now in course of construction from Olney to that place.

George Hill, Tyler, has completed his contract for putting in two large oil tanks at Victoria for the Gulf Refining Co.

The Brownwood North & South R. R. of Brownwood, recently incorporated, has awarded grading contracts for the first 20 miles of its line north from Brownwood to May.

Citizens of Commanche, Tex., are in favor of raising a bonus of $50,000 and granting right of way and terminals for the Abilene Central, which was recently incorporated with a capital stock of $150,000 and headquarters at Abilene, Tex., from Abilene to Waco, Tex. Morgan Jones, Abilene, Tex., is an incorporator of the company.

According to reports in circulation at Fort Worth, Tex., H. U. Mudge, president of the Chicago, Rock Island & Pacific R. R., has announced that he will accept the proposition of Stamford and extend a line to that city. Nothing definite has been decided on.

Advices from Rising Star state that E. F. Bucy and Lee Burkhead have begun work on their contract for constructing 15 miles of the Abilene Central R. R.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Eastern capitalists have made overtures to Simon Bamberger, Salt Lake City, looking to the construction of a new interurban line from Brigham City to Ogden, tapping a new territory, and connecting with the Bamberger lines at Ogden. The Bamberger line will form another part of the system, linking Ogden and Salt Lake, and passing through a most productive territory. From Salt Lake a line will be built southward to Payson and other Utah county points, which include Provo, American Fork and Lehi. In Salt Lake City the line will be extended from Postoffice place and Main St. to the city limits, where the interurban system will continue onward to the south.

Jesse Knight of Salt Lake City has applied to the city council of Provo for a street railway franchise to be used in connection with an interurban line which he proposes building to connect Brigham City and Payson. The first section of the line to be built will extend from Payson to Murray. The county commissioners of Utah and Salt Lake counties will be asked to grant certain rights along the public highways to make this connection, and later the line will be extended from Murray to the southern limits of Salt Lake, where the line will be met with an extension of the Bamberger line, which runs from Salt Lake to Ogden. The northern end of the interurban system, projecting into Box Elder county, will be built from Ogden, while the line to the south is being constructed. Several power plants, in addition to the ones already owned by Mr. Knight, will be required.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chesapeake & Ohio R. R. has engineers in the field making a survey for a new double track line between Gordonsville and Charlottesville, by which it is said the distance between the two cities will be shortened two miles. The line surveyed is a quarter of a mile nearer the mountains than the present Cobham Station.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Grays Harbor & Puget Sound Ry. (Union Pacific) has an application before the City Council of Aberdeen for permission to build a spur track on Hume St., in that city, from Division St. to 1st St.

Robert E. Strahorn, President North Coast R. R., is reported to have issued orders for contractors to immediately start work on the deep cut and fill at Union Gap, six miles below North Yakima, where the North Coast and Northern Pacific Co. occupy a narrow pass through the hills. This work is taken as an indication that Strahorn's road will soon be in North Yakima, Union Gap being the only heavy grading near the city. F. L. Pitman, Spokane, Wash., is Chief Engineer, North Coast R. R.

The Chicago, Milwaukee & St. Paul Ry. has filed notice with the secretary of state at Olympia that at a meeting in Chicago the directors ordered the construction of a branch from Warden, on the present main line, in Grant County, northerly and easterly to Griffith, Adams County, 45 miles.

C. E. Lind has been making such progress with his contract for constructing the water front cut-off line at Bellingham that it is believed that the road will be completed and ready to turn over to the Bellingham Terminals & Railway Co. on March 1. The contractor had only the work of grading and trestle building to do, as the company will itself lay the rails. The grade has been established up the Squalicum Creek bottom and comparatively little work remains to be done before the junction with the old line immediately north of the city will have been affected.

The Olympia Canal Co. has been incorporated with a capital stock of $20,000,000, and headquarters at Tacoma, and proposes to build a canal from Olympia to Elma in Chehalis County, on the Chehalis River, and dredge out that stream to the harbor. The incorporators are A. P. Gillies, Tacoma; H. C. Scheel, Tenino, and H. C. Davis, Tacoma. The F. M. Andrews Co., New York City, is back of the project.

The Columbia Contract Co. will resume active work at the Fisher Landing quarries, nine miles above Vancouver, on March 1, when 500 men will be put to work getting out rock for the government jetty at the mouth of the Columbia River. The company has 15 large barges for carrying the rock to Fort Stevens, where the rock is hoisted aboard cars belonging to the government and taken out over the jetty track to a point where the sea has a depth of over 30 feet. The chunks of rock weigh from 18 tons each down to 50 pounds.

Winter operations on the Oroville-Pateros branch of the Great Northern have been confined to sections of the line where construction work is sufficiently heavy to make excavation and grading economical, the lighter work being of such a character that it can be finished quickly after the spring break up and be ready as early as the sections of rock excavation and heavy dirt cuts. Several crews are at work between Oroville and Riverside, generally engaged in rock cuts. A large camp has been established five miles above Okanogan by Peterson Brothers. Swanson Brothers, who have a contract below that place, are making good progress and have opened up two rock cuts. Louis Larson is at work on an eight-mile stretch extending from Malott to Ophir. Between Pateros and Ophir Captain A. L. Riley has several crews at work and has established a new camp near the Zeller ranch, where a third steam shovel will soon be put in operation. Riley's equipment consists of three large steam shovels, a number of "dinky" engines, and several score of dump cars. His first camp is at the Adams ranch, below Brewster; his second about two miles above Brewster, and the third is being established near the Zeller ranch. All the sections of the line that can be worked economically at this time are covered. Other outfits are at Oroville awaiting the first signs of spring, and when the frost has left the ground there will be no delay, it is announced, in establishing camps every few miles on the entire branch.

Advices from Everett state that the Sultan Railway & Power Co., a corporation promoted and financed by Judge George D. Emery in 1907, and which has expended upwards of $60,000 in work upon the site of its power plant, at the head of the Sultan Canyon, will this season construct an electric line from the Great Northern power plant site in order to transport its machinery. It is further said that Boston and other Eastern capitalists who are interested in the Forty-five and other mining properties of the upper portions of the district are arranging for an extension of the line up the valley. The distance from the railroad to the power plant is about 16 miles, and from the latter point to one equally accessible to the Forty-five, North Coast, Little Chief and Blackman mines is about eight miles.

Announcement has been made that the Northern Pacific Ry. will begin work on the extension of its peninsula line northward from its present terminus at Moclips to Port Angeles, during the coming spring months.

Grading for the yards of the Grays Harbor & Puget Sound (Union Pacific) Ry. at Cosmopolis, across the river from Aberdeen, will commence shortly.

The extension of the North Yakima & Valley R. R., 12 miles up the Moxee Valley, which is now under construction, will be completed by May 1, 1910. The work was delayed owing to condemnation proceedings to secure the right of way. George Donald, North Yakima, Wash., is president of the railroad.

The Wenatchee Valley Railway & Power Co. of Wenatchee has asked that city for a franchise to operate a street railway on certain streets in the city. Plans of the proposed railway have been under consideration for some time.

The Northern Pacific Ry. has filed papers at Olympia for three subsidiary lines, the Port Angeles & Olympia Ry. Co., the Port Angeles Peninsular Ry. Co. and the Olympic Peninsular Ry. Co., indicating that the N. P. is to take an active part in the development of the Olympic peninsula. The officials of the three railways are all identified with the Northern Pacific Ry. The Port Angeles & Olympia Ry. was surveyed two years ago and follows a water grade from Olympia to Port Angeles, skirting Hood canal, from Olympia to Quilcene; thence to Port Williams, Dun-

genness and Port Angeles. The Port Angeles & Peninsular Ry. has also been surveyed from Port Angeles through the valley of the Soleduck river to the vicinity of the Pacific coast, thence south to join the present Northern Pacific terminal at Moclips.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Ambursen Hydraulic Construction Co., 176 Federal St., Boston, Mass., is stated to have been awarded a $300,000 contract by the Chippewa Valley Railway, Light & Heat Power Co., of Eau Claire, to build a dam and power house at Cedar Falls, Dunn County, on the Cedar River, to develop 8,000 H. P. The plant will be finished by Sept. 1. The equipment will cost $200,000 additional. Enough machinery to generate 2,000 H. P. will be operated this year.

The Chicago & Wisconsin Valley Ry. Co. has applied to the City Councils of Stevens Point and Portage for franchises for its projected interurban line. According to a statement of Allan T. Russell, chief engineer of the company, the finances of the company have been arranged for and building will go ahead rapidly as soon as the spring opens the roads, and it is expected the line will be in operation between Stevens Point and Portage early next fall.

Officials of the Milwaukee & Fox River alley are to take steps immediately toward securing right of way for the proposed line from Milwaukee to Cedarburg, Plymouth, Elkhart Lake, Kiel, Chilton and Stockbridge on Lake Winnebago, a total distance of 135 miles. The estimated cost of the project is $3,000,000 and eastern capitalists are backing it. The Western Engineering & Construction Co., J. A. Mesiroff, president, is in charge of the work.

The Rockford Interurban Co. has applied to the city council of Janesville for a franchise to run cars over the route now operated by the Janesville Street Railway Co. on South Main St., then on to West Milwaukee St. to the terminal of the present line.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Announcement has been made to Parliament by George H. Graham, Minister of Railways, Ottawa, Ont., that the Canadian Government will begin the construction of the railway to Hudson Bay next spring. The road will be built as a government work, but probably will be operated by one of the existing private corporations or by several jointly. It is calculated that the route will be available four months in the year and that a great portion of the Western Canadian wheat crop can be hauled out each year at a saving of 5 cents a bushel in freight. The line is expected to be opened for business in three years.

The St. John Valley Ry. Co., of Fredericton, N. B., has completed arrangements for having surveys made for its projected line.

The Monarch Co. has applied to the provincial parliament at Toronto, Ont., for incorporation for a proposed new radial railway. It is proposed to start at the corner of Bathurst and Dupont Sts., Toronto, and, running in almost a straight line through the counties of York and Simcoe, provide a street railway for Barrie and Orillia and an express service between Barrie and Toronto, scheduled to make the run of 65 miles in one and a half hours.

The Canadian Pacific Ry., according to an announcement of G. J. Bury, General Manager, will spend $30,000,000 in Western Canada this year in extensions into new settlements, bridges, shops and double tracking the main line.

John Gunn & Sons, Winnipeg, Man., will shortly commence work on their contract for constructing the substructure of the Canadian Pacific bridge at Edmonton. The contract amounts to about $500,000.

Announcement has been made by Wm. Mackenzie, Toronto, Ont., president of the Canadian Northern Ry., that construction of the Vancouver-Edmonton section of his railway would commence on March 15 at New Westminster, B. C. He also stated that the line would be open for traffic from Vancouver to Montreal in April, 1914. M. H. MacLeod, Winnipeg, Man., is general manager.

The Canadian Northern Ry. is said to be planning extensive improvement work for this spring on its Winnipeg-Prince Albert line. Heavier steel will be laid and much ballasting done. It is said that at least $250,000 will be spent on the Winnipeg-Brandon portion of the line.

Mexico Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Tabasco Plantation Co., owning the Oaxaquenna sugar plantation in the State of Vera Cruz, is having surveys made for a standard gage railroad to give the Oaxaquena plantation connection with the Tehuantepec Railway near Santa Lucrecia Station, a distance of 18 kilometers. Construction will be commenced after the close of the rainy season in the fall and the line will be in operation next year. The company has 28 kilometers of narrow gage railroad on the plantation, and will increase this to 42 kilometers during the next year. The home office of the Tabasco Plantation Co. is in Minneapolis, Minn. The president is George McArthur of Aberdeen, S. Dak.

An official of the Dardanelle, Ola & Southern R. R., is reported to have announced that a proposition has been submitted to him by New York capitalists interested in the undeveloped coal section of Arkansas, to construct a railroad from a connection with the Dardanelle, Ola & Southern to Fort Smith or to a connection with the Arkansas Central R. R. F. S. Yantis, Dardanelle, Ark., is Superintendent of the company.

Officials of the New Mexico Central Ry. Co., are considering the construction of a 100-mile extension of the line southeast of Torrance to Roswell, N. Mex. W. S. Hopewell, Albuquerque, President of the company, is reported to have said that the financial affairs now pending in the courts will not delay the construction of the new line.

According to reports the Great Northern Ry. Co.'s surveyors are running lines for the proposed line from Fargo, N. Dak., to Minot or Williston. The survey passes two miles north of Amenia, N. Dak. H. F. Hamilton, Minot, N. Dak., is Resident Engineer of the company.

Citizens of Fort Ransom, N. Dak., are taking vigorous steps toward securing the construction of the proposed Chicago, Milwaukee & St. Paul line from Harlem, S. Dak., to Valley City, N. Dak., through that town. A bonus and free right of way has been offered the company, it is said.

According to reports from Watertown, S. Dak., the Minneapolis & St. Louis R. R. Co., has set aside $165,000 for the purpose of constructing a new pasenger depot and yards in that city, which is to be the chief division point of the road west of Minneapolis, Minn. J. H. Reinholdt, Minneapolis, Minn., is Asst. Chief Engineer of the Company.

Progressive Union of Hammond, La., is making vigorous efforts to obtain the construction of a motor railway from Hammond to Genesee to connect with the Illinois Central R. R. Towns along the proposed route have offered assistance to the promoters.

Contractor M. J. Heney, Cordova, Alaska, is continuing construction work during the winter months on the Copper River & Northwestern Ry. and now has about 1,000 men at work. It is expected that at least 4,000 men will be at work by the early part of March. The first 100 miles of track was completed to Tiekal on Dec. 23, and it is expected that the road will be completed to the Bonanza copper mine—its present objective point—in the early fall of this year. From there extensions will be made as warranted by the development of the country. Up to the middle of January there had been very little really severe weather, and with the exception of a week or two during December the trains have been running with regularity. For a while it was impossible to go beyond Miles glacier, owing to a sudden thaw and heavy rains, but these did no damage, and a subsequent freeze-up put everything in excellent shape. The big rotary snow plows have been called out but twice so far.

Citizens of Lewiston, Ida., are organizing the Lewiston Terminal Co., for the purpose of constructing an interurban and street railway around and in Lewiston.

Plans are now under way for the construction of the proposed electric line from Manning, N. Dak., to Mandan.

Application has been filed with the City Council of Newbern, N. C., for a franchise for a motor car line which is projected to run from Newbern to Trenton, N. C., in Jones County, a distance of 18 miles. W. S. X. Taylor and A. D. Stevens are interested in the proposition.

The Northern Pacific has decided upon a route for the construction of its portion of the new coast cutoff from Marmarth, N. Dak., through the Bad Lands. The line will cross the Missouri river near Marmarth, necessitating the construction of a bridge over one mile in length and 210 ft. above the water level. The 10 miles of track through the Bad Lands will cost $6,000,000 and will require three years work.

Construction work on the Gilmore & Pittsburg R. R., now being built in Idaho, is being rushed. Thomas Dixon, Sunfield, Idaho, has the sub-contract of 35 miles of grading out of Salmon. It is expected that the entire roadbed will be in shape so that the rails can be laid into Salmon sometime during March at the latest.

The Idaho Northern R. R., W. P. Smith, Chief Engineer, Enaville, Idaho, has petitioned the County Commissioners at Emmet, Idaho, for the privilege of extending its line along one of the main roads east of Emmett, which passes by section 4. This is one of the surveys the Idaho Northern made during the past summer.

The Georgia, Southwestern & Gulf Ry., recently organized to build a line from Cordele, Ga., to St. Andrews Bay, Fla., is said to have negotiated a loan of $4,000,000 in France for building and equipping the line. Of this sum $500,000 is said to be available for immediate construction work. The company proposes to take over the Albany & Northern R. R., which extends from Cordele, Ga., to Albany, Ga., and to build a line of road from Albany to the Gulf. It is also proposed to build a line from here to Hawkinsville. This will give a direct line to Charleston, S. C. J. S. Crews, Albany, Ga., is General Manager, Albany & Northern R. R.

The stockholders of the Boise & Interurban Ry. Co., H. E. Dalton, Manager, Boise, Ida., have approved plans for an early extension of the interurban line and there is a strong probability of the line being extended either to Payette, Emmett or Kuna during the summer.

The Osceola Construction Co. has been organized, according to reports, to construct the projected electric railway of the Omaha, Western & Lincoln R. R., from Omaha, Neb., to Hastings, Neb. Frank E. Schaff, Lincoln, Neb., is President of both companies.

The stockholders of the Aberdeen Street Ry. Co. of Aberdeen, S. Dak., have decided to proceed at once to comply with the company's charter requiring the construction and operation of four miles of street railway in the city in 1910. Charles N. Herreld, Aberdeen, is manager.

BIDS ASKED.

Bids are asked on following work, the notes being arranged alphabetically by states:

Bridges.

Denver, Colo.—Until noon, Feb. 26, by Charles W. Comstock, State Engineer, Denver, Colo., for the construction of five concrete piers and two concrete abutments for the State Bridge to be erected over the Grand River at Grand Junction, Mesa County, Colo. Official advertisement will be found elsewhere in this issue.

Montezuma, Ia.—Until Feb. 23, by Board of County Supervisors, for the construction of cement bridges and culverts in this county for the year 1910. J. W. Rose is County Auditor.

Savannah, Ga.—Until noon, March 14, by County Commissioners for furnishing necessary material and labor for the construction of a steel highway bridge including foundations for the same over Herb River on LaRoche Ave. G. Reuben Butler, Clerk of County Commissioners.

Decatur, Ill.—Until Feb. 14, by Board of County Commissioners for the construction of two steel bridges across the west fork of Flint Creek in the southern part of this county.

Wilmette, Ill.—Until noon, Feb. 16, by Sanitary District of Chicago, Ill., for the fabrication and erection of metal work for Sheridan Road Bridge and Wilmette Pumping Station, for the North Shore Channel of the Sanitary District of Chicago in this village. Robert R. McCormick is President of the Board of Trustees.

Niagara Falls, N. Y.—Until 7:30 p. m., Feb. 15 (readvertisement of bids asked Feb. 1), by Board of Public Works, for the construction of old Fourth St. Bridge over Gill Creek at East Falls St.

Snohomish, Wash.—Until 10 a. m., Feb. 28, by Board of County Commissioners, for the construction of a steel swing span over the Snohomish River at this town. The work consists of a 280-ft. span, 20-ft. roadway, two 6-ft. sidewalks on concrete center pier and concrete abutments.

Saskatoon, Sask.—Until 5 p. m., Feb. 14, by J. H. Trusdale, City Clerk, for foundations for the foot bridge at 20th St.

Saskatoon, Sask.—Until 5 p. m., Feb. 21, by J. H. Trusdale, City Clerk, for the construction of a steel overhead foot bridge at 20th St. William Hopkins is Mayor.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Kankakee, Ill.—Until 10 a. m., Mar. 8, by Board of Administration, State Capitol Bldg., Springfield, Ill., for the construction of a building at the Kankakee State Hospital. Frank D. Whipp is Fiscal Supervisor.

Rome, Ga.—Until 3 p. m., March 18, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the extension, remodeling, etc., including plumbing, gas piping, heating apparatus, electric conduits and wiring of the United States Post Office at Rome, Ga.

Crookston, Minn.—Until noon, Feb. 28, by State Board of Control, St. Paul, Minn., for the construction and completion of a Ladies' Dormitory Building and an Auditorium and Gymnasium Building at the Northwestern Experiment Farm, Crookston, Minn.

Glencoe, Minn.—Until 1:30 p. m., Feb. 25, by F. D. Stocking, County Auditor, for remodeling the old court house building.

Fremont, Neb.—Until 3 p. m., March 22, for James Knox Taylor, Supervising Architect. Treasury Department, Washington, D. C., for the extension, remodeling, etc., including plumbing, gas piping, heating apparatus, electric wiring and conduits, of the U. S. Post Office at Fremont, Neb.

Butte, Mont.—Until 2 p. m., March 30, by Board of County Commissioners, for the erection of a new county court house at Butte, Mont. M. Kerr Beadle is County Clerk.

Jackson, Tenn.—Until 3 p. m., March 11, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the extension, remodeling, etc., including plumbing, gas piping, heating apparatus, electric conduits and wiring and standard clock system of the U. S. Post Office and Court House at Jackson, Tenn.

Fort Douglas, Utah.—Until 10 a. m., March 1, by Kenneth P. Williams, Constructing Quartermaster, for the construction of one double bar rack, with plumbing, heating, electric wiring and fixtures complete at Fort Douglas, Utah.

Fort Monroe, Va.—Until 10 a. m., March 3, by Capt. E. R. Tilton, Constructing Quartermaster, for wire door and window screens for eight new buildings at Fort Monroe, Va.

Richmond, Va.—Until 3 p. m., March 17, by James Knox Taylor, Supervising Architect Treasury Department, Washington, D. C., for the construction of the United States Post Office, Court House and Custom House at Richmond, Va.

Seattle, Wash.—Until 11 a. m., Feb. 16, by Capt. E. C. Long, Constructing Quartermaster, 482 Arcade Annex, Seattle, Wash., for the construction of a wagon shed for 18 vehicles and the conversion of a stable into a commissary sales and storehouse, a wagon shed into a quartermaster and commissary storehouse and a coal shed into an ordnance machine shop at Fort Worden.

Green Bay, Wis.—Until noon, Mar. 15, by County Commissioners, for furnishing and decorating the new court house at Green Bay, Wis. Elmer S. Hall is County Clerk.

Fort D. A. Russell, Wyo.—Until 9:30 a. m., March 2, by Constructing Quartermaster, Cheyenne, Wyo., for the construction of the following buildings at Fort D. A. Russell: For constructing, plumbing, heating, electric wiring and electric fixtures, for two Administration Buildings, Plans No. 122-F; one Guard House, Plans No. 206; one set of quarters for four officers, Plans No. 237-B; for construction, plumbing, electric wiring and electric fixtures for one Stable, Quartermaster's Department, Plans No. 139-L; for construction and plumbing for one Vehicle Shed, Plans No. 209; for construction only of one Storehouse for Powder, Plans No. 263; one Storehouse for Ammunition, Plans No. 262, and one Ice House, Plans No. 196-A.

Fort Mackenzie, Wyo.—Until 2 p. m., March 7, by Constructing Quartermaster, for the construction, plumbing and electric wiring of a brick stable for 50 horses plan 139-L.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Burlington, Ia.—Until 4 p. m., Feb. 21, by J. F. Winter, City Engineer, for improving Arch St., including grading and curbing and paving with mineral rubber asphaltic concrete. A certified check for $500 must be filed with each bid.

Wichita, Kan.—Until 9 a. m., Feb. 21, by William Sence, City Clerk, for paving West Douglas Ave., from Exposition Ave., to Sheridan Ave., Washington Ave., from Second St. to Kellogg St., and Roosevelt Ave., from South Park Ave. to Central Ave. The approximate quantities are 75,000 sq. yds. brick block pavement on 6-in. Portland cement concrete base and 18,000 cu. yds. of earth excavation. Bert C. Wells is City Engineer. Official advertisement will be found elsewhere in this issue.

Towson, Md.—Until Feb. 17, by Highway Commission, E. Stanton Bosley, Secretary, for grading and macadamizing road between Mount Washington and Brooklandville, known as the Falls Road, Sec. 2, 3.20 miles in length.

Westminster, Md.—Until noon, Feb. 14, by Board of County Commissioners, for improving the public highway between New Windsor and Uniontown Road. The work will include the grading and macadamizing of about 1 mile of road. O. E. Dodrer is Clerk.

Fort Hamilton, N. Y.—Until 11 a. m., March 3, by Constructing Quartermaster, for walks, drains and grading in vicinity of new buildings at this post.

Dallas, Tex.—Until Feb. 11, by J. B. Winslett, City Secretary, for the improvement of Austin St., between Commerce St. and Jackson St., by paving. Bids will be received on the following materials: Vitrified brick, vitrified brick paving block, concrete curb and concrete gutter, combination curb and gutter.

Appleton, Wis.—Until 3 p. m., Feb. 19, by Board of Public Works, for paving the following streets: Prospect and Second St., from Pearl St. to Locust St.; Walnut St., from Prospect St. to Dillon St.; Lawrence St., from the Lawrence St. viaduct to Walnut St.; Appleton St., from the Chicago & Northwestern Ry. tracks north to Second Ave.; Durkee St., from Lawrence St. north to the Chicago & Northwestern Ry. track; Union St., from Alton to North St.; Union St., from North St. to the Chicago & Northwestern tracks. Permanent pavement is to be used on concrete foundation. Official advertisement will be found elsewhere in this issue.

Burlington, Wis.—Until 2 p. m., March 15, by P. J. Hurtgen, City Engineer, for brick paving. The work includes 10,321 sq. yds. of brick paving on 6-in. concrete base; 2,500 lin. ft. of cement curb; 2,660 cu. yds. of excavation.

Green Bay, Wis.—Until 2 p. m., Feb. 17, by City Clerk, for the paving of certain streets with brick, asphalt, tar, macadam, creosoted wood block, Blome's granitoid block, sandstone block, or concrete. W. W. Reed is City Engineer.

Lake, Wis.—Until 2 p. m., Feb. 19, by M. J. McNamara, Town Clerk, for grading the south half of Oklahoma Ave., from Clement Ave., to the Chicago & Northwestern Ry.

Oshkosh, Wis.—Until 2 p. m., Feb. 17, by Board of Public Works for furnishing all necessary labor and material for grading, curbing and repaving with brick, creosoted wood blocks, cement, Blome Co. patented granitoid concrete pavement, rock asphalt, sheet asphalt or tar macadam on concrete foundation Oregon St., from 15th to 17th St.; Otter St., from State to Broad St.; State St., from Washington St. to Ceape St.; Market St., from High to Marion St. J. E. Mallery is Chairman of the board.

Sheboygan, Wis.—Until 4 p. m., Feb. 11, by Board of Public Works, for grading, curbing, paving or macadamizing portions of Michigan Ave., Huron Ave., Superior Ave., North 12th St., and Center Ave. John Kummer is Chairman of the Board.

Sewers.

Bids are asked on following work, the notes being arranged alphabetically by states:

Oakland, Cal.—Until 11 a. m., Feb. 9, by Board of Public Works, for furnishing necessary labor and material for the construction of drainage structures on Broadway between 20th St. and Piedmont Ave.

Boone, Ia.—Until 7:30 p. m., Feb. 16, by Otto Hile, City Clerk, for the construction of the Fifth Ward Sewer. The work includes approximately 9⅓ miles of vitrified pipe sewer from 8 to 15 in. K. C. Kastberg is City Engineer.

East St. Louis, Ill.—Until Feb. 16, by Board of Local Improvements, for the construction of vitrified pipe sewers in several streets.

Holton, Kan.—Until noon, by Mayor and City Council, at the office of City Clerk, for reletting the work for the construction of a sewerage system and disposal works for this city. S. H. Newell is City Clerk. Official advertisement will be found elsewhere in this issue.

Carterville, Mo.—Until 5 p. m., Feb. 17, by H. E. Moody, City Clerk, for the construction of 9,050 ft. of district sewers. F. A. Funk is City Engineer.

Vandalia, Mo.—Until Feb. 24, by City, for the furnishing necessary labor and material for the construction of a water works and sewer system. Fuller-Coult Co., Chemical Bldg., St. Louis, Mo., is the Engineer.

Medina, N. Y.—Until 8 p. m., Feb. 15, by Board of Sewer Commissioners, for furnishing of all materials and labor for the construction of an addition to the sewer system of the village. Daniel D. Holdredge is President, Board.

Cincinnati, O.—Until noon, Feb. 11, by Director of Public Works, for the construction of a surface water sewer in Harrison Ave. J. J. Wenner is Clerk of the Board.

Cleveland, Tenn.—Until April 1, by City, for the construction of a sewer system and disposal plant. Solomon Norcross Co., Atlanta, Ga., is Engineer. The work is estimtaed to cost $35,000.

El Paso, Tex.—Until March 3 (extension of date from Feb. 3), by Percy McGhee, City Clerk, for furnishing necessary labor and material for the construction of refuse incinerator, steel stack and sewage pumping station equipment with appurtenances. Hering & Fuller, 170 Broadway, New York, N. Y., are the Engineers.

Vancouver Barracks, Wash.—Until 11 a. m., Feb. 25, by Constructing Quartermaster, for the construction of a storm sewer, catch basins, manholes, outfall, etc.

Burlington, Wis.—Until 2 p. m., March 15, by P. J. Hurtgen, City Engineer, for sanitary sewers and storm sewers. The first includes 1,861 lin. ft. of 10-in. vitrified pipe sewer; 1,073 lin. ft. of 8-in. vitrified pipe sewer; 560 lin. ft. of 6-in. vitrified pipe sewer; 8 manholes; 2 lampholes. The latter includes 716 lin. ft. of 12-in. vitrified pipe sewer; 360 lin. ft. of 10-in. pipe sewer; 300 lin. ft. of 12-in. vitrified pipe sewer; 5 manholes; 12 street inlets.

Water Supply.

Bids are asked on following work, the notes being arranged alphabetically by states:

Burlington, Ia.—Until 2 p. m., Feb. 17 (date postponed from Feb. 2), by County Board of Supervisors, for furnishing and erecting a complete pumping station, including buildings and machinery. Harman Engineering Co., Peoria, Ill., are the Engineers. Official advertisement appeared in the Jan. 19 issue.

Chicago Heights, Ill.—Until 8 p. m., Feb. 18, by W. E. Lennertz, City Clerk, for new pumping equipment, including 4 deep well pumps, 2 service pumps, transformers, switchboards, one drilled well, etc.

Fort Wayne, Detroit, Mich.—Until 11 a. m., Feb. 17, by Capt. D. W. Kilburn, Constructing Quartermaster, for the construction of an extension to water mains, etc.

Fort Bayard, N. Mex.—Until 11 a. m., Feb. 21, by Capt. S. P. Vestal, Constructing Quartermaster, for complete construction of extension of post water main from end of main near hay barn to the dairy barn with the installation of a fire plug.

Nottingham, O.—Until noon, Feb. 18, by J. C. Steinickle, Village Clerk, for the construction of water mains on several of the streets. J. B. Davis & Sons, 207 Arcade, Cleveland, O., are the Engineers.

Ardmore, Okla.—Until noon, Feb. 21 (readvertisement of bids called Feb. 1) by G. H. Bruce, City Clerk, for the construction of sedimentation basins and filtration plant and for the extension of the present water main at the city lake.

Burlington, Wis.—Until 2 p. m., March 15, by P. J. Hurtgen, City Engineer, for the extension of the water works system. The work includes 1,334 lin. ft. of 4-in. water pipe; 4 4-in. gates and valve boxes; one 6-in. gate and valve box; one hydrant; two hydrants reset.

Miscellaneous.

Bids are asked on following work, the notes being arranged alphabetically by states:

Hammond, Ind.—Until Feb. 15, by Board of Public Works, for the construction of an electric light and power plant.

estal is 1 ft. 11½ ins. above the top of the curb or crown of the street. In the curb piers this pedestal has its horizontal dimensions 6 ins. greater than the column shaft. In the case of the center piers, the pedestals are replaced by a continuous base or wheel guard running the full length of the pier and built with a starling at each end.

The columns are reinforced with about 1.5 per cent of steel consisting of 1-in. vertical bars. This reinforcement is held in place by ties of ½-in. bars spaced 12 ins. c. to c. vertically. The main column bars extend from the construction joint at the level of the crown of the roadway to the top of the top girder. Each one of these column bars is wired to a footing bar which extends from the bottom of the footings to a height of 4 ft. 6 ins. above the construction joint, thus furnishing continuous reinforcement from the bottom to the top of the piers to provide for any bending moment which is likely to occur. The concrete columns are 18 ins. wide in a direction perpendicular to the center line of the roadway, except in the case of the center pier at Davis St., where they are 24 ins. wide. The dimensions of the curb columns are either 18x20 ins. or 18x22 ins. except at Davis St., where they are 18x24 ins. The center pier columns are all 18x22 ins., except at Davis St., where they are 24 ins. square. The maximum stress on the column section is about 450 lbs. per sq. in. including impact. The stress ratio between concrete and steel is 12, thus the maximum stress on the steel in compression is about 5,400 lbs. per sq. in., including impact.

Fig. 6—View of Washington Street Subway Bridge, Showing Piers and Falsework.

A footing beam 27 in. deep distributes the load of the columns to the footing slab. The top of this beam is reinforced by ¾-in. bars extending the full length of the pier, and a number of ¾-in. stirrups tie it to the footing slab. The footing slab is 30 ins. deep and varies in width according to the bearing area required to keep within the allowable unit pressure on the foundations. The slab is reinforced by transverse 1-in. bars. Four to five ¾-in. bars are placed longitudinally in the bottom of the footing to provide for possible inequalities in pressure brought about by variations in the foundation conditions, and to take any negative moment which might occur directly underneath the columns or in the side cantilevers.

The concrete for the piers, with the exception of the column shafts, is a 1:2½:5 mixture. The concrete for the column is better than a 1:2:4 concrete. Square corrugated bars were used.

The abutments are massive plain concrete construction of gravity section above the footing and have sufficient width of footing to keep the toe pressure within the allowable limit. Reinforced concrete abutments were not considered because it was expected that this work would be done during freezing weather. The abutments were figured for earth pressure (according to Rankine's theory) for a live load surcharge of 10,000 lbs. per lin. ft. of track spread over a width of 13 ft. and for the reaction of the slab spanning the sidewalk.

Fig. 4 is a cross section of the north abutment at the Chicago Ave. subway. This abutment is 21 ft. 6 ins. high from base of rail to bottom of footing, and has a base of 14 ft. 6 ins., making a ratio of base to the height of .67. The footing has a toe projection of 5 ft. reinforced by 1-in. bars. The step is added to keep the unit shear low and make shear reinforcement unnecessary. The north abutment at Church street is on piles. The rows of piles are spaced in such a manner that the load on the extreme front row will never exceed the allowable bearing value for the maximum lateral forces, and that the load on the rear row will not exceed the bearing for the minimum lateral forces. For average conditions the bearing on all piles is practically the same.

As shown by Fig. 4, a seat is provided near the top of the abutments for a width necessary to accommodate the sidewalk slabs. On either side of this seat the abutments are carried up level with the tops of the slab parapets and base of rail. The abutments which adjoin those of the Chicago & Northwestern R. R. subways have a slight batter on the front face and a coping under the bridge seats in order that the structures for the two railroads might be similar where they come into close proximity. The abutments for the other subways are made with vertical faces and without coping. The wing walls are carried out along the street line sufficiently far to prevent the slopes from encroaching on the sidewalks. The tops of the wing walls are sloped down 1½ to 1 to a height of 7 ft. above the ground and are then carried level to the end in order to match up with the 7-ft. fences. All abutments are designed with a view to providing for a future third track. The footings are built to the full width on the side upon which the future track will come and the wings are stepped down in such a way as to make the addition of future neatwork practicable.

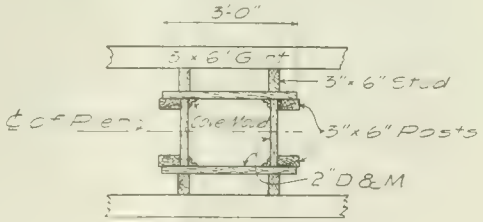

Fig. 7—Section of Column Form.

Design of Slabs.—In all the subway bridges, except Davis St., each track is carried over each span by a single reinforced concrete slab about 13 ft. wide (12 ft. 11¾ ins.). The roadway opening at Davis St. are spanned by two slabs per track. As all of the subway bridges are on a skew varying from 2° to 21° 13', the slabs take the shape of parallelograms with their sides parallel to the direction of the track and their ends parallel to the center line of the street. The outside parapets of the track slabs are carried up to the level of the base of rail and are 9 ins. wide at the top. The faces of the slabs are panelled as shown in Fig. 2. The inside parapets are made low and merely serve as curbs for the gutters as shown in the detail, Fig. 5.

The slabs are designed for a live load equivalent to Cooper's E-50 loading plus impact, and for the dead load of track, ballast and concrete. It was assumed that the entire load would distribute over the full width of 13 ft. The presence of 15 to 28 ins. of ballast and the transverse reinforcement as well as the large ratio of the thickness of the slabs to their width, makes this a safe assumption. The longitudinal tension reinforcement consists of a double row of 1-in. bars laid in a direction parallel to the track and spaced as shown in the cross section, Fig. 5. The shear reinforcement consists of ½-in. "U" stirrups, assisted by the bent up ends of a number of the longitudinal bars, as shown in the detail. The transverse reinforcement consists of ½-in. bars spaced as shown. Inverted U-shaped handling stirrups are embedded at each end of the slab in a line parallel to the track and passing through the center of gravity of the slab. A rectangular depression around the tops of these stirrups gives room for the lifting device. The ends of the stirrups are bent horizontally for a distance of 1 ft. Seven ¾-in. bars placed transversely in both the top and bottom of the slabs at each stirrup take care of cross bending stresses which occur during the handling of the slabs.

The roadway slabs 13 ft. wide vary in thickness from 2 ft. 5 ins. to 3 ft. 5 ins., making the thickness of the bridge floor from bottom of the slab to base of rail from 3 ft. 8 ins. to 4 ft. 10 ins. The sidewalk slabs vary in thickness between 1 ft. 6 ins. and 1 ft. 7 ins. The roadway slabs are given a crown of 2-ins. under the center line of track, which provides for a gutter at each side with a minimum depth of 2 ins. These gutters are sloped from the center line of the bridge toward the abutments. The sidewalk slabs are sloped 3 ins. between the curb piers and the abutments. This arrangement provides for draining the entire bridge floor in each direction from the center line of the street over the back of the abutments. The joints between the sidewalk and roadway slabs are to be sealed and waterproofed in such a manner that the water will pass over them. The section, Fig. 2, shows the arrangement of slabs and direction of drainage.

The roadway slabs at Davis St. have an over-all length of 27 ft. 6 ins., and it was found that a single slab 13 ft. wide would be too heavy to handle; consequently two slabs were used, each 6 ft. 6 ins. wide. A difficulty was encountered in the design of these slabs due to the fact that the resultant of the live load does not pass through the longitudinal center line of the half slab. On

Fig. 8—Details of Form Work for Slabs.

account of this fact the intensity of the reaction near the inner edge was increased, making it necessary to provide for a greater moment at this edge than at the outer edge. This variation of moment was taken care of, partly by varying the cross section, partly by varying the per cent of reinforcement, and partly by adding compressive reinforcement.

Construction of Piers and Abutments.—The building of the piers and abutments was difficult on account of the adverse local conditions, such as the narrow right of way (in some cases only 40 ft. wide), the frequency of the electric trains on the double track line, and the presence of the overhead trolley wires. The trains were operated at 10-minute intervals for the greater part of the day and night, the only respite being gained between the hours of 2 a. m. and 5 a. m., when the interval was increased to 1 hour.

Fig. 9—View of Slab Yard at Harvard Ave.

All excavation, driving of foundation piles, and placing of concrete footings were done, insofar as possible, before the construction of the falsework bridges and before the raising of the grade. The track was carried across the pits on wooden stringers. The foundation piles were of oak or tamarack 24 to 30 ft. in length. The standard track driver was employed and it was necessary to operate the trains single track while the driver was in a position to work. The trolley wires were thrown aside as much as possible and the interfering span wires removed. Two drivers were used, and day and night shifts were kept busy. The night crew drove the piles farthest from the center line of track because in driving such piles the swing of the driver interfered with both tracks, consequently the time of night was chosen in which the interval between trains was the greatest.

Pile trestles were put in over all crossings to carry traffic during the erection of the forms and the placing of the concrete for abutments and piers, Fig. 6.

It was found impracticable to use sectional forms for the piers to the extent planned, and only the forms for the column shafts and the centers for the arches were designed to be interchangeable. The sheeting for the column bases and the top girders was built in place. All sheeting was placed with joints horizontal and was composed of 2x8-in. lumber. Fig. 7 shows the details of the formwork for one column. The sections parallel to the side of the pier were made 3 ft. wide and braced by 3x6-in. vertical studs, and by horizontal girts running the full length of the pier. The sections for the column sides perpendicular to the face of the pier were made of the exact width of the column and fitted in between the side sections. The sheeting for these sections was nailed to 3x6-in. posts, which were offset at the bottom from shorter posts supported on the footing girder. The top posts were bevelled at the top for the 3-in. offset to the top girder, and also afforded support for the arch centers. The arch centers were made up of solid semicircles of 2-in. lumber and 1x2-in. lagging was used. The lagging was made just long enough to fit between the forms for the faces of the pier. The reverse curves at the ends of the piers were cut from 2x12-in. boards and were nailed to the inside of the side forms to support 1x2-in. lagging. Cleats were nailed across the tops of the pier forms to support the reinforcing bars in the top beam and to keep the forms from spreading. All steel was wired into place before the pier was poured. A loose board was left at the bottom of each column to make it possible to inspect and clean out the column form before placing concrete. To remove the forms it was only necessary to take off the side girts and the centering for the reverse curve cantilevers, after which the sections could be peeled from the face of the pier.

Forms for the abutments were of the Bridge & Building Department's standard type for such work, consisting of 2x8-in. form lumber supported by 3x6-in. posts spaced about 24-in. centers, which in turn were braced by double 3x6-in. girts. The forms were tied across by form-bolts and No. 10 wire.

Two alternative methods for providing the concreting plant were considered, (1) a mixer set up on the ground to handle material dumped at the site, and (2) a concreting train. The first method proposed would make construction less dependent on train service than the second and would obstruct the track only during the unloading of material. The disadvantages of this scheme, however, were numerous; the equipment could not be used continuously, the concrete would have to be raised with a derrick or wheeled into position, and at many points the right of way was hardly wide enough to provide sufficient space for the accommodation of the plant and material. The method of concreting direct from trains was adopted. To permit the use of this scheme, both facing and trailing point-switches were put in at convenient intervals along the line. With this arrangement either track could be used over the various crossings and all trains were operated single track through the block while the mixer was in use. A pilot and switchmen were used to handle trains through the block on account of the fact that there was no dispatching system. There were three concreting trains operated and two No. 1 and one No. 2½ Smith mixers were used. The mixers were mounted on flat cars in such a position that the discharge just cleared the end of the car. The number of cars of material varied—the average was three cars stone, two cars sand and one car cement following the mixer in the order named. An old locomotive boiler was mounted and hauled in the rear of the train during winter months to furnish steam for heating concreting materials.

Both chutes and wheelbarrows were used in depositing the concrete. The use of chutes was found to be the least satisfactory for piers because it required that the train be spotted at each pier in turn, while the use of wheelbarrows made it possible to concrete all of them at the same time, thus permitting the use of a larger crew and doing away with considerable switching and delay.

Construction of Slabs.—The slabs were molded in the Howard Ave. yard, Fig. 9, at the south end of the track elevation, about an average distance of one mile from their place of erection. The ground on the site was first leveled and second-hand 12x12-in. or 8x16-in. sills were laid and driven to a uniform bearing with a 65-lb. sheet pile pounder. A floor of 2x8-in. D. & M. planking was laid on the sills and the whole carefully leveled with an instrument. The slabs were cast to bring the direction of the span parallel to the joints in the floor. The forms for the face of the slab parapet were made up of 3x6-in. posts 5 ft. high and spaced 24-in. centers, sheeted with 2x8-in. D. & M. planking, which extended within 12 ins. of the top of the posts. The forms for the ends and backs were made of 3x6-in. x 4 ft. posts spaced 24-in. centers and sheeted with 1-in. S1S&2E boards. The side forms were braced to 6x8-in. timbers spiked to the projecting end of the sills. The sides were made long enough for the longest slab, but were used for the shorter slabs as well, and each side and end was built as a complete section and moved from place to place on a push car. It was found possible to use each section about 12 times, after which the sheeting was renewed. The old lumber was used for backs of walls and abutments for sheet piling. Pairs of posts in the side forms were directly opposite, and a 2x8-in. or 3x6-in. plank was spiked to their sides above the sheeting. These timbers stiffened the entire form, afforded support for the reinforcing bars, carried the forms for the back of the parapet, and sustained runways for the wheelbarrows. Fig. 8 shows these details. Blanks made up of 1x8-in. S1S&2E lumber and 1x4-in. cleats were nailed to the inside of the parapet form to produce the recessed panels in the face of the finished slab.

Fig. 10—Elevation of Slab Erecting Train.

The inforcing bars and stirrups for the track slabs were cut to the proper length and bent to the required shapes at the yard. They were hauled to the forms on a push car and wired into place. The lower longitudinal bars were first laid on wooden blocks at the required distance from the top of the floor, cross bars were next placed and wired to the longitudinal bars to act as spacers, and finally U-shaped stirrups were hooked under the

longitudinal bars at the bottom and supported by wire from the top cross pieces of the form. After all bars had been hung from the form in this manner, the small blocks were removed and the concrete was poured.

The concrete was machine mixed, a No. 1 Smith mixer being used on the job. The mixer discharged into a hopper with a gate at the lower end, and each workman loaded his own barrow by lifting this gate. The mixer was spotted each day in the most convenient location relative to the slabs to be concreted in that day's work. When the form had been filled to within about 4 inches of

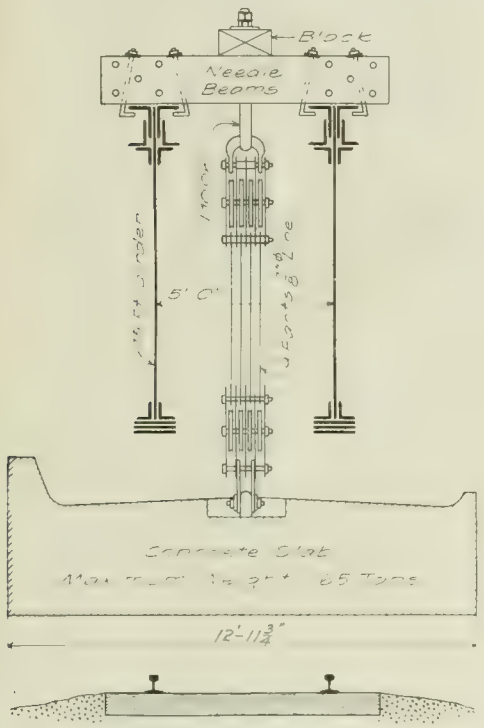

Fig. 11—Cross-Section of Erecting Girders.

the top, the supporting wires were cut and pushed down into the concrete in order that the slab might be finished to the required surface.

Erection of Slabs.—The problems involved in the erection of the slabs were the transportation from the seasoning yard to the respective bridge sites, and the placing of them in their final position; all to be done in a way to cause the least possible interference with passenger traffic. The first idea was to transport the slabs on flat cars and place them with a derrick car or wrecking crane. The company had a number of 100-ton wrecking cranes and a number of 30-to 50-ton derrick cars available, and it was found that the sidewalk slabs could be handled readily in this way. The roadway slabs, however, averaged about 65 tons each, and needed special consideration. The use of a 100-ton wrecking crane was considered first. The slabs were to be handled by means of a triangular toggle frame attached to the handling rods which were imbedded in the concrete. The frame consists of a channel strut and two pairs of eye bars which extend from the ends of the strut to a pin over the middle of the slab. This device is used by the B. & B. Department in the erection of concrete trestle slabs. The use of the device requires a reach on the part of the crane equal to at least one-half of the length of the slab, and this reach could not be obtained in this case without a considerable outhaul and alteration in the body of the car. The next scheme involved the use of two derrick cars; one at each end of the slab. The cars were to be spotted at each side of the span and the slab was to be brought up on the second track and lifted from the flat car into place. This plan would interfere with traffic on both tracks to an undesirable extent and also would require an excessive side pick with the accompanying necessity for blocking outriggers and guying towers. A scheme for bringing the slab to the bridge site between derrick cars and on the same track was suggested as an alternative and found to be better in some respects, but far from satisfactory. At this juncture an erection device was suggested by Mr. C. F. Loweth which eliminated all the uncertainties accompanying derrick car erection and it was used without any material modifications.

The general layout of the erecting device as used is shown in Fig. 10 and consists of a 75-ft. plate girder span, taken from stock and temporarily available, mounted on two steel flat cars of 100-ton capacity. The cars are spaced to permit the slab to hang between them when attached to the girders, and are provided with a special timber deck of 8x16-in. timbers securely cross braced and bolted to the car body. Transverse to this decking are two 12x12-in. bolsters carrying a bearing plate upon which the bearing plate and timber bolster of the girders is placed. A king pin was passed through both plates and bolsters and the plates were kept well greased to permit turning motion. The train pull was transmitted from the girders to the cars in each case by means of a special lower lateral system which provided a pin plate to receive the king pin. Fig. 11 is a cross section of the girders and shows the methods of supporting the slabs. Two pairs of 8x16-in. needle beams, spaced 8 ins. apart, and carrying a wooden block with hook, spanned the girders. Each end of the concrete slab was suspended from a set of these beams (see Fig. 10) by tackle made up of two 4-sheave blocks and 9 parts ⅞-in. diameter wire line. The company had two derrick cars, completely equipped with engine, rigging and tackle, which could be spared from other work. These cars were coupled to the train, one at each end, and the lines supporting the two ends of the slab were controlled by the respective derrick car engineers. The procedure in placing the slab with this device was as follows: The slab was jacked up and placed on girder carriages mounted on rails. After the erecting train had been properly placed, the girder carriage track was extended across the main track, and the slabs were rolled underneath the girders, connected, lifted and carried to the bridge site. The train was spotted in a position which would bring the slab directly above its final bearings, the track was removed, the falsework was torn out, and the bridge seats were prepared with a stiff cement mortar. When all was in readiness the slab was carefully lowered into place. By making the mortar of the right consistency and thickness, and by raising and lowering the slab a few times, it was found possible to bring the thickness of the bed to the required dimension and to line up the adjacent slabs in a very satisfactory manner.

Retaining Walls.—The right of way of the C. M. & St. P. Ry. through Evanston varies in width from about 40 ft. to about 115 ft. The two tracks were elevated to an average height of about 17 ft. above the natural ground surface, and, as mentioned before, provision was made throughout the work for the probable future addition of a third track. With these conditions existing, it would have been necessary to build a retaining wall along at least one side of the right of way for practically the full length of the track elevation, if it had not been for the fact that the right of way of the Chicago & Northwestern Railway adjoined that of the C. M. & St. P. Ry. for a large part of the distance. The two railway companies entered into an agreement in advance of the work, by the terms of which the space between the shoulders of their respective embankments was to be filled to the level of the tracks, and the cost of about 8,000 ft. of full height retaining wall saved to each of the companies.

There is in all about 4,500 ft. of retaining wall in the track elevation work, the walls varying in height, above the ground surface, from a mere curb of 3 or 4 ft. to the full height of the embankment. With a few exceptions, the walls were of the ordinary plain concrete gravity section similar to the abutments. This type was considered an advisable one on account of conditions beyond the control of the designer. Rankine's theory of earth pressure was used in designing for the lateral forces. The effect of the live load surcharge was calculated on an assumption of vertical spread through the embankment. A maximum toe pressure of 1¾ tons per sq. ft. was adhered to. As a general rule the walls were constructed in alternate sections; the sections are approximately 25 ft. in length and the construction joints are marked with a V-groove. The appearance of the walls is improved wherever possible by the addition of a coping and rectangular recessed panels. In cases where it is desired to provide for a future increase in height which might be made necessary by the shifting or addition of tracks, the design of the footings was modified and a heavy step is added to the back of the neatwork in order that any future extension will require a minimum of excavation and give the greatest stability to the final wall.

There were a number of inclined teamways required by the Chicago & Northwestern Ry. adjoining the right of way of the C. M. & St. P. Ry. and at these points it was necessary to build retaining walls. These teamways are on a 5 per cent grade, making a total length of about 265 ft. of wall necessary in each case. The height of the teamway varied from the street grade to the full height of the track elevation work. As the C. M. & St. P. Ry. found it necessary to place its embankment before the fill for the teamway was made, a wall founded on the natural ground and capable of sustaining the embankment without front support was required. With the teamway in place the difference of the elevation of the earth on the two sides, and therefore the overturning moment, for that part of the retaining wall at the upper end would be small, and the lower part of the wall would be buried and useless. On account of this fact the design adopted as the most economical one under the circumstances shows a full height solid gravity retaining wall to a point 90 ft. from the summit of the teamway. The wall beyond this point consists of a curb coming 3 ft. below the final surface of the teamway and supported on buttresses. The curb wall was reinforced as a beam to carry its weight between piers and was made of a section sufficient to give it stability in itself. The buttresses or piers and their footings

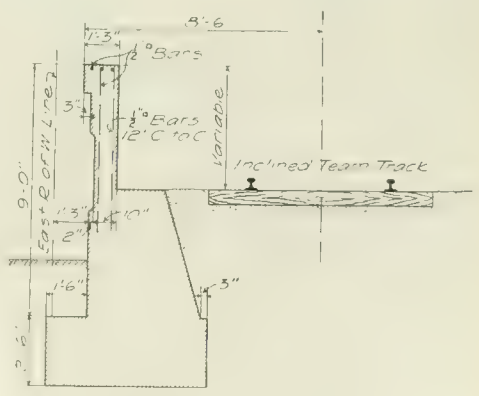

Fig. 12—Section of Wall Along Chicago Avenue.

were proportioned to sustain the entire structure when under the action of the back fill before the teamway was in place without exceeding the allowable pressure on the foundations.

The ordinance required a concrete wall or fence 7 ft. high for a distance of about 1,550 ft. along Chicago Ave. where the C. M. & St. P. Ry. was permitted to extend its right of way to the curb line. This wall is of variable section depending on the grade and the position of the nearest track. From Madison St. south there are two team tracks parallel to Chicago Ave., rising on a grade of

0.5 per cent. Fig. 12 is a cross section of the wall at this location showing the method of providing for the 7 ft. height required by ordinance. The opening and paneling shown serve to break the monotony of the long stretch of concrete surface in a rather satisfactory manner. The coping is continuous and the panels are 9 ft. in length by 3 ft. in height, the spacing between panels being 3 ft. 6 ins.

The form work for retaining walls was of the department's standard type as described in connection with the construction of abutments. There were several cases, however, where the location of the tracks made it impossible to support the forms by the usual outside braces, and in these cases the rather unusual expedient was adopted of tying the side forms to bolts embedded near the opposite edge of the concrete footings.

The concrete for retaining walls at some distance from the track was placed by means of a stiff legged derrick mounted on a flat car of the concreting train and carrying a concrete bucket designed by the department for this special purpose. Fig. 13 is a detail of the bucket. It has a conical shape and is made up of sheet steel plates. A sliding discharge gate at the small end is controlled by a handle and a system of levers. The position of the levers and the gate while concrete is being discharged is shown dotted in the figure. This bucket proved especially convenient in discharging into narrow openings, and was very easily controlled.

Mr. Griefenhagen in his paper dwells somewhat at length on the design and construction of the stations. The problems were somewhat special and few readers of ENGINEERING-CONTRACTING will be interested in them. The paper will be published in full in the Journal of the Western Society of Engineers.

The grading and paving of the subways and station approaches were done by contract, with brick on a 6-in. concrete base, expansion joints being provided at 40 ft. intervals.

The actual track raising was begun in the spring of 1909 and was carried on by the engineering department. To facilitate the handling of material a temporary yard was built at Howard Ave., and the engines on the work usually tied up in this yard at night, thus eliminating delay on account of the late arrival of motive power. Side dump cars were used throughout the work and all material was unloaded by hand. About 300,000 cu. yds. of material were used for the entire work. It consisted of sand and gravel hauled from the Fox Lake region.

The scheme of raising tracks was according to the usual methods. One track at a time was thrown out of service, cars were emptied, the material leveled and the tracks were raised about 6 ins. to 8 ins. ready for the next load of fill. When the difference in elevation of the two tracks became about 2 or 3 ft., the traffic was shifted and the low track raised.

Owing to the narrow right of way the problem of raising the tracks at some places was quite complicated, especially where space had to be left for walls which could not be completed before the elevation was begun. At such points a system of bulwarks was employed. The work over Main St. is typical. Retaining walls were required on both sides of the right of way north of Main St. and on the west side south of Main St. The tracks were first raised about 4 ft. over the crossing and temporary bridges put in to keep the street open for traffic. North of the crossing the west track was raised as high as possible without interfering with the operation of the east track. Then the east track was thrown out of service in its turn and elevated, and a falsework bridge was put in across the street. Solid piles were driven on both sides of the track north of the bridge for a distance required to prevent the slopes of the embankment from blocking the west track and northeast wall location. These side piles were from 22 to 30 ft. long and had from 10 to 18 ft. penetration. They were driven about 7 ft center to center and old ties were thrown in behind them to retain the fill. It was found that after a time they began to spread and consequently were tied together by a number of strands of No. 10 wire running through the embankment just below the track.

The backs of abutments and retaining walls were not waterproofed. The fill was drained with 6-in. tile laid along the back of the walls, one drain served for retaining walls, but two lines were laid behind abutments, one near the bottom and one near the top. Tile pipe laid between the tracks drained the subgrade. A combination manhole and catch-basin with about 3 ft. interior diameter was placed behind each abutment. All drains were carried into the nearest catch-basin, and the catch-basin in turn discharged into the city sewers through a 9-in. pipe. The subways are drained by suitable inlets which were in all cases located at some distance from the street intersections in order that the depth of gutter and the step at the sidewalk crossings might be as small as possible. The gutter grates were of the "Duplex" type. There was a catch-basin located at each inlet and one manhole in each subway.

The design and construction of the subway bridges, retaining walls, concrete work connected with the stations, station buildings and platforms, as well as the street paving and drainage for the entire track elevation work, were executed by the Bridge and Building Department of the Chicago, Milwaukee & St. Paul Ry. under the direction of Mr. Loweth, engineer and superintendent. The filling and track work were done by the engineering department of the company. With the exception of a few minor contracts, all of the construction work was done by the Bridge and Building Department's forces. The construction and design, respectively, were, in a general way, in charge of L. D. Hadwen and J. H. Prior and were directly in charge of R. J. Middleton and of E. O. Greifenhagen.

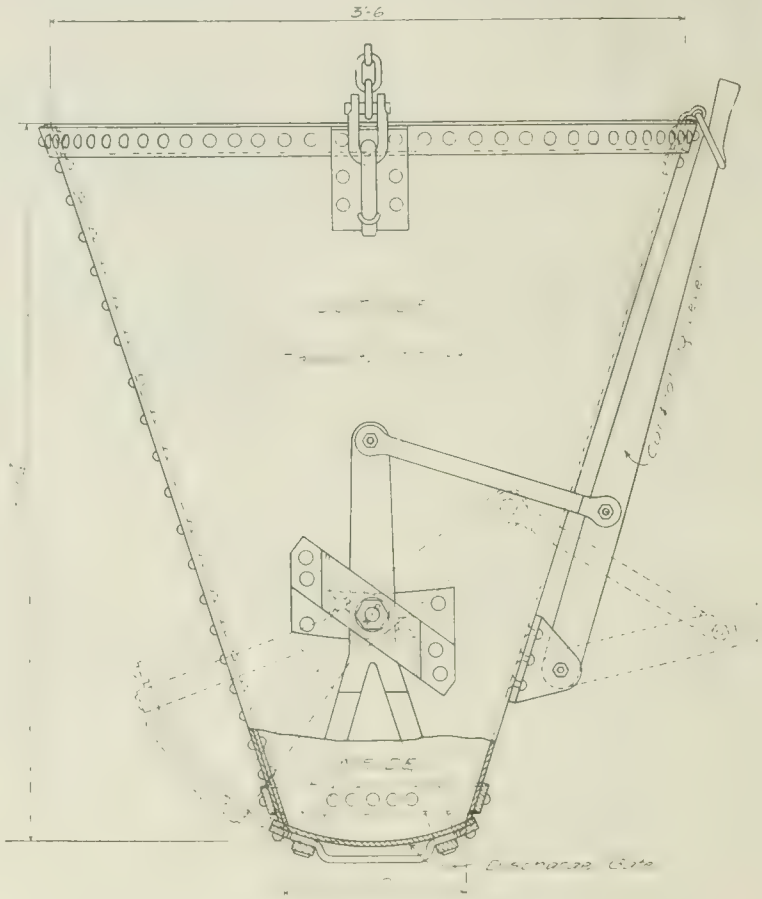

Fig. 13—Side Elevation of Concrete Bucket.

Annual Meeting of the Ohio Engineering Society.

The annual meeting of the Ohio Engineering Society was held at the Great Southern Hotel, Columbus, O., Feb. 8, 9 and 10, 1910. President C. J. Peters of Tiffin, presided throughout the sessions. The attendance was large and enthusiastic, and about 30 applications for membership were favorably acted upon, making the total membership of the society about 250. The report of the secretary-treasurer showed a prosperous condition.

Considerable time was spent in the consideration of the proposed bill now pending in the state legislature, providing for the appointment of a State Board of Registration and Examination for civil and mining engineers and surveyors. It is believed that this bill, for which the engineers of the state have been working for several years, has an excellent chance of favorable consideration by the legislature.

The sessions opened on Tuesday, February 8th, with an address of welcome by Hon. George S. Marshall, mayor of Columbus, who referred in complimentary terms to the work of engineers employed by that city in designing and construction of the water and sewage purification plants and the garbage reduction plant now under construction, and extended the usual felicitations.

President Peters, in his annual address, offered numerous suggestions for the betterment of professional conditions in the state, and urged the policy of more aggressive self-assertion.

Mr. T. C. Connar, mining engineer of Zanesville, read an original and somewhat unusual paper on the origin of weights and measures, tracing the connection between the modern units and ancient Egyptian and Hebrew standards, in a very ingenious manner.

Professor John R. Chamberlin, of the Ohio State University, described at length the Cerro de Pasco Railway in South America. The road is about 80 miles in length, having a maximum curvature of 16 degrees and approximately 2 per cent average grade.

An interesting paper entitled "Some Principles Governing the Design of Small Sewage Purification Plants," was read by Paul Hansen, acting chief engineer, Ohio State Board of Health.

Mr. George P. Shute, of the firm of Bradbury & Shute, civil and sanitary engineers of Columbus, contributed a description of a small waterworks system installed under his supervision at Medina, Ohio. The source of water is a gravel bed underlying the Rocky River, at a distance of 2½ miles from the village, the water being collected by an

open joint tile and lifted to a standpipe 290 ft. above the pumps; the pumping outfit being of the producer gas type. A special feature to which attention was called was the economical operation, the present operating cost being about 3½ cts. per 1,000 gals., or less than one-third the average cost of supplying of water to municipalities of comparable size of the state. The quality of the water is excellent, being soft and free from any contamination of consequence.

Mr. George J. Bock, Jr., contracting engineer of Coshocton, discussed the relation of the engineer to the contractor from the standpoint of the latter. Mr. Bock traced much of the friction betwen engineers and contractors to improper specifications or incompetency on the part of the engineer. A lively discussion followed the expression of his views during which many instances were given tending to show that the fault was not always with the engineer.

Mr. James C. Wonders, State Highway Commissioner, spoke on the subject, "Proper Types of Roads."

A report upon the use of Road Preservatives and Dust Suppression Materials in Hamilton County, Ohio, was read by Colonel J. M. Harper of the Committee on Highways. Tarvia has been used as a preservative on 13½ miles of macadam roadway and asphalt oil as a dust eliminator on 45½ miles. The use of these materials is reported to be satisfactory. The specifications provide for the application of from 2 to 2½ gallons of Tarvia per square yard, which was paid for at a uniform price of 25 cts. per square yard, including application. Roads treated 18 months ago, subjected to heavy traffic, are reported to be in as good condition as when built. The application of oil cost on an average of 2.9 cts. per sq. yd. Methods of application were described in detail and specifications quoted.

A paper on Road Construction in Hamilton County, Ohio, by Clinton Cowen, County Surveyor, was also read. An interesting point brought out in this paper was the greater cost of maintaining macadam roads in this latitude than is the case either farther north or south, owing to the alternate freezing and thawing so frequent during the winter season.

Mr. Frank R. Landers of Cleveland, County Surveyor of Cuyahoga County, described the extensive road improvement of that county, giving a historical sketch of the development from the old plank road through the evolution period to the present system of paving with brick. The development of the road laws of the state was mentioned.

Mr. D. W. Seitz, Assistant State Highway Commissioner, described the experimental road recently constructed by the State Highway Department, near Columbus.

Mr. Frank M. Kennedy of Washington, C. H., read a paper descriptive of a flat slab reinforced concrete construction for road crossings over small waterways.

An exhaustive description of the Rocky River bridge at Cleveland, Ohio, was given by Mr. A. M. Folgate. The principal features of this bridge are the design of the main arch with a span of 280 feet, the method of raising the compressive strength of the concrete by the introduction of embedded stone slabs, and the arrangements for the centering used during the erection of the main arches.

The use of automatic siphons and air lock apparatus was described and explained in detail by Mr. E. G. Bradbury, M. Am. Soc. C. E. The various types of siphons were illustrated by charts. Remedies for defective operation were suggested.

The convention closed with a most enjoyable banquet, at which Col. J. M. Harper of Cincinnati, acted as toastmaster.

The following officers were elected for the ensuing year: E. G. Bradbury, Columbus, O., president; John Laylin, Newark, O., vice president; C. J. Knisely, New Philadelphia, O., secretary-treasurer; J. M. Harper, Cincinnati, O., F. J. Collarius, Dayton, O., A. F. Cole, Marietta, O.; and B. E. Trask, Granville, O., trustees.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Methods and Cost of Hydraulic Filling at Cairo, Ill.

BY JEAN M. ALLEN.*

A notable job of hydraulic filling is now in progress at Cairo, Ill. This city has a large acreage of "low areas" resulting from the building of levees and the establishment of the city grade from 6 ft. to 9 ft. above the original ground, and this low ground has been a handicap to the physical development of the city. In the early days a large amount of the low ground was filled in by hauling in material by teams. The fact, however, that there was in the Mississippi River just back of the city and within a mile of the lowest areas a large sand bar suggested the practicability of hydraulic filling and in 1906 a local company, with a capital stock of $30,000, was organized to take up this work and contracts amounting to approximately 500,000 cu. yds. were taken. Of this amount about 270,000 cu. yds. were for the filling of the terminals of the Cairo & Thebes R. R. and about 230,000 cu. yds. for filling the low streets of the city. This company was originally the Cairo Contracting & Dredging Co., but was later reorganized as the Cairo Sand & Gravel Co., which company is now carrying on the work.

There seemed very few data available on a plant of this kind. Some of the builders of standard dredging pumps declared that the proposed heads were excessive and declined to submit bids on the equipment. A somewhat similar plant found working in Kansas City, was carefully studied and much valuable information gained therefrom.

The following was the plant eventually decided upon and installed: A floating dredge was installed in the Mississippi River adjacent to the sand bar. It was connected to the bank by a pile trestle extending into the river a distance of 100 ft. and by a rigid pontoon line 160 ft. long connecting the boat with the trestle. (Fig. 1.) Articulations at the connection of the trestle with the pontoons and of the pontoons with the bow of the boad enable the suction pipe, located at the stern of the boat, to pump sand from any point in the interior of a semicircle whose radius is 380 ft.

On the boat was installed a 12-in. centrifugal dredging pump of a standard make with a 32-in. runner. This pump was belted to a 20x24-in. slide valve engine. Three "Mississippi River" boilers, each 44 in. in diameter and 22 ft. long, supply steam at a pressure of 140 lbs. To save time necessary to construct a hull for the dredge a river tow boat 141 ft. long, 26 ft. beam and 4½ ft. deep was secured and the dredging machinery placed upon it. The boat's original boilers, feed pumps and capstans were utilized in the dredging equipment. The suction pipe passes over the stern of the boat and is raised and lowered by a small hoisting engine. In high water periods this suction pipe is about 50 ft. long. (Fig. 3.)

A shore pumping plant or "booster" plant was located just inside the levee at a distance of about 1,800 ft. from the boat. The pump and engine are duplicates of those on the boat. Steam is furnished by two standard tubular boilers 76 ins. in diameter and 16 ft. long. The discharge pipe from the boat plant connects directly to the suction of the shore plant

Fig. 1—Map of Portion of Cairo, Ill., Showing Areas Filled by Hydraulic Filling Plant.

*Superintendent Cairo Sand & Gravel Co., Cairo, Ill.

pump. Both boat and shore plant use the Mississippi River water for boiler feed and both plants run non-condensing.

The length of the pipe line from the shore plant to the discharge was about 1,300 ft. when the filling commenced and has been increased to 4,400 ft. with the progress of the work. All pipe used except the suction and pontoon pipe is 12-in. spiral riveted pipe, asphalted. Nearly all the pipe is No. 12 gage, but on the end of the discharge line where the pipe requires frequent handling and lightness is a prime consideration, some No. 14 and 16 gage is used. (Fig. 4.)

Fig. 2—Pontoon Line Supporting Pipe Carr ying Dredged Material.

A private telephone line connects the boat, shore plant and end of discharge pipe, and by it the suction operator is kept constantly informed as to the percentage of solids carried in the water and is thus enabled to regulate the supply. It may be mentioned here that the surplus water finds its way to the river by means of the city sewers.

The original estimates of the cost were somewhat exceeded and $42,000 was expended on the plant before it was ready for operation.

The plant was started late in the season of 1907. A number of difficulties developed after the plant had been in operation a short time. The most serious was the rapid wearing of the shells of the dredging pumps. These were of cast iron and not very thick and it was found that every 15,000 cu. yds. pumped required a new set of shells at both the boat and the shore plant. This extreme wear was due in part to the quality of the material handled. The Mississippi River sand is very coarse and sharp. The high speed at which the pump had to be driven caused the shells to cut out faster than most sand pumps. It was found that, at low water periods and when pumping to the most distant areas a peripheral speed of the runner of about 5,500 ft. per minute had to be maintained to produce the required velocity in the pipe. Considerable trouble was experienced with the pump shafts as they wore very fast in the stuffing boxes and finally broke. As the pumps were of the side suction type great trouble was experienced in caring for the end thrust of the runner.

A great deal of time and money was spent in the endeavor to produce a pump more suitable for the work. Pumps with larger diameter runners, and with renewable liners in the shells were tried and at length a pump was evolved that gives very good satisfaction. The present pumps, which were designed and built specially for this work, are of the double suction type to obviate the end thrust. The runners are built up of steel casting and ¾-in. boiler plate and are 52 ins. in diameter. The shaft is 6 ins. in diameter.

The shells are concentric with the shaft and are heavy steel castings. The inside dimensions are 6 ft. in diameter and 10 ins. wide. The metal in the shells is 1½ ins. thick on the sides and 2 ins. thick on the circumference. These pumps have given excellent service. A pair of them has pumped 80,000 cu. yds. of sand and it is estimated that a pair of the steel shells will deliver 200,000 cu. yds. before wearing through.

The 22-in. belts connecting the engines and pumps gave a great deal of trouble. Canvas, rubber and leather belts were tried, but none would stand the severe service. At last a wire rope drive was installed in both plants. This drive consists of the ordinary grooved pulleys and ten parts of ¾-in. wire rope. Each strand of the wire is served with marlin which produces a very flexible rope. This transmission has given excellent service and has caused no trouble since its installation. (Fig. 5.)

The periods of unusually high and low water experienced the last two years have proven a great handicap to the work. At the extreme low water, which has lasted for two or three months in the fall of the year, the sand bar is entirely dry and the boat is aground and cannot be moved to secure a supply of sand. Again at high water which is sometimes 45 ft. above low water, the land outside the levee and the trestle work to which the pontoons connect is from 6 to 10 ft. under the water. The running ice which fills the river during January and February makes it dangerous to work during those months. These conditions render it necessary to suspend operations for at least six months out of the twelve. The plant has been averaging about 30,000 cu. yds. per month when running, and, up to date, about 340,000 cu. yds. have been moved.

A set of observations of the working conditions were taken December 4, 1909. The elevations and locations of suction and discharge pipes were about as shown in the accompanying map, Fig. 1.

Fig. 3—Suction End of Boat Pumping Plant.

Fig. 4—Method of Supporting 4,400 Ft. Pipe Line on Shore.

BOAT.

Engine	132 R. P. M.
Pump	352 R. P. M.
Indicated horse power	321
Pump suction	15 ins. vacuum
Pump discharge	60 lbs. pressure
Steam pressure, boiler	138 lbs.
Coal consumption	About 1 ton lump per hour

SHORE PLANT.

Engine	140 R. P. M.
Pump	384 R. P. M.
Indicated horse power	365
Pump suction	4 lbs. pressure
Pump discharge	82 lbs. pressure
Steam pressure, boiler	130 lbs.
Coal consumption—About 0.7 lbs. screenings per hour.	

The velocity of the water was not determined accurately, but was about 10′ per second. The percentage of solids carried is also difficult to determine for the reason that a

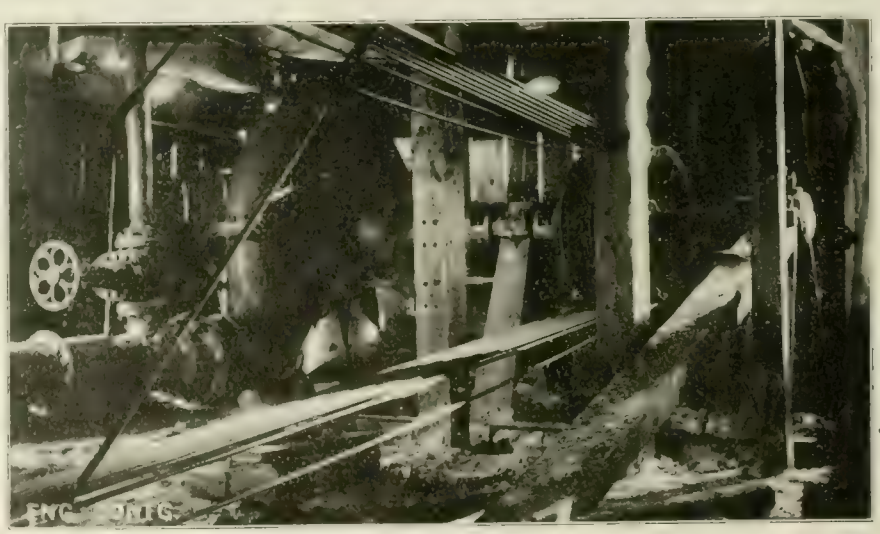

Fig. 5—Interior of "Booster" Plant on Land, Showing Pump and Wire Rope Drive.

few hundred feet away from the pumps the sand settles to the bottom of the pipe, and while from 10 per cent to 20 per cent of the cross sectional area of the pipe may be filled with sand, this sand travels at a much slower velocity than the water. The average amount of solids delivered per hour is about 65 or 70 cu. yds.

About 16 men are required on the day shift and about 14 on the night shift. The weekly pay roll amounts to about $500. An extract from the report of October, 1909, is an average performance and may be of interest:

Total yardage pumped		33,577.9
Total hours run		515
Yards per hour		65
Expenses—		Per cu. yd.
Fuel	$1,630.36	$0.0482
Labor	2,011.45	0.0599
Repairs	277.17	0.0082
Oil	75.39	0.0022
Office and sundry	269.88	0.008
Total	$4,264.25	$0.1265

This statement makes no allowance for interest, depreciation nor insurance.

The contract price on the above work is from 24 cts. to 30 cts. for the railroad work and from 28 cts. to 44 cts. for the city work—the latter payable in bonds.

A feature of the work which may be of interest to some is the method used in building the levees to confine the material within the desired areas. At first the levees were thrown up of earth by means of slip scrapers, but later they were built of sand directly from the pipes by what are termed "shutter" or "slide pipes." A number of lengths of the regular discharge pipe are provided with openings on the lower side about 3x4 ins., the 4-in. dimension being crosswise of the pipe. These openings are spaced about 3 ft. apart in the pipe and are closed by suitable sliding plates of No. 8 sheet steel which work in grooved castings which bolt over the openings in the pipe. (Fig. 6.) When one or more of these slides are opened the sand issuing from them is of the consistency of mortar and builds up very steeply. It is possible with a little care in operation to build up the sand to a 1:1 slope on the outside of the fill. If the slope is too steep the slides may be opened wider and some water allowed to escape which flattens down the slope to any extent desired. (Fig. 7.) The end of the discharge pipe is continued some distance away so that the water therefrom will not interfere with the levee building.

In making the levees in this manner advantage is taken of the fact that the heavy sand in long pipe lines is not carried in suspension by the water, but moves along the bottom of the pipe, three or four inches deep, and at a much slower velocity than the water. The action is very much like waves, there being alternately high and low places, the higher material being continually removed and carried forward to a depression. This peculiar wave-like action of sand transported in water is dealt with in many U. S. Government Engineer reports and in Johnson's Surveying.

During the present winter the boat plant was badly damaged by floating ice and plans are now under way to place the machinery on a specially built barge and it is also intended to put surface condensers in both plants. It is expected that this will result in decreased coal consumption and also in increased capacity, as in the past it has been necessary to wash boilers about every five days, causing a loss of from 12 to 16 hours at each washing.

Fig. 6—Method of Building Levees to Retain Sand Fill.

Sanitary Considerations in the Establishment of Contractors' Camps.

The housing of large bodies of men as in the construction camps of contractors is at-attracting more and more the attention of sanitarians. In the state of New York regular investigations are made into the state of the camps with a view to minimizing the danger to surrounding communities. It is a well known fact that a disease resembling small pox has swept over sections of country in which heavy construction work has been going on for some months and the cases of infection have been traced to contractors' camps. Typhoid fever, and in earlier days typhus, have been traced to workmen's camps. Some English papers have lately referred to the attention now being paid to "navvies" camps in Great Britain and the more strict supervision of such camps is being urged there.

Apart from the danger to health of the community in the immediate vicinity and to the pollution of water supplies of communities located on streams that might be contaminated by the refuse of camps, is the question of comfort for the men themselves. The standard of living everywhere is being raised now and unless there are some comforts provided for the men they prefer to loaf in towns and cities where the moving picture machine vies with the saloon as an attraction and the flaming arc is more attractive than the dirty, smelling oil lamp of the bunk house. Formerly men complained of the food because it is in the nature of men to complain when herded in bodies, and now they even complain if the camp is not clean and sanitary. They have read so much about microbes and germs that they exaggerate the dangers to themselves of unsanitary surroundings and a bad camp is now worse than a poor camp in the minds of some.

In the first place the camp should not be selected alone for convenience, but it should be selected with a view to good drainage. The site should be somewhat elevated above the surrounding country, so it cannot be inundated by near-by streams or by rains. The writer has a number of times been obliged to turn out in the night and hold a tent in a driving rain while the other fellows dug trenches around it to keep the rain from wetting everything inside. In after years when he was in charge himself things of that sort never happened. In even a temporary one-night camp the site for the tent was carefully selected and everything made snug before nightfall. But we are not considering temporary camps of one-night stands. The fault is common with contractors camps, whether tents or shacks are used, of selecting some place convenient to the work and a little off the line of the work, and erecting the domiciles for the men, regardless of whether the ground is well drained or capable of drainage.

The camp site should not be under large trees, but rather should be in a sunny spot. There should be no low lying ground near by nor should there be swamps. Of course these points cannot always be guarded against, but they should be taken into consideration, and the best that can be done under the circumstances in selecting the camp site should be done. When near streams it is an excellent idea to camp above high water line and away from mud flats. Plenty of air and sunshine are wanted. The presence of stagnant water means that mosquitoes will breed and possibly some varieties will appear that may carry infection from man to man. When flies appear in great numbers it is a foregone conclusion that the sanitary conditions are bad. Some men believe it is not a bad idea to have plenty of flies around, as they are scavengers. Flies are certainly scavengers, but they are really a warning sent out that health conditions are bad and growing worse.

Tents should not have earth floors, nor should shacks have earth floors. There should be a space underneath for a free circulation of air. If it is not possible to have floors in the tents or buildings, then by all means build cots for sleeping purposes, so that no man will be obliged to sleep next the ground. When temporary camps are used

Fig. 7—Slope of Levees Built by the Bottom Sand Gates in Pipe Line.

every man should have under his blankets a thick layer of straw or boughs of trees. During the daytime the walls of the tents should be raised to permit a free circulation of air and buildings should be provided with means to secure a free circulation of air close to the floor.

Catarrhal complaints arise when men are compelled to sleep night after night in unaired blankets. It has been found that mattresses make men more comfortable than blankets only, and some sort of mattress should be supplied every man. Blankets may be piled on top of a man until his bones ache with the weight, but if there is not a comfortable thickness of bedding underneath he will be cold and the cold will likely develop into catarrh. When, however, mattresses are used there should be a careful and frequent examination made of them. If the mattresses are simply bags filled with straw they should be emptied and washed at least once a month or vermin will appear.

All buildings should have plenty of windows and there should be openings in the walls near the roof, so that air and sunshine may be obtained. During the day the windows and ventilating openings should be kept open for ventilation. If there are no watchmen and thieves are feared the openings should all be protected with heavy netting. The fear of thieves should not prevent the securing of a change of air after the men leave. It is one of the hardest things in the world to make the average laborer sleep with open windows, for this class of men is generally afraid of night air. Therefore during the day when the men are out, the buildings should be well aired.

A camp usually consists of a number of bunk houses in which there is a stove, generally in the center of the room, a table or two, some benches along the sides of the lower bunks, and around the room tiers of bunks. Men who prefer to go to bed early will get into their bunks, where they often lie and read and smoke by the light of a candle or poor oil lamp. The men who sit around on the benches and talk are also smoking. The men who are reading are smoking. The men playing cards at the tables are smoking. All windows and doors are closely shut and the air is so thick that it is hard to see and the eyes water when first one enters the room. Very often the odor is stifling, especially when the stove is red hot and the men are vying with each other as to who can spit the straightest at the hottest spots.

The writer believes this system is bad. There should be a common room apart from the sleeping apartment and communication between the two should be by a porch. In other words the two rooms should be separated a few feet and the men in passing from one to the other should be compelled to pass through the outer air. It will do them good and can do no harm. Of course, the passage way may have a roof, but it should have no sides. The common room should have tables and plenty of chairs and benches, so that all the men may be accommodated there. The men may smoke and read and play cards if they desire. In some cases it is really advisable to have something like the old style army canteen in connection with the camp. The men can secure light drinks of beer, coffee or tea; tobacco and all the profits of the canteen to go towards a premium account. This premium may be divided among the men in proportion to the number of hours time they have put in during the month, in addition to their regular pay. Of course, strict regulations would have to be enforced to prevent the men getting enough liquor to get drunk, but this is a matter of detail, to be arranged for each camp or contractor. The men who are employed by contractors who house their employes in camps are of a wandering nature and some premium device might work to hold them.

The sleeping rooms should be kept clear of smoke. A rule should be strictly enforced that the sleeping rooms are for sleeping purposes only and no smoking or talking above a whisper should be permitted. They should be aired daily and swept daily. At least once each month the mattresses should be changed and the bunks at that time given a thorough cleaning and the insides of the bunks should be whitewashed occasionally. Stoves should not be permitted in the sleeping rooms except in very cold weather. Lines should be provided in the aisles between the bunks so that each morning when the men arise they will hang their bedding on the lines to air during the day, and thus the bedding cannot collect dampness from perspiration, to give the sleeper catarrh and rheumatism. The writer has had several camps where such regulations were in force and has found the men more than willing to do their share when they found it was the rule.

There are some men who delight in being filthy and who are proud of the number of days they can go without a bath. They take a particular delight in telling stories at meal times that will turn the stomach of a squeamish man and the tales they tell about the condition of the clothing in contact with their skin are not pleasant. Such men are seldom good workers and are not favorites with the majority of their fellow workers. They should be discharged as soon as possible. Some attention to comfort of the men will result in a camp getting a good name and from such camps there is no cry of a scarcity of labor. The average farmer boy does not like to herd with the common run of laborers to be found in construction camps, but in decently ordered camps it is no trouble to draw upon the surrounding farms for a large proportion of the labor.

The question of water supply is a most important one in establishing a camp. A spring is no whit better than its surroundings and the springs in the vicinity of a construction camp should be carefully investigated. They are only overflows of ground water, and ground water is easily contaminated. In a lava or in a limestone formation, where great cavities are found in the country rock it is almost impossible to find good springs if the surrounding country is well settled or in the vicinity of sheep camps or cattle ranges. In a sandstone country, in shale, or granite the springs may be safer, but springs are as a rule pretty poor sources of water supply.

The little mountain stream may be pleasing to the eye but a trip should be made for several miles up the stream above the camp before deciding upon it as a source of water supply. The river and the lake have the same objections that the stream may have, and wells are of course only springs. As a matter of preliminary treatment of water it is a good plan to dig a hole about 15 or 20 ft square and about 4 ft. deep in the ground near the water. In the middle set a barrel with a great many holes bored in the side. On the outside of the barrel place pieces of broken burnt clay, charcoal and stones that will pass through a 1 in. mesh, this material to be about 6 in. thick around the barrel. One way to hold it is to place 6 in. outside the barrel a wire netting with ½-in. mesh and fill the space with the clay, stone and charcoal. Then fill the rest of the excavation with coarse sand. Make a connection with the water so that it will fill this bed of sand and seeping through it get into the barrel, from which all the water used in the camp shall be taken. Several of these sand filters may be put in, and while they clog after awhile, still, for the short time a camp is used, they are a pretty fair substitute for a good spring. In the kitchen there should be a Forbes water sterilizer, or all the water should be boiled and the men instructed to drink only the sterilized or boiled water. The barrel of course should be screened, and so should every open receptacle containing water. If the country is subject to frequent rainfalls it will certainly pay to make some provision for saving the rain water.

In the greater number of camps the men do their own washing, Sunday being wash day. To prevent contamination of the water supply and to encourage the men to wash their clothes some conveniences should be supplied. There should be a place provided where the work can be done conveniently, and, if on a running stream, the place should be below the source of water supply. It is, of course, very desirable that there be plenty of running water and if the water supply for the camp can be procured at a point considerably higher than the camp site so a flowing stream can come to the camp, it will be easy to arrange so that a small stream can be diverted through a spot arranged conveniently for laundry work. A plant of this kind once arranged consisted of a long bench above which ran a small flume, having holes bored in the bottom at regular intervals, closed with wooden plugs. On the bench the men set metal wash tubs, furnished by the contractor, and these tubs were filled by pulling out the plugs in the flume. A waste flume ran underneath the bench so it was an easy matter to change the water and dispose of the waste without causing much sloppiness in the camp. Poles with metal clothes lines were erected close by and the men all took pleasure in the comforts never before enjoyed in such camps.

Waste is a matter not hard to take care of. It consists of combustible matter, such as paper, etc., of which the men in camp individually contribute a great part. There should be boxes placed at certain buildings and the men urged to throw waste paper and old clothes into these boxes. In addition there should be a man employed during the day to look after waste and garbage.

Combustible waste is readily disposed of by merely taking it to a convenient place and burning it. This should be done frequently. There is also incombustible waste such as tin cans and bottles. Most of this will come from the kitchen, but a little will come from the bunkhouse. It is not dangerous, but is unsightly and should be thrown into some convenient ravine or into a hole and buried. Of course when thrown into a ravine it should be cast into one that drains into the stream below camp. The incombustible matter is collected and taken out of sight merely as a part of the scheme to make the men adopt a decently high standard of living.

A third kind of waste matter, furnished almost entirely by the commissary department, is putrescible, or what is generally termed garbage. The best way to dispose of garbage is to plow a piece of ground and allow it to stand. Each day the garbage should be taken to it and laid in one of the furrows when men with shovels will throw dirt from the next furrow to cover it. The covering should be thin but complete. Nitrifying organisms will attend to its disposal and the covering of earth will prevent the breeding of too many flies. If the camp is a pretty good sized one it might pay to construct a furnace in which to burn all garbage and combustible waste. Usually, however, there is so much moisture in garbage it pays better to bury it and the combustible waste may be burned in the open without a furnace.

The waste matter most dangerous to the community is human excreta, and when this question is reached we have to pause. Privies in construction camps are a frightful nuisance. If none are provided the whole camp becomes so filthy as to render it dangerous to walk around it after dark and it soon becomes unsightly and odorous in the daytime. The men dislike to do anything to make matters any better and yet the proper disposal of the human excreta is the gravest problem to be faced in camp sanitation. Privies are fly breeders, and after a very short period of use the men abandon them and consult simply their own convenience each day regardless and heedless of results. Yet it is from the vast amount of this particular form of waste matter that we have most to fear. Only this can convey the germs of typhoid fever. Talks to the men do little good and there are no means of controlling them as in military camps.

In this disposal of faecal matter then it is practically necessary to have men to look after it. Dry earth closets are the things to use. If men would be willing to attend to such matters it is best to have holes dug

3 ft. deep with posthole diggers, with the soil placed around the edge of the hole. Immediately after use enough earth is scraped or kicked in to cover the faecal matter. When the hole is filled another can be dug immediately along side. Since it is hard and generally almost impossible to get men to attend properly to this the contractor should erect buildings like the ordinary privy but without any pit underneath. The back should be open and under the seats should be placed boxes or pails. Inside should be large boxes full of ashes, sand, etc., with scoops. Each man can put a scoop full of ashes into the box under the seat and he should be asked to do so, but to insure it being done there should be a man or two in camp whose duty shall be to visit the sinks regularly and see that all faecal matter is covered with the ashes, sand or dust. If black loam can be secured it is far better than any other material. The contents of the pails may be deposited on the plot of plowed ground used for the disposal of garbage or may be placed in any other convenient place and covered with a few inches of earth. Properly taken care of a dry earth closet is perfectly odorless. Some idea of the amount of this waste may be gained when it is estimated that from 2½ to 3 oz. of excrement per day must be figured on for each person. For a camp of 300 men this means between 50 and 60 lbs. per day, for the disposal of which about double that amount of dry earth or ashes will be required. If proper closets are erected and looked after by a good attendant they will be used by the men and the full amount of excrement may be expected to require disposal. Galvanized metal coal scuttles make the best receptacles and one should be provided for every ten men in camp. This number will be found amply large.

If the camp is located on a stream the kitchen and dining room should be at the upper end of the camp and the sinks should be at the lower end, but not near the water. In fact the water disposal of waste is the one thing to guard against. It breeds carelessness in the occupants of the camp, increases the number of flies and mosquitoes and other pests on wings, and is a source of danger to communities lower down.

The vicinity of the camp should be protected also. For a distance of about 1,000 ft. in all directions care should be taken to drain all pools of standing water or they should be oiled. In pools not readily drained and in which the oil might be a permanent detriment it is a good idea to plant catfish spawn, for this fish will soon dispose of all wrigglers and larvae to be found in water. The malaria carrying mosquito is to be especially guarded against.

The stables should be located some distance from the camp and be kept as clean as possible. The manure should be carried out daily and piled where it will be least offensive and where the leachings will not poison the water. The drinking place for horses should not be near an eddy nor should it be a place where the horses will stand in mud. In fact, it pays to go to some expense to provide drinking troughs. If the water can be brought to camp by gravity this is an easy matter to arrange, but the expense of pumping is not large and providing water in this way is preferable to permitting the horses to drink directly from the stream in which they are standing.

While it is realized that all the remarks here made about camps for workmen simply touch upon well understood points, only a cursory visit to the majority of camps is required to see that few of the precautions here recounted are regarded. The camp site is generally selected without any preliminary study or thought, and as soon as selected the erection of tents or shacks is begun. The question of water supply is not as a rule considered until the stream near by begins to show evidence of pollution. It is economy to do all that can be done in a sanitary way for a camp. The health of the men under sanitary conditions will be good and even the poorest kind of a man likes a clean camp and a place where some thought is given to his comfort, without too many irksome rules.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Directions for Working Steam Road Rollers and Steam Traction Engines.

The following instructions and directions for the working and maintenance of steam road rollers and steam traction engines have been taken from a booklet issued by Aveling & Porter, Lt., Rochester, England, while the directions were principally intended for engineers operating the road rollers and traction engines manufactured by the above mentioned firm, yet in a general sense the directions can be applied to other makes of rollers and traction engines.

PREPARATIONS FOR COMMENCING WORK.

The Boiler.—Pour clear soft water (or the best that can be obtained) into the boiler by means of the funnel until at least 1 in. of the water appears in the gauge glass, the lower cock of which should be opened two or three times for a moment to ascertain that it is in proper working order; should the water refuse to rise freely up the glass, take out the two front screws, pass a piece of wire through each passage to the boiler, replace the screws, shut the bottom cock (the other two being kept open), and the true level of the water inside the boiler then will be shown.

The Tubes.—Pass the brush or cleanser through the tubes from the smoke-box every morning and once during the day—say at noon—remove all soot from fire and smoke-box.

The Fire Bars.—Clean the fire bars, and see that the proper number are in their places; remove all dirt from the ash pan twice a day, or oftener if necessary, spread over the fire bars some straw or shavings and firewood, cover thinly with coals, apply a light and add coals in small quantities as the fire burns up, then afterwards keep the fire thin and regular over the whole of the grate surface.

Bearings.—Turn the flywheel of the engine gently round to see whether any of the bearings are screwed or keyed up too tight, or if (after a frosty night) there is any ice in the cylinder or pump; if there be any ice, thaw it with hot water or hot irons; and if the bearings are too tight, stand at the side of the flywheel, take hold of two opposite arms and move the wheel round about 1 in. backwards and forwards a few times; this will show whether any bearings are either too tight or too slack, especially the eccentric straps.

When the steam is up to the working pressure, set the engine to half stroke, open the cylinder cocks wide, and the starting valve or regulator about one-third; the engine will then be set in motion. Close the cylinder cocks when water ceases to be blown out, and open the regulator to the extent required to work the engine.

The Pump.—The feed pump should be tried immediately the engine is in motion to ascertain whether it is in working order before the water has time to get low in the boiler; first open the suction cock, then the snifting cock, this will ensure the pump working if the valves are free from dirt, the packing good, the joints air-tight, and the pump cool. Should the pump have become heated cold water must be poured upon it.

Should the pump not work properly and steam or hot water only issue from the snifting cock, the conclusion will be that the delivery valve is choked; the fire should then be immediately withdrawn and steam blown off. The cover of the feed valve box must then be removed, and the valve taken out and cleaned; but should no water issue from the snifting cock, then see if the suction valve—namely, that next to the pump barrel—is choked. This may be done while steam is up, and if on inspection this valve be found free in action, clean and satisfactory, then remake the joints of the cover and suction valve with a little twine or lamp cotton, as the defect must have arisen from the pump drawing air either at the packing round the pump plunger (which must be removed and new packing put in), or else from the plug of the suction cock being too slack.

If the pump still refuses to work, as shown by the water disappearing in the gauge glass, withdraw the fire, blow off the steam, again carefully examine the pump and valve, refill the boiler to the proper height by means of the funnel and make a second trial, and if not successful an engine fitter should be at once sent for.

When the pump is properly at work with the cock full open the supply of water to the boiler will be more than is required; the cock should therefore be closed to such a point that, when the pump is constantly at work, the proper quantity of water will be passed into the boiler. This arrangement will keep the pump in good working order, and (provided the work does not vary) will prevent the irregularity of steam pressure which would arise from starting and stopping the pump at intervals. The aim should be, as far as possible, to regulate the supply to the demand (just sufficient to keep the water at one level in the glass), so that an even temperature may be maintained in the plates of the boiler, the tubes and the fire-box. It is impossible to work an engine economically unless a *constant moderate* supply of water is kept in the boiler.

The small screw in the valve box leading from pump to boiler should be occasionally scoured out with a piece of wire.

THE INJECTOR.

1st.—Open the valves or cocks connecting the injector with the boiler.

2d.—Open the water supply, by means of the hand lever, to the extent required for the steam pressure in the boiler.

3d.—Open the steam spindle slightly, until the water issues freely from the overflow pipe, then open up the steam spindle or cock to the full extent. If water continues to issue from the overflow pipe, regulate the water supply by the lever.

The injector should always be used for supplying water to the boiler in preference to the pump, as by its use the steam which gives the velocity requisite to enable the water to enter the boiler returns with the water into the boiler in a condensed state.

BEFORE STARTING ENGINE.

Before starting the engine open the cylinder cocks and let the crank shaft make a few revolutions, to ascertain that every part of the engine is working properly. The driver should also see that he has the requisite supply of fuel and that the tender is full of clean water, that the oil cups are filled up, and that the worsted syphons in the oil cups really supply oil to the bearings.

The oil holes and teeth of the compensating gear must be examined and all dirt picked out; the teenth of the pinions and spur wheels must be greased or oiled; the axle bearings of driving wheels and front must also be attended to and oiled; take hold of the flywheel and pull the crank to half stroke; connect the driving gear with the crank shaft pinion, and take the greatest care to have it properly secured, as many accidents have occurred from the neglect of this precaution, especially at night; push over the reversing lever to the forward part of the quadrant, and carefully turn on the steam by pushing forward the regulator handle a short distance.

Should the engine not start in consequence of the crank being on the center, shut off the

steam by pulling the regulator handle back again, and also pull the reversing lever to the back part of the quadrant without turning on the steam; the crank will then most probably leave the center—if it does so, reverse the lever and turn on the steam gently at the same time. The engine will then start; but should the crank not leave the center, take hold of the flywheel and turn the crank up or down as may be required. The regulator should be *opened gently*, especially with a full boiler, to avoid priming. As the engine feels the load the regulator may be opened, and as the engine increases in speed the reversing lever should be pulled back a notch or two at a time, in order to work the steam expansively and with the greatest economy.

MANAGEMENT ON THE ROAD.

If any difficulty is found in hauling a train of loaded wagons up an incline, one-half the train should be taken up first, and the remainder afterwards, and the two parts connected again at the top of the incline. Should the engine sink into a soft place in the road, disconnect the train, let the engine get out of the hole itself, and then draw the train through by means of a long chain. If the engine becomes so far embedded in the ground as to rest upon the tender, raise it by means of the screw-jack, and place blocking under the wheels before starting—faggots, small branches of trees or straw will be found very suitable for this purpose.

In ascending steep inclines the engine should be steered straight up the hill, and, to prevent priming, the water level in the boiler must neither be too high nor too low, lest the lead rivet should melt out when the engine again arrives at level ground. The feed pump must be shut off while ascending a short incline, but must be started again just before reaching the top of the hill. Before going down hill the driver should see that he has a good supply of water in the boiler, or otherwise the furnace crown will he laid bare, and the lead rivet will be melted; the furnace door should be opened and the dampers closed, and if the engine goes too fast the regulator must be partially or wholly closed; also, if necessary, the engine must be reversed, but this should be avoided if possible by using the break on the tender and wagons.

In steering let care be taken not to turn the steering wheels more than is absolutely necessary to make a required curve, as both additional work and an unnecessary strain are put upon the engine by so doing, and when turning a corner the driver should make as great a sweep as the road will permit.

If the driving wheels should slip in passing over soft ground, put the spikes into the wheels; and if these prove insufficient, fix the paddles; these paddles must, however, be removed on arriving at hard ground, upon which they are never to be used.

Advantage should be taken of each stoppage upon the road to examine the driving gear and wheels, to see that they have not sustained any injury; to try the brasses, and to see whether they are loose or have been heating; to tighten up glands if necessary; to examine cotters and eccentrics and see that they have not worked loose.

A fresh supply of water should be taken along the road whenever it can be obtained, and the tender filled up before leaving the spot.

Take care that ashes and soot are not allowed to accumulate in the smoke box, or the door will become red hot and be drawn so that air will enter. The smoke box door must shut tight to enable plenty of steam to be made.

A portion of the water in the boiler should be blown out at least twice every working day, but before doing so raise the water in the boiler about 2 or 3 inches above the working level; then open the blow-out tap and allow the water to run down to the working level, by this means a considerable quantity of deposit will be carried out with the water which would otherwise adhere to the firebox.

The firebox is fitted with a lead or safety rivet, and if the water is allowed to become so low as not to cover the top of the firebox, this rivet will be melted and let out the steam and water, which will extinguish the fire; but as the replacing of the rivet causes stoppage and annoyance, this should never be allowed to occur. This lead rivet can be replaced by unscrewing it from the inside of the firebox.

PRIMING.

Priming is an indication of either dirty water, low steam, or slovenly driving, and sometimes of all three causes existing together.

After a large quantity of water has been evaporated from a boiler, certain deposits must accumulate, as nothing but pure water can be generated into steam. If a glass window could be conveniently and safely fixed so that the state of the water could be seen it would, where cleaning out had been neglected, be found to have the appearance of thick gruel.

Priming is often caused by drawing off considerable quantities of steam when the pressure is low. The engine driver should therefore see that the steam is steadily maintained at a little below the maximum working pressure, even when there is very little of it being used.

Should priming occur, open the cylinder cocks, and partly close the regulator, so as to reduce the speed of the engine. Priming is at all times to be avoided as much as possible, for the foul water damages the slide valve, piston and cylinder surfaces. In nearly all cases the remedy is to clean out the boiler.

FIRING.

Proper attention is to be paid to the firing of the boiler, and care must always be taken to keep the bars covered with fuel. The coal should be put on in small quantities at frequent intervals. Where smokeless fuel cannot be obtained, the fire should not be fed when passing, or just before passing, through towns or villages, or by houses on the road side. If hard coals are used there will be little or no trouble from the accumulation of clinkers upon the bars or of soot in the tubes; but if soft coals are used, then at least once during the day (say at noon) the clinkers must be removed and the tubes swept. This can be readily done by cleaning one side of the bars at a time and removing the fire in each case to the opposite side. In firing, the coals should be placed in the corners of the firebox and next the plates, and the fire should be kept lowest in the middle, as the fuel will always have a tendency to work to the center of the grate by reason of the shaking of the engine. If too much coal is put on at once the fire will be choked, clinkers will be formed, stays, tubes, and even the fire box-plates (especially the corners of the frames) will start leaking, because of the unequal contraction, the plates being of different thicknesses, the smoke-box door will get hot, become twisted, and will not shut closely, steam is not made, and clouds of black smoke issue from the funnel, all in consequence of it being impossible for the air to pass through the grate bars in sufficient quantities to produce proper combustion. Nothing shows the ability of an engine driver more than firing. Some men will burn twice as much coal as others, and yet their engine will be constantly short of steam or blowing off "like mad," wasting fuel, water, and steam and ruining their master's property.

The Damper.—The damper door and the ashpan should fit well, as it is impossible to fire economically unless attention is paid to the admission of air, which must be adjusted according to the load.

OILING.

It is the duty of the engine driver to be as economical with the oil as possible without running the risk of heated bearings. All oil cups should be carefully inspected, and the worsted in the syphon pipes should be renewed whenever they are found to be choked or "gummed up;" the threads of worsted should be arranged so as to supply to big ends of connecting rods about four drops of oil per minute. When the engine is standing the trimming should be pulled out of the syphon pipe and placed on one side in the cup or axle box until the engine is again required to work; before replacing them a few drops of oil may be poured down the pipe to ensure lubrication while the trimming is getting to work. The oil cups should never be filled so full as to waste the oil over the side. The appearance of the engine will show if proper care and attention has been paid to this important point. Heated bearings, worn out brasses, and the engine covered with oil thrown from the overfilled oil cups tell their own tale. The teeth of the pinions and spur wheels should be kept carefully oiled or greased.

ADJUSTMENT OF BEARINGS.

Connecting Rods.—The brasses in the "big end" of the connecting rod require to be fitted "brass and brass" to work well, but with sufficient slackness on the crank bearing to allow of their being easily moved sideways by hand. Before a brass is tightened up it is advisable to mark the cotter on the underside, that it may show how much it descends at each blow. The "little end" brasses require the same treatment and attention. Care must be taken that the length of the connecting rod is not varied by the adjustment; the marks upon the slide bar will show this. If it has been necessary to file the brasses to bring them closer together, and the connecting rod has been shortened, a piece of metal may be placed between the strap and the brasses. Crank shaft and connecting rod brasses will wear longer and knock less if the edges of the brasses or packing pieces are filed away for adjustment (by keying or screwing up as the case may be) *a little at a time and often.* With proper attention they seldom run hot. The necessity for adjusting a bearing will be made known by a disagreeable knocking or thumping of the engine when passing its centers, and which, if allowed to continue, is very injurious to the working parts of the engine.

Eccentrics.—Particular attention should be bestowed upon the bolts, nuts, cotters and pins; the straps are adjusted by means of two set screws which are tapped into one-half of the eccentric strap, consequently the nuts on the outside are only locking nuts to secure the screws at the proper point; the strap should therefore be adjusted by turning equally the screws which join the two halves of the strap together, and when sufficiently tight they should be held by a spanner, and the locking nuts screwed up tight to prevent the screws from working loose.

After adjustment, the crank shaft should be turned round by hand to ascertain if the eccentric straps have been screwed up too tightly.

Piston Rod, Etc.—The cross head cotter and split pins, the gland nuts, the valve spindle nut, and gland require careful inspection every time steam is got up; nearly all accidents are caused by engine drivers not carefully examining all bolts, nuts, set screws, and split pins about the working parts of the engine and seeing that they are in their proper places before starting work.

Packing Glands.—The stuffing boxes and all the parts of the engines, where hemp packing is used, must be so packed and screwed down as to entirely prevent an escape of steam. When screwing down, if the gland fails to accomplish this, the old packing should be removed and fresh put in. This operation is best performed as follows: Cut the spun yarn into lengths of two feet, soak it well in oil or tallow, draw back the gland, then pass the yarn round the rod one turn at a time, then force it down to the bottom of the stuffing box with a piece of wood or iron, and repeat this process until the stuffing box is nearly full; the gland must then be put back in its place, and the two nuts screwed down with care; should the gland be *easily* screwed close up, it will show that more packing is required.

Piston Cylinder and Slide Valve.—No engine can work efficiently unless the piston fits the cylinder accurately; the sound of the exhaust steam should be clearly heard and the "beat" should be at regular intervals; any defect in either the slide or the cylinder will be noticed by an attentive driver, who detects at once if "blowing through" is taking place by the exhaust becoming continuous and weak

instead of sharp and clearly defined; this may be caused by slack or broken piston rings, by the slide valve faces becoming worn and allowing the steam to pass into the exhaust without having previously entered the cylinder, or by the cylinder wearing oval. In either case an engine fitter should be at once employed and the defect remedied, or the increased and wasteful consumption of coal will cause damage to tubes and firebox.

AFTER THE WORK IS FINISHED.

The fire is to be carefully withdrawn and all ashes and clinkers entirely removed from the firebox and raked clear of the boiler. The fire must not, under any pretence, be quenched by throwing water in the firebox.

During frosty weather open all cocks, including the blow-out tap (if the boiler is empty), so that the water may escape instead of freezing; the risk of bursting cocks will then be avoided. Take off the cover of the suction valve and see that the pump is free from ice; if the frost is very severe bind up the pump and glass water gauge with straw or hay bands, so that the water may not be liable to freeze while the engine is at work.

The engine should be well rubbed over with cotton waste, and all dirt, grit, and superfluous oil that may have accumulated during the day's work removed, and everything made clean and tidy; the brasses adjusted, if necessary, glands tightened up, cotters and eccentrics examined to see that they are not loose, and the driving gear and wheels examined to see that they have not sustained any injury; and everything left ready (as far as practicable) for future work.

If the engine is likely to be out of work for two months or longer, the piston rod should be withdrawn and the interior of the cylinder greased. The packing should also be removed from the valve glands, and all bright work should be coated with a mixture of tallow and white lead to prevent rusting.

The engine driver should also ascertain that no parts are rusting from water or steam leakages, and he should give the same attention to the parts out of sight as to those that are visible. The corners of the coal bunkers and foot plate should be thoroughly cleaned, and accumulations of small coal removed to prevent rusting.

WASHING OUT BOILER.

There are four mud holes at the bottom of the firebox of the boiler, the covers of which should, under ordinary circumstances, be taken off after every 100 hours' work, but if the water be very dirty after every 50 hours' work. All dirt and sediment is to be removed from the firebox by means of the rake furnished for that purpose. The boiler should then be thoroughly washed out by means of a hose (if available), or pails of clean water be thrown in at the manhole until the whole of the accumulated mud and sediment is removed from the boiler. If this be neglected the tubes will commence to leak and the firebox (more especially the tube-plate) will crack in those parts where the sediment is allowed to accumulate, after which constant leaking from some part or other will be the result.

The driver should get inside the firebox and thoroughly examine with a light everything in it; when bulging of the plates round the stay heads is discovered, it is generally a sign of dirt at the back of the plates and should be at once removed.

Leaky tubes and cracked tubes or side plates are a sure indication that the boiler is in a foul state; and upon the first appearance of such symptoms the tubes should be drawn and cleaned, the boiler properly cleaned out and examined by a boiler maker, or a person accustomed to such work. The mud-hole joints are a common source of leakage and corrosion and should be kept perfectly steam and water tight. With ordinary care and good water the boilers will last many years; but if these instructions are not properly carried out, and the water be impregnated with lime or dirt, a few months' working will suffice to do considerable damage to the plates in immediate contact with the fire.

Strict attention to the proper cleaning of the boiler is therefore of the greatest importance, for if neglected extensive damage to it will be the result.

The tender should also be thoroughly cleaned out and the pump pipes cleaned and examined.

Any defect must be at once remedied, even if it be necessary to suspend the boiler from work for a time. No pressure of work shall be considered equivalent to the risk of accident.

PRECAUTIONS FOR SECURING SAFETY OF BOILERS.

It is the duty of the engine driver to ascertain, by personal observation and minute inspection, that the boiler is steam tight. Positive safety is the first consideration, and with a view of securing this condition the boiler should, in addition to the ordinary cleaning, be annually inspected by a properly qualified person, the man-hole and mud-hole covers should be removed, and the tubes and boiler be scaled as far as practicable, and afterwards thoroughly washed out. If the tubes are very dirty they should be drawn and cleaned (under any circumstances, even if none but clean water has been used, this operation should be performed once in two years). The several fittings, cocks, valve, safety valves, bearings, gearing, and other appendages should then be examined, the boiler filled with water, and when any doubt exists as to the strength of any part of the boiler it should be tested by hydraulic pressure to at least double that at which the safety valves open when under steam.

The interior of the boiler should also be examined with a candle or a small spirit lamp on the end of a piece of copper wire. Special attention should be taken to ensure the removal of all dirt from the stays around and on the top of the fire box.

Great attention should be paid to the prompt renewal of any broken firebox stays. It is to be noticed that it is not always possible to detect a broken stay by the ordinary process of sounding with a hammer, as a stay may sometimes be broken nearly through and still sound all right when tapped. A far better plan is to drill a small hole, say about 1/10 in. diameter, up the center of any stay of which the soundness is suspected, when, if a fracture exists, it will be, of course, indicated by leakage. As the fracture of stays almost invariably takes place close to the plates to which they are screwed, a hole drilled in for about an inch deep from each end is sufficient.

All repairs, testing and cleaning should be conducted, not only in a proper manner, but also promptly, but at the least expense that is compatible with efficiency.

Slight repairs should be performed by the driver in charge of these engines, but a properly qualified mechanic should be employed if any considerable repair or alteration is required.

The dangerous practice of attempting to repair cracks in fire boxes by the insertion of copper plugs should never be permitted. The cracked piece of plate should be cut out and a patch put on and secured by screwed studs (or rivets if possible); the stays should come through the patch, which should be of good size, as small patches never stand well.

Work of the Municipal Asphalt Plant of San Francisco in 1909.

The accompanying table shows the output and unit costs on the operation of the municipal asphalt plant of San Francisco for the seven month period beginning March 1, 1909, and ending Sept. 30. It will be observed that the output of the plant for the month of March is much less than the results obtained for the other periods named. The principal cause of this is due to the installation of an extra asphalt heating tank, which has more than double the original capacity of the plant. The cuts in the table include the expense of improvements and repairs at the plant during the seven months period.

The cost of material delivered at the yard of the asphalt plant for the fiscal year 1909-10 was as follows:

Broken rock for binder per ton	$ 1.45
Antioch sand, per ton	1.30
Monterey & Bay Development Co.'s sand, per ton	1.00
Limestone dust, $8.50 per ton, less sacks returned, $2.60	5.90
Cement, $2.38 per bbl., less 10c for sacks returned	2.38
Asphalt from refinery, per ton	15.00

The binder consists of two-thirds broken rock to one-third sand (two parts Antioch to one part Bay Development Co.'s sand), 50 lbs. of lime-stone dust to 8 cu. ft. of mixture, rock and sand, and asphalt enough to cement the particles together.

The following is an analysis showing the constituent parts of the asphaltic binder:

	Per cent.
Asphalt	6.00
Sand	37.18
Dust	6.50
Rock	50.31

The mesh composition of sand and filled is as follows:

	Per cent.
Pass 200 screen	6.50 dust
Pass 80 to 200 screen	13.28 sand
Pass 50 to 80 screen	13.98 sand
Pass 30 to 50 screen	5.31 sand
Pass 20 to 30 screen	3.85 sand
Pass 10 to 20 screen	.76 sand
Pass 0 to 10 screen	50.31 sand

This mixture is giving excellent results under heavy traffic with 1½ in. wearing surface laid over it. The wearing surface is held as closely as possible to the New York formula for mixing asphaltic wearing surface.

The following is an average analysis of wearing surface delivered from the plant:

Sand	8 cu. ft.
Limestone dust	150 lbs.
Asphalt	130 lbs.

This gives the following:

	Per cent.
Bitumen	10.57
Passing 200 mesh screen (dust)	14.80
Sand passing 80 screen rejected by 200.	28.04
Sand passing 50 screen rejected by 80.	30.80
Sand passing 30 screen rejected by 50.	8.20
Sand passing 20 screen rejected by 30.	6.86
Sand passing 10 screen rejected by 20.	.70
Sand passing 0 screen rejected by 10.	.00

COST OF OPERATING MUNICIPAL ASPHALT PLANT, SAN FRANCISCO, CAL.

1909.	Cubic feet binder.	Cubic feet wearing surface.	Cost of material in binder. Per cu. ft.	Cost of material in wearing surface. Per cu. ft.	Cost of labor at plant. Per cu. ft. binder and surface.	Expense at plant. Per cu. ft. binder and material.	Total cost material, repairs and labor at plant Per sq. yd. pavement	Total cost labor, teams, etc., on street Per sq. yd. pavement.	Total cost of laying pavement. Per sq. yd.	Square yards pavement laid.
March	11,702	9,054	$0.150	$0.319	$0.0402	....	$0.908	$0.441	$1.399	6,604

Total	151,238	159,750	$0.143*	$0.274*	$0.438*	$0.017*	$0.639*	$0.309*	$0.948*	132,377*

*Average.

The lime stone dust gives about 85 per cent of its weight, passing the 200 screen.

Where the pavement is laid for very heavy traffic, cement is used instead of limestone dust for a filler. This character of pavement with a cement filler has been in use on Market St. for several months where the traffic is the most severe in its wear on the pavement and no appreciable deterioration is noticeable.

Market St. from Second St. to East St. has been paved with this class of pavement for nearly four years and has received the wearing effects of the heaviest traffic in the world (considering that a dead axe is used here) and except where the pavement has been patched over trenches, it appears to be as good as when laid.

The asphalt used is the residuum of the asphaltic oils obtained from the oil fields of California. It is prepared specially for city use, having a penetration of 70 to 90 by the District of Columbia standard. Annual contracts are made with the Union Oil Co. and the Monarch Oil Co. of this state. The plant is in charge of J. R. Price, assistant city engineer, to whom we are indebted for the above information.

English Methods of Using Tar as a Binder in Macadam Road Construction.

The use of tar in macadam road construction has been common in England for a number of years. In fact tar macadam has been in use in many residential towns for the past 20 or 30 years. Broadly speaking the three following methods of applying the tar have been employed: Tar-painting or waterproofing the surfaces; tar-macadam or mixing tar with the stone previous to its being laid on the road; and tar grouting or grouting the stone with tar and pitch when the road is being coated. In a paper read before the Northern District Meeting of the Institution of Municipal Engineers, Mr. William Wade, assistant surveyor to the Northumberland County Council, gave the following information, drawn from his own experience, regarding the use of tar by the above three methods:

Tar Painting.—Tar painting may be used on either an ordinary road, made in the usual manner, or upon a new stretch of metal. In the case of tar painting, a stretch of road which has carried traffic for some time, it is essential that all dust should be removed from the road before the liquid is applied. After the removal, the road is then ready for the application of the tar, which is heated in tanks of various sizes. These tanks are fitted with distributors or jets, and tar at the proper temperature is applied by pressure so as to secure a certain amount of penetration as well as equal distribution. The tarred surface has then granite, spar or other suitable screenings sprinkled over it. The cost of tar painting works as follows: One gallon of tar will cover an area of from 10 to 20 sq. yds., at a cost of from 1d to 1½d per square yard.

Tar Macadam.—I have now to deal with the second method—*viz.*, that of thoroughly mixing the stone with tar and pitch previous to its being laid on the highway. This is perhaps better known to you as tar-macadam. As it is absolutely essential that all stone should be perfectly dry and free from moisture, you will readily see that a shed or some covered-in structure will materially help in getting the work done in a speedy and efficient manner. The stone used is of three sizes—2½ in., 1½ in. and ½ in.—and should be free from dust and moisture. The tarring may be done by hand or by machinery. The latter method is much cheaper, and I find that machine-tarred stone is superior to that mixed by hand. After the stone is tarred it is stacked in separate heaps. The best results are obtained when the tarred material is allowed to be undisturbed from one to three weeks before it is applied to the road. I omitted to mention that the proportion of pitch must be greater for the bottom coat than for the two succeeding ones.

The 2½-in. stone is first put on the road foundation. Above this the 1½-in. is placed, and the ½-in. is used as a finishing coat, over which is sprinkled ⅜-in. dry granite screenings free from dust. Each layer of stone is well rolled before the one above is put on. It is very necessary that more than ordinary care should be taken in the consolidation of the separate layers. When completed, the combined thickness of the three coats gives an average depth of 4 in., the depth of material, of course, being greater in the center than on the sides of the road. A 15-ton roller is preferable, especially if the traffic be heavy, for if a light steam roller be used, when traffic heavier than the roller passes over the road, the result will, in all probability, be disastrous for the road. One ton of tarred stone will cover an area of 6 sq. yds., and the average quantity of tar required for 1 ton of stone is 8 gal. and 20 lb. of pitch.

The 8 miles of tar-macadam laid by the Northumberland County Council cost on the average 2s 2d per square yard, inclusive of mixing plant, etc. The roads treated were structurally weak—a penned bottom of 6-in. whinstone was laid down on the existing road to give a good foundation, on which the tarred stone was placed. Good drainage and strength of structure are important factors in the laying down of a successful tar-macadam roadway. The cost of reconstructing a road by means of penning it with 6 in. of whinstone varies from 10d to 1s 6d per square yard, according to the distance the stone has to be brought.

Tar Grouting.—And now I come to deal with the third method, that of tar grouting the stone with tar and pitch when the road is being coated.

Before beginning tar grouting it is necessary to take into consideration the weight of loads and the nature of the traffic the road is likely to be called upon to carry. This will altogether determine the size of the broken stone, its quality and the thickness of the coat to be laid on the surface. On roads that carry heavy traffic 3-in. hand-broken whinstone should be used, while on those where there is no motor wagon or locomotive traffic. I would recommend 2½-in.

After the stone is laid on, it is slightly rolled. The pitch and tar are together heated in tanks to boiling point and a quantity of creosote oil is added. Stirring is necessary to enable the ingredients to be thoroughly well assimilated.

The boiling matrix is poured in the interstices by means of a specially made can and distributor. Each individual stone is thus thoroughly well grouted and embedded in or surrounded by the mixture. While still hot, ⅜-in. slag or whin chippings are applied and properly consolidated with a 15-ton roller until an integral crust is formed.

I have given a very brief outline of the preparation and use of material for the three different methods of treating a road with tar as a binder. I now propose to deal with, in as concise a manner as possible, the various advantages and disadvantages connected with these respective modes of road making and repairs. At the outset, let me say that I consider wet rolling will shortly be a thing of the past on our main highways where motor traffic has to be dealt with.

Tar painting may with great advantage be used on suburban roads where the traffic is light or where the dust nuisance is greatly felt and watering has to be resorted to. The tar acts as a protection, and protects the life of the road surface *so long as it is dry.* It has this great drawback, being only *externally* applied, it breaks up in wet weather, and the combined action of the wheels and horses' feet soon put the roads into an uneven and dirty condition. This, of course, applies to roads where the traffic is heavy. To sum up, tar painting is not to be compared with either tar-macadam or tar grouting as far as lasting properties are concerned. The tar in this case is not so much a binder as a protection to the road surface.

Tar-macadam possesses the following advantages:—

(1) The small stone of which the crust is composed being well tarred before being laid on the road gives a compact and smooth surface.

(2) The tar-macadam road is perfectly sanitary and almost dustless, so that cleansing is reduced to a minimum.

(3) It is easily repaired and the cost of maintenance is 30 per cent less than that of ordinary macadam.

For motorists it is an ideal road.

Tar-macadam, as no doubt you are aware, is not without its drawbacks. The chief of these, so far as road authorities are concerned, is the heavy initial cost. From the point of view of those using the road, the slippery nature of the surface, especially during hoar frosts, is an objectionable feature. However, this remedies itself in course of time by the tar gradually leaving the road dry by evaporation. Locomotive traffic tends to cause the top layer, which is only 1½ in. in thickness, to become separated from the layer below. This, of course, means the break up of the road so far as the crust is concerned. This is the reason why tar-macadam is not adapted for heavy loads.

Tar grouting differs from tar-macadam in these respects:—

(1) By broken stone being applied in one coat.

(2) The stone is of a uniform size.

(3) Owing to a larger quantity of pitch being mixed with the tar, the mixture quickly solidifies and adhesion is instantly secured, in much the same way as is done in the wood or granite paving.

The Northumberland County Council has this year (1909) tar grouted 15,436 tons of broken stone on a stretch of upwards of 14 miles of main road in various parts of the county. This work, I find, can be carried out very satisfactorily by doing one half of the road at a time. I may say I did not receive a single complaint while the work was in progress. Furthermore, there was an entire absence of loose stones—generally an annoying feature on ordinary newly-rolled patches. In September last I supervised the work of making the road approaches over a new bridge. Clay was used in order to bring the roadway to the required level. You are all aware of the difficulty of making a satisfactory highway over newly-filled clay. Yet, after these approaches had been penned with rubble whin, and then coated with 2½-in. hand-broken whinstone, I found that by tar grouting I was enabled to get a firm and permanent road at once. The cost of tar grouting is no more than that of repairing a road by the old water-bound method.

A tar-grouted highway is, as yet, the nearest approach we have to an idea road. It is certainly for mixed traffic superior to the other methods I have mentioned. Yet, at the same time, I must not omit to say that the surface is not quite so suitable for motors as that of tar-macadam.

Road Maintenance With the Road Drag.—Hale township in Carroll county, Missouri, has an excellent system for the maintenance of its roads by means of the road drag. By this system an overseer is placed over every eight miles of road and is held responsible for dragging the roads under his care. The overseers are under the Township Board's direction, thus making a central authority by means of which a united action is obtained over the entire township. After a rain, each overseer uses the telephone to get the citizens out with ten drags, and all the roads of the township are dragged at practically the same time. The major part of the work is done in April, May and June. Volunteer work is gratefully accepted but not depended upon Those doing the regular work are paid for it by a previous agreement. In this way the roads over the whole township are maintained in excellent condition at a cost of from $10 to $15 per mile per year, including $15 paid each overseer.

Engineers of the Great Northern Paper Co have prepared plans for a new concrete dam to replace the wooden dam on Millinocket stream, at Bangor, Me. It will be built largely of concrete and will cost about $30,000, in addition to the cost of land at each end.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Depth of Water Pipe.

Water pipes have been in use so many generations that in every community custom has established depths at which all pipes should be laid. A great many men have brought up the question of lessening the depth in many places, for a lessened depth not only results in lowering first cost but affects service connections and repair work. To assist in a study of this matter the New England Water Works Association appointed a committee in 1908 with Mr. Frank A. Barbour of Boston as chairman, and the report of this committee has been lately published in Vol. 23, p. 425 of the Journal of the New England Water Works Association.

A carefully prepared circular containing a number of questions bearing on the subject, was sent to three hundred and twenty officials in charge of water works plants and ninety replies were received. Each city replying was given a number, which number is shown on the accompanying map, Fig. 1, in relation to the temperature curve. A chart, Fig. 2, was prepared in which the horizontal lines represent depths to center of pipes and the vertical lines, the mean temperature of coldest month in an average year. On this diagram the different places, from which replies were received, have been plotted. The diagonal straight line expresses the relation of depth to mean temperature of coldest month as indicated by an average of the replies received. Extremes are illustrated by Mauch Chunk, Pa., (34) and Cleveland, Ohio, (44) the former satisfactorily operating pipes at a depth to axis of 3 ft., 6 ins., and the latter believing 6 ft. 6 ins. to be necessary. The committee remarks that obviously local conditions other than temperature, and including depth of snow covering, must furnish, in great part, the explanation. The diagram emphasizes the variation in depth in cities and towns with the same mean temperature of coldest month.

The report of the committee concisely stated is largely negative in character,—that is to say, it appears that freezing has not occurred at the depths generally adopted for laying water pipe. Whether these depths are excessive, however, cannot be predicated from the information at hand, because where freezing has occurred there has always been an obvious explanation, usually little or no velocity, and an analysis of these explanations and of the local conditions pertaining does not finally justify any general deduction as to necessary depths.

With practical unanimity all replies state that the present depths are sufficient, and a considerable number suggest that lesser depths might safely be used. Whenever freezing has occurred it has been largely at night or where there was practically no current, and it is believed that where there is a velocity, say, in excess of one-quarter of a foot per second, and particularly in the case of ground water supplies, depths somewhat less than those now used would generally be safe. In main feeders, and in those portions of the distribution system where there will be an assured circulation, the question of minimum depths should be given careful consideration. It is not in the mains but in the services that most of the trouble from freezing occurs, and in the services such trouble usually results from skimping by plumbers or contractors, resulting in the actual laying of the services at depths considerably less than the mains. There is a strong feeling apparent that services should be laid by the municipalities.

Twenty-eight of the places replying report the tapping of service connections on the top of the main, 39 on the side, 12 on the quarter, and 7 in various ways. Freezing of services generally starts at the house and backs out into the main, and it is believed that if services were tapped on the side of the main and then dropped to the depth required to meet local conditions, the lessening of the depth at which the main is laid to that justified by the velocity of the water in the main would not result in increased freezing of services.

In determining the depth of pipe, the character of the soil and of the surface of the ground are factors of some importance. In but very few places, however, from which replies were received is the nature of the soil taken into account in deciding as to the necessary depth at which the pipes should be laid. In 10 per cent of the replies it appears that some attention is paid to the character of the street surface, although apparently there is no prevailing rule. Some consider that a pavement is equal to one foot of cover; others that pipe should be laid deeper in a paved street. An average of the replies received indicates that freezing extends one foot deeper in streets than in fields; also that in streets frost will reach 1 foot 5 inches deeper in gravel than in clay, with sand half way between. In fields it would appear that frost will extend one foot farther in gravel than in clay, with sand again intermediate in effect. It is

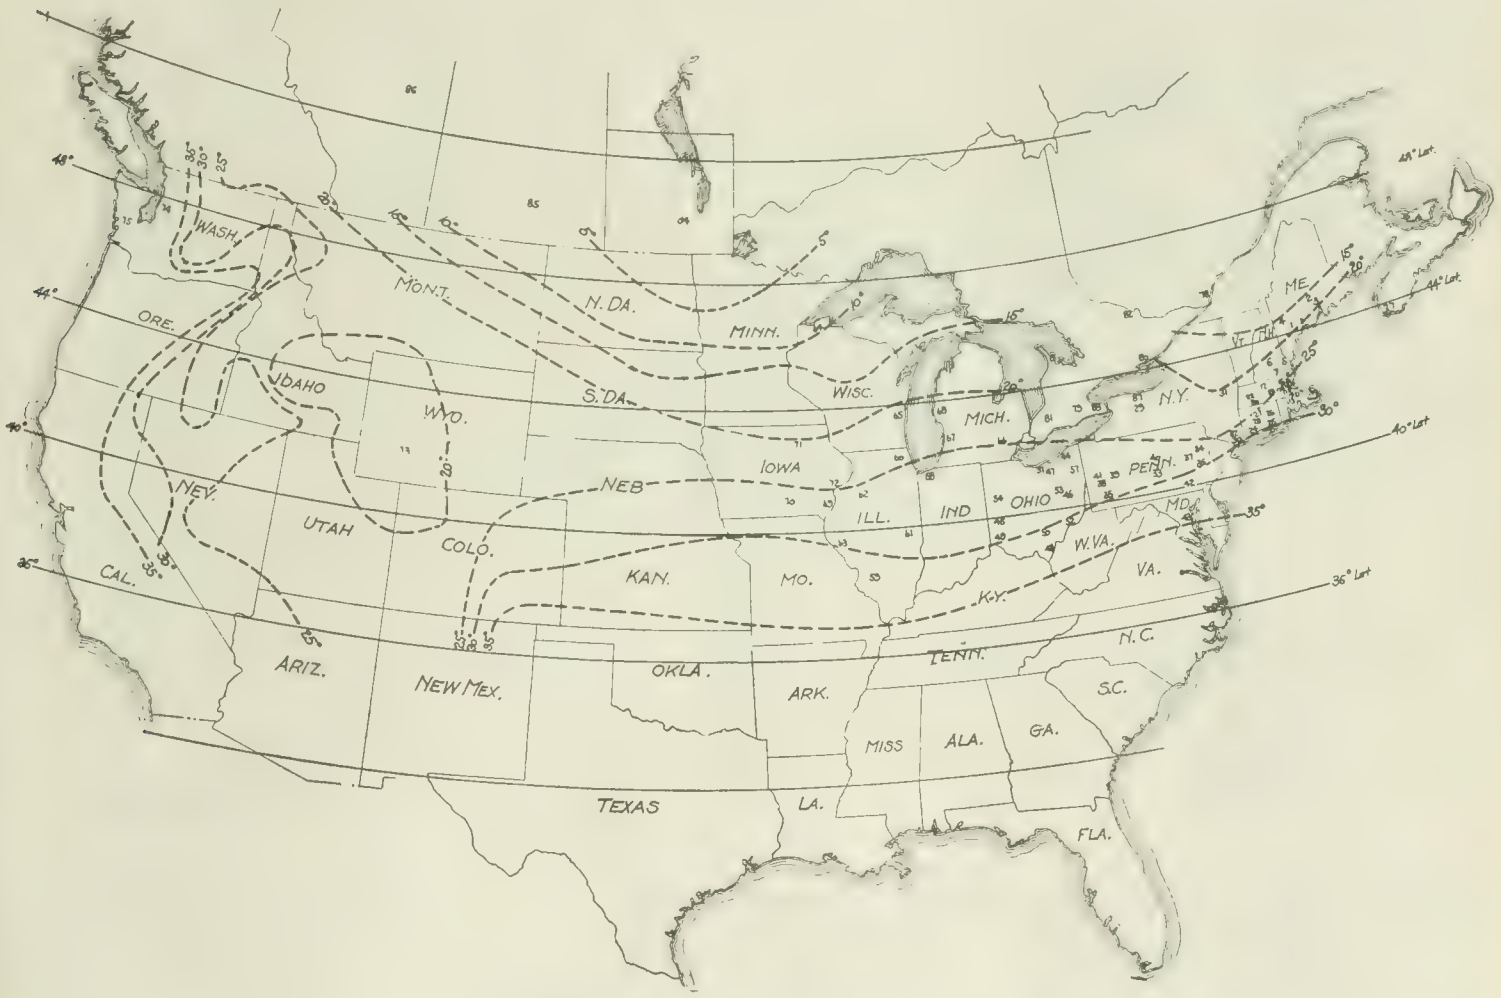

Fig. 1—Map of United States Showing Relation of Depth of Pipes to Temperature.

obvious that the character of the soil is a factor of such relative importance as to demand consideration in determining the economical depth.

Fifty-three places report actual experience in the freezing of pipes. All of these cases were in distribution systems and none in the leading mains Fifty per cent were on dead ends and all were in pipes where there was little or no velocity. All but three of the cases of freezing were in pipes smaller than 10 inches in diameter, only seven in pipes as large as 8 inches in diameter; in all cases the ground was frozen below the axis of the pipe, and the ground water level was also below the pipe. In 80 per cent of the cases the ground was bare of snow at the time of freezing. All stoppages were total. Thirty-five places report the character of the earth in which the pipes were laid; of these 40 per cent were in clay, 48.6 per cent in gravel, 5.7 per cent in sand, and 5.7 per cent in rock.

While all cases of freezing reported are stated to have resulted in total stoppage of the pipes, there are records of ice formation in concentric rings in pipes as large as 24 inches in diameter, the occurrences not being evidenced by stoppage of the large main, but only by loss of head through increased friction, or, in some cases, by stoppage of gates or smaller pipe connections by the ice loosening and breaking up in a thaw and forming an ice jam at some point of obstruction. Such formation of ice in a layer adjoining the metal of the pipe has occurred in instances of extreme low temperature in the eastern Canadian Provinces in conduits where there was a considerable velocity. Obviously, as the ring of ice forms, the velocity of the water increases and a total stoppage does not result. In other cases of freezing, particularly in smaller pipes, the ice formation is not solid nor does it start from the outside, but is rather in the form of "slush" uniformly distributed throughout the cross-section of the pipe. This has been noted in a 4-inch pipe, in which there was considerable velocity, laid at a depth of 6 feet in a salt marsh in New Brunswick.

There is a belief or tradition in the minds of many plumbers and water-works superintendents that most stoppages by ice formation occur in a thaw which follows a period of severe cold weather, and the reason generally advanced for this alleged phenomenon is that the evaporation from the surface during the early stages of the thaw produces additional refrigeration or reduction of temperature at the depth of the water main sufficient to cause freezing. No indication of the existence of such conditions has appeared in the reports received of frozen pipes, and this reference is here made to induce the production of evidence, if any exists, in support of this theory.

In the discussion following the report the information was brought out that there are no more cases of freezing in those places where the depth of the pipe is less than in those where the depth is greater than that shown by the average line. It must, therefore, be concluded either that this variation in the depths at which pipes are laid in different localities with the same mean temperature of coldest month are to be explained by peculiar local conditions, or that in some places the depth shown is unnecessarily great. Personally, Mr. Barbour believes that it is safe to lay pipes where there is an assured circulation at all times, at depths less than are frequently adopted in present practice. Mr. Leonard Metcalf believed it desirable to follow up all reports of frozen pipes and commenting on the fact that the freezing of pipes seems to depend more on the velocity through the pipe than anything lese, stated that it is on this very fact that we have the fewest data, as it is difficult information to get. Mr. Coggeshall stated that he had noticed several times when thaws came after a long period of cold weather during which some services had frozen, that other service pipes in the immediate vicinity stopped. Mr. Charles W. Sherman suggested that pipes of the largest sizes might to a greater extent than is now the practice be advantageously laid at a lesser depth than the smaller pipes; in view of the fact that the committee had no reports of pipes larger than 10 inches in diameter which have frozen and very few pipes larger than 6 inches.

Considerable interesting information was given in many of the reports from cities and towns but it was noticeable throughout that in the work of the committee and the discussion following the committee report, no consideration was given to causes other than danger of freezing, as affecting depths at which pipes are laid. At the present time the danger of freezing is a minor point, for the traffic on streets must largely settle this important question. Interurban electric cars of great weight travel over streets in small towns and in the larger cities the street cars are yearly growing in size and weight. Heavy auto trucks are supplanting horse drawn delivery wagons and road rollers of great weight are used on all modern street construction. Machine excavators are used generally for sewer work and these heavy machines play havoc with the joints of water pipe laid in shallow trenches. A minimum depth of about five feet should be required to the top of the water pipes to protect them from heavy traffic and freezing should be taken into consideration in localities where experience has proven that five feet is too shallow. Metering alone is not going to check the present costly water waste in American cities. Good construction must come before meters, which, after all, chiefly affect water supply after it leaves the mains and goes into the house service pipes.

Reclaiming Dredged Lands.—In California thousands of acres of once fertile lands have been lost to agriculture because of hydraulic and dredge mining which covered the land with boulders and debris. Near Oroville the Feather River Dredging Co., with a capital stock of $2,500,000 has been organized to reclaim these lands by means of dredges and rock crushers. The Natomas Consolidated Co. has also established four rock crushing plants for the same purpose. The crushed rock is used for concrete, railroad ballast, macadam and other purposes. The land from which the boulders are removed is put under cultivation as fast as it is cleared and orchards are now seen where a few months ago were piles of stone and sand. Much of the material will be used for levee work, thus reclaiming many acres of swamp and overflowed trite lands.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Some Types of Sea Walls and Their Structural Characteristics and Cost.*

The low cost of water born freight has been a deciding factor in the location of many industrial undertakings and with the location came the important problem of maintaining and securing the sea-wall or bulkhead against settlement and other movements tending to deform or destroy the structure. Many types

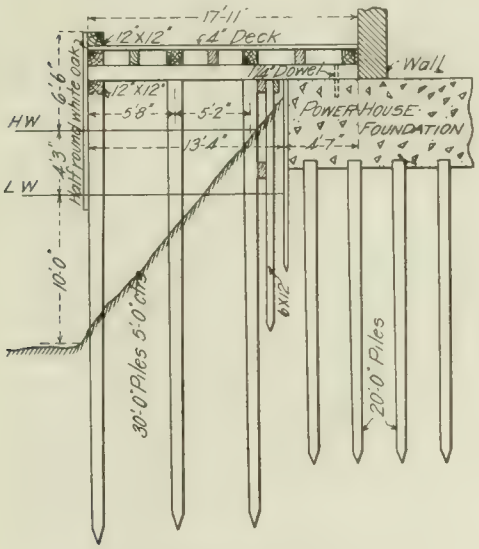

Fig. 1—Pile Bulkhead With Timber Platform, First Street Slip.

of sea-wall or bulkheads have been used in this work, and the present paper is an endeavor to indicate a number of constructions which have been used with success, together with a brief statement of the difficulties encountered,

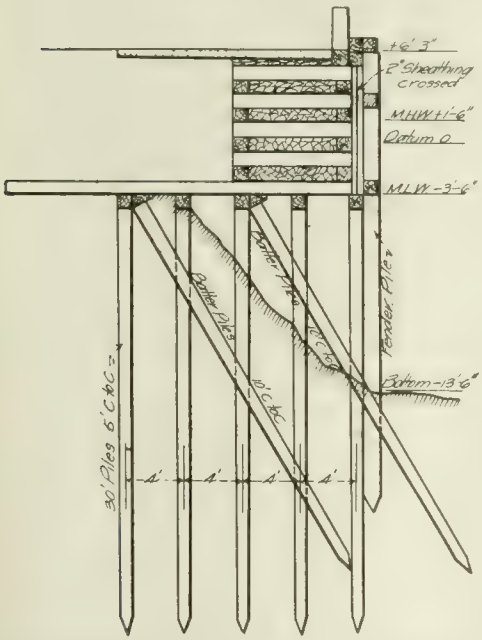

Fig. 2—Crib Bulkhead on Piles, Gowanus Canal Type.

and an approximate statement of the costs involved.

*A paper by Geo. A. Orrock read at the annual convention of the Connecticut Society of Engineers for 1910.

Two general types of construction have been followed according to the conditions found in the subsoil. On rocky or ledge bottom, the stone retaining wall was probably first used and is a common type today. Where the subsoil is sand, silt or clay the pile or pile and relieving platform construction have generaly been used. The crib bulkhead may be used on any bottom.

Crib Bulkheads—The earliest examples of this type consist of a few rough logs laid along the water's edge, the filling behind being earth and sand. Later the crib was built of rough logs, notched at the junctions to form a kind of rectangular framing, weighted with stone to sink it to the bottom, the filling being rock, earth and sand as before. As the crib sank into the subsoil additional logs were placed, building it up to the proper height. Many of these bulkheads are in use today and are strong and substantial. The modern crib is made of squared timber, halved

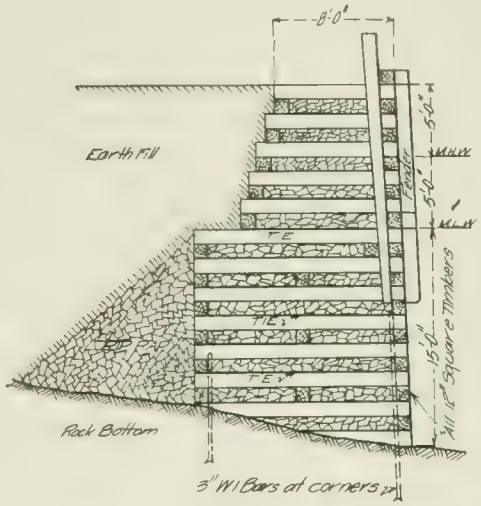

Fig. 3—Crib Bulkhead on Rock Bottom.

together at the corners and splices, the successive corners held together with drift bolts. Mooring piles and string pieces are provided and a deck of 6-in. plank is usually added.

Where timber is cheap and a good hard clay or gravel bottom may be found at a reasonable depth, the crib bulkhead is perhaps the best method of cheap construction, and in good locations its life is from 50 to 75 years.

Crib bulkheads are also used on rocky bottom swept clean by swift currents. See Fig. 4. The cribs are built on shore with the lower courses fitted to the contour of the bottom, floated to the location, held in place by hawsers while being sunk, and then anchored by drilling holes in the ledge at the internal corners of the crib for the insertion of heavy iron bars. A bulkhead of this type in good water should have a life of 50 years or longer.

Pile Bulkhead—Where good bottom is not obtainable at reasonable depths, recourse must be had to piling, and the most ordinary form of pile wharf or bulkhead may be adopted. This consists of four or more rows of piles capped with square timber, placed at about 5 to 8 ft. apart and floored over with planking of suitable thickness. The caps extend 8 or 10 ft. over the earth bank and the projecting ends are supported on a mudsill which also caps the short sheet piling used to prevent the washing away of the earth fill. See Fig. 1. A better construction caps each line of piles with 6x12 in. timbers gained into the pile head. A still better construction gains into the pile head two longitudinal caps breaking joints, the square timber cross sills being above the longitudinal caps and drift bolted to the pile heads. The deck planking should run longitudinally. Mooring piles and string pieces are provided and in the best examples two additional stringers are run on the front row of piles and vertical plank is placed to cut off access beneath the bulkhead. The bracing of pile bulkheads may be accom-

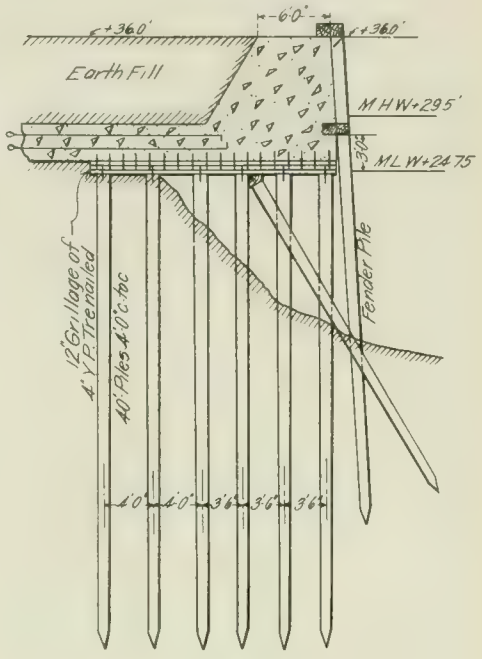

Fig. 4—Kent Avenue Bulkhead, Wallabout Basin Type.

plished either by brace piles (by far the commonest way), driven at an angle, the tops sawed off and bearing against a longitudinal stringer; or by cross bracing between low water and the bulkhead deck. The latter method is much better in ordinary situations as every pile is partially braced, while with the brace pile a slight settlement usually spoils

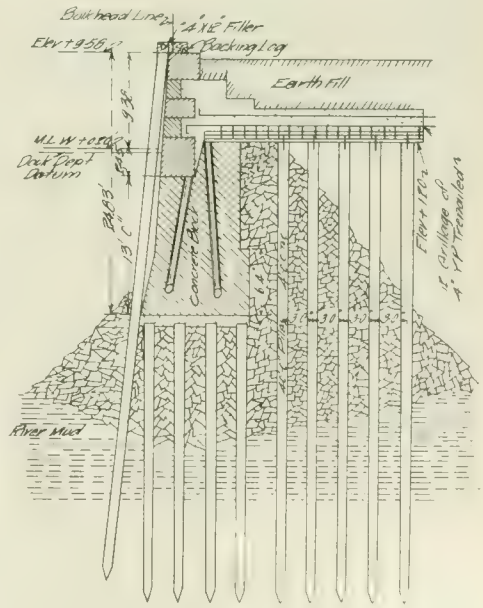

Fig. 5—Standard Bulkhead, Department of Docks, New York City.

the bearing of the brace pile and prevents its action.

Masonry Bulkheads—For important works, with good bottom available, and especially with a high range of tide levels (10 ft. and above) the ordinary stone retaining wall is quite satisfactory and has been much used. This wall is usually built in sections between sheet piling and when properly built is permanent. Seawalls of this type are known to

have been in existence as early as 800 B. C. and have been in use ever since. The masonry wall is possible only when good bottom is available.

Where the tide range is small and the bottom is bad the masonry wall may be built on a plank platform supported on piles. See Fig. 5. The piles are cut off about 1 ft. below low water and capped by two layers of 4 in. planks laid in opposite directions and held in place by trenails. On this platform as a foundation the wall is built in rubble masonry or concrete and carried to the proper height. The plank platform should be carried 10 or 15 ft. back of the wall to act as a relieving platform preventing the thrust of the earth from coming on the piles. Brace piles are also used, a double row, two piles to every cross row. A better method is to tie the masonry wall to a bunch of piles driven in the solid earth about 60 ft. back of the bulkhead by means of iron rods embedded in concrete. This method has been used a number of times and in no case has any outward movement been observed. This type of bulkhead has been criticised as to permanence, but most of the critics agree that it will last 50 years at least.

Where a more permanent and better type of bulkhead is desired, the sea wall (Fig. 6) adopted by the Dock Department of the city of New York may be used. The wall itself is made up of concrete blocks 80 tons in weight. Rows of piles about 2 ft. 6 in. c. to c. are driven and cut off 15 ft. below low water. These piles are covered with a mattress of concrete in canvas bags and the blocks, which are made up on shore, are set up on the mattress. Back of the blocks rows of piles about 5 ft. c. to c. are driven and cut off at low water. These piles are capped with two layers of 6 in. planking laid crossways and held with treenails and drift bolts. This capping extends over a part of the top of the concrete face block. The wall above low water mark is built of granite ashlar backed with concrete and the filling is carried by the relieving platform. Two sets of brace piles are driven in every 55 ft. bay. The bottom is usually prepared by dredging to 18 ft. below low water, and after the piles are driven, sufficient rip rap is dumped between them to consolidate the mud and steady the piles near their upper extremity.

This type of bulkhead is now adopted as the standard bulkhead for Manhattan Island. Where the bulkhead is loaded very heavily and the supporting piles are quite long, the tying in of the bulkhead to heavy construction further inshore has been very successful, no measureable horizontal movement having been observed in a period of 5 years, while in somewhat similar construction depending on brace piles the movement in the same time has been as great as 3 or 4 in.

Where timber is used in bulkhead construction an investigation should be made as to the presence of the "teredo navalis" and "limnoria lignorum." The ravages of these marine borers appear to be confined to the portion of the pile between mean tide and about 2 ft. below the lowest water level, but never below the mud. Creosoted timber is not affected till the dead oil is washed out by the action of the water, but untreated piles are rapidly affected. Near New Glasgow, N. S., a yellow pine pile 14 ins. in diameter was observed to be eaten entirely off by the "teredo" in the course of one season. Similar occurrences are reported from various ports in the West Indies and gulf of Mexico. At Norfolk the life of an untreated pile is only two or three years. In the neighborhood of New York the teredo does not flourish, due to the sewage contamination, but the limnoria is common and destructive. Untreated timber lasts from 5 to 15 years, and much longer when protected by mud. Where creosoted timber cannot be obtained or is too costly the portion of the pile from the mud level to above high water is often protected by a wrapping of tar paper held in place by wooden battens, and this method is effective as long as the battens last. The best and safest method is to creosote the piles, using about 12 lbs. of dead oil of coal tar per cubic foot. Concrete or tile pipes slipped over the piles have also been used as a protection.

Friction Bearing Piles.—In New England waters reasonable good bottom for piles is usually to be found within a reasonable depth and piles longer than 45 ft. are seldom needed. Silt deposits are sometimes found, however, where piles over 100 ft. long are needed, and in one case in my own practice we drove a pile 128 ft. with a settlement of 6 ins. at the last blow. In such a case friction bearing piles are a necessity and four 3x3-in. strips are nailed longitudinally along the pile to give additional surface, and where a very long pile is needed, to act at the same time as splice plates. It is usual to allow from 100 to 300 lbs. per sq. ft. of pile surface in the silt for the supporting power of these piles. In the installation mentioned above (see Fig. 3) 90-ft. piles were used without strips and about 250 sq. ft. of friction surface was available on each pile. The loadings averaged 16 tons per mile and no serious settlement has occurred. The ground back of the bulkhead has been loaded in excess of 1 ton per sq. ft. at various times in the six years since the bulkhead has been in place and a considerable movement outwards has occurred, amounting in some places to over 3 ft. Timber cribs 20 ft. wide on the bottom, 10 ft. wide on top and 25 ft. deep along the side lines of the property have been pressed outwards in some places to the extent of 7 ft. That the movement comes from the center of the property and much below the surface is shown by the position taken by the face of the bulkhead and cribs, which invariably slant inwards at the top. From certain borings made on the property it would appear that solid bottom is at least 2550 ft. below the water level.

Where pile bulkheads are built on sand bottom boulders are frequently encountered at such depths that piling is impossible. Where the boulder is small, 6 to 10 ft. in diameter, I have had a number of heavier piles driven surrounding the boulder, pulling the pile heads into place with chains until the rip rap and grillage could be placed. Larger boulders were broken up with dynamite until a 4-ft. pile spacing could be obtained.

Costs.—Under New York conditions the standard bulkhead in Fig. 6 should cost about $600 per running foot. The bulkhead shown in Fig. 5 and known as the Wallabout Basin type should cost about $225. Pile and crib work depend largely on the timber cost. The First Street wall, Fig. 1, cost about $30 per running foot. The Gowanus Canal wall, Fig. 2, cost about $50 per running foot. In all these examples the piles average 30 to 40 ft. long.

Crude Petroleum As a Timber Preservative.*

With one or two exceptions it has not been possible as yet to formulate any definite results on the treatment of wood, in which crude petroleum (or combinations of it with other things) have been used. It is, therefore, only within my power to give a short resume of the status of the crude petroleum treatments.

It has been only recently that treatment of timbers with crude oil has been undertaken commercially. Two railways have adopted it. The National Lines of Mexico, at Aguascalientes, and the Atchison, Topeka & Santa Fe Ry., at Albuquerque, N. Mex. The former is using the Mexican crude oil, and the latter gets its supply from Bakersfield, Cal.

As yet it is purely an assumption, as to the probable results of this kind of treatment, because it is radically different from all past deductions as to the preservation of timber. Heretofore it has been considered essential to have in the preservative medium an element that was either germicidal or antiseptic in its nature. This new treatment is depending upon an entirely new conception of preservation, namely, the elimination of air or oxygen and moisture. This has for its basis the well-known fact that in order that fungi may thrive, there must be present three essential conditions: moisture, air or oxygen, and the proper temperature.

Therefore, this crude oil treatment gets its impetus from the fact that it probably will be (1) a weatherproofing agent, as the tie is thoroughly impregnated with the oil, and (2) that the fungi will not be able to thrive, from the presence of any moisture which may have been left in the timber previous to treatment, due to the absence of oxygen or air.

The various crude oils which are in use either commercially or experimentally have been examined as to their germicidal or antiseptic properties, and from all known tests covering such work none of them contain any such properties.

The first oil to be used in the United States commercially was the Bakersfield oil. Timbers treated with this oil have been in the experimental track of the Gulf, Colorado & Santa Fe Ry., near Pelican, Tex., for over three years, and some ties taken out recently for examination were entirely free from all indications of decay. This is promising, though not convincing, that the treatment has its merits; that it will preserve the tie for its mechanical life. Recently the Santa Fe Ry. has investigated other oils, more especially a Mexican oil from Ebano. Another oil from Oklahoma has been tried.

Pine has been the principal wood used in the experiments. The gums required a considerable longer time and a higher pressure. Using Ebano oil on gum ties, one experiment gave an absorption of 55 lbs. per tie, yet the ties were somewhat checked from being subjected to such a high pressure (175 lbs.) and a high temperature (200° F.).

There is, apparently, no difficulty in thoroughly impregnating all the sap wood of the different species of pine. In the case of the loblolly, it is thoroughly saturated. All the sap of the shortleaf and some of the heart receive treatment, while with the long-leaf, the penetration is confined entirely to the sap wood.

With cresoted ties, it is not unusual to find that after they have been air-seasoned a year after the treatment they weigh less than they did when treated. Such is not the case with the crude oil treatment. Seasoning tests with the three oils gave the following tie results, after seasoning ten months: 27 ties treated with Bakersfield oil lost an average of 2.6 lbs. each; 30 ties treated with Oklahoma oil lost an average of 14.3 lbs. each; 30 ties treated with Ebano oil lost an average of 14.4 lbs. each.

The crude oils are viscid at ordinary temperatures, but do not affect pipe lines during treatments. The oil is used at a temperature varying from 175° to 200° F.

Checking seems to be reduced to a minimum with this treatment, except in a few cases where it was necessary to use great pressure and high temperatures. On standing any small checks that are former become filled with the oil, which forms a plug against the entrance of any moisture. On seasoning the ties after treatment, the oil has a tendency to form a coating on the outside. This forms a very insoluble covering to the whole tie, very much like the theoretical leather formation which was supposed to form in the Wellhouse process.

The Ebano oil does not mix with thinner crude oils, as it becomes coagulated, forming a sticky mass. At the outset of this treatment, two objections were suggested: (1) The ties would be inflammable, and (2) the spikes would be liable to work loose. Both the objections never existed in actual practice, and no such conditions exist among ties treated with these crude oils.

The success of this treatment depends upon the fact that all the sap wood must be thoroughly impregnated and with all the oil that it is possible to force into them.

The National Ry. of Mexico has not much doubt that the Mexican pine ties will last their mechanical life, which they figure will be about five or six years when treated. They figure the cost to be less than 20 cts. (Mexican currency) per tie, and will answer their special requirements, if they get five or six years' life.

*Abstract of a paper by C. M. Taylor read at the annual meeting of the Wood Preservers' Association, at Chicago, Jan. 19, 1910.

LETTERS TO THE EDITOR.

Observations on the Panama Canal Work.

We are requested by Mr. C. L. Bartlett of Cedar Rapids, Ia., to state that the communication under the above title and above his name, which was published in this column in our issue of Jan. 26, 1910, does not embody the ideas intended to be conveyed in his original manuscript and he therefore disavows the letter as published. This letter was an effort of the editors to arrive at and to express clearly the meaning of our correspondent as truly as it could be determined from his manuscript. The task was undertaken at the instance of our correspondent, who in his letter submitting the manuscript wrote: "Make any changes you may wish to to make it more readable." The editors regret that they were incapable of the task.—Editors.

How to Increase the Efficiency of the Civil Service.

We have received two communications discussing questions raised in our editorial of Feby. 2, 1910, bearing the above title. These letters are signed with pseudonym only. If the writers will send us their real names, not necessarily for publication but as guarantee of good faith, we shall be glad to give space to their very interesting letters. We cannot publish anonymous communications.—Editors.

Comparative Methods and Costs of Underground Conduit Construction.

Sirs: Referring to the article under the above title in your issue of Jan. 5, 1910, we must take exception to the unfavorable comparison which Mr. Mayer has made between fiber and tile conduit. We should very much like to know whether the fiber conduit he mentions in Table I, Comparative Costs, was laid in the same trench or under the same soil, labor and other conditions as the tile which is mentioned in the same table, and if so, where? In view of the fact that a direct statement has been made that it costs 18 cts. per duct ft. to lay single fiber as against 15 cts. to lay single tile, with the same concrete envelope (which statement we beg to take exception to) we think we are entitled to know the particulars of this installation and the original memorandum of cost data on same.

Very truly yours,
AMERICAN CONDUIT CO.,
Per A. G. McClure.

New York, N. Y., Jan. 22, 1910.

Ripley Combination Wood and Concrete Piles—A Correction.

Sirs: In your article, page 122, of the issue Feb. 9, 1910, referring to the Ripley Combination Pile, you state that the manufacture of this pile is controlled by the "Robbins-Ripley Co., Engineers and Contractors, New York City." The Monks-Ripley Pile Co. owns the pile in the United States and West Indies. The Robbins-Ripley Co. owns it in Canada and Mexico. I may possibly have written you concerning the work on the Robbins-Ripley Company's paper, but feel sure that all my letters have been signed "Monks-Ripley Pile Co." I would appreciate it if you would correct this error in your next issue.

Yours truly,
JOHN W. RIPLEY,
Sec. The Monks-Ripley Pile Co.

82 Beaver St., New York, Feb. 10, 1910.

Depreciation of Contractors' Plant.

Sirs: Will you kindly inform me if there are in your files any articles on records of actual depreciation of contractors' plant.

Yours very truly,
JOHN H. LANCE.

Wilkes-Barre, Pa., Feb. 8, 1910.

(In February, 1906, issue of ENGINEERING-CONTRACTING data on this subject were given from records of Messrs. McArthur Bros. Co., as follows: Locomotives, cars, track excavators, power machinery, furniture 1.1 per cent per month; scrapers, wagons, carts, buggies, horses, mules, harness, cook house, bedding, tents, etc., 2.0 per cent per month; boats, scows, docks, marine equipment, 4 per cent per month; picks, shovels, blacksmith's small tools, 5 per cent per month; real estate, buildings, fence, yards, walks, 0.5 per cent per month. These items were given again in ENGINEERING-CONTRACTING, issue of July 15, 1908, p. 49. In the 1906 publication the statement was made that this monthly depreciation allowance does not include the actual current repairs to the plant. While the percentages are called "arbitrary," they are doubtless based upon the long experience of this firm of contractors. The 4 per cent monthly depreciation appears too high for boats and the 2 per cent seems too low for drag scrapers. We believe our readers should be able to give some data on this important subject.—Editors.)

Bonding Concrete to Wood.

Sirs: I am trying to find something to make concrete adhere or bond firmly to wood. I have tried many compounds and chemicals, but find that in most cases they have a tendency to weaken the concrete. It may be that in your experience you have come across something that would accomplish this end. If so, I wish you would kindly communicate with me or publish the same in the columns of your valuable publication.

Yours sincerely,
JOS. M. CLEARY,
Landscape Architect.

San Francisco, Cal., Feb. 1, 1910.

(The swelling of wood when wet and the shrinking while drying, prevent a bond with concrete. When wooden frames have to be set in concrete and it is essential that a close fit be obtained the wood should be well soaked, preferably in oil, to prevent any alteration in shape or size. Then it should receive two or more coats of paint to retain the liquid with which the pores are filled. It will not bond with the concrete but it is customary to drive nails in it with two or three inch spaces between and projecting a couple of inches. The concrete when poured will embed these nails and the heads furnish a grip in addition to the bond of the concrete to the metal.—Editors.)

Earth Pressure on Buried Structures in Trenches.

Sirs: I have just been reading a paper by your Mr. McCullough before the Illinois Society of Engineers and Surveyors on "Culvert and Sewer Design," in January, 1909. On page 113 he gives a formula which is intended to express the result of Mr. Barbour's experiments on the pressure on buried structures, and which appears to show that the ratio of pressure to weight becomes a constant at a depth of about 10 ft. and is equal to about 37 per cent. I am not quite sure that I fully understand Mr. McCullough's meaning, and would like to ask if he intends to say that Mr. Barbour's experiments show that the vertical pressure on the cover of a culvert buried more than 10 ft. is only 37 per cent of the vertical height of the filling directly over it? For instance, suppose a filling 20 ft. deep of sand weighing 100 lbs. per cu. ft. over a box culvert of 4-ft. span. The weight directly over each square foot of the cover is evidently 2,000 lbs. Does the formula mean that the vertical pressure on each square foot is only 740 lbs.? This is certainly very important if correct. Suppose the trench were sheeted vertically and the sheeting left in, how would that modify the formula, if at all?

Yours truly,
E. W. MUENSCHER,
County Engineer, Manistee County, Michigan.

Manistee, Mich., Feb. 7, 1910.

(The paper clearly states that the experiments made by Mr. Barbour showed the transmitted pressure to buried structures, *in trenches*, to be practically 37 per cent of the weight of the filled material, as well as of vehicles passing over the trench, for all depths exceeding 10 ft. The following is an extract from the paper referred to:

Mr. Barbour states as a result of the experiments, in which many different materials were used, that the pressure of earth in a trench is a function of the cohesion of the material, rather than of friction on the sides of the trench, or of the width of the trench.

Mr. Barbour's paper is printed in full in Vol. XIX (1897) "Journal of the Association of Engineering Societies," p. 193. A paper by Professor Ketchum on the cohesion of earth as affecting the tendency of trenches to cave was published in Vol. XL, Transactions of the American Society of Civil Engineers and this was republished in the August 26, 1908, issue of ENGINEERING-CONTRACTING. The experiments of Mr. Barbour on trenches with banks sloped ¼ to 1 indicated that after a depth of 4 ft. the pressure transmitted to the buried structure was 52 per cent of the weight and remained constant for all depths exceeding 4 ft. This fact was taken as lending color to the theory that in *embankments* all the weight directly over a buried structure should be counted. The experiments indicated that the condition of the sides of the trench was a negligible factor.—Editors.)

The Cost of Filtering Water.

Sirs: Can you advise the writer where he can learn what it costs to filter water per million gallons? Also the total cost per million gallons for furnishing filtered water to cities of about 15,000 inhabitants.

Yours truly,
THOS. O. POPE.

Massillon, O., Feb. 7, 1910.

(The cost for furnishing water is not far from $100 per million gallons and the cost of filtering is less than $10 per million gallons, including capital charges. Counting 100 gals. per capita per day the city of 15,000 inhabitants will require 1,500,000 gals. in 24 hours.

In ENGINEERING-CONTRACTING, June 2, 1909, information was given for five slow sand plants from which the following data are taken. Ashland, Wis., daily capacity 1,000,000 gals., the cost for filtering was $2.26 and capital charges were $5.05, making the total cost for filtering $7.31 per million gallons. The cost of the plant was $40,178.

The Berwyn, Pa., plant with a capacity of 1,500,000 gallons per day cost $18,535.59. The cost of operation is not given. The Uyack, N. Y., plant with a daily capacity of 630,000 gals. cost $29,094; cost of operation not given. The Superior, Wis., plant with a daily capacity of 5,000,000 gals., cost $89,485. The cost per million dollars for cleaning sand was $1.48 per million gallons. The cost of a plant treating 70,000,000 gals. per day (slow sand filter) was $3,356,300. The cost of operation is about $2 and with capital charges added is a total of about $9 per million gallons. Mr. J. A. Vogleson gave the following costs for cleaning filter sand per million gallons. Washington, D. C., (1906), $0.60; Albany, N. Y., (1899-1901) $1.66; Belmont, (Philadelphia) Pa., (1905) $1.25; Upper Roxboro (Philadelphia) Pa., (1905) $0.63.

In ENGINEERING-CONTRACTING for July 7, 1909, the following data are given, with references to sources of information: Albany, N. Y., slow sand plant cost for 12,500,000 gals. per day, 1899, $1.67 per million gallons, exclusive of capital charges, the sand cleaning alone being $1.19 per million gallons. During 1899 the cost at Lawrence, Mass., was given at $8.19 per million gallons. During 1900 the cost at Mt. Vernon, N. Y., including interest on plant, $5.51 per million gallons. Cost of scraping sand at Poughkeepsie, N. Y., during 1900, $1.30, and cost of snow and ice removal, $0.48 per million gallons. The estimated operating cost (1899)) for a plant for Cincinnati, Ohio, was $9.96 per million gallons. This plant is now in operation.

In ENGINEERING-CONTRACTING, Nov. 24, 1909, there was an account of the Philadelphia, Pa., filters from which the following operating costs, exclusive of capital charges, are taken. Lower Roxborough, daily average 9,701,700 gals., $5.21 per million gallons; Upper Roxborough, daily average, 13,106,700 gals., $4.46 per million gallons; Belmont, daily average 36,211,400 gals., $3.30 per million gal-

lons; Torresdale, daily average 63,000,000 gals., $2.80 per million gallons.

In ENGINEERING-CONTRACTING Dec. 22, 1910, in an article on the Washington, D. C., filter plant it was stated that it cost $3.66 per million gallons, the daily average being over 61,000,000 gallons.

Slow sand filters, sometimes called the English method of filtration, are filters of large area through which the water trickles slowly with little or no head. Suspended matters slowly collect on the surface and organic matters collect so that bacteria develop and the purification of the water is partly biological. From time to time the surface clogs and must be cleaned, this cleaning being the principal operating expense. Mechanical filters are essentially sand washing machines. They cover much less area than slow sand filters and are generally all under roof. Water stands over the beds with depth sufficient to give a head that forces water through the sand many times faster than through slow sand filters, therefore this method is now generally termed rapid sand filtration. The action is entirely one of straining and to do the work of the mat that slowly forms on the slow sand beds, it is necessary to use coagulants. These coagulants are added to the water in a preliminary settling basin to collect the suspended matter and bacteria, the sand beds completing the work of clearing the water. While rapid sand filters properly operated are efficient in removing bacteria, there is no biological action. The sand beds are washed by reversing the flow of water, thus forcing filtered water back through the sand and carrying off mud, etc., caught on the top. About 5 per cent of the filtered water is used for washing.

The operating costs of rapid sand filters are higher than with slow sand filters, due to the cost of the coagulants and wash water. The capital charges are less because of the smaller amount of land covered and the smaller amount of sand used in the beds. The difference is in favor of the rapid sand filters. As the city grows and land increases in value, extensions to the rapid sand filtration plant are more cheaply made as compared with the slow sand filtration plant. In the slow sand filter bacteria and organic matter are removed and oxidized in a more efficient manner than in rapid sand filters. Recent work however done in sterilizing water in rapid sand filters puts them ahead of slow sand filters as efficient removers of harmful bacteria.—Editors.)

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Institute of Mining Engineers.
March 1-5. Annual meeting at Pittsburg, Pa. Secy., R. W. Raymond, 29 West 39th St., New York City.

American Railway Engineering and Maintenance of Way Association.
March 15-17, 1910. Annual convention at Chicago, Ill. Secy., E. H. Fritch, 962 Monadnock Block, Chicago, Ill.

American Society of Engineering Contractors.
Feb. 24-26, 1910. Annual convention at Chicago, Ill. Secy., Daniel J. Hauer, Park Row Building, New York, N. Y.

American Water Works Association.—April 26-30, 1910. Annual convention at New Orleans, La. Headquarters, Gruenwald Hotel. Secy., J. M. Diven, Charleston, S. C.

Engineering Society of Wisconsin.
Feb. 23-25. Annual meeting at Milwaukee, Wis. Secy., W. G. Kirchoffer, 31 Vroman Bldg., Madison, Wis.

Illinois Association of Municipal Contractors.
Feb. 24-26. Annual meeting at Chicago, Ill. Secy., Orie T. Dunlap, Edwardsville, Ill.

Iowa Association of Cement Users.
March 9-11, 1910. Annual meeting in Cedar Rapids, Ia. Secy., Ira A. Williams, Iowa State College, Ames, Iowa.

National Association of Cement Users.
Feb. 21-25, 1910. Annual meeting at Chicago, Ill. Secy., Geo. C. Wright. Address all communications to Edw. E. Krause, Asst. to the President, Harrison Bldg., Philadelphia, Pa.

Northwestern Cement Products Association.
Feb. 18-21, 1910. Annual meeting at Chicago, Ill. Chairman of Executive Committee, O. U. Miracle, Minneapolis, Minn.

Personals.

Mr. Frank T. Fowler, member of the Board of Local Improvements of Chicago, Ill., has been appointed temporarily as Superintendent of Streets of that city.

Mr. E. G. Johnson has been appointed assistant engineer of the Vincennes division of the Vandalia line and of the Indianapolis terminals of the Pennsylvania line.

Orville A. Henrie, a contractor of Berwick, Pa., died Feb. 10 in the hospital at Washington, D. C., from injuries sustained in the burning of a hotel in that city.

Mr. J. W. Stone has been appointed Acting Division Engineer of the Philadelphia Division of the Pennsylvania R. R., with office at Harrisburg, Pa., succeeding Mr. G. H. Brown, who has been granted leave of absence.

Mr. Elwood Grissinger, of Buffalo, N. Y., has resigned his position as Superintendent and Electrical Engineer of the Genesee Light & Power Co., of Batavia, N. Y. He will continue as Consulting Engineer for the company.

Mr. T. J. Wyche, heretofore Division Engineer of the Western Pacific Ry., with headquarters at Elko, Nev., has been appointed Chief Engineer with headquarters at San Francisco, Cal., succeeding Mr. Virgil G. Bogue, retired.

Mr. M. H. Wickhorst, of Aurora, Ill., Engineer of Tests of the Chicago, Burlington & Quincy R. R., has been made Chief Steel Chemist, in charge of rail tests, by the American Railway Engineering and Maintenance of Way Association.

Frank Hanigan, a well-known contractor and builder, of Denver, Colo., died suddenly last week at London, England. Mr. Hanigan retired from active business life a short time ago, and at the time of his death was on a vacation trip. He came to Denver in 1876.

Mr. I. M. De Varona, heretofore Chief Engineer of the Department of Water Supply, Gas and Electricity of Manhattan Borough, New York City, has been made Chief Engineer of the reorganized department for the entire city, with jurisdiction in all the boroughs.

Mr. Elwin C. Foster, recently President of the New Orleans Railway & Light Co. and formerly Vice-President and General Manager of the subsidiary companies of the Massachusetts Electric Companies, has become associated with Sanderson & Porter, with offices at 52 William St., New York City.

A. S. Bieber, J. C. Griffin and J. B. Joyce, Civil Engineers in the employ of the Ray Consolidated Copper Co., and R. P. Coleman, W. H. Freeland and W. C. Franz, Mining Engineers of Salt Lake City, Utah, were killed Feb. 6 in the wreck of a motor car on a private railway running from Kelvin, Ariz., to the mines of the Ray Copper Co. The car was wrecked by a blast

Dean F. E. Turneaure of the College of Mechanics and Engineering of the University of Wisconsin gave two addresses before the instructional staff of the College of Engineering of the University of Illinois on February 10 and 11. His subject on the first day was "The Stress in Bridges under the Load of Moving Trains," and on the second day, "Some Features of the Manhattan Suspension Bridge."

Mr. Howard G. Hetzler, who was recently elected President of the Chicago & Western Indiana and the Belt Rys., at Chicago, Ill., began his railroad service as Assistant Civil Engineer for the Chicago, Burlington & Quincy R. R. This was in 1886. From 1891 to 1892 he was Engineer of Maintenance of Way for the Louisville, New Albany & Chicago Ry., and from 1892 to 1898 he was Roadmaster of the Chicago, Burlington & Quincy at Chicago. In 1898 he became Superintendent of Freight Terminals for the Burlington, and later was elected President of the Metropolitan West Side Elevated Ry., of Chicago, a position he has held for the past five years.

Mr. A. W. Grosvenor, until recently Assistant Engineer in connection with the Grand Central Station improvements of the New York Central lines at New York City, has opened an office at 311 Bank Block, Fort Waynes, Ind., where he will engage in a civil engineering practice. Mr. Grosvenor was graduated from the Massachusetts Institute of Technology, at Boston, in 1899, and has since been employed consecutively as Assistant Engineer of Maintenance of Way on the Pennsylvania Lines West of Pittsburg; Assistant Superintendent of Caissons with S. Pearson & Son, Inc., on East River tunnel construction at New York City, and Night Superintendent with the United Engineering & Contracting Co., of New York City.

The Turner Construction Co., 11 Broadway, New York City, has recently reorganized its branch office at Buffalo, N. Y., and has given up its old quarters at the Builders' Exchange Building to occupy its new larger offices at 312 Prudential Building. This organization has put the Buffalo branch office on an independent basis, so that the branch will be able to handle jobs independent of the main office in New York City. Mr. James L. Bruff will continue as Manager of the Buffalo territory; Mr. H. E. Plumer, who has been associated with the Company at its main office during the past four years, will be the Engineer; Mr. Wm. E. Lyle, now acting as Superintendent for the Company on the buildings being erected for the Pierce-Arrow Motor Car Co., will be General Superintendent.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Trident Water Meters.—Paper, 8x10 ins. 62 pp. Neptune Meter Co., New York, N. Y.

This catalogue contains full information about water meters made by this company. All details are illustrated and tables of capacity given.

The Lehigh Valley.—Paper. 5x7½ ins. 48 pp. Blanc Stainless Cement Co., Allentown, Pa.

A beautiful little brochure containing a historical sketch of the Lehigh Valley and illustrated with half-tones of noted buildings.

Rock Drills.—Paper. 3½x6 ins. 30 pp. McKiernan Drill Co., 115 Broadway, New York City.

This is the 1910 catalogue of McKiernan Rock Drills.

The Svenson Mixer.—Paper. 5½x8 ins. Svenson-Schuman Company, Bessemer Building, Pittsburg, Pa.

Describes a continuous delivery, automatic proportioning concrete mixer, that mixes first dry and then wet.

Concrete Machinery.—Paper. 6x9 ins. 40 pp. The McKelvey Machinery Co., Cleveland, O.

Describes McKelvey continuous and batch mixers and illustrates many combinations and installations of the mixers in actual use. Cars and buckets are also shown.

Symons Crushers.—Paper, 6x9 ins., 38 pp. The T. L. Smith Co., Old Colony Bldg., Chicago, Ill.

This catalog shows evidence of preparation by a man who understands how to give information to practical men. Stone crushing plants are illustrated and tables given to show sizes and capacities and horse power required, together with a new table showing percentages of crushed stone which will pass through screens of different sizes.

Pile Driving Machinery.—Paper, 6x9 ins., 32 pp. Union Iron Works, Hoboken, N. J.

A valuable book for contractors illustrating the use of Arnott's Patent Steam Pile Hammers in driving piles, especially sheet piling.

Keays Cable Grip.—Paper, 5x7 ins., 8 pp. Keays Cable Grip Co., 95 Liberty St., New York, N. Y.

Describes a reliable and efficient device for handling industrial cars on the cable haulage system.

Elevator Controllers.—Paper, 5x8 ins., 128 pp. The Cutler-Hamner Mfg. Co., Milwaukee, Wis.

This book describes the newly re-designed line of electric elevator controllers recently placed on the market by this company. It should be of value to structural engineers, mill designers and architects. Full information is given as to sizes, installation and operation.

The Contractor's Pump.—A. A. Parker, Waterford, N. Y.

This circular describes a new style of motor driven diaphragm pump for contractors' use. Mr. Parker is a contractor and the pump was evolved by him to meet his own needs in pumping out excavations. The valves will pass anything large enough to get through a 3-inch suction.

The Freezing of Concrete.—The Carbondale Calcium Co., Carbondale, Pa.

This company sends in several valuable bulletins dealing with the prevention of freezing in concrete by the addition of calcium carbide. Tables are given showing how to proportion water in mixing concrete and how much calcium chloride to use with certain amounts of water.

Chanute Medal Award.—Professor Arthur N. Talbot has been awarded the 1909 Civil Engineering Chanute Medal of the Western Society of Engineers for his paper entitled "Tests of Cast-Iron and Reinforced Concrete Pipes." Three medals on the foundation established by Dr. Octave Chanute are given annually by the Western Society of Engineers for the best paper read the preceding year in the lines, respectively, of Civil Engineering, Mechanical Engineering and Electrical Engineering.

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of Engineering-Contracting—Contract News—Engineering World—The Dirt Mover.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The principal feature on the week in railroad construction work was the awarding of contracts by the Norfolk & Western Ry. for a considerable amount of double track and branch line work in Ohio and West Virginia; the contractors who got in on this work were as follows: D. W. Flickwir, Roanoke, Va.; J. R. Sarpell & Son, Louisville, Ky.; Luck Construction Co., Roanoke, Va.; Carpenter & Boxley, Roanoke, Va.; Moorman Bros., Lynchburg, Va.; Ryan Co., Lexington, N. C.; E. G. Nave Bros. Co., Portsmouth, O., and Sturm & Adams, Columbus, O.—The Callahan Construction Co., Knoxville, Tenn., secured the contract from the Louisville & Nashville R. R., for constructing the Harlan extension on the Wasioto & Black Mountain R. R. in Kentucky. The extension will be about 25 miles long with a yardage of 600,000, mostly rock.—The Cincinnati, Hamilton & Dayton R. R. has awarded the contract for its new dock and freight terminal at Toledo, O., to the Great Lakes Dredge & Dock Co., of Toledo.—Another large contract, which we are unable to confirm at this writing, is said to have been let to F. S. Darling, Toronto, Ont. This contract calls for the construction of the Alberta & Great Waterways Ry. which is to be 350 miles long and will extend from Edmonton, Alberta, to Fort McMurray.—A couple of large stripping contracts in the iron range in Minnesota were awarded during the past week. Winston, Dear & Co. secured one of these calling for the stripping of the Buffalo & Susquehanna iron mine, the work requiring about 6,000,000 cu. yds. of excavation. The other contract was secured by the Roberts-Kingston Co., of Duluth; it calls for stripping the Union mine of the Republic Iron & Steel Co., near Virginia mine. There is about 1,250,000 cu. yds. in this contract.—Matters are shaping up so that it now looks as though the Duluth, Winnipeg & Pacific Ry. (Canadian Northern line) would shortly let the contract for constructing its 75 mile line from Virginia, Minn., to Duluth. H. T. Hazen, 619 Lyceum Bldg., Duluth, Minn., is Chief Engineer.—The city of Chicago is going to take active steps soon for the construction of its long projected subway system. The city has $4,500,000 available to start the work, and recently appointed Bion J. Arnold, Chicago, as Engineer to have charge of the subway construction.—The Big Four (C. C. C. & St. L. Ry.) has announced a considerable amount of new construction work to be done this year, the work including two pieces of second track, a 7½-mile cut-off and a new line for Mt. Carmel, Ill., to Evansville, Ind.

Trunk Line Highways.

One of the most interesting developments of the Good Roads movement has been the agitation for the construction of additional trunk line roads—continuous stretches of improved highway connecting important cities. In the eastern states before the advent of the steam railroad all the important cities were connected by continuous lines of highway, which were, in most cases, about the only really passable roads in the neighborhoods through which they passed. Many of these highways were built by private capital and toll was charged for the teams pasing over them. Perhaps the best example of these old time lines of continuous highway was the National Road which was constructed by the Government under a special act of Congress. As originally planned this road was to extend from the tidewater of the Atlantic ocean to the Ohio River. It was, however, built from Cumberland, Md., to a point in Ohio, several hundred miles from the Ohio River, and there allowed to stop. The road was several hundred miles long, and was 80 ft. wide, 30 ft. of which was macadamized. With the coming of the railroads and the consequent passing of the stage coach many sections of these old highways were neglected and fell into disrepair. The advent of the automobile has brought about a demand for a revival of the old trunk line highways and many eastern states have harkened to the demand. New Jersey has a number of such highways crossing the state, and New Hampshire is now constructing a highway to extend from the lower border of the state up the Connecticut River valley to the White Mountains. At the Massachusetts state line connections will be made with trunk lines from that state. In New York the State Highway Commission has been engaged in locating 38 of these state through routes, and contracts for $2,500,000 worth of work on these will be let shortly.

Water Power Conservation.

The state of New York, which is now spending a large sum in constructing its barge canal and on state highway work, will offer a further field for the contractor if the State Legislature takes favorable action on the recommendations of the Water Supply Commission. The Commission has just recommended an amendment to the constitution permitting an issue of $20,000,000 of state bonds for the building of storage reservoirs with a view of generating electric power and controlling the water flow of the streams of the state. The commission estimates that 1,500,000 H. P. of water energy is running to waste in the state annually and that this energy, if properly controlled, would have a yearly rental value of $15,000,000. The bill which accompany the commission's proposed plan of operation provided for a general and systematic development of the water resources of the state. Under its provisions the initiative for building storage reservoirs may be taken by individuals, associations or corporations subject to the recommendations of the commission and the approval of the governor. All contracts for the acquiring of lands and the construction of reservoirs by the commission must have the governor's approval. It is recommended that the first water storage dam be constructed at Conklinville on the Sacandage River 50 miles north of Albany. This would convert 30 miles of the present river valley into an artificial lake as large as Lake George, the cost being estimated at $4,650,000. The annual fixed charges and maintenance are estimated at $337,700, while the gross earnings of the plant from the sale of electric power would be $427,500, leaving an annual net revenue to the state of $189,000. The Genessee River dam and reservoir at Portage would cost $4,518,000. The commission recommends the construction of other reservoirs by the state for the purpose of regulating the flow of the rivers for power purposes and flood control whenever the owners of the interests which will be benefited by such control shall ask by petition the state water supply commission to build such reservoirs and furnish a sufficient guarantee that such reservoirs when completed will provide a net revenue to the state.

Busting the Trust.

The city of Los Angeles lately advertised for bids to supply the city with approximately 110,000 bbls. of Portland cement. A number of bids were received and the price was $1.85 per bbl. The reading of the prices was monotonously proceeded with and interest in the subject was suddenly awakened by a bid in which no price was fixed; the bidder merely stating that he was prepared to furnish cement at 10 cts. per bbl. lower than any legitimate bidder. Logically this meant $1.75 per bbl., but to the business men of the Council it gave an opportunity to "bust the trust" and do some trading. The trust was busted and the man was so rigidly held to his offer to underbid that he sold the city of Los Angeles all the cement required for $1.35 per bbl. The saving was about $60,000 and may be more by the time all the cement is purchased.

The Southern Pacific is said to be planning to enlarge its yards at Bowie, Cal., by the addition of several miles of siding.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

INDIANA.

The Cleveland, Cincinnati, Chicago & St. Louis Ry. is to undertake the following new construction work this year: A second track from Indianapolis to Anderson on the Indianapolis Division, a second track from Shelby to Greenwich on the Cleveland Division, a 7½-mile cut-off from Middletown to Miamisburg on the Cincinnati Division, and a new line from Mt. Carmel, Ill., to Evansville, Ind.

KENTUCKY.

The Louisville & Nashville R. R. Co., has awarded the Callahan Construction Co., Empire Bldg., Knoxville, Tenn., the contract for what is known as the Harlan Extension of the Wasioto & Black Mountain R. R., commencing from near Pineville, Ky., and extending through Bell and Harlan counties to Harlan, Ky., a distance of 25 miles. The yardage will approximate 600,000 yds., mostly rock, with some good scraper work, and about 10,000 yds. of cut stone and concrete masonry. The material is very fine, being sandstone, shale, earth, etc. Mr. E. R. Keller, general superintendent of the Callahan Construction Co., will be in charge of the work and is now located at Pineville, Ky. The work includes one tunnel about 520 ft. long with small approaches. All good work for contractors with this sort of equipment.

MISSOURI.

Mulvill Brothers, P. O. Box 81, Alton, Ill., have been awarded a contract by the Chicago & Alton R. R. for putting in tracks to the new quarry the railroad intends to operate between Selsa and Independence, Mo., 14 miles from Kansas City. The company has purchased 80 acres which is half a 50 foot ledge. This makes a very desirable quarry location, the rock being of good quality with no stripping on it. About 16,000 ft. of track is to be laid. Mulvill Bros. will sublet the team work, amounting to 7,000 yds. embankment, 4 ft. fill; free transportation for men and outfits.

OHIO.

The Cincinnati, Hamilton & Dayton R. R. has awarded contracts for its dock, ore handling plant and freight terminal at Toledo, O. The Wellman-Seaver-Morgan Co., Cleveland, O., was awarded the contract for the ore handling plant and the Great Lakes Dredge & Dock Co., Toledo, O., was awarded the contract for the dock and dredging. The latter contract includes 300,000 cu. yds. of earth excavation, 22,000 cu. yds. of concrete masonry, 300,000 lin. ft. of piling and dredging 300,000 cu. yds.

The Norfolk & Western R. R. has awarded contracts as follows for second track work and branch line work in Ohio and West Virginia: D. W. Flickwir, Roanoke, Va., 3.2 miles of branch lines work on Indian Creek above Cedar Bluff, including 4,700 ft. tunnel. J. H. Sarpell & Son, Louisville, Ky., three miles of double track, including tunnels, east of Huger, W. Va. The Luck Construction Co., Roanoke, Va., three miles of double track west of Wyoming, W. Va. Carpenter & Boxley, Roanoke, Va., three and a half miles double track west of Wharncliffe, W. Va. Moorman Bros. Co., Lynchburg, Va., three and a half miles double track east of Devon, W. Va. Ryan Co., Lexington, N. C., eleven miles double track in Ohio west of Davis. E. G. Nave Bros. Co., Portsmouth, O., seven miles double track east of Piketon, Ohio. Sturm & Adams, Columbus, O., six miles double track between Renick and Delano, O. A. H. Valz, Staunton, Va., .8 miles Dry Fork Branch Extension.

PENNSYLVANIA.

The Easton & Washington Traction Co. is making arrangements to secure the necessary capital for the construction of its 43-mile line through Hackettstown, Lake Hopatcong, High Bridge, Clinton, Oxford and Belmer. M. P. McLeath, Easton, Pa., has the contract. R. M. Petby, Washington, N. J., is president and W. O. Hay, Easton, Pa., is general manager.

TEXAS.

The Texas Central R. R. has run one preliminary line for its branch from DeLeon to Rising Star and location work is now under way, over 16 miles of the line having been located on Feb. 4. On the proposed Rotan extension one preliminary line of about 100 miles has been run and the chief engineer is now running preliminary on another line several miles south of the first preliminary. The ties and rails have been purchased for the DeLeon branch, but no contracts for earth work or bridge work have been let nor will be until the location is completed and estimates made. Chas. Hamilton, Waco, Tex., is vice president and general manager.

WASHINGTON.

O. F. Leonard, Railroad, Canal and Drainage Contractor, North Yakima, Wash., will sublet 50,000 yds. of wheelbarrow and car work, limit of haul is 2,400 ft., cuts 18 ft. wide, 1 ct. overhaul after 600 ft.

WEST VIRGINIA.

The Buckhannon & Northern R. R. Co. will probably let construction contracts this spring for its projected 32-mile line from the Pennsylvania-West Virginia State Line along the Monongahela River to Riversville, W. Va. Surveys were made in 1907 and are being revised this year. J. T. Blair, Parkersburg, W. Va., is president; S. D. Brady, Parkersburg, is chief engineer, and B. M. Laughead, Morgantown, W. Va., is locating engineer.

Power Developments, Levees, Drainage and Irragation Works.

CALIFORNIA.

The South San Joaquin Irrigation District has been organized under the Wright Law and proposes the irrigation of about 70,000 acres of land. A bond issue of $1,875,000 has been voted and as soon as these bonds are sold the work will be commenced. The district is located in the southern part of San Joaquin County. In connection with the irrigation system, plans have been made for a drainage system to control the underground water level. Edwin Duryea, 1314 Humboldt Bank Bldg., San Francisco, Cal., is Chief Engineer of the district.

The Stockton Chamber of Commerce, J. M. Eddy, Secretary, Stockton, Cal., has launched a project for the construction of a reservoir in the foothills to control the freshets of the Calaveras River. The undertaking is still in its infancy, although an organization is contemplated to promote such a construction in behalf of the public welfare, and it is probable that an incorporation will be formed to secure the rights and promote the financing of it with a view of turning it over either to the county, the city of Stockton, or to a district to be formed for the purpose. At the present time, no steps have been taken farther than filing on the water, investigating the capacity of the dam, consulting with engineers regarding its feasibility, and taking steps to secure the dam site and the acreage covered by the reservoir.

IDAHO.

The Portland Wood Pipe Co., Portland, Ore., has been awarded the contract for furnishing the material and construction of 25,500 ft. of 42-in. continuous stave pipe for the irrigation system at Port Falls, Idaho, mentioned in these columns in our Jan. 12 issue. The line will require approximately 640,000 ft. of lumber milled into staves, approximately 365,000 lb. of mild steel bands of ½-in. and ⅝-in. diameter, and about 40,000 lb. of malleable cast iron shoes. Construction work will begin about the middle of March.

LOUISIANA.

Damerin & White, Hennen Bldg., New Orleans, La., have been awarded the contract for constructing David's Ferry South Levee No. 2 for the Red River and Bayou des Glaises Levee and Drainage District. The work includes the placing of about 350,000 cu. yds. of material and the contract price is 25 cts. per cubic yard. Bids were opened Feb. 1.

NEW YORK.

David Peoples, Betz Bldg., Philadelphia, Pa., has been awarded the contract for constructing seven steel pipe siphons, and adjoining portions of the Catskill Aqueduct for the Board of Water Supply of New York City. Bids for the work were opened Jan. 18, and the contract price was $1,189,500. The contract includes 30,000 cu. yds. removal of rock, 90,000 cu. yds. earth excavation, 20,000 cu. yds. rock excavation, 140,000 cu. yds. refill and embankment, 43,400 cu. yds. concrete, etc.

OREGON.

The Oregon Valley Land Co., with general offices at 101 Massachusetts Bldg., Kansas City, Mo., and field office at Lakeview, Ore., is building an irrigation system in the vicinity of Lakeview at an estimated cost of $750,000, of which it has spent to date about $280,000. Last July, the company let a contract to the Hall Construction Co., of Los Angeles, Cal., for construction of one of its main canals, requiring the excavation of about 600,000 cu. yds. of material, of which 50 per cent was loose rock and 15 per cent was solid rock. This contract has now been completed and another contract has been let to the same party for one other main canal, amounting to about 500,000 cu. yds., which they will complete by next July. The Orchard Valley Land Co. will let to contract not later than next April 1st the following: A loose rock dam, 62 ft. high and 600 ft. long on top, and containing the following approximate quantities:

Loose rock fill, 40,000 cu. yds.
Hand-laid dry wall, 15,000 cu. yds.
Wasteway (Exc.), 15,000 cu. yds.
Masonry, 2,000 cu. yds.
Lumber in facing, 150,000 ft. B. M.

The company has already built an outlet tunnel and stripped the foundation to bed rock. The sluice-gates were made by the Coffin Valve Co., Boston, and are on the ground ready for erection. An additional contract will be let for about 3½ miles of flume, about half of which is on bench and remainder on trestle, with bents up to 30 feet high, although the average height is about 18 ft. This will require about 2,500,000 ft. B. M. of lumber and one or more cars of ⅝ bolts. About ⅔ of the lumber to be used is within a mile of a saw-mill operated by the company. The company will also have somewhere in the neighborhood of 500 miles of laterals of different dimensions to let next summer.

The Orchard Valley concern has under consideration at the present the following: One earth dam, 80 ft. high and 1,000 ft. on top, approximating 200,000 cu. yds., 20 miles of canals beside laterals, all within 15 miles of Lakeview. One earth and loose rock dam about 60 ft. high and approximating 100,000 cu. yds., and 50 miles of canals, beside laterals, all within 30 miles of Lakeview. Only preliminary work has been done on these so far and plans are not yet completed. G. W. Rice, Lakeview, Ore., is Chief Engineer in charge of the work.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city council of Bessemer has granted a franchise to the Birmingham Light & Power Co. to construct tracks and operate lines on Second Ave., 18th St., First Ave., 20th St. and Fourth Ave.

The Atlanta & St. Andrews Bay R. R. recently completed from Dotham, Ala., to St. Andrews Bay, now proposes to extend the line to Opelika, Ala., a distance of 90 miles, crossing the Seaboard from Montgomery to Cordele, the Central of Georgia from Montgomery to Eufaula. B. W. Teele, Dothan, Ala., is general manager and chief engineer.

Advices from Mobile state that the Mississippi Central, the New Orleans & Great Northern and the New Orleans, Mobile & Chicago, formerly the Mobile, Jackson & Kansas City Ry., are to be merged, the object being the establishment of a new trunk line between Chicago and the gulf coast with New Orleans as the southern terminal. The plan provides for the New Orleans, Mobile & Chicago R. R., W. F. Owen, general manager, Mobile, Ala., to extend its tracks from Middletown, Tenn., to Cairo, Ill., 180 miles. This will be the northern link of the new route. Later on it will extend into Chicago. Meanwhile traffic arrangements will take the line into the lake city. The southern link necessary to complete the trunk system will be built between Columbia, Miss., and Hattiesburg. This is only 27 miles.

The Louisville & Nashville R. R. has completed plans and specifications for its new shops to be erected at Boyles, a few miles north of Birmingham. About $650,000 will be spent on the shops and an additional sum for side tracks. Contracts are to be let at once. The work is in charge of T. Q. Harrison, division engineer, Birmingham.

Citizens of Anniston, Ala., are taking active steps to secure the construction of the branch line of the Seaboard Air Line Ry. to that city from Jacksonville. Surveys for the line have already been made. W. L. Seddon, Portsmouth, Va., is chief engineer of the company.

The Hodges-Downey Construction Co. of Birmingham, has been organized with a capital stock of $100,000 fully paid, and will engage in a general construction business for railways, canals, public and private highways. Officers are: James Downey, president and general manager; H. C. Hodges, vice president; J. C. Hodges, secretary and treasurer.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Ground has been broken at a point three miles south of Rogers, Ark., for an extension of the Arkansas, Oklahoma & Western R. R. to Bald Knob, a distance of 172 miles east. M. Hays, Rogers, Ark., is chief engineer.

Citizens of Cotton Plant, Ark., are taking steps toward securing the construction of a railroad from that place to the Caché River.

The Fort Smith & Interurban Ry. Co., has been chartered with a capital stock of $100,000, and headquarters in the Cotton Exchange Bldg., Fort Smith, Ark. The projected route is from a point in the northern part of Fort Smith in a northeasterly direction to a point beyond the city limits where a spur will be built toward the proposed free bridge. The main line will turn southeasterly and running near the Arkansas River will enter Mazzard Prairie about half way between McNally hill and Little Mazzard Creek, and will extend across the prairie, dividing the section lying between the Fort Smith suburban and the Arkansas Central lines, crossing Fort Towson, or Texas road, and coming into Wheeler Ave. near the southern limits of the city, where another Y will be made and the line extended to Bonanza, Jenny Lind and Greenwood. George Sengel is President and Jerome Sengel is Secretary.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Harbor Improvement Co., T. J. Hampton, president, Santa Monica, proposes the construction of breakwaters and wharves and has obtained options on water front land. The plans of the company call for the construction of a sea wall, completely protecting three long wharves, which will be able to accommodate the largest ships afloat.

The Redlands & Yucaipa Land Co. of Redlands is considering abandoning its plan to build an electric line connecting the valley with Redlands, and may turn over the right-of-way, surveys and work already completed to E. H. Huntington, who is said to contemplate the extension of the Redlands Central line on Citrus Ave. through Sand Canyon to the valley. Engineers of the company are said to have completed a survey and prepared a report for the directors and an early decision is expected. The line would be about ten miles in length and of this one mile has been constructed and material is at hand for more.

One of the heaviest pieces of railroad construction work now under way in California is the Rocklin-Colfax cut-off on the Southern Pacific Ry. Work on this cut-off was started last March and will probably be two years before it is completed. Erickson & Peterson, 841 Monadnock Bldg., San Francisco, the contractors for the work, have had 3,000 men at work on the Rocklin cut-off, extending from Rocklin to Clipper Gap, along the line of the old Central Pacific, in reconstructing a part of the old roadbed and double tracking others a distance of 20 miles. In the distance named the contractors are cutting eight tunnels, having an aggregate length of almost 10,000 ft., one of the heaviest and longest of these being through Clipper Gap mountain. The contractors have on the ground, distributed along the line of work, 14 steam shovels, 30 locomotives, 600 head of stock, 14 construction camps and all the equipment necessary to a railroad contract of this nature.

The Del Norte Southern Ry., financed by Hobbs, Wall & Co., of San Francisco, and operating in Del Norte county, will be extended southward about eight miles this summer. This line will eventually connect with the Southern Pacific chain of roads in Humboldt County.

The Central California Traction Co. has secured water front land at X St. in Sacramento and will soon start work there on its water front terminal. The line is now under construction between Sacramento and Stockton.

The formation of a new river protection district comprising the territory lying between Olive and the Newbert protection districts is proposed and a committee made up of J. A. Knapp of Anaheim and C. S. Holt and W. W. Mills of Garden Grove have asked the board of supervisors to indorse the scheme.

The Southern Pacific has surveys under way in Colusa county on the new cut-off which is intended to shorten running time between San Francisco and Portland. The cut-off will be constructed between Colusa and Rumsey and will give the Southern Pacific a shorter route by way of Elmira, Rumsey and Colusa Junction.

The commissioners of the Northwest Long Beach Stormwater District of Long Beach have recommended to the county supervisors that the district be extended to include 2,000 more acres. It is urged that the proposed dredging of the channel through the district as far north as the Los Cerritos trestle would benefit this other property. The district now includes 4,000 acres.

Agents supposed to be representing the Mojave River Power Co. are now working in the Mojave River district securing options on lands and water rights. The Mojave River Power Co. is composed of wealthy San Francisco and Oakland men, who have taken over the Westwater power and water interests, including the Victorville reservoir site. It is said that within 90 days this syndicate will commence the construction of the reservoir at Victor Narrows, and that the power will be used at Los Angeles.

It is reported here in Sacramento that as soon as the Northern Electric R. R. secures the permission of Sacramento and Yolo counties and the government to erect a bridge across the Sacramento River from Sacramento the extension of the line to Woodland will be undertaken.

The Butte & Tehoma Power Co. has had preliminary work started on its proposed power plant on Mill Creek, 14 miles south of Lyonsville.

The Sevier Light, Power & Milling Co. of Salina, has acquired the property of the Salina Mill & Power Co. and will spend $50,000 for improvements. A power plant will be erected on Rattlesnake site in Salmon canyon. This will furnish light for the Gunnison and Sevier valleys, and also power to the present roller mill and also to a gypsum mill of 400 tons capacity, which it is proposed to erect. The new company is capitalized at $100,000.

The San Diego, El Cajon & Escondido Ry. Co., recently organized to construct 60 miles of railway into the interior of San Diego county, has applied to the Board of Harbor Commissioners for a franchise to construct a wharf and pier at the foot of E St. in San Diego, Cal.

Engineers of the Atchison, Topeka & Santa Fe Coast Lines are making preliminary surveys for the proposed branch line from Mentone in the Yucaipa Valley, above Redlands, Cal. H. C. Phillips, Los Angeles, Cal., is chief engineer of the company.

The Central Mission and Hayes Valley Improvement Club are to take action in the interest of the franchise for the cross-town street car line on Gough St., Mission, Cal.

Citizens of Lockeford, Cal., have turned down the proposition of the Central California Traction Co. to construct a branch line from either Norton Station or Lodi and assert that right-of-way and other inducements will be offered only to a company who will construct a direct line from Lockeford to Stockton, Cal.

Peter Hoare, Hayward, has been awarded the contract for constructing the loop line of the Southern Pacific Co. in Oakland. The company has commenced the demolition of 16 houses on its right of way through Melrose to Elmhurst.

The Northern Electric Ry. Co., which operates a line between Sacramento, Marysville, Oroville and Chico, has secured rights of way across Los Molinos colony, twelve miles below Red Bluff. The right of way was granted free on condition that the railroad be extended from Chico to Los Molinos before the end of 1910, and on to Red Bluff before the close of 1911. Other necessary rights of way have nearly all been secured. The deeds just filed cover twelve miles of the distance between Chico and Red Bluff. The company will also soon build from Yuba City through Meridian and Colusa to Hamilton City.

The matter of constructing an electric street railway from Corte Madera through Ross Valley towns and San Rafael to McNears Point is under consideration. John Foge, San Rafael, is interested.

The Golden Gate Valley Improvement Association of San Francisco, has petitioned the Supervisors to offer either the United Rail-

Over 40 years building Contractors' Tents, Tarpaulins and Canvas Goods of Every Kind

MORRISON TENT & AWNING CO., 115-117 OLIVE STREET ST. LOUIS, MO.

roads or the Presidio and Ferries Railroad a franchise for a car line on Chestnut or Greenwich Sts.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Incline Ry. Co. of Colorado Springs has secured all the right of way for its projected incline railway up the slope of Mt. Manitou.

The Arizona & Colorado R. R., a Southern Pacific line, is planning to have work started shortly on its projected branch toward Globe, Ariz., via Lordsburg, N. Mex. Incorporation papers have been prepared in Santa Fe, N. Mex., for the Arizona-Colorado Railroad Co., with capitalization of $4,000,000, to build a branch line of the Southern Pacific from Lordsburg through western New Mexico, to Durango. L. H. Lord, Tuscon, Ariz., is assistant chief engineer, Arizona & Colorado R. R.

The Greeley Construction Co., Greeley, has been awarded the contract for building the McGraw reservoir for the Greeley-Pondee District. The work amounts to about $100,000.

The Plateau Valley R. R., recently incorporated by Patsey McCaffrey, L. T. Stewart, T. H. Brown, Morgan Hall and John Carlisle of De Beque, Colo., and the Plateau Valley, is reported to have secured the necessary capital for the construction of its proposed steam railroad to the Plateau Valley. Surveys for this road were made in 1906.

It is believed here in Denver that construction work will be started early this spring on the Arizona & Colorado Ry. It is said that a construction company is to be incorporated shortly under the laws of New Mexico witn a capital stock of $4,000,000 to have charge of the construction of the road. The new line, which is a Southern Pacific project, will start at a point near Clifton, Ariz., cross over into New Mexico and go almost directly north. It will cross the Navajo Indian reservation for almost its entire width and follow the Rio Chaco up to Fruitland, a point a few miles west of Farmington, N. Mex. It will then turn east to Farmington. An extension will then be continued north up the La Plata River to Hesperus, Col., or some point in that vicinity. If trackage agreements are not made with the Denver & Rio Grande the road will build up the Las Animas direct into Durango. The new line will cost approximately $4,000,000, and will be built under the direction of Epes Randolph, President, Tucson, Ariz. Wm. Hood, San Francisco, Cal., is Chief Engineer.

The Toll Gate Reservoir & Irrigation Co. of Denver, has been incorporated with a capital stock of $100,000, the incorporators being A. D. Annis, A. J. Simonson, and Arthur Ponsford.

The city council of Fort Morgan has passed the ordinance vacating the streets and alleys crossed by the new Union Pacific right of way through the heart of the city and also granting it 30 ft. along Railroad Ave.

The Denver, Laramie & Northwestern R. R. Co. has filed its charter in Wyoming and will, it is reported, take over the holdings of the Denver, Laramie & Northwestern Ry. It is said the company is planning extensive developments in Wyoming with 200 miles of construction work promised for this summer. E. A. Buck, 511 E. & C. Bldg., Denver, Colo., is chief engineer.

Work has been resumed on the Nederland dam of the Central Colorado Power Co., near Boulder. About 50 men were sent to the camp on Feb. 1 to put the concrete mixing plant in shape to resume construction of the dam, which will be 186 ft. high, of solid concrete and has been completed to a height of about 100 ft. The company expects to commence storing flood waters in the reservoir next spring, and will push the dam, expecting to have the plant ready to deliver energy by July 1.

Advices from Salida state that the O. K. Mining & Developing Co. has commenced work on its 3,000-ft. tunnel through the Big Four mountain, in the Cleora district. The tunnel will be called the Big Four.

The stockholders of the DeWesse-Dye Ditch & Reservoir Co. at a meeting at Canon City accepted a proposition allowing the Colorado Southern Irrigation Co. to construct a dam in Grape Creek canon in Custer county, for the conservation of the flood waters. The dam which the latter company proposes to build will be nearly 200 ft. high, and will cost $500,000.

Work has already been commenced upon the Little Dry Creek reservoir between Platteville and Fort Lupton by Charles C. Woodward, Prairie City, Ia. The estimated cost of the improvement is $25,000. Mr. Woodward is also interested in the J. S. ditch and reservoir in that vicinity, which is estimated to cost $14,000.

The Big Dry Creek Ditch & Reservoir Co. of Brighton, Colo., has secured a renewal of its charter. Daniel Brown is president of the company.

It is reported that all surveys have been completed and other preliminary matters arranged for the immediate construction of a new railroad from Delta through the Surface Creek valley to Cedaredge, Colo. The line which will eventually extend south to Montrose and into the Paradox Valley is promoted by a number of capitalists of northern Colorado. The Delta County Business Men's Association, Delta, Colo., is interested in the project.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

B. G. Jayne, New York City, has filed maps in the U. S. land office at Boise, Idaho, for a large dam and reservoir on Snake river in the vicinity of Hall's fruit ranch, 20 miles south of Mountainhome. It is proposed to develop power and to irrigate about 200,000 acres of land lying between Snake river on the south, the Oregan Short Line road on the north, Medbury segregation on the east, to Sunnyside segregation on the west.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

It now looks as though active steps would be taken soon to have work started on a subway system for Chicago. Bion J. Arnold, Chicago, chairman of the board of supervising engineers, has been appointed engineer in charge of the subway work, and it is said that he will begin at once to organize a force and prepare plans for the work. The city has a fund of about $4,500,000 received from the traction companies as compensation, which is available for subway construction. The traction companies are also required to advance $5,000,000 for subway construction under the terms of their franchises.

The Decatur Southern Traction Co. of Decatur, has been incorporated and proposes to construct a line from Decatur to Pana. The capital stock is $25,000, and the incorporators are George H. Winsor, James Aldrich, Smith and Joseph Nordenchild of New York; J. J. Pierpont of Pana; B. J. Wilson of Denver, Colo.; Harry M. Snape of Springfield, Ill., and H. C. Simons of Virden, Ill. This is the same company which took out incorporation papers a few weeks ago. Arrangements for building the road are now practically complete, and it is planned to begin work within 60 or 90 days.

A franchise has been granted to the Springfield & Jacksonville Electric Ry. Co. to construct a line through Morgan county. This completes the necessary rights that the company needs and work will commence at once to further the road, of which two miles has already been built out of Springfield. It is proposed to complete the road by July 1, and work is now under way at both ends.

Surveys are now under way in Christian county for an interurban line which is projected from Springfield to Cairo through the western part of the county. The proposed line is an extension from the Springfield, Rochester & Pawnee interurban road which is already constructed from Springfield to Rochester and is in operation. The route, according to the chief promoter, John E. Melick, will be from Rochester southeast and from Morrisonville to Hillsboro, Greenville, Pinkneyville, Carlyle, Nashville, Murphysboro, Jonesboro and on to Cairo.

The Illinois Light & Power Co. has spent about $85,000 on preliminary work on its proposed power development on the Kankakee River, 14 miles below Kankakee. The dam is to furnish power and light for Kankakee, Wilmington, Joliet and other cities in this section, and in addition the company is to build and operate an electric traction line between Kankakee, Wilmington and Joliet. Franchises are now being asked in Kankakee by Arthur N. Powers, one of the promoters.

The Tri-Cities & Northeastern Ry. is negotiating with the Village Board of Watertown for a right of way through that place. J. W. Simonson, Port Byron, Ill., is president.

The Peoria Terminal Ry. Co., E. A. Burrell, general manager, Peoria, will begin work this spring on laying a considerable amount of new track for its terminal system.

The Rock Island Southern Ry., J. W. Walsh, president, is to apply to the city council of Rock Island for permission to lay a single track along the river front from Fourth Ave. and First St. to the 20th St. depot, which is to be terminal of the steam and electric trains of the new road.

Promoters of the proposed Sterling & Northern R. R. Co., are preparing to incorporate the company with a capital stock of $300,000, and headquarters at Sterling, Ill. The line as projected by the organization will connect Sterling, Savanna and probably Freeport, Ill. William Usborne, Sterling, Ill., T. A. Gault and G. M. Weed are interested.

The directors of the Illinois Traction System are considering the improvement and extension of the present system during 1910. H. E. Chubbuck, Peoria, Ill., is General Manager of the company.

Right of way has all been secured for the proposed line of the Bloomington, Pontiac & Joliet Ry. Company's line from Joliet to Chicago, and steps are being taken to obtain right of way south of Pontiac. H. A. Fisher, Joliet, Ill., is interested in the company.

The River Front Committee of the East St. Louis City Council are to at once decide upon the best site for a public wharf and how much of the river front will be necessary. William O'Malley is Chairman of the Committee.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Northern Indiana Ry. Co. has taken over the property of the Southern Michigan Ry. and will hereafter operate that road. The construction of a line from St. Joseph to a connection with the Michigan electric line may be considered. Samuel Murdock, Lafayette, Ind., is secretary.

The Evansville & Terre Haute Ry. Co., is to soon construct coal docks 1,000 ft. in length on its property along the river below Pigeon Creek.

W. E. Moser, Logansport, Ind., who was connected with the Logansport, Frankfort & Indianapolis Ry., sometime ago, has organized a new company and will start on preliminaries at once for the construction of a line from Logansport to Franfort.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Davenport-Muscatine Ry. Co. has filed its articles of incorporation with the county clerk at Davenport. The company has a capital stock of $100,000 and will have its headquarters at Muscatine. It was organized for the building and maintenance of an interurban railroad between Davenport and Muscatine, the same to be constructed in the event a concession extending the franchises at present held by the Davenport railway and lighting companies is granted by the city. J. F. Porter is president and H. E. Weeks is secretary.

At a recent meeting at Creston of the stockholders of the proposed Des Moines, Winterset & Creston R. R. reports were made showing that stock to the amount of $62,450 had been disposed of. About $75,000 more of stock is to be sold and arrangements for this end are being made. Work is to be started when this final block of stock is sold. R. Brown, Creston, is president.

The Commercial Association of Columbus Junction is to have surveys made to decide on the possibility of constructing a power dam across the Cedar River above Columbus Junction.

The Dubuque Boat & Boiler Works, of Dubuque, is building a dredge boat for the C. B. & Q. Ry. It will be used between St. Paul and Savanna, and will be 120 ft. x 30 ft. x 5 ft. with an 18-in. pump.

The Atlantic North & Southern R. R. has secured $411,000 of the $512,000 required to build its 38-mile extension from Atlanta to Villisca. Rottenborg, Ross and Judd, Atlantic, Ia., are the owners of the road.

J. V. Wellsford, of Dubuque, will shortly make a proposition to the Dubuque Industrial Corporation for the construction of an interurban line from Dubuque to Clinton by way of Maquoketa. The syndicate which Mr. Wellsford represents, is said to be willing to construct and equip the road ready for use if Dubuque will secure the necessary franchise, the right of way and will construct the terminals.

The construction of an interurban line through Harrison County is proposed. The route under consideration is between Council Bluffs via Beebeetown, Logan, Magnolia, Little Sioux and Sioux City, connecting with an eastern line at Logan. M. H. Miller, Des Moines, is reported to be interested.

It is announced at San Angelo that construction work on the Colorado & Concho was to commence about Feb. 15. It is reported that the contracts were mostly let to people living in Colorado City, and who will begin the construction on that end of the line. It is believed that the grade will be completed within eight months.

Surveys are to be resumed in the spring for the projected line of the South Dakota Interurban Ry. Co., west from Sioux City to Bijou Hills, S. Dak. It will require one month's work to complete the surveys. W. E. Miller, Bijou Hills, S. Dak., is President.

The Chicago, Burlington & Quincy R. R., G. A. Laubenfels, District Engineer, Burlington, Ia., has ordered out twenty construction gangs on the Creston Division. One of the first pieces of work to be begun will be the double tracking between Red Oak and Balfour, which is the only stretch of the line between Chicago and Pacific Junction that is not already double tracked. New bridges also are being contemplated.

C. A. McGee, Parkston, S. Dak., and Pittsburg, Pa., has presented a proposition to Centerville for the construction of an electric line through that city with terminals at Sioux Falls and Sioux City, Ia., passing through Elk Point, Beeville and Worthing. Work he says, will be started about March 1. The estimated cost of the project is $600,000, the line costing about $15,000 per mile.

Preliminary arrangements are being made for the extensive improvement of the Chicago, Rock Island & Pacific yards at Muscatine, Ia. Ties and other material have already arrived for the purpose.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

It is believed here in Kansas City that the Chicago, Rock Island & Pacific Ry. will soon change its attitude regarding the Kaw River improvements and that the Kaw Valley Drainage Board will be enabled to go ahead with its extensive plans for drainage work. William H. Daniels, Kansas City, Kan., is chairman of the Kaw Valley Drainage Board.

D. H. Siggins, Coffeyville, Kan., is considering a proposition from the Commercial Club of Chanute, for extending the electric interurban which he is operating in Montgomery county to Chanute.

An irrigation project is proposed for southwest Kansas and John W. Baughman, Liberal, Kan., has filed notices appropriating water from the Cimarron River in southeast Grant county. It is proposed to irrigate about 40,000 acres of land. A dam is to be constructed at the intersection of the north and south forks of the Cimarron in southeast Grand county. W. E. Adams, Lewiston, Idaho, was the engineer.

The Illinois Traction System, H. E. Chubbuck, General Manager, Peoria, Ill., which owns the street railway and light plant at Wichita, is planning to construct a new $700,000 power plant in that city, capable of developing 4,000 HP. The Illinois Traction system interests are also said to be considering several interurban propositions in the vicinity of Wichita.

The Wichita, Kinsley, Scott City & Denver Air Line R. R. Co. is taking steps to construct the line from Wichita to Kinsley. The cost of the proposed line will be $15,000 per mile, $2,000 of which the promoters expect to raise by township aid bonds. W. F. Brown, Iuka, Kan., is interested in the project.

The improvements to be made this year by the Missouri Pacific R. R., on its Kansas lines, will cost about $4,000,000. The following is a detailed statement of the expenditures:

Ballast	$ 500,000
Rail (new)	450,000
Flood protection	100,000
Bridge filling	60,000
Bridge strengthening	240,000
Grade reduction	80,000
Sidings, passing, miscellaneous	50,000
Hoisington yard and shops	435,000
Kansas City, Kas., Kaw bridge and tracks	266,000
Kansas City, Kas., rearrangement	40,000
Other terminal yards	100,000
Edgewater connecting railway	20,000
K. C., Kas., passenger station	36,000
Miscellaneous new stations	70,000
Living houses	30,000
Miscellaneous structures (new water tanks, stock pens, scales, etc.)	140,000
1,015,000 new ties (material only)	485,500
New equipment	745,000
Repairs to bridge and structures	124,165
Total	$3,944,665

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Lansing & Northeastern Ry. Co. has been granted a franchise to enter the city of Owosso. The company intends to secure the present Owosso & Corunna electric railway and later extend this to Durand and possibly to enter Flint. To the north a branch will be run to Saginaw and this will give the new road a line parallel with the M. C. branch all the way from the main line to Saginaw. The road will be constructed by the recently incorporated Lansing & Northeastern Construction Co., the principal stockholders of which are T. E. Atwood, Caro, George G. Moore and Kirke Lathrop, Detroit.

An ordinance has been before the city council of Saginaw granting a franchise to the Saginaw Valley Traction Co. to lay tracks in Franklin St., Genesee to Janes, and in Germania Ave., Washington to Franklin.

The Commonwealth Power Co., J. B. Foote, General Superintendent, is planning the erection of a large auxiliary steam power plant at Kalamazoo.

Arthur C. O'Connor and Matthew Flinn, who have large property interests in Hamtramch, a suburb of Detroit, have petitioned the village council for permission to lay about five miles of street car track and also have asked franchises for gas, heating and electric light.

The roadbed of the proposed Coldwater, Marshall & Macinac R. R. Co., which went into the hands of Elbert E. Simmons, Trustee, in 1902, has recently been transferred to the Michigan Trust Co., Grand Rapids, Mich. The deed includes the company's lands from the southern line of Calhoun County through Marshall, Tekonsha, Olivet, Vermontville, Sunfield, Portland, Lyons, Carson City Summer and Elm Hall.

The town of Brighton will vote at an election to be held in March on granting a franchise to the proposed Detroit, Grand Rapids & Lansing Electric Ry.

The Village Council and Township Board of Watervliet have granted a franchise for an electric railroad through that place to Wm. C. Plumb, representative of the Uncle Sam Oil Co., of Kansas City, Mo. He proposes building an electric interurban from Kalamazoo to Benton Harbor.

The Boyne City, Gaylord & Alpena R. R. has secured right of way for its projected extension to Hillman, where a connection will be made with the Detroit & Mackinac.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chicago, Milwaukee & St. Paul Ry. has presented a plan to the City Council of Minneapolis for the elimination of the present grade crossings of its H. & D. Division tracks in the city. The plan proposes the depression of the tracks, the cut starting at the company's yards in south Minneapolis, with the first bridge at Cedar Ave., and continuing for three miles and 2,800 ft. to the present bridge across Hennepin Ave. The work involves a great deal of excavation to a level of 20 feet below the present street grade; the building of 37 concrete bridges, and the double tracking of the new roadbed the entire distance. If the proposition is accepted by the city, the company will start work as soon this spring as possible, and complete the job in two years at a cost estimated at from $1,250,000 to $1,300,000. M. D. Rhame, Minneapolis, is Division Engineer.

Work on the southern part of the Thief River Falls line and the Cuyuna Iron Range line of the Soo is pretty well finished and early next month the headquarters of the engineering crews in charge of the work, will be moved from Aitkin to Bemidji. This will put the engineers in closer touch with the work on the northern section of the Thief River Falls line, which will be the principal scene of operations hereafter. Early this month, steel was laid a few miles north of Lawler Junction in the direction of McGregor; tracklaying, however, has been abandoned until the weather becomes warmer. The grading has been completed to the point where the road crosses the Mississippi river. In the spring the grading will be pushed all along the line between the present extremities of the completed work and this will be completed

CONTRACTORS' TENTS
PLAIN DUCK WATERPROOFED DUCK
Our waterproofing and mildewproofing process is the best known. We do this work ourselves and consequently are in a position to name bottom prices. Our workmanship and materials are not excelled. We offer you QUICK SERVICE. BEST TENTS MADE.
THE COLUMBUS TENT & AWNING COMPANY, Columbus, Ohio

before tracklaying is started. When the crews start laying steel again it is the intention to keep right on until the line is completed.

The Chicago, Milwaukee & St. Paul R. R. is to construct new yards at Bass Lake, 1½ miles west of Lake Isles Boulevard in Minneapolis. As noted elsewhere in this column, the railroad has submitted plans for the depression of tracks for its H. & D. Divisions, and if these plans are approved, the work of making the fill at Bass Lake for the new yards will be carried on simultaneously with the track depression work. The depression work will require about 600,000 cu. yds. of excation and this will be used in the fill. M. D. Rhame, Minneapolis, is Division Engineer.

Duluth and the Ranges.

BY PETER E. MEAGHER.

Winston, Dear & Co., stripping contractors, were awarded a large contract this week to strip the Buffalo & Susquehanna Iron Mine. There are 6,000,000 cu. yds. of material to be excavated in this contract, and it will take about five years to complete the same. They are going to put a large standard gauge outfit on this work, and will start the same immediately.

Johnson, Rodgers & Curtiss is the name of a new contracting company that was formed here recently. The first contract they have taken is for some railroad work on the Soo line, under Foley, Welch & Stewart. They have already started on this work.

C. A. Lewellen, general manager of the Minneapolis branch of the J. I. Case Threshing Machine Co., spent a couple of days here recently. He reported business in his line very good.

C. J. A. Morris of the contracting firm of Shepard & Morris, St. Paul, Minn., was a caller on the writer recently. They have about 60 miles of railroad work on the Great Northern in North Dakota and will start on the same about March first. They have some good team work to let, and any contractors interested by writing them will get any information that they desire.

W. F. King, concrete contractor, was a caller recently. He has several jobs under way at the present time, and is employing about 300 men.

Jerry Mahoney, railroad contractor, came in from his work at Mandan, N. Dak., and paid us a visit this week. He expects to be all cleaned up in a short while, and will then be in the market for work for a 30-team outfit.

Howard Greer, Jr., contractor, from Chicago, was a caller in Duluth a few days ago. I understand he was up here looking over some work.

Martin Cain, railroad contractor, was a caller at this office recently. He is engaged on a logging contract at the present time, but will be in the market for some work just as soon as the season opens.

The Roberts-Kingston Co., contractors of Duluth, were awarded, a few days ago, a contract by the Republic Iron & Steel Co. to strip their Union mine near Virginia, Minn. There is about 1,250,000 cu. yds. in this contract, and they will start on the same about April 1st and rush it to completion as fast as possible.

Andrew Perrin of the contracting firm of Carl Hall & Co., left last week with his family for a trip to Mexico. He expects to be gone for about six weeks.

Dale & Bumgardner, steam shovel contractors on the Soo Line, who shut down their work a short while ago on account of frost, have again started up their operations, and will continue to work until their present contract is completed.

The writer is very glad to report that Greer Thompson, formerly general superintendent for the Drake & Stratton Co., stripping contractors on the Iron Range, near Duluth, has been promoted to the position of general manager for the same company. Mr. Thompson is a very popular man in this vicinity, and has a host of friends. We wish to congratulate Mr. Thompson on securing his new position. J. P. Baines, who was assistant superintendent under Mr. Thompson, has been promoted to Mr. Thompson's old position of general superintendent. Mr. Baines is a very capable man, and is well liked by all who come in contact with him, and this office wishes him success in his new position, which we know he will fill capably.

F. G. Winston, Gardner Stevens and H. C. Hanson of the Winston-Dear Co. were visitors in Duluth last week looking over new work that is contemplated being let in the very near future.

The Canadian Northern Railway Co. have at last ended the controversy that they have been having with the city council of Duluth regarding right-of-way for their railroad into this city. This week the council gave them full authority to come in here over the right-of-way that they had staked out. We understand that this was the only technicality that was holding back the letting of their contract for the extension of their road from Virginia, Minn., to Duluth, a distance of 87 miles. So the probabilities are that this work will be let in the very near future.

F. J. Mann, steam shovel contractor, was a caller in Duluth recently. He has taken a new contract from Foley, Welch & Stewart on the Soo Line, and will put one shovel to work immediately.

J. E. Erickson of the railroad firm of Murphy Brothers & Erickson, contractors on the Soo Line, was a caller at this office. They have about 200 men working at the present time, and just as soon as the weather loosens up a little they will put a larger force of men to work.

The demand for laborers in Duluth at the present time is quite heavy. There seems to be quite a bit of work going on in all different lines, and already we are commencing to feel a slight scarcity of laborers to fill the positions offered. The lumber, woods and saw-mills are employing a great many men, and there is quite a bit of stripping and railroad contracting going on at present, but the real heavy work will not start in until about April 1st, and as it looks now we will then have quite a scarcity of men.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The land owners in the Phelps City Dike and Drainage District will soon issue bonds for raising money to straighten the Nishnabotna River. James F. Gore, Rockport, Mo., is attorney for the district.

The Laclede, Dallas & Western R. R. Co. has been incorporated and proposes to construct a railroad from Phillipsburg, Laclede county, to a point eight miles west of Buffalo, Dallas county. The road is to be 30 miles long. The stockholders are all residents of Kansas City and are as follows: Sam T. McDermott, B. B. Joffee, C. M. Blackman, W. F. Farren and C. W. German.

F. C. Yentsch of Mount Vernon, Mo., is taking steps to organize a company to build an interurban railroad from Springfield to Carthage. The projected route will be from Springfield to Haseltine, Nichols, Halltown, Paris Springs, Mount Vernon, Hoberg, Stotts City and Carthage. The line will be about 60 miles in length. The Springfield Traction Co., of Springfield, is also projecting a line from Springfield to Carthage. Surveys for such a line have been made and according to these the route will be through Billings, Republic, Marionville, Aurora, Verona, Monett, Pierce City, Sarcoxie and in Carthage.

The St. Louis, Iron Mountain & Southern has under way extensive improvements on the main line from Poplar Bluff, Mo., to Little Rock, Ark., the 100-lb. steel which is being used costing alone about $1,300,000. The company is also planning the construction of new shops at Argenta, and an expenditure of about $100,000 for small depots along the line. E. F. Mitchell, St. Louis, Mo., is Engineer of Construction.

Nevada Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Eureka & Palisade R. R., G. D. Abbott, superintendent, Palisade, Nev., is to build a new branch line to the new mining camp of Buckhorn. The branch will leave the main road at a station called Blackburn and will be 17 miles long. It is stated that steel has already been ordered to complete the job, work upon which will be started within the next two months.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Catskill Traction Co., of Catskill, N. Y., has been incorporated with a capital stock of $200,000, the incorporators being F. N. Dubois, J. H. Story and R. F. Story, Catskill, and J. C. Conway, Brooklyn.

The Water Supply Commission in its report to the Legislature recommends an amendment to the Constitution, permitting an issue of $20,000,000 of State bonds for the building of storage reservoirs with a view of generating electric power and controlling the water flow of the streams of the State. The Commission recommends a second Constitutional amendment permitting the flooding of State lands for storage reservoirs. About 50,000 acres of State lands of which but 11,000 acres would be timber land, is needed for this purpose.

C. D. Hodge & Co., Watertown, N. Y., have begun work on their contract for developing 1,400 HP. on the Oswegatchie River, 1½ miles from Gouverneur, for the Oswegatchie Light & Power Co., of Gouverneur. The power house will be 50 feet in length and 30 ft. wide. The plans call for the construction of a concrete and steel frame 70 ft. in length and 40 ft. wide. The contract further calls for its completion by July 1, and includes the excavation of 8,000 cu. yds. of dirt.

According to reports circulating in Speonk, L. I., the Long Island R. R. Co., has secured 10 acres of land for the purpose of constructing an intermediate terminal station at that place. The work will include the construction of a pumping station, round house and sufficient sidings for 100 cars. J. R. Savage, Jamaica, N. Y., is Chief Engineer of the company.

A number of the business men on Madison St., Oneida, N. Y., have held a meeting to take steps toward securing the Oneida Railway Co. to continue its tracks down that street as was contemplated when the franchise was granted. R. B. Ruby is interested.

The Hudson Cos., 30 Church St., New York city, have arranged to sell $5,500,000 of notes,

the proceeds of which will complete the Hudson system of tunnels as originally planned to 33d St. and 6th Ave., New York.

A committee, of which Raymond Smith, Oyster Bay (L. I.), N. Y., is Chairman, has been appointed to take steps to receive the construction of a trolley road to connect Hicksville and Oyster Bay, and which shall then be carried along through Central Park to Farmingdale and there connect with the cross-island trolley at Amityville.

Bids were opened at Albany on Feb. 10 by the State Armory Commission for grading the site and constructing a new rifle range in Blauvelt, Rockland County, to take the place of the Creedmoor range for the National Guard organizations of New York city and vicinity. Martin Murray of Troy, was the low bidder, at $111,121.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

County commissioners at Ravenna have been asked for an extension of time for the franchise granted Thomas Childs, Akron, O., for an electric railroad between Akron and Youngstown. It is said that work on the line will be commenced this summer. The project will cost about $1,000,000.

Surveyors have been at work at Findlay on the proposed electric line that will run from Toledo to Columbus, connecting at Marion with a road already built. The route is from Upper Sandusky to Carey, Fostoria and to Toledo. Frank M. Ohl of Toledo is interested.

The Schoepf syndicate controlling a number of electric railways in Indiana is said to be having maps made by its engineers at Indianapolis, Ind., for building a traction line from Zanesville to Cambridge, and from that place to Wheeling with an ultimate destination at Pittsburg, Pa.

The Ohio Electric Ry. Co. has applied to the city council of Zanesville for a franchise to permit it to extend its line over Linden Ave. from Lee St. to Commission St.

The Skinner Shipbuilding & Drydock Co., of Baltimore, Md., has launched the first of the six lighters it is building for the Breakwater Co. of Cleveland, O. The vessel is 115 ft. long, 34 feet beam and 8½ ft. deep, and is to be fitted with derrick and steam machinery for the lifting of heavy stone to be used in the building of the harbor of safety at Cape May, N. J.

According to a statement, reported to have been made by Dr. L. E. Niles, Springfield, O., the capital has been secured for the construction of the Kentucky North & South R. R. Co.'s 200-mile line in coal territory of Kentucky. Bonds amounting to $12,400,000 have been sold, it is said, and construction work will be started early in the Spring. Edgar Parsons, Springfield, O., is Engineer of the company.

The Minster & Laramie Ry. Co. has been incorporated with a capital stock of $100,000, for the purpose of constructing a trolley line from Loramie to Minster to connect with the Minster branch of the Western Ohio Electric Ry. The incorporators are: F. D. Carpenter, of Lima, Ohio, General Manager of the Western Ohio; John H. Koenig, of St. Marys, President of the Ft. Wayne and Springfield Railway Company; E. L. Herr, and E. C. Riddle and C. C. Collins, of Cleveland. Work will commence on the new road at once.

Contracts aggregating nearly $1,000,000 have been let by the Norfolk & Western Ry., for work on the division between Columbus and Portsmouth, the successful contractors being as follows: Strum & Adams, Columbus, six miles of track between Renick and Delano, O.; the E. G. Nave Brothers' Co., Portsmouth, O.; seven miles double track east of Piketown, O.; the Ryan Co., Lexington, N. C., 11 miles double track in Ohio, west of Davis Station.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

D. P. Siggins of Coffeyville, Kan., and R. S. Litchfield and H. F. Sinclair of Independence, Kan., and others have applied to the city commission of Tulsa for a franchise for an interurban railway system which will connect Bartlesville, Coffeyville, Muskogee, Tulsa, Sapulpa and Okmulgee.

The Chickasha Street Railway Co. of Chickasha has been chartered with $150,000 capital and proposes to build an electric line in Chickasha and into parts of Grady county. The length of the proposed line is six miles, and the estimated cost $100,000. The directors are Charles F. Woodward and W. Raymond Emerson, of Wakefield, Mass.; Lawrence Martin, E. D. Welborn and W. P. Weston, of Chickasha.

The Wichita Falls & Northwestern Ry., Frank Kell, general manager, Wichita Falls, has ordered the steel for the extension from Altus to Hollis, Okla., and that as soon as it arrives active construction work will begin. The Wichita Falls & Northwestern recently purchased the grade and the right of way of the Altus, Roswell & Pacific between Altus and Wellington, Texas. The road is to be constructed at once between Altus and Hollis, but it is not yet certain that it will be built to Wellington.

The Kansas, Lawton & Gulf R. R. Co. has filed an amended charter. The original charter of the road calls for a line from Randlette, in Comanche county, to the northwest line of the state, to Harper county. The amended charter gives a branch line from Randlette northeast to the north line of Osage county. J. M. Bellamy of Lawton is President.

The Wichita Falls & Northwestern Ry. Co., has submitted a proposition to construct a line to Lawton by way of Devol, to the Lawton Chamber of Commerce. Frank Kell, Wichita Falls, Tex., is President of the railroad company.

Work is progressing rapidly on the proposed line of the Clinton, Oklahoma & Western. Twelve miles of track have been laid from Clinton, Okla., to a point within 7 miles of Butler.

The Chamber of Commerce of Magnum, of which T. P. Clay is President, has closed a contract with the American Central Ry. for the construction of the road through Magnum, from or near Miami, Tex., to the Santa Fe, via Vernon, Tex., to San Antonio.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys for the Coos Bay-Boise R. R. are being continued and early this month Engineer F. W. Stevens, who is in charge of one of the survey parties moved his headquarters to Marshfield, after having run the survey from a point midway between that place and Roseburg. The location has been made to Myrtle Point from the summit of the mountain, and the preliminary surveys have been made from Myrtle Point to Marshfield, or a point near here. Thirteen men are at work under Engineer Stevens, and Engineer F. W. Haines has the same number working for him on the Roseburg end of the line. The company has asked at both Coos Bay and Roseburg for a bonus of $150,000 to be paid after a locomotive is run over the finished road from Marshfield to Roseburg.

Land owners in the vicinity of Vale are planning to form a co-operative organization for the purpose of installing an irrigation system. It is proposed to build a large storage reservoir on the Middle Fork of the Malheur River at Warm Springs, near the Harney county line.

The Oregon Railroad & Navigation Co. has secured a strip of land between its right of way and the river, north and east of the depot, at The Dalles, which will be used for double track purposes at its yards in that city.

The Oregon Eastern Ry., a Harriman line, has filed amended surveys at the U. S. Land office at Lakeview. The new survey eliminates a large number of curves in the 12 miles covered by it.

The Northwestern Corporation, A. Welsh, General Manager, Portland, Ore., now operating in Walla Walla and surrounding territory, will enter the Grande valley, touching at all the towns, and penetrate Wallowa county.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Wilkesbarre Ry. Co. has been chartered and proposes to operate a line ten miles long between Wilkesbarre and Pittston. The capital stock is $100,000, and the incorporators are Thomas J. Connelly, Ashley, president; Joseph L. Dunn, E. J. Loughran, Henry de Mun and J. Francis Folz, Wilkesbarre, and Joseph H. Smith and John R. Williams, Edwardsville.

Final surveys have been started by F. E. Barrett, C. E., Pittsburg, Pa., on the projected trolley line of the recently organized Pittsburg, Butler, Slippery Rock & Grove City Ry. Co. The line will be about 20 miles long and will connect Butler and Slippery Rock. The officers of the company are W. C. Thompson, president, Butler, and J. A. Smith, secretary, Butler. Connection will be made with the Pittsburg & Butler and the Pittsburg, Harmony, Butler & New Castle lines at Butler, and with the proposed Slippery Rock & Grove City trolley line, contracts for the construction of which will be let in March. The road will likely go by way of Prospect and West Liberty. With this link constructed Grove City will be connected with Pittsburg by trolley. Plans are also under way for a line from Grove City to Greenville and on to Meadville, where connection will be made with the Meadville-Conneaut Lake lines, making a continuous trolley system between Pittsburg and Buffalo.

The construction of an electric railway from New Castle to New Wilmington and thence north to Mercer and possibly to Greenville and Sharon is proposed. At a recent meeting of the promoters at the office of State Senator Campbell, Sharon, steps were taken to finance the road.

The Schuylkill Valley Traction Co. of Norristown is considering extending its Chestnut Hill line from City Line along the Wissahickon road to the Wheel Pump Hotel on the Bethlehem turnpike, and thus secure a terminus at Chestnut Hill Park.

It looks as though something would be doing soon regarding the double tracking of the Somerset and Columbia branch of the Baltimore & Ohio R. R., in Somerset County, as contractors have been over the line preparatory to submitting bids on the work. A. M. Kinsman, Baltimore, Md., is Chief Engineer.

The Pennsylvania Water & Power Co. has acquired possession of all property of the McCalls Ferry Power Co., and has recorded a mortgage for $12,500,000, the Knickerbocker Trust Co., of New York, being the trustees of the mortgage bonds. With the proceeds received from the sale of bonds, work on the dam will be pushed to speedy completion.

The New Park & Fawn Grove R. R., of Fawn Grove, proposes to extend its line from the latter place to Delta.

Delaware, Lackawanna & Western R. R. has decided to construct a line from its present terminus at Northumberland, Pa., to Winfield on the western side of the Susquehanna River, where it will connect with the Reading Ry., giving the D. L. & W. a direct route to Philadelphia, Pa. The work will include the construction of a steel bridge across the river. G. J. Ray, Hoboken, N. J., is Chief Engineer of the company.

The Western Maryland Ry. is to have a bill introduced in the Maryland Legislature to amend its charter so as to empower the company to sell its unissued treasury stock, amounting to about $26,000,000. It is proposed to use these funds to enable the road to build and equip its proposed extension from Cumberland, Md., to New Haven, Pa., without increasing its indebtedness. It is planned to begin work of construction upon the new branch early in the spring, and it is estimated that the line will be opened for traffic by the middle of 1912. H. R. Pratt, Baltimore, Md., is Chief Engineer.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

At a meeting recently held at Caldwell by parties interested in the Brazos levee an agreement was reached which will settle the injunction which had been issued and allow the work to be begun without unnecessary delay. It was agreed that the levee be extended, the parties whose land was included in the extension agreeing as to the amount they were to pay for the extension.

Citizens of the southern section of Houston are discussing ways and means to have the Houston Electric Co. build an extension to its system to include that portion of the city.

Citizens of Temple have subscribed over $100,000 for the Temple Northwestern Ry. and as soon as the remainder of the bonus is secured W. J. McDaniel, Dallas, will put 75 teams on the grading work.

The Missouri, Kansas & Texas Ry. of Texas will construct a spur switch from the main line of the railway near Fisher, northeast of Dallas, to the site of the new White Rock pumping station at the west end of the dam in White Rock reservoir. The switch will be four or five miles long.

Announcement has been made that the contract for constructing the San Antonio, Rio Grande & Tampico R. R. Co.'s line has been signed and work will begin within the next four weeks. Work will be started in the first 100 mile section, from San Antonio to Tampico, Mexico. Eastern capitalists have financed the road and it will be built under the direction of G. W. Noch, railroad construction engineer, of New York city, who has been staying at the St. Anthony Hotel in San Antonio, Tex. The San Antonio, Rio Grande & Tampico was recently chartered, the incorporators being: J. F. Edwards, St. Louis; A. B. Hedden, Plainfield, N. J.; G. Stuart Simons, New York; H. M. Aubrey and A. L. Mattlock, San Antonio.

The Commercial Club of Seminole is taking steps to secure a railroad to connect with the Rock Island lines at or near Dalhart, in Dallam county.

The War Department has returned the plans for the 13-ft.channel at Corpus Christi, Tex., to the Board of Engineers, and it is expected that the work will be recommended with an appropriation of $225,000.

According to an announcement, reported to have been made by Lee Frisby, Austin, Tex., construction work will be started about September on the proposed line from Beeville, Tex., to the border by way of Oakville and Cotulla.

Articles of incorporation of the Coleman, Brady & Southern R. R. have been signed. The proposed road will run from Coleman to Brady and Llano and will connect with the International & Great Northern at some point in Comal County, Tex.

It is expected that at the February meeting of the stockholders of the St. Louis, Brownsville & Mexico R. R., formal control of that road will be assumed by the St. Louis & San Francisco Ry., and that the offices of the former company will be moved to Houston and merged with the Colorado Southern, New Orleans & Pacific, other companies controlled by the Frisco.

The Denver & Gulf R. R. Co., of Texas, has filed articles of incorporation at Austin, Tex., with a capital stock of $100,000, and headquarters at Texhoma, Tex. The company proposes the construction of a line from Texhoma to the Texas-Oklahoma boundary line. The incorporators are W. A. Evans, H. C. Umstead, James Hicks and F. A. Umsted, Texahoma, Okla.

Board of Trade of Cotulla, Tex., has taken up the proposition regarding the bonus necessary to secure the construction of a railroad from Beeville to Eagle Pass. Work will probably begin at once, it is reported.

Practically all right of way has been secured for the Fort Worth-Cleburne Interurban line, and it is understood that the road will be built this spring.

The Uvalde & Crystal City R. R. now has 41 miles of line in operation and has had surveys made from Crystal City to Carrizo Springs. J. E. Franklin, St. Louis, Mo., is interested.

The final route for the St. Louis & San Francisco extension from Brady to Menardville has been adopted. Most of the grading on the first 17½ miles of line out of Brady has already been completed and contracts are to be let at once for the remainder of the line into Menardville.

Grading into Seymour for the line of the Gulf, Texas & Western R. R. has been completed and the tracklaying gang is only a few miles from the city.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Boyer Bros., railroad contractors of Springville who have been working on the Cedar Creek railroad, which is being built for the Castle Valley Coal Co., have completed their contract and have brought their outfit home.

The Ogden Rapid Transit Co., Joseph Bailey, superintendent, Ogden, is planning to begin the construction of a street railway line down 24th St. from Washington Ave. to Wall Ave., connecting with the 25th and Wall Ave. lines. The work will begin as soon as the spring opens.

The Daly-Judge Mining Co., George W. Lambourne, Manager, Salt Lake City, is still working on the details for the proposed Daly-Judge-Snake Creek tunnel. Bids for the work are said to have been received.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Norfolk Terminal Railway Co. of Norfolk, Va., has been incorporated with a capital stock of $50,000 to $150,000 and proposes to build a railroad on Main St. in Norfolk. The officers of the company are: L. E. Johnson, president, Roanoke; Raymond Du Puy, vice-president, Norfolk; Francis W. Russell, secretary, Norfolk; Caldwell Hardy, treasurer, Norfolk.

Surveys for the extension of the Richmond & Chesapeake Bay Ry., an electric line, have been completed to a point midway between Ashland and Fredericksburg. Wm. Northrop, Richmond, Va., is general manager.

The Virginian Ry., according to reports, is to let contracts shortly for the construction of a branch line between Survey and Sweenyburg, a distance of ten miles.

Maps for a route through Dickens County have been filed with the Circuit Court at Roanoke by the Elkhorn Southern Ry. The route most likely to be selected seems to be down Crane Nest River, passing within two miles of Clintwood, the capital of the county, and through the famous "Breaks," to Elkhorn City, Ky. Other surveys have also been made along McClure and Found rivers, as well as Russell's fork of Big Sandy River.

The Norfolk Terminal Ry. Co., of Norfolk, has applied for a charter and proposes to build and maintain a $1,000,000 terminal in Norfolk. The project has been financed and work will be pushed as rapidly as possible as soon as detail plans are prepared. The Norfolk & Western, the Virginian and the Norfolk & Southern Rys. are back of the project.

The U. S. Senate has granted another extension of six months to the Washington, Spa Springs & Gretta Ry. Co., of Maryland, in which to enter the District of Columbia. The company was authorized to extend its tracks into the District by an act approved by Congress Feb. 18, 1907, which provided that the line should be completed with cars running within two years from its passage. Last year this was extended to March 3, 1910.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city of Charleston will shortly vote on issuing $3,000 of bonds for constructing a new city dock.

Ranchers and business men met in Mount Vernon recently and organized the Skagit River Improvement Association, the object being to rebuild the present dike and secure aid from the government for dredging the Skagit River. Alfred Polson is president of the association.

The Valley Railway & Power Co. is seeking a franchise in Kent for its projected railway which is to connect that city and Renton. Right of way has been arranged for. The officers of the Valley Railway & Power Co. are: H. B. Madison of Kent, president; Robert Bridges of O'Brien, vice president; Isaac P. Calhoun of Kent, secretary; Thomas Chapman of O'Brien, treasurer; Lee Monohan of Renton, auditor, and A. T. West, general manager.

Track laying on the Union Pacific, interrupted in December by floods, has been resumed and if no further delay results the tracks will be laid to South Aberdeen by March 15. There will be seven stations located between Aberdeen, Grays Harbor and Rochester. All of the material is now on the ground.

The Skagit County Power Co. is planning to begin actual construction work this spring on its power plant on the upper Skagit River, 30 miles from Rockport. The proposed power plant will cost in the neighborhood of $6,000,000. It will have a capacity of 100,000 h. p. A flume 20,000 ft. long and averaging about 20 ft. in width is being built in order to obtain "head." The river at present is a succession of small cascades and will be harnessed and forced through a long tunnel, most of which is to be cut through solid rock. E. H. Freeman, Anacortes, Wash., is field manager. In connection with the work the Great Northern Ry., A. Stewart, assistant chief engineer, Seattle, Wash., is to build a 30-mile branch to the site of the power plant, to be used in carrying in supplies for the work. Surveys for the branch have been made and work is to be started shortly.

The Oregon & Washington R. R. Co. has awarded a contract to Dibble & Hawthorne, National Bank of Commerce Bldg., Tacoma, Wash., for the construction of three miles of track in that city, from the Northern Pacific drawbridge to the Prescott yards.

The Chicago, Milwaukee & Puget Sound R. R., has recently awarded construction contracts for the extension of the Tacoma & Eastern R. R., a subsidiary line, 20 miles south of Glenavon, Wash.

The Puget Sound Electric Ry. Co. is planning to make improvements to its interurban line between Tacoma and Seattle this year that will involve the expenditure of about $400,000. The immediate improvements as outlined by R. T. Laffin, District Manager for Stone & Webster, Boston, Mass., are as follows: Station at Puyallup, $8,000; station at Black River, $5,377; station at Renton, $1,000; tool house at Bay street yards, Seattle, $500; new pits, $600; second track at Black River, $7,500; parlor car, $9,500; motor car, $17,000; car barn at Bay street, Seattle, $12,000; second track at Argo, $34,640, and Riverton siding, $4,000.

The Chicago, Milwaukee & Puget Sound Ry. is rushing work on the construction of its line to Everett from Moncton. H. C. Henry, the contractor who constructed the Milwaukee road from Mowbridge, Mont., to the Puget Sound country, is working a large grading crew this side of Moncton. As soon as condemnation suits pending against McDougall St. property owners, at Everett, for right of way are concluded, the company proposes to begin its preparations for the laying of steel in Everett, and still later, when the weather becomes more settled, Contractor Henry will begin construction on the road each way, north and south, from Tolt, in the Cherry valley.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Manitowoc Dry Dock Co., Manitowoc, has been awarded a contract for constructing a $50,000 sand sucker dredge for the Great Lakes Land Co. of Chicago, Ill.

The Merrill Electric R. R. of Merrill, Wis., has been granted permission to extend its

lines from the west side to the 6th ward in Merrill.

The city council of Winona has reconsidered its action and will now grant the La-Crosse & Winona Traction Co., of LaCrosse, a franchise to enter the city.

Citizens of Waukesha, Wis., are to take active steps immediately toward raising a $5,000 bonus to secure the construction of the Milwaukee-Western Branch line from Sussex to that city.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Canadian Pacific Ry., F. Lee, division engineer, Winnipeg, Man., will commence work soon on double tracking its line to Portage La Prairie.

Work is to be started in June on the construction of a light railway line from Stewart at the head of the Portland canal, British Columbia, inland 15 miles to tap a number of mining properties owned by a syndicate in which D. D. Mann, Toronto, Ont., is interested.

Among the improvements planned by the Canadian Pacific Ry. for the present year for western Canada are the completion of the new line from Weyburn to Lethbridge, and the construction of a line east from the latter point. Work will also probably be done this year on the line from Outlook to Castor, where there remains a gap of 225 miles, which will connect Moose Jaw directly with Edmonton.

Lawford Grant, Montreal, Que., has a proposition before the city council of Regina, Sask., for establishing a street railway there.

The Railway Committee of the House of Commons has authorized the Canadian Ry., M. H. MacLeod, general manager, Winnipeg, Man., to construct the following new lines in the west: From a point at or near Dundee, thence in a generally northerly and easterly direction to a point on the Winnipeg River in or near township 18, range 10 east of the principal meridian. From a point on the company's line at or near Portage la Prairie, thence in a generally southerly and easterly direction to a point on the Ridgeville section of its line of railway in or near township 5, range 7, west of the second meridian. From a point at or near Moose Jaw, thence in a generally southern and easterly direction, keeping west of Moose Creek, and the Souris River, to a point in or near township 2, thence easterly to a point at or near Beinfait, with a branch from a point at or near Roche Percee in township 1, range 6, west of the second meridian. From a point on the Qu'Appelle, Long Lake and Saskatchewan railway between Division and Disley, thence in a generally westerly and northwesterly direction to a point on the Saskatoon-Calgary line in or near township 30, range 14, west of the third meridian. From a point on its main line at or near Lashburn in township 48, range 25 west of the third meridian, thence in a generally westerly and northwesterly direction to a point on its authorized line between Edmonton and Camrose in or near township 50, range 22, west of the fourth meridian. From a point on its Saskatoon-Calgary line in or near township 28, range 6 west of the fourth meridian, thence in a generally northwesterly and westerly direction to a point at or near Rocky Mountain house on the North Saskatchewan River. From a point on its Saskatoon-Calgary line at or near the crossing of the Red Deer River in or near township 28, range 19 west of the fourth meridian, thence in a generally northwesterly and westerly direction, passing through or near Innisfail and Rocky Mountain house, to the headwaters of the Brazeau and McLeod rivers, and thence to a point on its authorized line at or near the Yellow Head Pass. From a point on its constructed line near Winnipegosis, thence in a generally southerly and easterly direction to a point on its constructed line near the south end of Lake Manitoba. From a point on its authorized line between Prince Albert and Battleford, in or near township 49, range 31, west of the third meridian, thence in a generally northwesterly and northern direction to a point at or near the Great Slave lake. From a point on its authorized line east of Lake Manitoba, then westerly via the Narrows, to a point on its constructed line between Grand View and Roblin.

F. S. Darling, Toronto, Ont., is stated to have been awarded the contract for constructing the Alberta & Great Waterways Ry. The line will be 350 miles long and will extend from Edmonton, Alberta, to Fort McMurray. W. R. Clark, Kansas City, Mo., is president.

P. P. Elliott, timber contractor, has a contract to take out 250,000 ties for the Canadian Northern Ry. Co., and has several camps at Banning, Ont., near Fort Frances, filling the orders. The Northern Construction Co. has a contract to take out 400,000 ties for the same company and have a number of camps in north and west of Banning.

The British Columbia Electric Ry. Co. of Victoria, B. C., has acquired a frontage upon Douglas St., which will be utilized for the company's suburban terminals, with the inception of their lines tapping the Saanich peninsula, work upon which, it is expected, will be commenced in the near future.

Work is to be started at once on re-arranging the various properties covered by the recent merger of electric and gas plants in Quebec, Que., so they can be operated as a unit. About $1,000,000 will be expended. The work will be in charge of R. S. Kelsch, Montreal, Que.

Articles of incorporation have been filed with the Canadian Parliament by the Monarch Ry. Co., with a capital stock of $1,000,000 and bonds amounting to $2,500,000. The organization proposes the construction and operation of a new radial railway from Toronto to Orillia, by way of Aurora, Holland Landing, Bradford, Deerhurst, Churchill, Stroud and Allandale and also branches to Lake Simcoe and Markham. The incorporators are W. H. Price, Charles M. Garbey, James F. Coughlin, N. R. Lindsay and Steffan F. Adalia.

Town Council of Niagara-on-the-Lake is taking steps to secure the extension of the International Ry. Company's line from Queenston to that place. James Aikens, Niagara-on-the-Lake, Ont., is interested.

Mexico Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Construction work is to be started this spring on the Jalisco Ry. which is to run from La Vega on the Central R. R. to Chamela on the coast. Paul de Velaine, Mexico City, represents the syndicate which is backing the road.

The German banking house of Bleichroeder of Berlin is considering building new railroads in Mexico. The company has sent Baron Hans von Bleichroeder to the United States to take active direction of the enterprise. For about six months he will have an office in the banking house of Kissell, Kinnicut & Co., in Wall St., in New York City, to work out the details.

A company has been organized to build a railroad from Tezziutlan, state of Pueblo, through the state of Vera Cruz, to the port of Nautla. The $2,500,000 gold capital has all been subscribed. A branch line will also be operated between Papantla and Misantla.

The government of the state of Coahuila, Mexico, has granted a concession to the Kansas City, Mexico & Orient Ry., to extend its proposed branch south from San Angelo, Tex., to Allerde, Mexico, where it will connect with the National Railways of Mexico. The company will commence work immediately on this branch which is 200 miles in length. Application will be made to the governments of the United States and Mexico for the construction of an International railway bridge across the Rio Grande. C. H. Webster, Sweetwater, Tex., is Chief Engineer.

Acosta brothers have applied to the Department of Fomento, City of Mexico, for permission to utilize the waters of the Palchan River for the purpose of supplying motive force. The power is to be used in the hacienda "La Mina," situated in the canton of Misantla, in the state of Veracruz. It is desired to use the water at the rate of 5,000 liters per second, at a point situated 1 kilometer south of the intersection of the road to the hacienda with that to the village of Vecuala.

The Waldo Street Ry. Co. proposes to begin work in the spring on an extension from Camden, Me., through to Belfast, Me., and several of the Waldo County towns. Wm. T. Cobb, Rockland, Me., is interested.

The Missouri Pacific Ry., M. L. Byers, Chief Engineer Maintenance of Way, St. Louis, Mo., is planning the expenditure of several million dollars for improvements to its lines in Nebraska. Surveys are already underway for work on the Kansas City-Omaha line, and nearly $500,000 will be spent for new yards at Falls City.

Hobart D. Shaw, C. E., of Gulfport, Miss., has gone to Richardson, Miss., where he will have charge of the engineering work for the projected Baton Rouge & Gulfport Ry. This company, which is backed by the Louisville Lumber Co., projects a line from Richardson to Bogalusa, La.

The Georgia Railway & Electric Co., of Atlanta, Ga., has an application before the City Council of that city for permission to make additions to certain of its street railway lines in order to better the schedules thereon.

At present there are about 900 men employed between Key West, Fla., and Knights Key on the extension of the Florida East Coast Ry. This force will be gradually increased and the work pushed rapidly to completion. There will be more openings in the fills between the keys which will materially strengthen the work, inasmuch as it will allow a passage for the great volume of water which sweeps in from the ocean.

A bill is before the U. S. Senate to allow the Standard Oil Co. to construct a pipe line for oil or gas across the public lands of Arkansas. The passage of this measure will make it possible to complete the pipe lines from the Oklahoma oil fields to the Gulf of Mexico.

The Maine State Board of Railroad Commissioners has been petitioned by the Boston & Maine R. R. to approve the location of a proposed branch or spur track in the city of Portland, Me. The city has already granted its consent.

The stockholders of the Winston-Salem Southbound Ry. Co., at a meeting in Winston, N. C., on Feb. 3, authorized the directors to issue bonds to the amount of $5,000,000 to be used in construction and equipment of this road, now being built from that city to Wadesboro, N. C.

The Knoxville, Sevierville & Eastern R. R. recently completed by W. J. Oliver of Knoxville, Tenn., is reported to have made preliminary surveys for a 25 mile extension east of Sevierville, Tenn.

It is stated that J. H. Barrett, of Pittsburg, Pa., has made a proposition to the promoters of the Highland street car line at Albuquerque, N. Mex., for the construction of the line.

Bids have been received by W. L. Darling, St. Paul, Minn., chief engineer of the Northern Pacific Ry., for the construction of eight miles of double track between Missoula, Mont., and De Smet station. The work requires a considerable amount of excavation. Winston Bros., Minneapolis, Minn., were among the contractors who bid on the work.

The Southern Power Co. proposes to erect its fourth power plant on the Catawba River and now has preliminary surveys underway for the development of water power on the Catawba River at the Lookout Shoals, N. C., at a point touching Catawba, Iredell,

and Alexander counties. For a long distance the river spreads out over a bed of rock, the water being very shallow in most places. The company will erect a dam, build a power house, etc., to develop the 8,000 HP. said to be available. The current will be turned into Hickory, N. C., and Statesville, the latter place being the chief distributing point.

Steps are being taken by citizens of the towns along the proposed right of way to secure the construction of a railroad from Columbia, S. C., to Greenwood by way of Lexington and Saluda. Farmers along the line have expressed their willingness to grant free right of way for the project.

A movement is under way to build an interurban railway from Lincoln to Auburn, via Cheney, Bennet, Dunbar, Talmage and Brock. T. P. Kennard, president of the organization that built the road to College View, Neb., is interested.

According to reports from Linton, N. D., surveys are being made by engineers of the Northern Pacific Ry., for a line from Edgeley, in LaMoure County, to some point in Morton or Hettinger counties, probably Mott, N. D. It is believed the line will run through portions of LaMoure, Logan, McIntosh, Emmons, Morton and Hettinger counties.

The Louisville & Nashville R. R., J. H. Peyton, Louisville, Ky., assistant to the president, is considering having an embankment made between Scarton, Miss. and West Pascagoula, Miss., on the south side of the track to protect it from tropical storms.

The Western Maryland Ry. Co., a new corporation, incorporated under the laws of the state of Maryland with a capital stock of $60,000,000 to take over the Western Maryland R. R., has been admitted to do business in West Virginia.

The Carolina-Tennessee Power Co., 114 Broadway, New York city, is planning to start work early in the spring on a $5,000,000 power plant, the main object of which is to furnish power for the two big copper plants at Ducktown, Tenn. Two dams will be built on the Hiwasse River, one at Appalachia and the second 20 miles above Appalachia. They will generate 60,000 HP.

It has been announced that Boise, Idaho, will be the base of all operations connected with the construction of the line of the recently incorporated Boise-Butte R. R. Co. Work will be started in the near future, it is expected, and the cost of the project will be upward from $20,000,000. E. H. McAuley, member of the city council of Boise, Idaho, is an incorporator of the company.

Advices from Clagstone, Idaho, state that Engineer Eidelblush has completed surveys for the ditch which is to drain Hoodoo Lake and reclaim the land now partly covered with water. There is 4,500 acres to be reclaimed for meadow land, the bonds having been sold to eastern capitalists. Work will start in the spring.

Good progress is being made on the Santa Fe cutoff from Parker to Bengal and it is reported that trains will be operating over it by May 1. The new route will shorten the distance from Phœnix to Los Angeles, Cal., at least 200 miles.

An ordinance is now before the City Council of New Orleans, La., to grant a franchise for a street railway in Algiers, a suburb of New Orleans. The project is said to contemplate the construction of a new electric line to be built out of Algiers along the southern coast. Ex-Governor H. C. Warmoth and Theodore S. Wilkinson are reported to be interested.

The city of Natchez, Miss., has voted a bond issue of $50,000 to be given the Mississippi River Western R. R. as a bonus to build into Natchez. The $50,000 is not to be paid to the road until they have completed the same from Meridian to Natchez and running trains into the city over its own tracks.

Wells Bros. & Bacon, contractors for the Bliss-Rupert cutoff, Idaho, are preparing to rush their work. They have the yards at Bliss full of ties, rails and other necessary material. During the past month a force of about 80 men have been employed blasting the rock along the right of way and men and teams are to start work on the first 10 miles.

A. J. Bright, Nashville, Tenn., who recently completed surveys for the proposed railroad from Westmoreland, Tenn., to Red Boiling Springs, has filed plans and specifications for the proposed work with the promoters of the road at LaFayette.

Citizens of Iberville Parish, Louisiana, have been granted permission by the Governor and the Atchafalaya Levee Board to dam the Alabama Bayou in the Atchafalaya District.

The Rutland Railway, Light & Power Co. of Rutland, Vt., has completed surveys and is securing right of way for its projected electric railway extension from Fair Haven, Vt., to Poultney, Vt. Construction work on the line is to be started in March.

The Minneapolis & St. Louis R. R. has two lines surveyed for the entrance of Pierre, S. Dak. This work was mentioned in our last issue. W. D. Taylor, Chicago, Ill., is Chief Engineer of the company.

The Cincinnati, Newport & Licking Valley R. R. has been incorporated with a capital stock of $20,000, and permission to increase it to $5,000,000. The principal office of the company is at Cynthiana, Ky. The road will be 65 miles in length and extend from Cynthiana in Harrison County to Newport, in Campbell County. The incorporators are as follows: R. W. Day, Scranton, Pa.; F. L. Fuller, New York; Wade H. Hall, Cynthiana; Harrison Peterson, Cynthiana; T. J. Foster, Scranton, Pa.; W. L. Connell, Scranton, Pa.; D. G. McVean, Covington; R. H. Ross, Cynthiana.

It is rumored in Ambrose, N. Dak., that the Minneapolis, St. Paul & Sault Ste. Marie R. R. is considering the construction of a 60-mile branch from that city to Plentywood, Mont. Thomas Green, Minneapolis, Minn., is Chief Engineer of the company.

The Midland Construction Co. of Jamestown, N. D., is reported to have asked bids for 4,000 tons of steel rails to be used in the construction of its proposed railway from Jamestown to Edgeley. The proposed route of the railroad will carry it through Edgeley, Jamestown, Cooperstown and Aneta, and crossing the Great Northern line near Shawnee, west of Larimore. The road will finally pass through western Walsh and Pembina counties.

The East Tennessee & Western North Carolina R. R. Co., has plans under way, it is said, for the construction of a two-mile branch line to the farm of J. H. Smalling, near the Watauga River. E. P. Howe, Johnson City, Tenn., is President of the company.

The Wasioto & Black Mountain Ry., which has 13 miles of line under construction from Wasioto, Ky., to Toms Creek, has opened bids for an extension of the line from the latter place to the town of Harlan, a distance of 24 miles. The Callison Construction Co., Middlesboro, Ky., is making rapid progress on the first 13 miles of the line, and it is expected that this portion of the work will be completed within a month. T. J. Asher is president.

Citizens of Gulfport, Miss., have about succeeded in raising a bonus of $40,000 to secure the construction of a belt line by the Gulfport & Mississippi Court Traction Co. of Gulfport. The line would necessitate the construction of about seven miles of track and overhead work.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Westbrook, Conn.—Until noon, Feb. 21, by P. C. Burdick, First Selectman, Westbrook, Conn., for the construction of the combination steel and concrete bridge over the Menunketesuck River.

Duluth, Minn.—Until 10 a. m., Feb. 18, by Board of Public Works, for the construction and erection of a mass concrete or reinforced concrete bridge complete with abutments and approaches and including pavement and sidewalk, over Tischer's Creek on East Superior St. J. W. Preston is President and R. Murchison is Clerk of the Board of Public Works.

Grand Forks, N. Dak.—Until Feb. 16, by Board of County Commissioners, for the construction of several county bridges, to be constructed of iron and wood.

Madison, Neb.—Until noon, Feb. 19, by S. R. McFarland, County Clerk, for furnishing all necessary labor and material for the erection of the following bridges: 70-ft. span steel bridge with 16-ft. roadway across Battle Creek, near Battle Creek Hill; 40-ft. pile and stringer bridge with 16-ft. roadway; all other bridges ordered by Board of County Commissioners between 50 and 60 ft. in length.

Cleveland, O.—Until 11 a. m., March 2, by Board of Commissioners, John F. Goldenbogen, Clerk, for the construction of a concrete arch bridge on Irish Road, Middleburg Township.

Reading, Pa.—Until 10 a. m., March 3, by A. L. Rhoads, County Controller, for the construction of a reinforced concrete arch bridge in Wyomissing Borough, Berks County, Pa.

Chattanooga, Tenn.—Until March 1, by Robert Hooke, City Engineer, for the reconstruction of the McCallie Ave. viaduct. The cost of the work is estimated at $16,000.

Galveston, Tex.—Until noon, Feb. 17, by John M. Murch, County Auditor, for the construction of a bridge over Chigger Creek, on the Alvin-Friendswood Road. A certified check for $100 must be filed with each bid.

Kalama, Wash.—Until April 5, by Board of County Commissioners, for the construction of a 300-ft. steel highway bridge at Castlerock, Wash. The structure will have one span with wood flooring on a 16-ft. roadway. The substructure will be of concrete, having two piers 70 ft. high, 55 ft. being above the water. G. S. Roberts, Kalama, Wash., is Engineer.

Snohomish, Wash.—Until 10 a. m., Feb. 28, by John F. Birney, County Engineer, Everett, Wash., for the construction of a steel swing span over the Snohomish River at the town of Snohomish. Official advertisement will be found elsewhere in this issue.

Milwaukee, Wis.—Until 10:30 a. m., Feb. 17, by Board of Public Works, for repairing the protection pier of Pleasant Street bridge, crossing the Milwaukee River.

Winnipeg, Man.—Until March 7, by Board of Control, for the construction of an overhead bridge at Brown and Brant Sts.

Winnipeg, Man.—Until March 7, by Board of Control, M. Peterson, Secretary, for the construction of the Brant steel bridge at an estimated cost of $299,646.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Birmingham, Ala.—Until March 1, by D. H. Marbury, Chairman of Building Committee, Birmingham, Ala., for the erection of a church building for the Southside Baptist congregation, Birmingham, Ala.

Denver, Colo.—Until noon, March 7, by William K. Burchinell, Secretary State Board of Capitol Managers, for certain portions of the structural steel and cast iron work entering into the construction of "The Colorado State Museum Building."

Bristol, Conn.—Until 3 p. m., March 8, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction of the retaining wall at the U. S. Post Office, Bristol, Conn.

Washington, D. C.—Until noon, Feb. 23, by District Commissioners, for constructing an eight-room school building on lots 20-24 square 388, at corner of 10th and E Sts., southwest.

Washington, D. C.—Until noon, Feb. 17, by District Commissioners, for the construction of the John Eaton school building No. 160, at the northeast corner of Lowell and 34th Sts., lots 2 to 11 exclusive, block 4, subdivision of Cleveland Heights.

Fort Dodge, Ia.—Until 2 p. m., Feb. 22, by C O. Case, Fort Dodge, Ia., for the construction of a Y. M. C. A. building at Fort Dodge, Ia.

Aurora, Ill.—Until 2 p. m., March 1, by Building Committee, Mrs. James Hanna, Chairman, at the office of Worst & Shepardson, Coulter Block, Aurora, Ill., for the erection and completion of a building for the Young Woman's Christian Association.

Chicago, Ill.—Until noon, March 2, by South Park Commissioners, at 57th St. and Cottage Grove Ave., for furnishing material and labor

for the construction of park buildings and swimming pool in Park No. 4, situated at 45th St. and Princeton Ave., Chicago, Ill.

Lincoln, Ill.—Until 3 p. m., Feb. 21, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the United States post office at Lincoln, Ill.

Quincy, Ill.—Until 3 p. m., March 28, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, gas piping, heating apparatus, electric conduits and wiring and standard clock system, of an extension, remodeling, etc.

Urbana, Ill.—Until 11 a. m., March 3, by Board of Trustees, University of Illinois, W. L. Abbott, Pres., at the Western Society of Civil Engineers, 1735 Monadnock Block, Chicago, Ill., for the construction of a fireproof school building at the University of Illinois, Urbana, Ill.

Connersville, Ind.—Until 3 p. m., March 23, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, gas piping, heating apparatus, electric conduits and wiring of the United States Post Office at Connersville, Ind.

Lexington, Ky.—Until 3 p. m., March 25, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the extension, remodeling, etc., including plumbing, gas piping, heating apparatus, electric conduits and wiring of the United States Post Office at Lexington, Ky.

Cambridge, Mass.—Until 5 p. m., Feb. 17, by Dr. A. P. Norris, Mass. Ave. and Pleasant St., Cambridge, Mass., for the construction of a 16-family apartment brick house at the corner of Pleasant and Greene Sts., Cambridge.

Fort Robinson, Neb.—Until 11 a. m., March 5, by Malvern Hill Barnum, Constructing Quartermaster, for the construction, heating, plumbing and electric wiring and fixtures for one noncommissioner officers' quarters; also for an addition to the water main to connect same with the post system.

Inkster, N. Dak.—Until noon, Feb. 23, by Secretary Grand Forks Builders' Exchange, for the construction of a brick store building for the Inkster Mercantile Co., Inkster, N. Dak.

Colfax, Wis.—Until March 7, by Henry B. Anderson, School Clerk, for the construction of a brick and stone school house at Colfax, Wis.

Fort Bayard, N. Mex.—Until 11 a. m., March 15, by Capt. S. P. Vestal, Constructing Quartermaster, for the complete construction, plumbing, heating, electric lighting fixtures for one double and one single ward building, three double and one single officers' quarters.

Toronto, Ont.—Until noon, March 1, by J. O. Reaume, Minister of Public Works, Toronto, Ont., for masonry, bricklaying, stone, carving, fireproofing, etc.; structural steel; steam heating; plumbing and gasfitting; iron armored conduit and electric wiring; vault doors, roofing; copper and sheet metal; carpenter work, ornamental iron and grille work; elevators; lathing and plastering; painting and glazing; marble and tile; metallic fireproof doors; base and trim; hardware; castings.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Montgomery, Ala.—Until noon, March 7, by Robert Tait, City Treasurer, for the improving of Jeff Davis Ave., from Holt to Oak Sts., by grading, curbing and all necessary storm water sewers, gutters, etc., in conection therewith.

Washington, D. C.—Until noon, March 1, by Capt. H. L. Pettus, Constructing Quartermaster, for the construction of macadam roads, concrete walks, etc., at the Walter Reed General Hospital, Washington, D. C.

Franklin Park, Ill.—Until 8 p. m., Feb. 23, by Board of Local Improvements at Village Hall for the construction of about 11,000 ft. of cinder sidewalk. K. W. Pelsma is Secretary of the Board.

Ottawa, Kan.—Until 5 p. m., March 2, by F. A. Marcell, City Clerk, for grading, curbing, guttering and macadamizing with a bituminous binder the following streets in the city of Ottawa; Fourth St., from Cedar to Cherry St.; 5th St., from Cherry to Ash St.; Ash St., from 4th to 5th St.; Elm St., from 1st to 7th St.; Cedar St., from 4th to 10th St.; Logan St., from Main to Cherry St. The work includes 55,000 sq. yds. of macadam and 20,000 lin. ft. of concrete curb and gutter.

Chisholm, Minn.—Until noon, Feb. 19, by C. A. Munro, Village Recorder, for furnishing all necessary material and labor for the construction of about 60,000 sq. ft. of Portland cement sidewalk with 5,800 ft. of combination curb and gutter and crosswalks on Lake and adjoining streets.

Corning, N. Y.—Until 11 a. m., March 17, by Board of Public Works, for the construction of about 1½ miles of brick pavement with cement curbs and 1½ miles of bituminous macadam pavement with cement curbs. The work includes 12,000 sq. yds. of brick and 8,520 sq. yds. of macadam. W. C. Sleight is Clerk of the Board of Public Works.

Cincinnati, O.—Until noon, Feb. 25, by Board of County Commissioners, for the resurfacing of Cincinnati Ave., from east to west corporation lines of North Bend in Miami Township. Stanley Struble is President of the Board.

Wadsworth, O.—Until noon, Feb. 28, by Village Council for furnishing the necessary labor and materials for the improvement of South Main St., from the Erie R. R. Co. tracks to the south line of J. W. Billman lot 930 and Pardee St., from the west line of Mrs. Kate Hook's property in this village. L. F. Allen is Clerk.

Oklahoma City, Okla.—Until 5 p. m., March 7, by W. C. Burke, City Engineer, for 262,215 sq. yds. of sheet asphalt pavement, total length of which is about 15.78 miles and estimated cost is $860,000. The work includes: 262,215 sq. yds. pavement at an estimated cost of $539,228; 227,700 cu. yds. of earth excavation at $79,695; 2,500 cu. yds. of rock excavation at an estimated cost of $1,750; 11,200 cu. yds. of embankment at an estimated cost of $2,240; 172,530 lin. ft. of curb and gutter at an estimated cost of $132,345; 10,900 ft. header at an estimated cost of $1,635; 45,895 ft. of 10, 12, 15, 18, 21 and 24-in. vitrified pipe at an estimated cost of $59,449; 376 catch basins at an estimated cost of $7,520; 90 manholes at an estimated cost of $3,600; 45 sq. yds. of cut paving at an estimated cost of $157.

Gallitzin, Pa.—Until March 5, by Harry F. Conrad, Borough Secretary, for paving with brick, 9,000 sq. yds. of street. D. W. Dillman, 47-49 Altoona Trust Bldg., Altoona, Pa., is Engineer.

Sewickley, Pa.—Until 5 p. m., Feb. 24, by M. M. Maker, Borough Engineer, for macadamizing Walnut St., from Thorn St. to Frederick Ave. The work includes 730 cu. yds. excavation, 140 lin. ft. of new curb, 910 lin. ft. of redressed curb reset, 550 sq. yds. brick gutters, 1,635 sq. yds. of macadam; 7½ in. slag base; 2½ in. broken stone; 1½ Kentucky rock asphalt.

Sewers.

Bids are asked on following work, the notes being arranged alphabetically by states:

Vincennes, Ind.—Until 1:30 p. m., March 2, by Board of Public Works, for the complete plans, specifications and estimates for the installation of a sanitary and storm water system for this city.

Mt. Sterling, Ky.—Until 1 p. m., March 1, by City Clerk, for furnishing all necessary materials and labor for constructing 9½ miles of sewers from 6 to 24-in. in diameter, with all manholes, lampholes, flushtanks, etc., also reinforced concrete septic tanks. W. A. Samuels is Mayor.

Louisville, Ky.—Until noon, March 4, by Sewerage Commissioners, P. L. Atherton, Chairman, for the construction of Section "A" Castlewood Sewer Contract No. 61, including 5,951 ft. of concrete sewer, 39 to 66-in. diameter; 930 ft. 20-in. vitrified pipe, including 4,521 ft. of earth excavation and 1,500 cu. yds. of rock; 1,440 cu. yds. of concrete; 2,760 sq. yds. vitrified brick. J. B. F. Breed is Chief Engineer.

Alliance, Neb.—Until noon, Mar. 2, by F. W. Irish, City Clerk, for constructing 8-in. vitrified pipe sewers in five districts, the total estimated cost being $8,700. Official advertisement will be found elsewhere in this issue.

Florence, S. C.—Until 8 p. m., March 3, by Board of Sewerage Commissioners, for furnishing all material and labor for the construction of a system of sanitary sewers at Florence, S. C.

Roanoke, Va.—Until noon, Feb. 23, by W. L. Craft, City Clerk, for the construction of a sewer in alley between Orange and Melrose Aves., N. W. from 13th to 15th Sts. F. L. Giboney is City Engineer.

Water Supply.

Bids are asked on following work, the notes being arranged alphabetically by states:

Coffeyville, Kan.—Until 5 p. m., Feb. 21, by City Clerk, Rosa Bell, for the development and installation of a ground water supply, the necessary preliminary tests for which have already been made.

Fort Riley, Kan.—Until 10 a. m., March 8, by Capt. W. M. Whitman, Constructing Quartermaster, for the construction of boiler house and pump pit and furnishing and installing boiler pumping engine and water main at this post.

Wallington, N. J.—Until 8 p. m., Feb. 28, by Mayor and Council, for the construction of a reinforced concrete water reservoir and extension of artesian wells. A. L. Pettersen, Passaic, N. J., is Engineer.

Fort Sill, Okla.—Until 10 a. m., March 7, by Capt. David L. Stone, U. S. A., Constructing Quartermaster, for water distributing system; sewerage system; drainage system at Fort Sill, Okla.

Portland, Ore.—Until 4 p. m., March 8, by City Water Board, for the construction of the second pipe line to Bull Run. The work includes the construction of 24 miles of pipe and is estimated to cost $1,629,000. Official advertisement will be found elsewhere in this issue.

Miscellaneous.

Bids are asked on following work, the notes being arranged alphabetically by states:

Fort Morgan, Ala.—Cisterns—Until 1:30 p. m., March 7, by Capt. H. B. Chamberlin, for the construction of three reinforced concrete cisterns, one 30,000 gals. and two 8,500 gals capacity, at Fort Morgan, Ala.

Washington, D. C.—Hoists—Until Feb. 21, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for furnishing double friction drum hoists, electrically operated.

Boston, Mass.—Trolley System—Until noon, March 2, by Board of Trustees, Infirmary Department, 28 Court Square, Boston, Mass., for the construction of a trolley system for the transportation of coal from the coal sheds to the power house of the almshouse on Long Island.

New York, N. Y.—Iron Standard—Until Feb. 21, by Maj. Gray Zalinski, Army Bldg., New York, N. Y., for furnishing under Schedule No. 34, labor and material for erecting one iron standard for Lincoln address cabinet in the Woodlawn national cemetery, at Elmira, N. Y.

Excavation, Earth and Rock.

Bids are asked on following work, the notes being arranged alphabetically by states:

Savannah, Ga.—Dredging—Until noon, March 9, by Col. Daniel C. Kingman, U. S. Engineers, Savannah, Ga., for dredging in Club and Plantation Creeks, Ga.

Harvel, Ill.—Drainage Work.—Until 10 a. m., March 1, by Commissioners of Union Drainage District No. 2, of the towns of Harvel and King, for cleaning out and reconstructing open ditches as follows: 18,200 lin. ft., base 6 ft., from 1 to 3½ ft. deeper than the present ditch, and 9,600 lin. ft., base 5 ft. from 3 to 4 ft. deeper than the present ditch, all side slopes 45 degrees, and all within an open ditch at present from 5 to 8 ft. deep, one single drain 22,700 ft. long and a branch drain 8,780 ft. long, in all estimated closely to contain about 49,886.

Monticello, Ill.—Drain.—Until 10 a. m., Feb. 26, by Lake Fork Special Drainage District Commissioners for the construction of 25,955 ft. of tile drains.

Woodstock, Ill.—Drainage System.—Until 10 a. m., March 4, by Commissioners of Rush Creek Drainage District, James E. Cunningham, Chairman, for constructing a system of drainage to include 88,000 cu. yds. open ditch work and 24,000 ft. of tile drains. Official advertisement will be found elsewhere in this issue.

Warrensburg, Mo.—Ditch Work.—Until noon, March 10, by Board of Supervisors of Blackwater Drainage District No. 1, of Johnson County, Mo., for clearing right of way and excavating main ditch, straightening Blackwater Creek and containing approximately 1,000,000 cu. yds. of earth and laterals and small ditches containing about 220,000 cu. yds. of earth. Robert J. Grover, Warrensburg, Mo., is Deputy Secretary and T. O. Stanley is Engineer.

Materials, Machines, Supplies, Etc.

Bids are asked on following work, the notes being arranged alphabetically by states:

Phoenix, Ariz.—Pumping Engine.—Until 4 p. m., March 14, by Superintendent of the Water Works Department, for one 5,000,000-gal. pumping engine.

Washington, D. C.—Paving Brick—Until 2 p. m., Feb. 18, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for furnishing 30,000 paving brick 2½x4x8 in.

Washington, D. C.—Electrical Material—Until 10:30 a. m., Feb. 25, by Capt. F. C. Boggs, General Purchasing officer, Isthmian Canal Commission, Washington, D. C., for furnishing Electrical Material, including fixtures, fittings, cable, wire, line material, lineman's tools, hardware, mica, soldering material, insulating material, paint, varnish, japan, conduit, molding, rubber gloves, tape, etc.

Washington, D. C.—Hoisting Engine, Capstan, Etc.—Until 10:30, March 7, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for furnishing: hoisting engine, capstans and engine, plumbs, boring machine, steel castings, dipper bails, gear cutters, milling tools, slitting saws, stocks and dies, twist drills, bits, chisels, open links, tacks, chain blocks, gauges, oil cups, steam whistles, unions, bellows, rubber belting, wick packing, gauge glasses, rakes, steel tapes, water closets, filing cabinets, beds, mattresses, chair bottoms, mats, awnings, cooks' aprons, napkins, towels, cheesecloth, yarn, kitchen utensils, dishes, glassware, cutlery, coal tar, soft soap, lumber, etc.

Washington, D. C.—Wireless Sending Sets.—Until Feb. 21, by Captain. C. DeF. Chandler, Capt, Signal Corps, U. S. Army, for furnishing four wireless telegraph sending sets, in accordance with Specification No. 525, Drawing No. 799.

Washington, D. C.—Steel Castings—Until 2 p. m., Feb. 18, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for furnishing four sets (two

pieces to each set) of jaw plates for use on portable crusher.

Washington, D. C.—Valves—Until 2 p. m., Feb. 17, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for 4 2-in. valves, cast iron body, brass lined, with blank flanges to reduce steam pressure from 170 to 80 lbs.

Washington, D. C.—Poles—Until 2 p. m., Feb. 23, Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for furnishing 150 creosoted wood poles, 40 ft. long and 8 in. in diameter at the top.

Fort Sheridan, Ill.—Sanitary Fittings—Until Feb. 16, by Capt. M. E. Saville, Depot Quartermaster, Fort Sheridan, Ill., for furnishing a miscellaneous quantity of sanitary fittings.

Jackson Barracks, La.—Repairing Launch—Until 10 a. m., March 12, by Lieut. A. L. Loustalot, Constructing Quartermaster, for repairing the launch Mansfield.

Portland, Me.—Mooring Stones—Until noon, March 16, by Light House Inspector, Portland, Me., for furnishing mooring stones for use in the first lighthouse district for the fiscal year ending June 30, 1911.

Baltimore, Md.—Lumber, Rubber Hose, Etc.—Until Feb. 23, by Board of Awards, for furnishing and delivering to the Street Cleaning Department lumber, rubber hose, hose supplies, wagon and harness, supplies, carts, cart bodies, sweeping machines, oils, paints, leather, hardware tools, iron, steel, etc.

Saginaw, Mich.—Castings, Sewer Pipe—Until Feb. 18, by City Clerk, for furnishing sewer castings, Portland cement, sewer pipe and drain tile.

Williston, N. Dak.—Material—Until 10 a. m., March 8, by Board of County Commissioners, for the following material furnished f. o. b. cars at Williston: Twelve I beams 12x30, twelve I beams 10x25, twenty-four I beams 8x20, three I beams 6x18, four channels 12x30, four channels 10x25, eight channels 8x20, seventy-six channels, 3x2x¼x4, four L's 2x2x3-16x32, four L's 2x2x3-6x27, eight L's 2x2x3-16x22.

Gallitzin, Pa.—Paving Block—Until Feb. 28, by Harry F. Conrad, Borough Secretary, for furnishing 450,000 paving block. D. W. Dillman, 47-49 Altoona Trust Bldg., Altoona, Pa., is Engineer.

Frankfort Arsenal, Philadelphia, Pa.—Chain Drives and Bearings—Until 10 a. m., Feb. 17, by Commanding Officer, for furnishing four chain drives and six grooved ball thrust bearings.

Wheeling, W. Va.—Steel Forgings, Etc.—Until 11 a. m., Feb. 28, by Capt. F. W. Altstaetter, U. S. Engineers, Wheeling, W. Va., for furnishing and delivering structural steel, forgings, bolts, etc., for dams Nos. 8 and 11, Ohio River.

Seattle, Wash.—Spare Tail Shaft.—Until 11 a. m., March 11, by Quartermaster, U. S. A., 322 Arcade Annex, Seattle, Wash., for manufacturing and delivering f. o. b. cars, Pier 5, Seattle, one spare tail shaft.

Calgary, Alta.—C. I. Pipe, Specials, Etc.—Until noon, Feb. 25, by H. E. Gillis, City Clerk, for furnishing city cast iron pipe, valves, hydrants, specials, etc.

Winnipeg, Man.—Asphalt.—Until Feb. 25, by Board of Control, for supplying from 2,500 to 3,500 tons of asphalt for street paving in this city. Col. H. N. Ruttan is City Engineer.

CONTRACT LET.

The following contracts have been let recently:

BRIDGES.

Astoria, Ill.—Bridge—Springfield Bridge Co., at $1,480, for the erection of a bridge on a line between Isabel and Kerton Townships, having a 70-ft. span, with a 14-ft. roadway.

Sioux City, Ia.—Bridge—Lewis & Leeder, at $2,948, for the building of the new Sixth St. bridge over Perry creek.

Sioux City, Ia.—Culvert—P. C. Hansen, for the construction of a culvert at 24th and Jones Sts.

Shubuta, Miss.—Bridge—Austin Bros., for the construction of an iron bridge across the Chickasahay River, one mile east of Shubuta.

Cleveland, O.—Bridge—Van Dorn Iron Works, Cleveland, O., at $61.25 per ton or $38,282, for the steel for the superstructure of the bridge to be erected at the W. 25th St. crossing of the Nickel Plate Railroad.

North Bend, Ore.—Bridge—Victor Anderson, of this city, at $7,785, for the construction of a drawbridge on South slough. The bridge is to be completed by June 1.

Pendleton, Ore.—Bridges—Atlas Bridge Co., Portland, Ore., at $8,000, for the erection of four new steel bridges. The bridges are to be located, one at McCoy, across the Walla Walla river; one at Milton, across the Walla Walla river, Butter creek, near its mouth, and one across Dry creek, at Blue Mountain station.

Pittsburg, Pa.—Bridge.—Friday Contracting Co., at $64,326, for building the Meadow St. bridge across Negley Run Hollow.

Yankton, S. Dak.—Bridges—Hennipen Bridge Co., Minneapolis, Minn., for the construction of all the bridges to be erected in Yankton County during 1910. Bids were opened Feb. 3.

Roby, Tex.—Bridges—B. F. Leonard, Bowie Tex., for the construction of all the bridges on the last four miles of the Estacado & Gulf Railway Co.'s road into this city.

Castle Dale, Utah—Bridges—James J. Burke & Co., Salt Lake City, Utah, at $29,597, for the construction of five bridges in Emery County. The bridges will be of steel, with concrete abutments.

Shoshone, Wyo.—Bridge—Des Moines Bridge & Iron Works, Des Moines, Ia., for building a 130-ft. steel bridge in this city for highway traffic.

Winnipeg, Man.—Bridge—Thos. Kelley & Sons, for the construction of the piers of the joint railway bridge across the Assiniboine river, to be built by the Canadian Northern & Grand Trunk Pacific Railways. The bridge is to be 454 ft. in length and will cost about $50,000. The bridge will be of the deck plate girder type. There will be one section of 44 ft. at the north end which will be a through span, then two of the deck plate sections, each 80 ft. in length. The central span will be 90 ft. in length (Strauss trunnion lift pattern). At the south end there will be two more deck plate spans of 80 ft. each. Seven concrete piers are to be constructed.

Winnipeg, Man.—Viaduct—Hill & Sons, for the construction of the pedestals of the steel viaduct which the Canadian Pacific Railway will construct across the South Saskatchewan river at Outlook, Sask. The bridge will be 3,000 ft. in length and 126 ft. from top of the pedestals to the base of the rail. There are 110 piers to be built to carry the steel. The shore piers will be carried on nests of concrete piles, 430 in number, while 100,000 lin. ft. of wooden piles, each 50 ft. in length, will be driven to carry the river piers. The bridge is to have a traffic deck, to be suspended half way up the towers, which gives a roadway 29 ft. in width, with 16 ft. of head room.

ROADS AND STREETS.

Birmingham, Ala.—Paving.—Southern Bitulithic Co., of this city, for the construction of 75,000 sq. yds. of bitulithic pavement.

Indianapolis, Ind.—Grading—Lucky Bros., at $.25 per ft., for grading roadway of the first alley east of Illinois, from 27th to 28th St.

Davenport, Ia.—Paving—McCarthy Improvement Co., for the paving of Sixth, between Ripley and Harrison, at the following prices: Excavation, $63; asphalt paving $1.79½; brick paving, $1.79½; curbing, $.59.

Arkansas City, Kan.—Paving—Rushmore & Gowdy, Cherryvale, Kan., for the construction of 15,000 sq. yds. of brick paving in this city. Work is to begin at once.

Hutchinson, Kan.—Paving—Rushmore & Gowdy, Cherryvale, Kan., for the construction of an additional 3,000 sq. yds. of pavement in this city. Work will begin at once.

New Orleans, La.—Paving—Standard Paving Co., at $1,500, for hauling sq. granite blocks at $.12 per stone for the completion of the paving of Magnolia St., from the New Basin canal to Erato St.

Goldsboro, N. C.—Paving.—Atlantic Bitulithic Co., of this city, for the construction of 50,000 sq. yds. of bitulithic pavement.

Goldsboro, N. C.—Paving—Atlantic Bitulithic Co., Norfolk, at $100,000, for paving the business and residence streets with bitulithic. The work includes the construction of 50,000 sq. yds. of pavement.

Newark, N. J.—Paving.—Standard Bitulithic Co., for repairing 50,000 sq. yds. of asphalt in this city.

Cincinnati, O.—Paving—Shanklin & Cash, Columbia Hotel, Cincinnati, O., at $7,871, for the improvement of Bramble Ave., from Central Ave. to Plainville Pike, in Columbia Township.

Ada, Okla.—Paving. — Shelby Downard Co., Ardmore, at $1.80 per sq. yd., for paving Main, Broadway and Townsend Sts., using a 5-in. concrete base and 2-in. rock asphalt. The total cost of the work will be about $90,000.

Portland, Ore.—Paving.—Warren Construction Co., for the construction of 3,950 sq. yds. of bitulithic pavement on First St.

Dallas, Tex.—Paving.—Texas Bitulithic Co., of this city, for the construction of 23,085 sq. yds. of bitulithic pavement on Cedar Springs St.

Spokane, Wash.—Paving Plant—Jennuys Co., Indianapolis, Ind., at $16,600, for the construction of a complete asphalt plant of 1,000 yds. capacity. Bids were opened Feb. 1.

Glenova, W. Va.—Grading—William Patterson, West Bridgeport, O., for making improvements in this city. The work will consist of the grading for the principal street through the town, and also the sidewalks.

SEWERS AND WATER SUPPLY.

Montgomery, Ala.—Sewer—J. N. Mitchell, for the construction of the sanitary sewer from Highland Park to the outlet.

Tombstone, Ariz.—Water Tanks—Des Moines Bridge & Iron Works, Clinton, Ia., at $3,495, for the construction of the water tanks at the territorial prison.

Bloomington, Ill.—Sewers—Frank Sullivan, of this city, at $1,635, for the construction of a sewer on Broadway, from Hovey to Burleigh St., and at $353, for the construction of a sewer on the same street, from Hovey Ave., to Florence Ave.

Bloomington, Ill. — Waterworks — Following contracts have been awarded by the City Council for the entire construction work at the water plant: Gray & Bowman, building roof and floors, at $13,500; Allis-Chalmers, pumping engine, at $21,600; Heine boilers, set complete, at $9,052; Greene Engineering Co., stokers, at $2,519; Fairbanks-Morse, track scale, at $1,352; Gray & Bowman, tunnel, hydraulic lift, industrial track bunkers, elevated track, grading, etc., at $10,474; Heine Chimney Co., chimney, at $3,751; Frank Sullivan, outside piping, at $6,359; Frank Sullivan, plumbing, at $1,684; Gray & Bowman, wrecking old boilers, at $60. Total, $70,351.

Chicago, Ill.—Conduit—John W. Farley & Co., at $78,000, for the construction of a 12x16 ft. concrete conduit, for draining the west arm of the south branch of the Chicago river. The conduit will connect the west arm of the river with the Western Ave. sewer.

Abilene, Kan.—Sewer—Lyon & Snider, Salina, Kan., for the construction of the sewer in district No. 6 on North Olive and Kuney Sts.

Caney, Kan.—Sewer—Johnson & Hyatt, for the construction of a sewer in this city.

Omaha, Neb.—Sewer—National Construction Co., for the completion of the Mud creek sewer.

Portales, N. M.—Sewer System—S. J. Mathews, Kansas City, Mo., for the construction of a new sewer system, electric light and water works.

Syracuse, N. Y.—Sewer—John W. Davin, at $10,303, for the construction of a 20-in. sewer in Roby, Elsner, Dwight and other strets in the Fourth ward.

Syracuse, N. Y.—Sewers—Michael J. Gleason, for the construction of small sewers of vitrified pipe in Greenway Ave., Willis Ave., Avery Ave., and North Franklin St.

Erie, Pa.—Sewer—Dennis O'Brien, for the reconstruction of the sewer extending 550 ft. west in Fourth St., from the Millcreek intercepting main sewer, at $1.20 a ft. for laying 15-in. pipe, $.35 for 6-in. pipe, $1.40 for Y or T branches, and $40 for manholes.

Salt Lake City, Utah.—Sewer Extension—Bids were opened Feb. 4 by the Board of Public Works, for constructing Sewer Extension No. 220, the contract being let to the James Kennedy Construction Co., at the following bid: Excavating and backfilling, 50,632.96 cu. yds., per ..... $ 1.45

Vit. pipe, incl. 4" y's per lin. ft.—

6" 276.0 lin. ft.	0.25
8" 32,234.7 lin. ft.	0.48
10" 22,545.0 lin. ft.	0.651
12" 9,564.0 lin. ft.	0.80
15" 2,481.0 lin. ft.	1.20
Manholes, each, 160	70.00
Flush tanks, each, 61	145.00
Total	$134,267

Salt Lake City, Utah—Sewer—James Kennedy Construction Co., of this city, at $33,730, for the construction of sewer extension No. 249. Bids were opened Feb. 4.

Albuquerque, N. Mex.—Sewer System—Ripley, Hassleman & Missue, Pueblo, Colo., at $60,000, as a sub-contract from Glass & Fischer, for the construction of that portion of the sewer system beginning at the corner of Fourth St. and Stover Ave. and running to Seventh St.

EXCAVATION, MISCELLANEOUS, MATERIALS.

Joliet, Ill.—Light & Power—Sanitary District, Chicago, Ill., at $.01 per kilowatt hour, for furnishing electric light and power to the Illinois state penitentiary at this city.

New Orleans, Ia.—Oil House—General Contracting Co., New Orleans, La., at $1,498, for the construction of an oil house in this city.

West Boylston, Mass.—Electric Light Plant—Delta Electric Co., Barton place, Worcester, Mass., at $13,479, for the construction of the electric light plant at this city. The contract includes the construction of pole lines, substation and what other electrical construction needed for the lighting plant. The plant is to be completed by July 1.

St. Louis, Mo.—Pumping Machinery—R. D. Wood & Co., Philadelphia, Pa., for the installation of the pumping machinery in the new sewage pumping station to be located at the foot of Park View Ave.

Kearney, N. J.—Cells—Stewart Jail Works Co., Cincinnati, O., at $1,965, for the construction of five steel cells in the basement of the Town Hall in this city. The work includes all steel work for five men's cells, two women's cells and 1 padded cell, to be constructed of mild Bessemer steel. Bids were opened Feb. 1.

Paterson, N. J.—House—Frank B. Gilbreth, Inc., 60 Broadway, New York, N. Y., for the construction of the four-story and basement apartment house, to be erected at the corner of Clark and Ward Sts., for Isaac Wrubel, Middletown, Conn. The building will contain three houses of 40 apartments and will be constructed of concrete foundations, brick and stone walls of ornamental design, tar and gravel roofing, to be complete in all respects, with modern plumbing, electric wiring, steam heating, fire escapes, etc. William D. Johnson, Inc., Hartford, Conn., is the architect.

Paterson, N. J.—House—Frank B. Gilbreth, Inc., 60 Broadway, New York, N. Y., for the construction of the new apartment house to be erected on the south side of DeGrasse St., east of Hamilton St., in this city, by Isaac Wrubel,

Middletown, Conn. The house is to be equipped with modern improvements. William D. Johnson, Inc., Hartford, Conn., is the architect.

Brooklyn, N. Y.—Warehouse—Turner Construction Co., 11 Broadway, New York, N. Y., for the general construction of a 10-story and basement reinforced concrete warehouse to be built for the Pioneer Warehouse at 37-39 Flatbush Ave., Brooklyn. The building will be 40x 75 ft. in plan, and will have a brick veneer on the front. Louis L. Firuski is the owner and J. G. Glover is the architect. Work will be started May 1.

New York, N. Y.—Library—Cobb Construction Co., 47-49 Liberty St., New York, N. Y., at $543,750, for equipping and furnishing the New York Public Library.

Wilson, N. Y.—Light and Power Plant—Conant-Bryant Co., Buffalo, N. Y., for the construction of a modern electric lighting and power plant to be built in the town of Wilson. The contract calls for street lighting by the use of incandescent lamps on the residence streets and for 2,000 candlepower arc lights in the business section.

Dayton, O.—Lead—Dayton Supply Co., at $4.89 per 100 lbs., for furnishing 15 tons of fine pig lead for caulking pipes in the summer time for the water works department.

Pittsburg, Pa.—Lights—Sunlight Illuminating Co., for the incandescent lighting on the city streets.

Pittsburg, Pa.—Structural Material—American Bridge Co., for furnishing about 2,000 tons of structural material for the ore docks that the Cincinnati, Hamilton & Dayton Railroad Co. will build in Toledo, O.

Dallas, Tex.—Clearing Timber—McCord & Hieatt, at $4 per acre, for the clearing of the timber acreage in White Rock reservoir site north of the Garland road. The wood is the basis.

Pasco, Wash.—Pumping Plant—Kilbourn & Clarke, Seattle, Wash., for the installation of a pumping plant for the Columbia River Orchards Co., at Columbia orchards, near Wahluke, on the Columbia river. The plant will have a total capacity of 40,000 gals. per min. and is to furnish water for a 15,000-acre fruit land tract.

Hamilton, Ont.—Supplies—Following contracts have been awarded for furnishing the annual supplies for the waterworks, sewers and Board of Works Departments: Cement, Canadian Portland Cement Co., at $1.50 per barrel; lime, E. J. Guest, at $0.16 per bushel; timber, M. Brennen & Sons, at $27.75 per 1,000 ft.; sewer brick, Ollman Bros., at $8 per 1,000; castings, Gartshore-Morison Co., at $2.05 perd 100 lbs.; iron pipe, Gartshore-Morison Co., at $34 per ton; gate valves, Kerr Engine Co., Walkerville, at $9 for 6-in. valves, $36 for 12-in. valves; pig lead, Adam Hope, at $3.53 per 100 lbs.; lead pipe, Canada Metal Co., at $4.35 per 100 lbs.; hydrants, Canada Foundry Co., at $43.12 each; sewer pipe, Toronto & Hamilton Sewer Pipe Co.; paving brick, The Paving Brick Co., Massillon, O., at $26.50 per 1,000; gravel, E. New, except the district east of Sherman Ave.; wooden blocks, United States Preserving Co., at $1.95 per sq. yd.; brass, London Brass Co., at $3,000.

PROJECTED WORK.

Bridges.

Items Arranged Alphabetically by States.

Van Buren, Ark.—Waddell & Harrington, Engineers, of Kansas City, Mo., are to prepare plans for the construction of the proposed free bridge over the Arkansas River, between Fort Smith and Van Buren.

San Diego, Cal.—County Supervisor John Griffin has decided upon the erection of a $6,000 bridge over the Santa Margarita Creek, at the Ysidora crossing.

San Francisco, Cal.—Committee of the College Hill Improvement Club has been appointed to present plans to the County Supervisors for the construction of a bridge from Richland Ave. to Miguel St., connecting the Fairmount district and College Hill.

Washington, D. C.—Ralph Cameron, Arizona Delegate in the House of Representatives, has secured an appropriation from Congress of $50,000 for the construction of a bridge over the Little Colorado River at Tamsero, 60 miles north of Flagstaff, Ariz.

Washington, D. C.—Bill has been introduced into Congress by Representative Dalzell, authorizing the construction of a bridge over the Monongahela River, between the boroughs of Wilson and Glassport, Pa.

Cedar Rapids, Ia.—City Council is considering the construction of a bridge over the river at Third Ave.

Glasgow, Ky.—Barren and Allen Counties are making preparations for the construction of a new bridge across the Barren River at the ford near Port Oliver. Work will probably be started in the spring.

St. Joseph, Mich.—City is considering the matter of borrowing $20,000 to aid in the construction of the new bridge or viaduct along Wayne Road over the Michigan Central R. R. tracks and the bayou. The structure as planned is to cost $42,000.

Bowling Green, Mo.—County is considering the construction of a new bridge at Bradley's Ford. C. H. Harris is County Engineer.

Jefferson City, Mo.—Engineers are making surveys for the construction of a bridge over the Missouri River for the new interurban now under construction from Jefferson City to Columbia and Fulton. The Jefferson City approach will be just south of Bolivar St.

New London, Mo.—County Commissioners have decided to construct a new bridge over Spencer Creek at a point northwest of Elk Springs.

Fremont, Neb.—Board of Supervisors have approved the plans on file at Omaha for the new bridges under contemplation for Dodge County during 1910.

Mays Landing, N. J.—Board of Trade is taking steps to secure the construction of an overhead bridge at Estelville Road crossing.

Paterson, N. J.—The Philadelphia & Reading Ry. is to construct a new bridge at this place to eliminate a grade crossing.

Trenton, N. J.—Information has been received at this place to the effect that the New Jersey & Pennsylvania Traction Co. is arranging for the construction of two additional steel spans across Stoney Brook on the Princeton line to double the length of the bridge.

Trenton, N. J.—The Washington's Crossing Park Commission has appointed an executive committee to take up the matter of constructing a park on each side of the Delaware River at the point where Washington and the Continental Army crossed and to build a bridge connecting the parks.

Artesia, N. Mex.—Committee of the Commercial Club and the County Engineer have selected a site for the construction of the proposed bridge over the Pecos River three miles from the city.

Buffalo, N. Y.—Plans are under way for the construction of a bridge over the Buffalo River at Abbott Road. The structure will be lift type. Plans have already been completed for a new structure to replace the old bridge at Michigan St. It will cost $90,000 and is to have two spans.

New York, N. Y.—Public Commission have selected 179th St. as the New York terminal for the new bridge across the Hudson River, to connect with New Jersey.

Syracuse, N. Y.—Council is soon to order the construction of two bridges over Onondagua Creek, one at Dickerson St., to cost $11,000, and the other at Brighton Ave., to cost $7,500.

Medford, Ore.—City is planning the construction of another bridge over the Bear Creek in order that the east side sewers may connect with the trunk sewer on the west side running to the septic tank north of the city.

Sellwood (P. O. Portland), Ore.—Residents of this suburb are agitating the construction of a new bridge across the Williamette River to connect with South Portland.

Reading, Pa.—County is making an expenditure of $50,000 for the construction of bridges during 1910; $37,500 will be used for the reconstruction of Weigner's and Virginsville bridges and for borough bridges at Blue Marsh, Kempton, Wyomissing and Ruth's. The balance of the amount will go for repairs.

Houston, Tex.—Plans for the proposed Buffalo Bayou Bridge at San Jacinto St., have been presented to the City Council by F. L. Dormant, Engineer. The cost of the structure will probably come as high as $125,000 instead of $80,000, as first supposed.

Ogden, Utah.—Plans and specifications for the proposed bridge mentioned in our Feb. 2 issue, have been approved. The plans call for a 100-ft. span 18 ft. in width, to be constructed by the Utah Light & Railway Co., under direction of Engineer E. H. Dundas, Salt Lake City, Utah.

Waitsburg, Wash.—A foot bridge is to be constructed over the Touchet River at this place to serve until the Boston Ave. bridge, which was recently destroyed by flood, can be rebuilt.

Roads and Streets.

Items Arranged Alphabetically by States.

Redding, Cal.—Board of Supervisors have been petitioned to rebuild and repair the west side road from this city through Keswick, Copley and Corn, to Kennett; also asking that a new road be viewed and built from Kennett to Gregory, on the west side of the river, a distance of 18 miles.

San Diego, Cal.—City Council has recommended the granting of the petition for the paving of F St., from the water front to 25th St., a distance of nearly two miles.

Stockton, Cal.—Highway Commission has approved plans for the improvement of almost 100 miles of county roads under the bond act, which provides about $2,000,000. The roads to be improved are as follows. Cherokee lane to Eight Mile House, distance 8 miles; Waterloo road to Waterloo, distance 7 miles; Linden road to Linden, distance 12 miles; Copperopolis road to turn at Bollinger's, distance 8 miles; Farmington road to Robinson's lane, distance 12 miles; Mariposa road to east line of section 3, distance 12 miles; French Camp road to the intersection of Hogan road, distance 10 miles; West Side road to county line, distance 25 miles.

Ventura, Cal.—A survey is being made of the proposed Avenue Good Roads Division. When surveys are completed the Supervisors will submit a bond issue to the voters of the district.

Denver, Colo.—A nine-mile wagon road will be built from a point midway between Wagon Wheel Gap and Creede to the Wheeler national monument, at a cost of $15,000.

Aurora, Ill.—Board of Public Works has ordered the paving of Garfield Ave., State St., and East and West Park Places.

Bloomington, Ill.—Township Clerk Reeves of Bloomington Township has received a petition signed by 128 voters requesting that the question of building a hard road on the East Clay St. road east of the city be submitted to the voters at the primary election next month.

Champaign, Ill.—Board of Local Improvements is getting the preliminaries ready for the matter of paving Healey St., between Neil St. and Prospect Ave.

Elgin, Ill.—Board of Local Improvements has adopted a resolution for the proposed South State St. pavement. The improvement extends from Washburne St. to the north asylum gates. The material is to be brick with a sand filler and the estimate is about $20,000.

Freeport, Ill.—Board of Local Improvements has decided to pave Adams St. with brick.

Moline, Ill.—Board of Public Improvements has approved the paving of 18th St., from First to Third Ave., with brick, at an estimated cost of $5,133, and the paving of 19th St., from First to Third Ave., with brick, at an estimated cost of $5,119.

Moline, Ill.—City Engineer will prepare new estimates on the cost of paving 16th St., from 11th to 19th Ave., with brick.

Oaklawn, Ill.—City Council will consider the proposed paving of Cannon Ave., from Vermilion to Smith Sts., on Feb. 22.

Fort Wayne, Ind.—City Engineer has been instructed to prepare plans for the construction of sidewalks on the north side of Bell Ave., from Fox Ave. to the first alley west.

Goshen, Ind.—Resolutions of necessity for the paving of the intersections on cross streets between Main and Sixth Sts., on Washington, Jefferson, Madison, Monroe, Douglas, South Main from Douglas to Sixth, Clinton from Fifth to Sixth, South Third from Lincoln Ave. to Washington, have been introduced in the city council.

Richmond, Ind.—Wayne County Commissioners have been petitioned to authorize the construction of a macadam street with cement retainers on the National road, west of West Fifth St., to the road which is the boundary line of Wayne and Center Townships.

Atlantic Ia.—City Council has received plans from the Iowa Engineering Co. of Clinton for combination asphalt and brick paving and concrete gutter.

Colfax, Ia.—Steps have been taken to improve the mile stretch of high graded road leading into the city from the north. The Commercial Club is back of the movement.

Dighton, Kan.—The Industrial Club of this city is back of the construction of the proposed road from Salina via Great Bend, and then west through Barton, Rush, Ness, Lane, Scott, Wichita and Greeley Counties in the state of Kansas.

Hutchinson, Kan.—A petition is being circulated for the construction of a permanent road between Buhler and this city.

Wichita, Kan.—City Council has declared it necessary to pave Riverside Ave., from Buffum Ave. to Beal Ave., with macadam.

Haverhill, Mass.—Municipal Council intends to reconstruct and macadamize a number of the main thoroughfares of the city this year.

Grand Rapids, Mich.—City Engineer Anderson has estimated the cost of street improvements, including resurfacing, grading, graveling and paving, to be done this summer, at $720,000.

St. Charles, Mich.—St. Charles Township, Saginaw County, proposes to spend $10,000 on road improvements. An election will be held April 10 to vote on the proposition.

Sault St. Marie, Mich.—H. L. Parsible, Clerk of Chippewa County, will sell bonds in the amount of $100,000 for the construction of roads.

Waseca, Minn.—City will pave three residence streets or 14 blocks, with brick, this year.

Jackson, Miss.—City has voted the issuance of $253,000 worth of municipal improvement bonds.

Carthage, Mo.—A proposition is being agitated to extend a good wagon road alongside the White River Railway for a distance of 10 miles or more east of town.

Kansas City, Mo.—Commissioners of Jackson County are planning on spending $100,000 for the improvement of roads and an equal amount to build new ones this year.

Kansas City, Mo.—Plans are being made by the Warden of the Kansas Penitentiary at Lansing and in the Wyandotte and Leavenworth County Court Houses for the construction of the rock road from this city to Leavenworth.

St. Joseph, Mo.—Farmers, autoists and County Court will co-operate in a movement to construct a road around Croy hill at an estimated cost of $4,500.

Hastings, Neb.—City Council has passed an ordinance calling a special election on March 8 to give authority for the issuance of $50,000 of intersection paving bonds.

Lakewood, N. J.—City will build a parkway that will not cross a public road and which will be about 8 miles in length. A large grand stand is to be erected. It is planned to have the work completed by October. It is estimated to cost more than $500,000.

Binghamton, N. Y.—An ordinance has been introduced in the city council declaring the intention of the common council to construct a brick pavement on Conklin Ave., from the termination of the present Conklin Ave., pavement to De Russey St.

Matteawan, N. Y.—Village Clerk B. I. D. Rosa will sell, Feb. 23, bonds in the amount of $30,000 for paving purposes.

Williston, N. Dak.—City will hold an election Feb. 21 to vote on the issuance of $50,000 worth of public bonds.

Cincinnati, O.—An ordinance has been introduced in the City Council asking the City Engineer to submit to Council plans for widening Ludlow Ave., between Clifton Ave. and Brookline, from 60 to 80 ft.

Dayton, O.—City Council has been petitioned for the grading and graveling of Reasor Ave., from Main to Stillwater.

Defiance, O.—Petition is being circulated along East Second St. asking for the paving of that thoroughfare from the Auglaize river bridge to the East Side school building.

Mansfield, O.—Following work was brought before the City Council: To recommend the widening of Ohio St., from Vennum Ave. to Poplar St.; petition asking that Waring Ave. be improved from Franklin to Adams St., by paving with brick or block to a width of 20 ft.; petition to open and widen Arthur Ave., from First St. to Glessner Ave.; to prepare plans and estimates of the cost of improving Sturges Ave., from Park Ave. to West First St., with brick, asphalt or sheet asphalt; to prepare plans and estimates of the cost of improving the alleys west and north of the high school building by paving with brick or block; to have prepared plans and estimates of the cost of improving Foster St., from Park Ave. to Fourth St., by paving the roadway with brick or block and laying a new sidewalk; to prepare plans and estimates of the cost of improving North Franklin Ave., from Fourth to Sixth St., by paving with brick or block; to prepare plans and estimates of the cost of improving West Fourth St., from Main to Sycamore St., by paving with block asphalt, brick or sheet asphalt; to prepare plans and estimates of the cost of improving Benton St., by the construction of a new sidewalk of cement or stone on the west side.

Mansfield, O.—City Council has been petitioned for the paving of Waring Ave., with brick to a width of 20 ft.; also for the widening and improving of Arthur Ave.

Altus, Okla.—City has voted the issuance of $200,000 worth of municipal improvement bonds.

Chandler, Okla.—Creek Township has voted $5,975 bonds for road building and will construct four cross country roads from border to border. Three north and south roads leading to Bristow and one east and one west road leading to the border of Kellyville are planned.

Portland, Ore.—City Council has provided for the widening of Alberta St. to a width of 60 ft. The street will probably be paved from Union Ave. to East 33d St.

Springfield, Ore.—J. H. Rhoads, Recorder of the Common Council, will sell bonds, Feb. 28, in the amount of $10,000, for improvements.

Chester, Pa.—City will hold an election Feb. 15 in the borough of Prospect Park to vote on the issuance of $65,700 bonds for the purpose of grading and macadamizing a number of streets in the borough.

New Castle, Pa.—City Council has passed the following ordinances: To grade and pave East Main St., in the Third ward, between Pine St. and Crawford Ave.; to grade and pave County Line St., in the Third ward, between Walnut St. and Ray St.

Philadelphia, Pa.—Following ordinances are before the City Council for the grading of streets: Twenty-second ward, Wissahickon Ave., from Johnson St. to Hortter St.; 38th ward, 25th St., from Lehigh Ave. to Cambria St.; 40th ward, 68th St., from Baltimore & Ohio Railroad to Cobb's Creek Parkway; Chester Ave., from 65th St. to Church lane; 57th St., from Kingsessing Ave. to Greenway Ave.; 43d ward, Camac St., from Butler to Pike St.; Old York road, from Erie Ave. to Wingohocking St.; Hunting Park Ave., from Fifth St. to 6th St.; 46th ward, 59th St., from Spruce to Walnut St.; Alden St., from Chestnut to Sansom St.; Locust St., from 59th to 60th St.; Irving St., from 59th to 60th St.

Youngstown, Pa.—Property owners on Hayes Ave. will soon present a petition to the City Council asking that that thoroughfare be paved this spring.

Dallas, Tex.—City will soon let contracts for the paving of East Side Ave.

El Campo, Tex.—Preliminary steps have been taken for the purpose of organizing a good roads and drainage association by citizens of this city.

Fort Worth, Tex.—Street Commissioners have announced that they will pave during 1910 about 25 additional streets. The streets named in the list are: East Weatherford, East Belknap, Samuels Ave., West 2d, West 7th, from Throckmorton to the City Park bridge; Summit Ave., Penn St., Hill St., Hurley Ave., Alston Ave., College Ave., Lipscomb St., Jennings Ave., Missouri Ave., Bessie St., 8th Ave., East Front St., Terrell Ave., North Main St.

Waxahachie, Tex.—City Engineer has established the grades of the public roads of this city, which are to be graveled.

Seattle, Wash.—King County will spend $575,000 for the construction and improvement of country roads this year.

Milwaukee, Wis.—A petition is before the City Council asking for a parked driveway out Cedar St., and the Watertown plank road to the state fair grounds.

Sewers.

Items Arranged Alphabetically by States.

Wilmington, Del.—City Council has been asked to appropriate $200,000, so that plans can be made at an early date for the proposed street and sewer improvements.

Pocatello, Ida.—City is contemplating the construction of a more complete sewerage system.

Chicago, Ill.—Board of Local Improvements has passed an ordinance providing for the construction of a tile sewer in West 108th St., from Wentworth Ave. to point 530 ft. west of Princeton Ave.

Danville, Ill.—Board of Local Improvements has announced that work on the Oaklawn sanitary sewer system will be started early in the spring.

Lockport, Ill.—Board of Local Improvements has passed resolutions for the construction of a trunk sewer system in the city.

Moline, Ill.—Board of Public Improvements has approved the laying of sewers in the southwest district of Fifth ward sewer district at an estimated cost of $14,945, and the laying of sewers on 18½ St., from 13th to 14th Ave., at an estimated cost of $2,507.

Moline, Ill.—Bluff Improvement Association has asked the city to construct a sewer in the southeast district of the city along 27th St.

Momence, Ill.—Plans have been made for the construction of sewers at an estimated cost of $46,000. The work will include concrete and vitrified pipe sewers, bulkhead, combined flush tanks, manholes and catchbasins. G. F. Harney, Momence, is the Engineer in charge.

Rockford, Ill.—Plans are being prepared by the City Engineer for the construction of another trunk sewer system. The sewer will be located in the Northeast Sewer District and will have over a mile and a half of large pipe. It will empty into the river at the foot of St. Clair St.

Fort Wayne, Ind.—Board of Public Works has instructed the City Civil Engineer to prepare plans for a sewerage system for North Wayne Heights. The Engineer was also instructed to prepare plans for sewers in Forest Park.

Tolleston, Ind.—Town Board is preparing to go ahead with the construction of a system of sewers. The cost of the system is estimated at $200,000.

La Porte, Ind.—City Council has decided to submit the question for a public sewer to the voters of this town at the city election to be held March 28.

Hays, Kan.—City has engaged the W. K. Palmer Co., engineers, 718 Dwight Bldg., Kansas City, Mo., to make survey and to prepare plans for the construction of a sanitary sewer system for this city.

Wichita, Kan.—Petitions will probably be circulated soon for the construction of a sewer system from the north end of town to the river. It is estimated that the system would cost about $250,000.

Calumet, Mich.—City Council has passed an ordinance for a tile sewer in Stewart Ave., from 113th St., to alley north of 115th St.

Detroit, Mich.—City is considering the construction of two trunk sewers to relieve the north, northeast and northwest sections of the city at an expenditure of more than $1,000,000.

Flint, Mich.—Bids for the construction of sewers on Avon and Court Sts. and Fifth Ave. have been rejected and the Street Commissioner has been instructed to construct the sewers.

Flint, Mich.—City Council has declared it necessary to construct sewers on Warren, Dayton and Baker Sts., and Hamilton Ave., from Saginaw to Bonbright St., and a storm sewer on Hamilton Ave. over the same territory.

Grand Rapids, Mich.—City Engineer Anderson has estimated the cost of constructing sewers in the city during the coming summer at $30,000. Following is a list of sewers for which approximate estimates were submitted: Horton Ave., Seventh St., Shoemaker alley, Ninth St., Pine St., Laurel Ave., North College Ave., Arthur Ave., Watrous Ave., Griggs Ave., Quimby St. and California St.

Austin, Minn.—City Council has voted to construct a new storm sewer on St. Paul St., between Water and Bridge Sts.

Springfield, Mo.—A bill has been introduced in the City Council establishing sewer district No. 3 of section 6 of the main sewer.

Beatrice, Neb.—City is contemplating the construction of a sewer system.

St. Paul, Neb.—Mayor H. J. Paul is working on a plan by which a sewerage system can be installed in this city.

Wymore, Neb.—The W. K. Palmer Co., engineers, 718 Dwight Bldg., Kansas City, Mo., has been engaged to make surveys and to prepare plans for a sanitary sewer system.

Nogal, N. M.—Engineer W. P. Bullock of Kansas City, Mo., has agreed to furnish plans for the proposed sewer system for this city.

Binghampton, N. Y.—City Council has adopted an ordinance providing for the construction of a sewer in Moeller St., from Court St. for a distance of 1,280 ft., at an estimated cost of $3,100.

Hudson, N. Y.—A sewage disposal plant is to be built by the state for the Training School for Girls. Plans and specifications have been prepared.

Newburgh, N. Y.—A petition was presented to the City Council for the construction of a trunk sewer through Robinson Ave., Broadway and Lake St., from First St., to connect with the West Newburgh trunk sewer near the Muchattoes Lake ice houses.

Rochester, N. Y.—Plans and an ordinance for a new outlet sewer to take the place of the present Lake Ave. outlet are being prepared in the City Engineer's office. The new sewer will run through Dewey Ave. to Ridgeway Ave., along that thoroughfare to and across Lake Ave., and then to the river along an easement now held by the city.

Mansfield, O.—City Council has been petitioned for the construction of an 8-in. sanitary sewer on the west side of South Franklin Ave. The council has adopted a resolution ordering the director of service to prepare plans and estimates of the cost of improving Hammand Ave., from Chestnut St. to Mansfield Ave., by placing an 8-in. sanitary sewer on both sides of the street.

New Philadelphia, O.—State Health Board has ordered this city to complete its sewer system by Jan. 1, 1911. About one-half of the system is already completed.

Wilmington, O.—City Council has decided to submit to the electors of this city the proposition of constructing a sewage system. The estimated cost of the proposed system is $95,000.

Youngstown, O.—City Council has been petitioned to sewer Delaware Ave.

Portland, Ore.—Plans are being drawn for a sewer system to drain the Woodstock and Mount Scott district that will embrace about 10 sq. miles of territory. Plans are to be drawn for a sewer system to drain the Rose City Park, Center Addition and Rossmere district.

Allentown, Pa.—County Engineer Robert S. Rathburn is preparing plans and specifications for the power house and sewage disposal plant at the County Home.

Chester, Pa.—Plans have been presented to the sewer committee of the City Council for a new sewer system, including a disposal plant that will cost about $1,500,000.

Philadelphia, Pa.—Bureau of Surveys has authorized the construction of about 60 branch sewers, which will cost in the neighborhood of $100,000.

Florence, S. C.—City has sold $70,000 worth of bonds for the installation of a sewerage system. Plans have been accepted and the work will begin some time in March.

Franklin, Tenn.—City Recorder H. B. Fowlkes will sell bonds in the amount of $35,000, Feb. 14, for sewer and water construction.

Morristown, Tenn.—Plans are in preparation for the construction of new sewers at an estimated cost of $40,000. Contracts will be let as soon as plans have been made. The work will include a septic tank and about 7 miles of laterals. H. F. Nayer, Morristown, has charge of the work.

Morristown, Tenn.—City Treasurer W. C. Bushong will sell bonds, Feb. 18, in the amount of $40,000 for sewering.

Wenatchee, Wash.—City Council has passed a resolution declaring it necessary to construct sewers throughout the city at an expense of $250,000. The work will require the laying of about 16½ miles of sewers. Bids will be called for about April 1.

Winnipeg, Man.—Board of Public Works has been petitioned for the construction of a sewer on Portage Ave., between Main and Carlton Sts.

Water Supply.

Items Arranged Alphabetically by States.

Dorris, Cal.—Trustees of this place are negotiating with the United Iron Works of Oakland, Cal., for a system of water works estimated to cost between $7,000 and $10,000. Several donations have already been received.

Maricopa, Cal.—James Wagy, Los Angeles, Cal., is to install a $50,000 water works system in this city. The system will be operated entirely by gravity and includes the construction of a 17-mile pipe line.

Pasadena, Cal.—The proposition to have municipal ownership of water works, recently vo-

The Study of Engineering-Contracting in Engineering Colleges.

Four years ago this journal urged editorially that engineering schools should establish courses in engineering-contracting in addition to their familiar courses in civil engineering, mechanical engineering, electrical engineering, etc. We have to thank Professor M. E. Cooley of the University of Michigan as the only engineering educator enough interested at the time to give attention to our plea. The idea has grown more familiar in the intervening years. A number of engineering educators have been thinking over and tentatively planning possible courses in engineering-contracting. A more general recognition of the possibilities of such a course of training exists among both engineering educators and engineering contractors. We are reminded of this at the present time by the perusal of the recently published discussions of some dozen teachers of engineering and well known men in the contracting business on a paper read by Mr. W. R. Harris at the December meeting of the American Society of Engineering Contractors. Mr. Harris' paper was printed in full in our issue of Jan. 12, 1910, so that any of our readers who are interested can turn to it. We shall mention here some few points in the discussion.

There was little question on the part of any of the men who took part in the discussion that engineering schools will be drawn upon for recruits to the business of engineering contracting; neither was it disputed that the value of these recruits depended upon the amount of their special knowledge of the business. The facts could hardly be otherwise, of course. But there was much difference of thought whether this special knowledge should, or could, be taught in school or left to be gained altogether in actual work after graduation, and, if taught in school, in what manner the teaching should be done. There can be no surprise at this difference of belief. It exists today, in part at least, in regard to the old established courses of civil, mechanical, electrical and mining engineering, in which, if anywhere differing notions should have in long years been jostled down to settled opinion.

Numerically the stronger notion among those who discussed the subject seemed to be that doubtful results would follow schooling in engineering-contracting. It is a notion that requires some analysis, it seems to us, before it is accepted. If it is contended that a school course will not make a trained engineering contractor, no one is likely to gainsay the fact. Neither do the older courses, long a part of the engineering college training, turn out trained civil, mining, mechanical or electrical engineers. Indeed, not too many capable engineering contractors have been developed by training both in and out of school. We do not imagine that this is the real thought of those who doubt the efficacy of schooling in engineering contracting. They think rather that the training in school cannot have the vital force of training in actual work. As one speaker said: "It is only playing at contracting. Failure would not strike home as it would if real dollars were lost." This is wholly true. It is just as true in the real designing of a bridge or a piece of machinery as compared with the school designing of the same structure or machine.

If we believe that specializing in bridge work or in machine design in school makes a graduate better fitted to be useful in a bridge works or in a machine works, then we must believe a special school training in engineering contracting will make a graduate better fitted to be useful to an engineering contracting firm. There is only one way of escaping this conclusion and that is contending that engineering contracting cannot be taught in school. Can such a contention be upheld? We think not. A student can be taught in the law of contracts and specifications; he can be drilled in taking off quantities and making estimates; he can be trained in recording and analyzing costs; he can be instructed in the general laws of business and of management engineering; he can even be schooled to some extent in the "human element" so interestingly discussed in the paper by Mr. DeWitt V. Moore, which is printed elsewhere in this issue. The above items by no means exhausts the schedule of things possible of being taught, and the boy who has had them taught him is better fitted to be useful as an employe of an engineering contractor than one who has not. If he knows little else, he at least knows that a knowledge of the subjects named is a part of the business and is so far ahead when he gets to learning from actual work.

There is another feeling noticeable throughout some of the printed discussions: That nothing is equal to practical experience and that practical experience cannot be taught. It it true that nothing wholly equals actual experience; it is only partly true that experience cannot be taught. General experience can be taught. It is general experience that a man works best when his pay increases in proportion to his output. This fact and other facts based on general experience is knowledge just as useful if gained while a college freshman as if gained after a year or two on the job. They can all be taught in school.

Another objection to college training in engineering contracting which is urged several times in the discussion is that the present engineering courses are too much crowded with work to permit the addition of more work. Perhaps. We have a notion that the average engineering curriculum could be cut down to give place to engineering contracting studies with considerable practical advantage to the student. Be this as it may, what has it to do with the matter? It is not proposed to add some score of engineering contracting studies to the present courses in civil or mechanical or electrical engineering, but to establish a *separate* course in engineering contracting. Or if anyone holds that the engineering contractor cannot possibly do without all the studies laid down for the engineering courses proper, add a two years' post-graduate course in engineering contracting. Some boys will stand for it.

The facts are, as they appear to us, that engineering-contracting can be taught in college just as well as can civil, electrical or mechanical engineering; that the results will be just as good in engineering contracting as in those older courses; that the teaching should be done in a course as separate and independent of the other courses as they are of each other; that post-graduate teaching in engineering contracting, like post-graduate teaching in any other line of study, should be left to the exceptional student who can afford the time and money for it.

In beginning these remarks we mentioned that the idea of special schooling in engineering-contracting in our technical schools was gaining ground. It is, but it will have to gain much more ground before we may expect to see engineering-contracting courses established in our technical schools. The great majority of engineering educators do not see that engineering-contracting is a distinct branch of engineering work, worthy because of required training and knowledge to be classed with other branches and the few who do see it cannot overrule the majority. We note that Prof. Haring in his discussion of Mr. Harris' paper expresses a different opinion, but we shall let our opinion stand as stated for the present. Again, engineering educators have not felt the call for school trained men in engineering-contracting. This, coupled with the fact that few engineering schools have money to spare to inaugurate and maintain the new course, furnishes another obstacle.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

The Use of Reinforced Concrete in the Subways Recently Constructed on the Track Elevation Work of the Illinois Central Railroad Co. in the City of Chicago, Ill.

When arrangements were made by the Illinois Central R. R., in the fall of 1906, to start the track elevation work in the city of Chicago, extending south from 67th to 87th streets, investigations were made and a considerable number of designs worked up for subway bridges. In this territory there are six main tracks and from two to three side or passing tracks, making a width of the bridges, including the space left for suburban trains, about 130 ft.

Fig. 1—General View of Completed Subway Bridge 130 Feet Wide.

The original ordinance of 1902 was amended so that supports could be provided in the middle of the streets, thus shortening the spans. This made it possible to build a bridge in which the floor could be waterproofed and do away with girders projecting above the track levels. The use of center supports made it possible to study a number of alternative plans.

After going into the matter carefully the most desirable form was decided upon as being a reinforced concrete slab supported on plain concrete abutments and intermediate reinforced concrete arched girders. For the abutments the mixture was 1:3:6, the larger aggregate being crushed limestone. For the slabs the mixture was 1:2:5. A general view of one of the completed structures is given in Fig. 1, and a detail of the slabs is shown in Fig. 2.

The slabs were made of a width of 6 ft. and 3 in., as this was about as heavy a slab as could be handled with the derricks available, and would also give a certain number of slabs of the same width if the subways were constructed for the full width of the right of way. The large slab weighs 33 tons, being 25 ft. long, 6 ft. 3 ins. wide and 34 ins. deep. The small slab weighs nearly 8.5 tons, being 9 ft. 11 ins. long, 6 ft. 3 ins. wide and 18 ins. deep.

The slabs were all designed to carry the standard live load, which is two 187.75-ton engines, followed by a load of 6,000 lbs. per lin. ft. of track, together with the weight of the ballast, track and the slab. The slabs being 6 ft. 3 ins. wide and as it may be necessary at some future time to shift the locations of the tracks, it was considered advisable to distribute the load under the tie for a width not exceeding 9 ft. In designing the slab the steel stress was computed at 12,700 lbs. per sq. in. and the concrete stress at 700 lbs. per sq. in., not including impact. By adding impact as computed by the Illinois Central R. R. bridge department, the steel stress becomes 15,800 lbs. per sq. in. and the concrete stress 800 lbs. per sq. in. Owing to the fact that there will be a minimum of 10 ins. of ballast under the tie, the stresses caused by impact would be materially reduced from what is ordinarily figured on steel bridges without ballast. The impact therefore on these slabs is 50 per cent of the impact for steel bridges. (Mr. Thompson did not state the ratio of deformation between the steel and concrete, but the discussion brought out the fact that it was 12.—Editors.)

The streets all cross the right of way at an angle of about 81°, thus necessitating either some form of skew, or building the bridges at right angle with the street and making the skew with some other form of construction. Finally, it was decided to build the bridges square with the streets and make the skew for the outside tracks with I-beams encased in concrete. The style of supports is shown by Fig. 3. The columns are spaced 12 ft. 6 ins. apart, are 36 ins. square in the center of the street and 30x36 ins. at the curb lines. The transverse arches or cross beams are the same width as their respective columns and have a depth of 36 ins. at the center.

The cross beams are reinforced as simple and continuous beams. The vertical reinforcement of columns consists of 6 upright ¾-in. square bars, with horizontal hooping of ½-in. round rods spaced 6 ins. apart. While the stress in the concrete is only 460 lbs. per sq. in., the cross beam width was required to provide sufficient end bearing for the slabs, and it was thought that any saving made in concrete by reducing the size of the column would be offset by increased form work.

The end slabs were cast in place, together with the coping and false arches, with a pocket provided in the abutments and a seat on the end of the piers, from which to spring the false arches. A study of Figs. 1 and 3, shows the construction clearly. These small seats, or offsets, at the end of the arched piers, also form a bearing for future extension of the arched piers.

Uneven settlement of the footings would produce an uneven bearing for the slabs and might cause their failure so the footing question was studied very thoroughly, with the result that concrete cylinder piers were decided upon. The depth to which it was necessary to go in order to get a good foundation varied from 30 to 35 ft. below the grade of the street, or from 28 to 30 ft. below the lake level. At that depth a dense hard pan was encountered, and the bottoms of the cylinder piers (caissons, they are frequently termed), were dug out in the shape of a bell, so that the bearing on the soil did not exceed 5 tons per sq. ft. The cross supports were constructed as nearly as possible in a continuous operation, without the use of expansion joints, so as to have the whole mass a monolithic body of concrete; the average length of one of these intermediate supports was 130 ft.

The slabs were constructed at a point about six miles from the location of the subways, with company forces. Fig. 4 shows some of the finished slabs in the yard, the side forms being removed. The slabs were numbered in the order of their construction. After 70 large slabs were completed a change was made in their design. The reinforcing bars were bent up at a more obtuse angle and farther from the support. A number of stirrups were put in at each end, extending from the under side of the longitudinal reinforcement, to within an inch of the top of the beam, to better take care of internal stresses in the concrete. This change in design is shown by Fig. 2. In University of Illinois, Experiment Station Bulletin No. 28 (see ENGINEERING-CONTRACTING, July 29, 1908), is given a full description of

Fig. 3—Supports for Subway Bridges Showing Arrangements for Extensions.

tests on two slabs made as shown by Fig. 2, Slab 70. After the test the design was changed.

In placing the large slabs, two derricks were used, as a derrick large enough to handle them was not available at the time. The subways not being at right angles to the railroad tracks it was necessaary at all times, during the placing of the slabs to have two tracks blocked to traffic. This did not cause any delay as the traffic could be shifted from one to another of the eight tracks. No trouble whatever was encountered in placing these heavy slabs.

After the slabs were placed the tracks were laid back, being blocked up temporarily until the waterproofing could be applied and the ballast put on. After the slabs were all placed the entire structure was waterproofed. Preceding the waterproofing all joints running with the tracks were filled with cement mortar. The end joints of all slabs were packed with oakum. On the concrete slabs, after being cleaned and dried, there was applied with brushes a coating of asphalt. This coating was made very thin so that the asphalt would penetrate all the recesses and voids and also form an anchorage for the waterproofing coat itself.

After this priming coat dried, there was applied with mops a heavy coating of an asphalt compound, which had been heated to a temperature of 400° F., and while this material was still hot, a layer of 8-oz. open mesh burlap was carefully laid down. The surface of this burlap was again heavily mopped with asphalt and two more layers of burlap applied in the same manner, making a three-ply burlap mat, all thoroughly saturated, cemented and bound together with the asphalt compound.

After the completion of this mat, the entire surface of the floor was covered with a mastic 1¼ ins. thick. Both the burlap mat and the mastic were carried up the sides of the coping, so that water could not get under the waterproofing material. The top of the mastic was then mopped with a coat of thin asphalt so that any cracks caused by the cooling of the mastic would be filled. This waterproofing has now been on about six months and has given entire satisfaction.

Proposed Standard Specifications for Plain Concrete Drain Tile.*

MATERIALS.

Cement shall meet the requirements of the Standard Specifications for Portland Cement of the American Society for Testing Materials, and adopted by this association (Standard No. 1).

Fine Aggregate shall consist of sand, crushed stone, or gravel screenings, graded from fine to coarse, passing when dry a screen having ¼-in. diameter holes, shall be preferably of silicious materials, clean, coarse, free from vegetable loam or other deleterious matter, and not more than 6 per cent shall pass a sieve having 100 meshes per linear inch.

Mortars composed of 1 part Portland cement and 3 parts fine aggregate by weight when made into briquets shall show a tensile strength of at least 70 per cent of the strength of 1:3 mortar of the same consistency made with the same cement and standard Ottawa sand.

Coarse Aggregate shall consist of inert material, graded in size, such as crushed stone or gravel, which is retained on a screen having ¼-in. diameter holes, shall not exceed in the largest dimension one-half the wall thickness of the tile and shall be clean, hard, durable, and free from all deleterious materials. Aggregates containing soft, flat or elongated particles shall be excluded.

*Committee report presented at the Feb. 21-24, 1910, convention of the National Association of Cement Users.

Fig. 4—View of Slab Yard.

Water shall be clean, free from oil, acid, strong alkalies, or vegetable matter.

PROPORTIONS.

A bag of Portland cement weighing 94 lbs. shall be considered as 1 cu. ft. All concrete shall be prepared and mixed in quantities requiring one or more full bags of cement, and the use of any device for mechanically proportioning the materials is prohibited.

Machine Made Tile, 8 ins. and less in diameter. Tile in sizes up to 8 ins. in diameter shall be made of a mixture of 1 part of cement to not more than 4 parts of fine aggregate (1:4).

10 to 16 ins. diameter. Tile from 10 to 16 ins. in diameter shall be made either from a mixture of 1 part of cement to not more than 4 parts of fine aggregate (1:4), or of a mixture of 1 part of cement to not more than 2 parts of fine aggregate and 4 parts of coarse aggregate (1:2:4).

18 to 30 ins. diameter. Tile from 18 to 30 ins. in diameter shall be made from a mixture of 1 part of cement to not more than 2 parts of fine aggregate and 4 parts of coarse aggregate (1:2:4).

Hand Made Tile, 8 ins. and less in diameter. Tile in sizes up to 8 ins. in diameter shall be made of a mixture of 1 part of cement to not more than 4 parts of fine aggregate (1:4).

10 to 16 ins. diameter. Tile from 10 to 16 ins. diameter shall be made either from a mixture of 1 part of cement and not more than 4 parts of fine aggregate (1:4), or of a mixture of 1 part of cement to not more than 2½ parts of fine aggregate and 4 parts of coarse aggregate (1:2½:4).

18 to 30 ins. diameter. Tile from 18 to 30 ins. in diameter shall be made of a mixture of 1 part of cement to not more than 2½ parts of fine aggregate and 5 parts of coarse aggregate (1:2½:5).

MIXING.

The ingredients of concrete shall be thoroughly mixed dry, sufficient water added to obtain the desired consistency, and the mixing shall continue until the cement is uniformly distributed and the mass is uniform in color and homogeneous.

a. Measuring Proportions. Methods of measurement of the proportions of the various ingredients, including the water, shall be used which will secure separate uniform measurements at all times.

b. Machine Mixing. When the conditions will permit, a machine mixer of a type which insures the proper mixing of the materials throughout the mass shall be used.

c. Hand Mixing. When it is necessary to mix by hand, the mixing shall be on a water-tight platform and the materials shall be turned until they are homogeneous in appearance and color.

d. Consistency. Machine Made Tile. For machine made tile the concrete shall be as wet as can be used and allow the immediate removal of the jackets. The concrete must be used within 20 mins. after the time it is mixed.

Hand Made Tile. For hand made tile the consistency of the concrete shall be such that it will be forced into every part of the mold by jarring or tapping. The concrete must be used within 40 mins. after the time it is mixed. The use of concrete requiring tamping is prohibited.

Fig. 5—Placing Slabs for Test; Illustrating Method of Handling.

e. Retempering. Retempering mortar or concrete—i. e., remixing with water after it has partially set—shall not be permitted.

FORMING.

Under no circumstances shall tile be made in a temperature lower than 40° F. Tile shall be formed so as to prevent laminations or planes of weakness.

Machine Made Tile. The tile shall be made in such a manner as to insure a dense and uniformly packed product with smooth ends and inner surfaces and show water marks on the outer surface (web-like markings indicating free moisture).

Hand Made Tile. Concrete for hand made tile shall be forced into the metal forms by jarring or tapping in such a manner as will obtain a smooth, dense surface and shall remain undisturbed in the form for at least 12 hours.

CURING.

Natural Curing. For the purpose of securing proper curing, the tile shall be protected from the sun and strong currents of air, shall be sprinkled at such regular intervals as necessary to prevent drying, and such other precautions taken as to enable the final set to take place under the most favorable conditions. At least 20 days shall be allowed for curing.

Steam Curing. The tile shall be removed from the molds as soon as the conditions will permit and shall be placed in an atmosphere of steam saturated with moisture for a period of at least 48 hours. The tile shall then be removed and stored for at least 14 days before use, being sprinkled three times a day during the first 7 days. Care to be taken to maintain the temperature at not less than 60° F.

DIMENSIONS

Diameter. The diameter or size of a tile shall refer to the inside diameter and be uniform in all directions. Tile with a diameter of more than 30 ins. shall be reinforced.

Thickness. The thickness of the tile wall shall be uniform throughout and shall not be less than one-tenth of the diameter, with a minimum thickness of ½ in.

Length. The length of a tile shall be uniform at all points and not less than the diameter, with a minimum of 12 ins. and a maximum of 30 ins.

FINISHED TILE.

Finished tile shall be free from cracks and other defects which will appreciably diminish their strengths, and shall give a clear metallic ring when struck with another tile or with a hammer.

Reinforced Concrete Bridge Construction, Track Elevation Work, C. B. & Q. R, R. Co. Chicago.*

The standard type of bridge used for the subways of the Chicago, Burlington & Quincy R. R. track elevation work at Chicago is a ballasted floor bridge, composed of two 24-ft. 3-in. street spans and two 8-ft. 9-in. sidewalk spans, resting upon solid concrete abutments at the street lines and three lines of columns and cross girders, two at curb line and one on the center line of street. The decks proper are reinforced concrete deck girder slabs and the columns and cross girders are also composed of reinforced concrete and rest upon concrete foundation cylinders, extending down to bed rock. The conditions to be met in the design of these bridges were as follows:

(1) Under the city ordinances the subways were to be 66 ft. wide, composed of a 46-ft. roadway and two 10-ft. sidewalks, allowing the use of three sets of columns and cross girders, one in the center line of the roadway and the other two on the curb lines. The spans were finally determined as stated. (2) The headroom or clearance was to be 12 ft. and 12 ft. 6 ins. above the established grades of the subways. (3) The bridges being at the eastern end of the Western avenue yard, it was very desirable that they be so designed that tracks and cross-overs could be placed at any point upon the structure. This requirement could only be satisfied with a ballasted floor type of bridge. (4) As thin a floor as possible within the limits of good practice was required to minimize the depth of fill, approach grades and height of walls. (5) A floor was required that was easily made water tight. (6) A floor was required that was as nearly sound proof as possible. (7) Comparative cost and permanence had to be considered.

After looking over the field for some time it was decided that one of the three following constructions would fill about all of the conditions: (1) A trough girder bridge composed of a number of troughs, made of plates and angles, concreted to form a solid deck. (2) An I-beam span, with concrete deck. (3) A reinforced concrete deck girder slab.

The different types were planned out and estimates made with the following result, the estimates being per square foot of superstructure:

	Pct.
Reinforced deck girder spans	100
I-beam span	171
Trough girders	208

This showed conclusively that a great saving could be made by the use of the reinforced concrete construction.

Abutments.—The soil underlying this location is composed mostly of soft blue clay and quicksand, and, taken as a whole, is not a very desirable material on which to place a foundation, but it was decided that with the bearing of the footing in addition to the piles it was amply safe to carry the abutment loads.

The footings for the several streets were put in during 1905 in advance of the other work and were built up to a point about 3 ft. above top of the footing proper. The abutments are of the solid type, as it was found that a buttressed abutment of this height would cost as much per lineal foot, if not more. As the forms were built and concreted after the temporary bridge was up, the work was done in a cramped space.

The forms were continuous, composed of

*From a paper by Mr. G. E. Tebbetts, read before the Bridge and Structural Section Western Society of Engineers, Chicago, Ill., Feb. 9, 1910.

studding and sheeting, the former being 3x6 ins. and the latter of 2-in. tongued and grooved planking. The sides were held together by ¾-in. rods, spaced about 4 ft. c. to c., both vertically and horizontally. This scheme worked

having an incline frame on it. The lower part of this incline is separate and can be removed and swung alongside the car when the outfit is moved. The cement car, which is placed immediately in rear of mixer, is an ordinary

This bucket was a V shaped affair, with a sliding door in one side, operated by a rack and pinion. Facing of the work was obtained by spading. This has worked satisfactorily, giving a smooth, uniform surface. The mix-

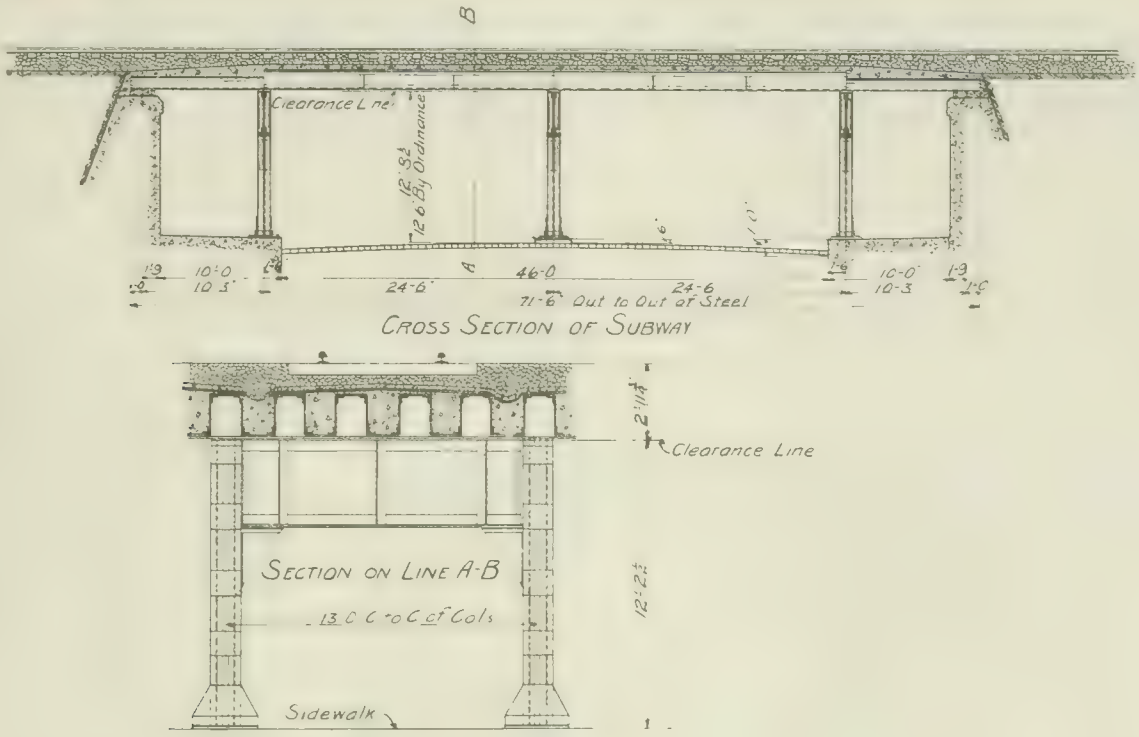

Fig. 1—Cross Section of Trough Girder Type.

far better than wire, as that was continually stretching and breaking. With wire ties it was not wise to fill the forms to a depth of over 4 ft., while with the ¾-in. tie rods the forms could be completely filled without danger of collapsing. The rods were incased in 1½-in. pipe of such lengths that the ends were about 3 ins. from the face of the forms, waste being packed around the rods. This worked very nicely, although there was considerable trouble in pulling the rods. A lever and chain were used to remove the rods from wall.

In concreting, the abutments were divided

gondola, having at the forward end an overhanging platform, supporting the two material hoppers. These have a capacity of 1½ cu. yds. or one batch. The gravel is wheeled in barrows from the gravel cars, a temporary runway being placed upon the cars for the purpose. The material is dropped from the hopper into the small material car and pulled up the incline by the hoisting engine. Here the load is dropped through the hopper bottom of the car to the mixer, the water being supplied from the barrel placed on top. This plant has proved to be very satisfactory as well as cheap.

ture was composed of 1¼ bbls. of cement to 1 cu. yd. of pit run gravel; this amount of cement was increased where the gravel was very fine. The gravel as a general thing was very fair quality, containing very little clay or other foreign matter and varied in size from 3-in. ring down to fine sand, the sand being in about the right proportion nicely to fill the voids.

The sections were, as a general thing, completed in one day, but where this could not be done, the surface was thoroughly cleaned the following morning, being scrubbed with wire brushes to remove all *laitance*, clay or other

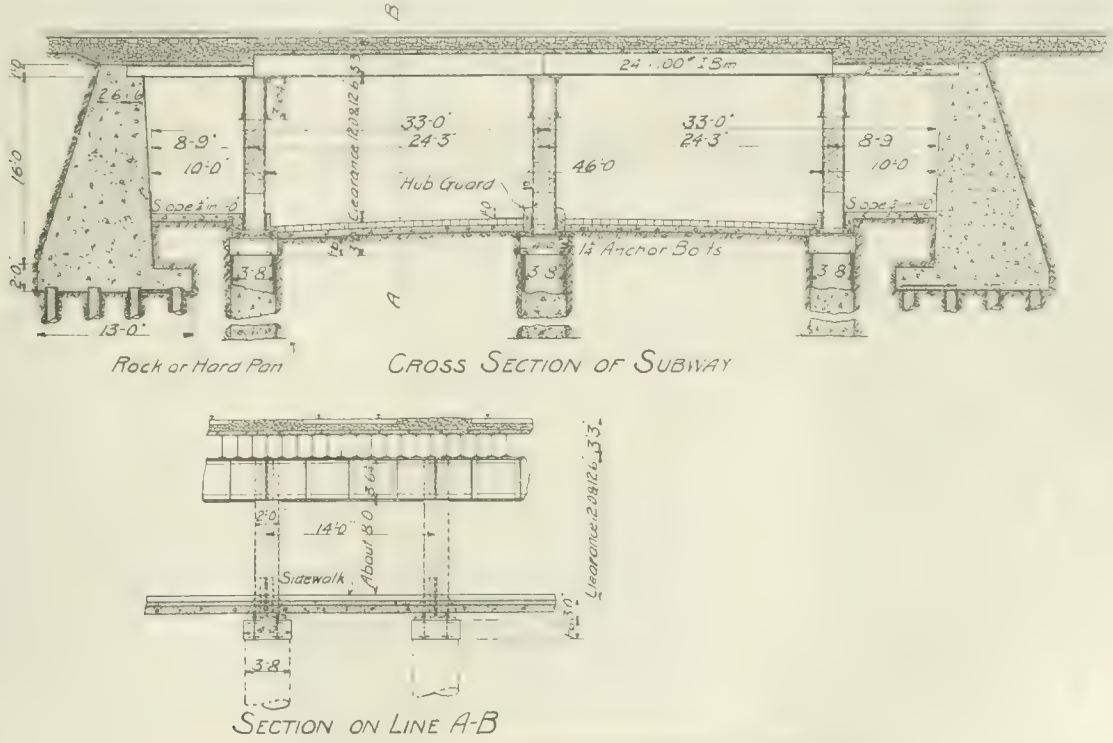

Fig. 2—Cross Section of I Beam Span With Concrete Deck.

into a number of sections, each containing about a day's work. The mixing outfit consists of a cylinder drum, with rods passing through it, driven by a chain drive from the hoisting engine. This is all mounted upon a flat car,

The mixer was set directly over the section where possible and the material delivered by a chute, but in cases where the section was too far away to use chutes a locomotive derrick car having a 1½ cu. yd. bucket was used.

foreign substances, and then well rinsed off before placing the fresh concrete.

Column Footings.—The loads upon the columns are as follows: Center column 204 tons and sidewalk column 138 tons. The question

as to kind of foundation lay between the use of an ordinary pile and concrete footing and cylinders; these after investigation were estimated to be about a stand-off as regards cost. Cylinders were adopted as they would rest upon a known substance, while the bearing power of a pile footing would be rather indefinite.

These cylinders are built in 3-ft. 8-in. wells, lagged with 2-in. lumber of about 5-ft. 6-in. lengths, and held from collapse by two 2x¾-in. steel rings. These rings are made in two pieces, and after being driven into place are bolted together. The depth of the cylinders varied from 15 ft. at Ashland Ave. to 65 ft. at Center Ave. There were in all about 600 wells dug, averaging about 40 ft. deep and costing approximately $250 each.

Columns and Cross Girders.—The columns and cross girders erected during 1906 were of steel, but after the success attending the construction of slabs during that year it was decided that reinforced concrete columns and cross girders would not only be more permanent but would also be more economical; this was borne out, as the following estimate will show (the estimate being for a 14-ft. bent):

Steel column and cross girder, 10,200 lbs. at 3.5 cts.	$357
Concrete column and cross girder, 7.12 cu. yds. and bars at $25	178

The concrete construction costs about 50 per cent of the steel work.

The lengths of span of the cross girders are 12 and 14 ft., these lengths being due to the fact that the shorter spans are more economical and that their lengths worked out to fit the width of right of way.

The columns are 24 ins. square, reinforced by a structural steel basket of four 3½x3½x½-in. angles tied together with batten plates about 2 ft. apart c. to c. This basket was about 18 ins. square and was wrapped with triangular mesh of No. 12 gage wire, the mesh being 4 ins., thus forming a wrapped column. The unit load upon the columns was 807 lbs. per square inch for the side columns, considering only that area inside the steel basket. Over the total area of column this reduces to 454 lbs. and 307 lbs. respectively.

The work was done as follows: The concrete in the cylinder having been purposely left below grade, the frames or baskets were placed over the center of the well column and carefully centered and plumbed, then enough concrete placed around the lower part to insure there being held firmly in place; after this had set for two or three days the column forms were set up and concreted up to the juncture with the cross girders, which is at the spring-

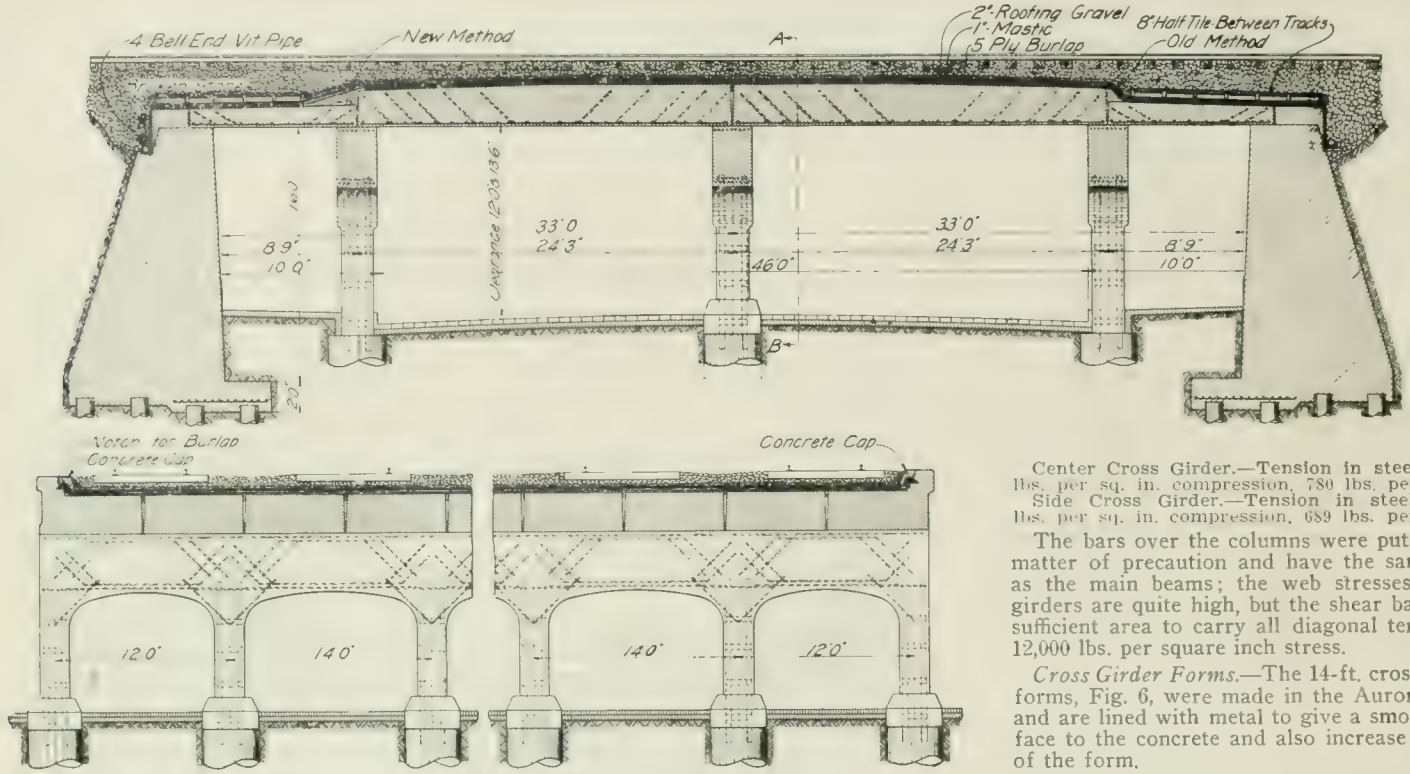

Fig. 3—Cross Section of Reinforced Concrete Deck Girder Slab.

ing line of the lower curve. The column forms were made in four pieces, metal lined, and held together by girts having a forked end to receive the bolt, this making a very stiff form. The mixture used was a 1:2:4 concrete of screened gravel, torpedo sand and cement, and was mixed and placed by hand.

The cross girders were designed as simple beams of 14 and 12 ft. span and are 2 ft. 6 ins. wide and 4 ft. deep at the center, the curve being put in for appearance only. They were designed as simple beams for the reason that they would be built as such, spans being bulk-headed at the center line of columns. The girders were designed by the use of the Johnson formula, and checked back by those of Prof. Talbot, the unit stresses being as follows:

Center Cross Girder.—Tension in steel, 14,850 lbs. per sq. in. compression, 780 lbs. per sq. in.
Side Cross Girder.—Tension in steel, 15,500 lbs. per sq. in. compression, 689 lbs. per sq. in.

The bars over the columns were put in as a matter of precaution and have the same area as the main beams; the web stresses in the girders are quite high, but the shear bars have sufficient area to carry all diagonal tension at 12,000 lbs. per square inch stress.

Cross Girder Forms.—The 14-ft. cross girder forms, Fig. 6, were made in the Aurora shops and are lined with metal to give a smooth surface to the concrete and also increase the life of the form.

Concrete Decks.—The decks, Figs. 7 and 8, were originally designed in 1905, the live load being the standard, live load, equivalent to about E60 Cooper's loading plus 50 per cent. For impact this was assumed to be distributed over 10 ft. of width. In checking back it was found that the stress in the steel was 12,750 lbs. and compression in concrete 668 lbs. per square inch for street slabs; it was 12,700 lbs. and 659 lbs. for sidewalk slabs. The slabs were cast in a specially designed yard, located at the west end of the Hawthorne yard, about four miles from the work.

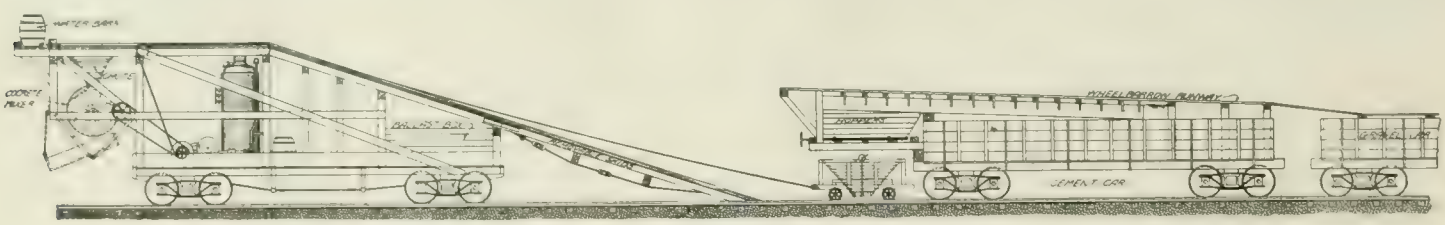

Fig. 4—Concrete Mixing Train.

The layout consisted of two main or working tracks, having forms on either side, 200 in number, these terminating in a single track used as a storage track, from which the slabs were placed in the storage piles. Later on in the year a third track south of the yard was put in as an additional storage track. The

Fig. 5—Type of Subway Built During 1906 Showing Tunnel Effect Where Bridge is Wide.

water supply came from a tank located about 1,000 ft. east of the yard and a 4-in. pipe was put in to supply the required amount.

Slab Forms.—A cinder foundation about 2

ft. deep was laid and upon this the mud sills were placed, being carefully tamped and leveled. The main sills rested upon the mud sills and were leveled up by the use of wedges.

uniformity was observed a mechanical analysis was made of the gravel and the required material added to give a dense concrete.

Test specimens in the form of cylinders, 6

street slabs and 20 days for the sidewalk slabs. In the storage yard the slabs were piled three high, the lower slab being placed on timbers set outside the quarter points and the ground

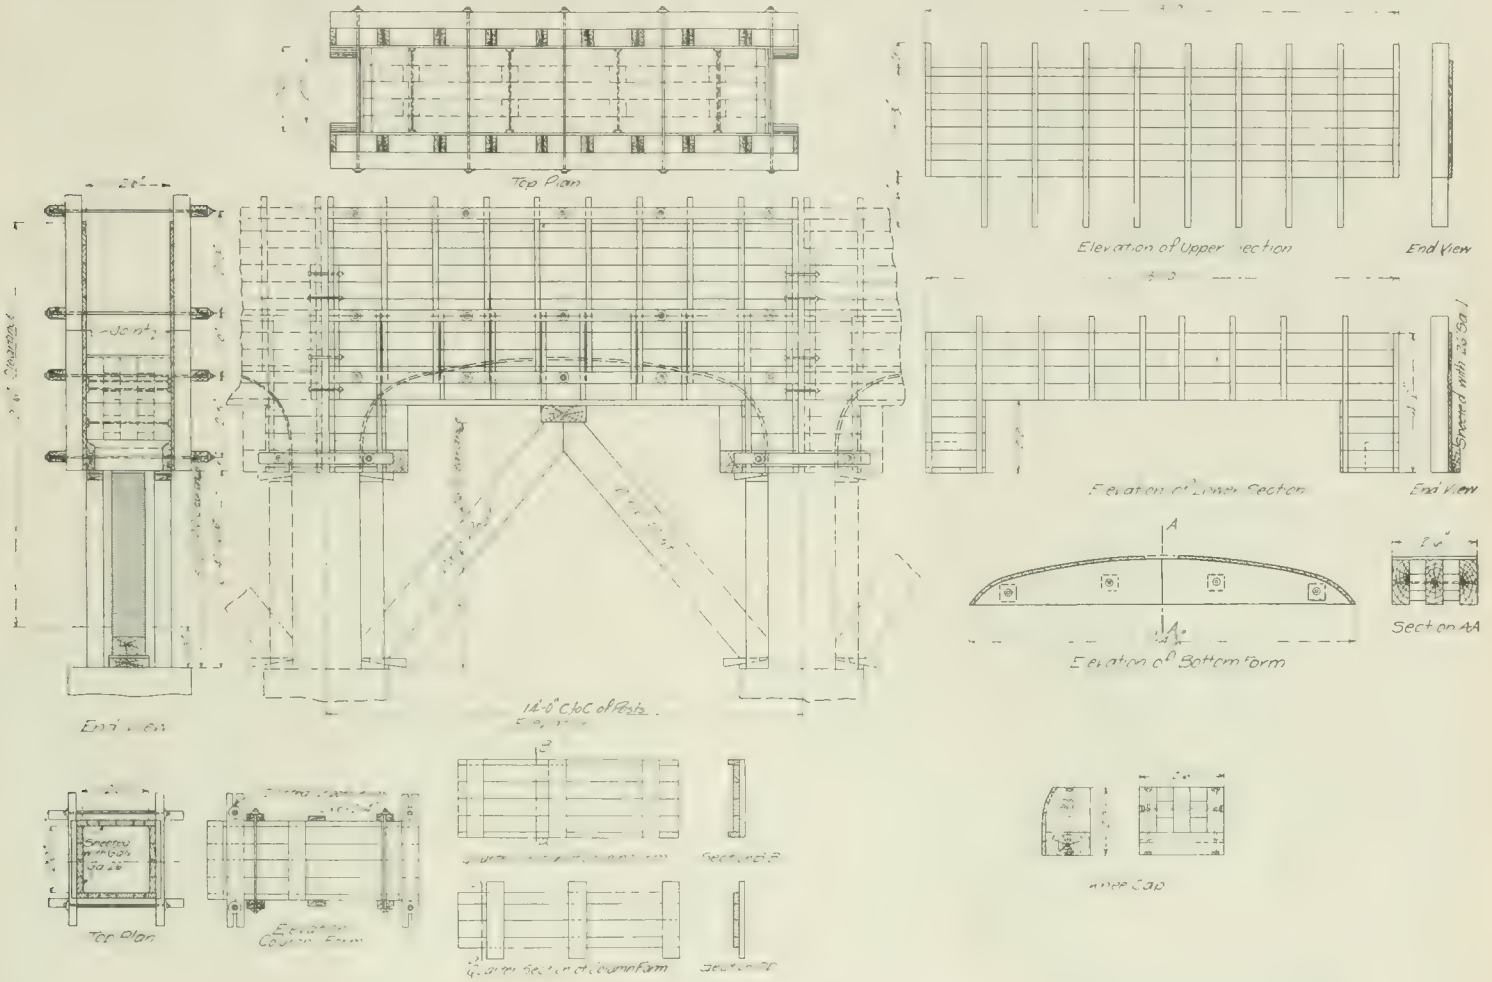

Fig. 6—Forms For Cross Girders, Showing Support and Arrangement for Using Forms on Different Spans.

(Fig. 9.) The floor consists of 2-in. tongue and groove lumber and was spiked firmly to all the sills so as to prevent warping. On the floor a template of 1-in. boards was laid and the sides and ends erected, these being units.

The bars were taken into the forms before the last end piece was placed and arranged later on as needed. In the placing of the bars small V shaped iron saddles were used. These were placed near the ends; the center and quarter points were carried on ½-in. bars placed transversely, to which the main bars were wired after being carefully spaced. The wiring had to be carefully done so as to hold the bars from spreading in concreting. The main stirrups were suspended in place and boxed in before concreting. These stirrups were made of 1⅝-in. round iron for the street slabs and 1⅛-in. for the sidewalk slabs, and were used to engage the toggle on the derrick for erection.

The forms were given a coat of coal tar paint, consisting of coal tar, kerosene and cement, which gave very good results and preserved the forms from checking and warping.

The mixing plant was placed opposite the slab form to be concreted and the concrete deposited direct by chute, the chute being long enough to reach well back past the middle of the form with trap doors intermediate, so that material could be placed uniformly. This mixing plant was the same as that used for abutments.

The first two or three batches were smaller and contained more sand than those later, this being done to simplify the working of the concrete around the reinforcement, which was not easy, the bars being only 2½ ins. c. to c. for 1-in. bars. After the lower 15 to 18 ins. were in place, the work was simple, care being taken to get a well spaded, smooth surface.

The mixture used was of a 1:4 concrete of pit run gravel, which was clean and of fairly uniform mixture. Whenever any change in

ins. in diameter and 9 ins. long, were taken every day and stored under identical conditions with the slabs. Results from 65 of these test pieces show an average crushing strength of 1,839 lbs. per square inch (60-day tests).

The side forms were removed from the slabs at the end of four days and the concrete kept

dug out under the center to prevent center binding. Two cases of center binding did occur with a result of breaking the lower slab over the back, there being no longitudinal reinforcement in the back of the slab.

The slabs built one year were for use the following year, so that they were well seasoned

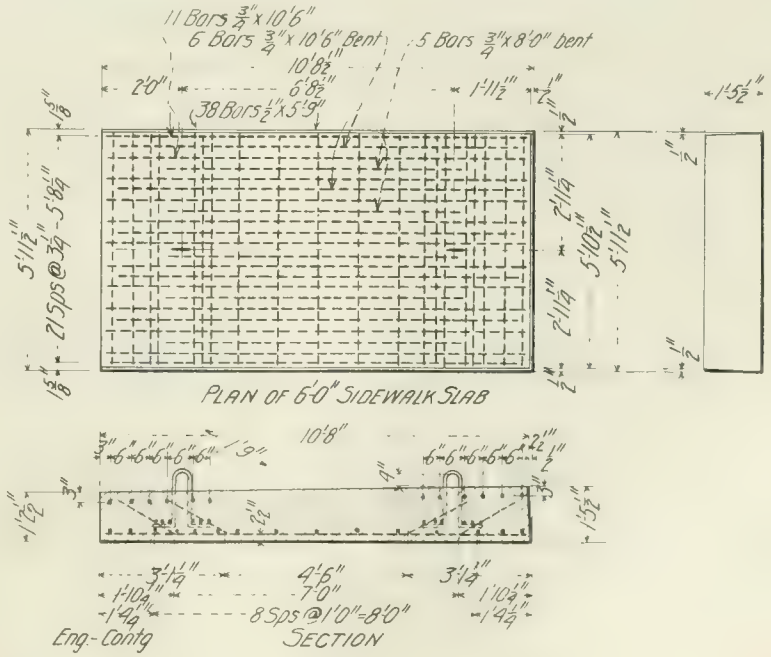

Fig. 7—Sidewalk Deck Slab.

damp by daily use of hose until three weeks old. The age at which the slabs were moved to the storage piles varied with the condition of the work, the earliest being 30 days for the

before being put under traffic. The slab is handled by the use of a toggle frame, consisting of four eye-bars with channel strut at the lower pins; this engages the slabs by the stirrup.

A pin connection is used, as it is far more reliable than a hook. The machine used the first year was a 75-ton wrecking crane, equipped with a 45-ft. straight boom. (Fig. 10.) The machine gave fairly good results, but the loads were too heavy, so a new derrick of 100 tons capacity has been bought for the coming year's work.

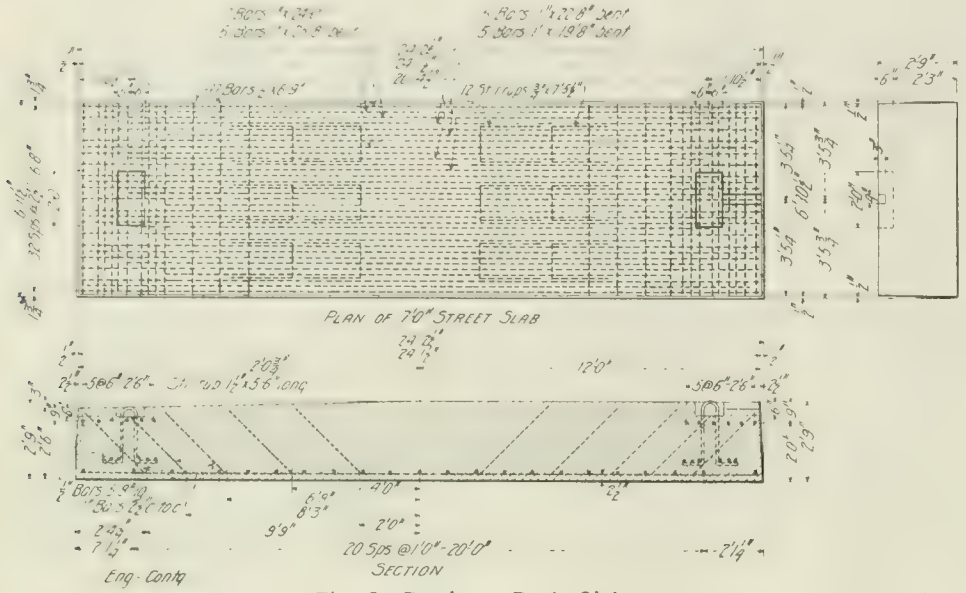

Fig. 8—Roadway Deck Slab.

In placing the slabs, they are loaded on cars at Hawthorne and shipped down to the work. The temporary bridge is pulled up by the derrick and the slabs are set directly ahead of the machine. This work is naturally slow on account of the loads to be handled and the care with which the machine must be blocked up before handling these loads.

At two of the street openings it was impracticable to secure, with the standard types of deck girder floors, the required clearance at the center of the roadway and a special reinforced concrete deck was accordingly designed to reduce the distance between the base of rail and clearance line sufficiently to obtain the headroom desired, without changing the grade of the tracks or affecting the established grades on street approaches to the subway. At the same time this design permits the floor system to be constructed in separate sections, which are delivered to the work as desired and erected without interrupting traffic on more than one track.

The floor is cast in sections which span the sidewalks and roadways the same as the floor slabs of the standard subway. The tracks are spaced 12½ and 13½ ft. apart on centers. Each of these sections consists of two built up girders spaced 3 ft. 8 ins. apart on centers, with a reinforced concrete trough cast between them. A section is thus made which can be handled from the storage piles to place on the bridge in a manner similar to that followed in setting the slabs.

The end of the trough sections are seated on rails embedded in the concrete of the abutments and of the cross girders. Each pair of troughs carry the rail of one track and are on a set of three rails bolted together and machined to give an even bearing surface. The lower flanges of the built up girders rest directly on these sets of rails, the joints of the abutments being embedded in concrete, while at the columns rust joints are made.

It may be noted that each rail is on short pieces of sawed ties placed on broken stone ballast in the trough girder. The rails are set on the inside of the center line of the row of short ties carrying each of them, in order to secure sufficient bearing on the ballast to provide for the outward thrust of the wheels. This arrangement also permits the use of track jacks for surfacing. The rails are placed on tie plates and attached to the ties by means of screw spikes. The pieces of ties fit so that it is impracticable to remove one at a time, but it is expected that renewals can be made when the rails are relaid.

After the sections of a trough have been set, they are bolted together. The top flanges of the beams in adjacent troughs also are tied together with straps and angles and are joined by reinforced concrete slabs of different depths, depending on the span and other conditions. A smooth floor broken only at each trough is thus secured. Between the tracks, the ends of the slabs are supported by 3½-in. angles riveted horizontally to the web of the built up steel beams, and the reinforcement is placed fully to utilize these supports.

The slabs are reinforced near the upper surface by strips of galvanized iron wire fencing to bond the surface of the slab together and prevent cracking. The ends of these strips are bent under the inside of the upper flanges of the girders in the space left at this point when the concrete trough is cast. A good anchorage is thus obtained to hold the slab to the top of the side of the trough.

The first bridge of this type was built at Forty-fourth Ave. in 1907 and proved so satisfactory in service that when similar conditions as to limited headroom were encountered at Union St. the same general design was followed. In fact the only change made in the second structure was to increase the width of the trough in order that longer ties could be used and the rails placed off center to provide for the side thrust. The possibility of having only one track out of service at a time, so interruption to traffic is avoided, was demonstrated with this construction at both crossings, since the trough girder sections carrying each track can be placed without reference to the balance of the tracks on the bridge.

Another special bridge was required in connection with this elevation where two tracks branch from the main line at Sangamon St. and extend to a manufacturing district 1.75 miles to the south. These tracks cross the street, which parallels the right of way closely, and had to be carried over it on a subway structure providing the same openings as those on the main elevation. At the crossing the tracks also are on a grade of 1 per cent and a curve of 12°, which made it impracticable to construct one of the standard subway bridge structures. A special trough girder reinforced concrete deck floor was accordingly designed to meet the conditions.

The three girders are built to act as beams between the points of support, and the floor slab permits the load of the track to be transferred to them, provisions being made for shearing stresses at the points of support of the latter. The abutments and the three transverse rows of concrete columns and girders carrying the floor were built in advance. The girders and floor were then built in sections extending between supports. No longitudinal joints were provided, but transverse joints were placed at the three piers and two abutments. The surface of the concrete in both track spaces was covered with a heavy coat of waterproofing, which was carried up to the top line of the ballast. A 4-in. tile was placed along both sides of each track to intercept and deliver to the sewers all water that passes through to the upper surface of the floor slab.

An entirely different type of bridge from those employed on the balance of the work has been erected to carry the tracks of this railroad over the right of way of the Pittsburg, Cincinnati, Chicago & St. Louis Ry. This right of way is to be elevated to eliminate grade crossings with streets which intersect it, and the tracks of the Chicago, Burlington & Quincy R. R. will be placed at a still higher level to avoid the existing grade crossings with these railroads. The bridge erected at this point consists of two through steel plate girder spans, one of 63 ft. 5 ins. and the other 77 ft. 8 ins., which carry five tracks. The general features of these spans follow the standard design of this company for structures of this type, which have suspended floors consisting of transverse I-beams embedded in concrete.

The abutting ends of the two spans are carried by latticed steel columns seated on 4'0 circular concrete pier footings, carried down to rock at a depth of 60 ft. The bases of these columns are placed 3 ft. below the present level of the tracks crossed, but the latter will be raised so as to leave a clearance of 18 ft. over them. The ends of the two spans also are carried by steel columns on concrete footings,

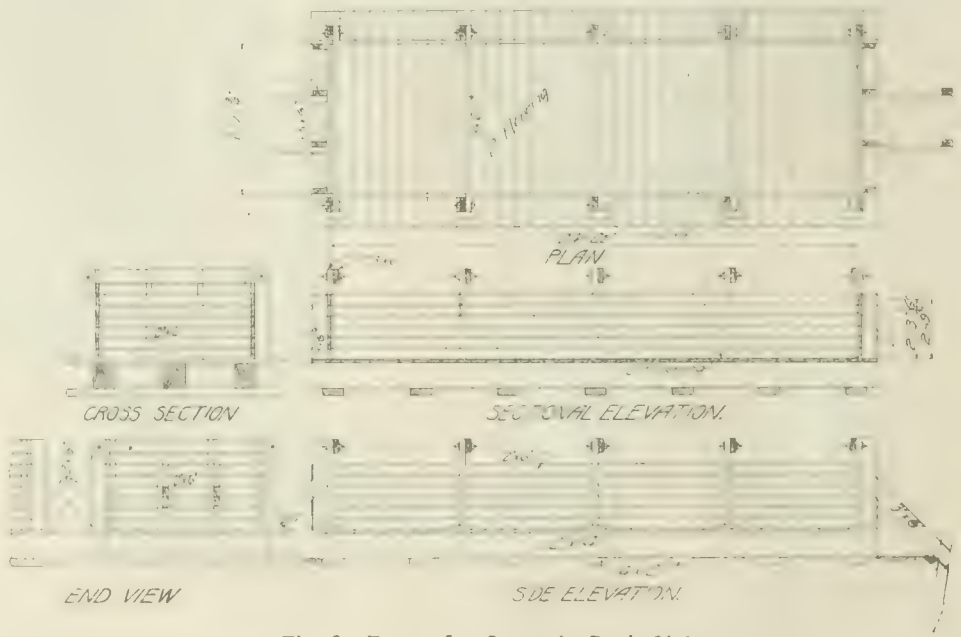

Fig. 9—Forms for Concrete Deck Slabs.

each of these columns being braced by diagonal strut seated on a reinforced concrete slab on piles under the fill, back of the opening provided. A reinforced concrete abutment was built on the line of the columns at both ends of the structure to hold the fill in place, wing walls being carried out on both sides to the toe of the slope. The columns are embedded in this wall, and the diagonal struts are in buttresses between the latter and the slab footing. The columns are designed, however, to carry the structure entirely independent of the abutment. The transverse row of columns near the middle of the crossing also embedded in a vertical concrete wall, 2 ft. 6 ins. thick, which has been placed simply as a means of protecting these columns from derailment.

The work is being done by company force under the direction of Mr. T. E. Calvert, chief engineer, and Mr. W. L. Breckinridge, engineer, maintenance of way, lines east of the Missouri river, and is under the immediate supervision of Mr. F. L. Stone, engineer of track elevation. The structures were designed under the direction of Mr. C. H. Cartlidge, bridge engineer.

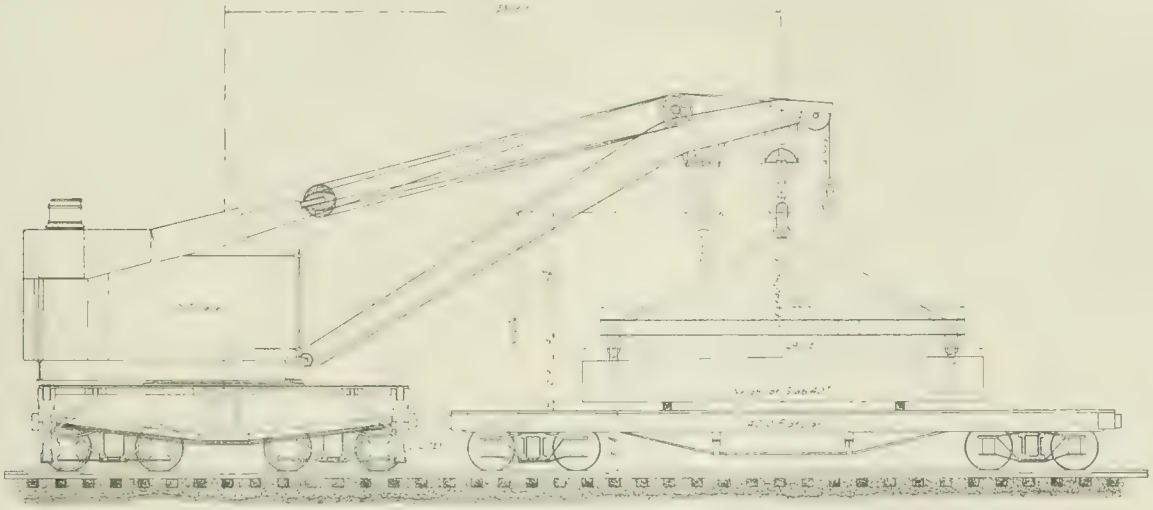

Fig. 10—Method of Handling Deck Slabs With Toggleframe.

What Consideration Should Be Given to Continuity in Reinforced Concrete Beams and Slabs.

BY M. E. THOMAS.*

A surprising variation exists in the present practice in calculating bending moments in reinforced concrete beams and slabs, speaking particularly of beams and slabs intended to act in a continuous manner. For instance for continuous beams the Cleveland, Washington, Boston and Kansas City building ordinances require the moment at the center to be calculated by $\frac{WL}{10}$, St. Louis, Chicago and New York require $\frac{WL}{8}$, while certain text books and engineers advocate using $\frac{WL}{12}$. For negative bending moment over the supports the practice varies, in some cases requiring steel as determined from a moment equal to $\frac{WL}{12}$ and in some 50 per cent of the amount used in center of beam, and in others the amount to be used over support is not definitely stated. The bending moments in slabs is in general more liberal, but just as varied. Of course in some cases where conservative moments are required, the allowable stresses in concrete and steel are more liberal, but it is not the intention here to discuss the relative merits of the different practices.

The two questions, What is the reason for all this variation? and What are the theoretical moments that would guide a designer? naturally occur to any one making a study of the moments allowed in practice, and it is the intention here to answer these two questions.

The difference of opinion as to whether continuous beams should be relied upon and to what extent may explain some of this variation, but this difference of opinion will not explain some of the inconsistencies existing. For instance, the St. Louis ordinance (April, 1907) requires all beams calculated as simple beams, with a moment at center $= \frac{WL}{8}$ and the full amount of negative moment at support or $= \frac{WL}{12}$, while Kansas City (ordinance 1908) allows moment at center calculated by $\frac{WL}{10}$ and only asks for 50 per cent of resulting amount of steel over support. As it happens, St. Louis allows $f_c = 800$, $f_s = 14{,}000$ for mild steel, 20,000 for high elastic limit steel, while Kansas City allows $f_c = 750$, $f_s = 16{,}000$, so that unit stresses allowed are practically the same.

The lack of a common idea of the principles of continuity explains the variations mentioned, also some of the apparent inconsistencies. So that in answering the second question the first is probably answered.

The accompanying diagram, Fig. 1, based on the theorem of three moments as presented in Merriman's Mechanics of Materials, has been developed and extended to give the true moment at the center and the supports of uniformly loaded continuous beams of equal spans. The rules accompanying table and the formulas from which they are derived are an important part of the table. The heavy hori-

*Schenectady, N. Y.

zontal lines in the table represent beams and the cross lines the various supports. Above this line are given the bending moment factors at center and at the supports of any span in a number of spans. Below this line is given the

l = distance between supports.

Stating this formula as a rule—

The average of moment factors at the supports (disregarding negative sign) plus moment factor at center equals — 1/8.

of continuity is to consider the ends of the beam cantilevering out to the point of inflection and the span of beam between the points of inflection as a simple beam. This idea affords an independent way of proving the

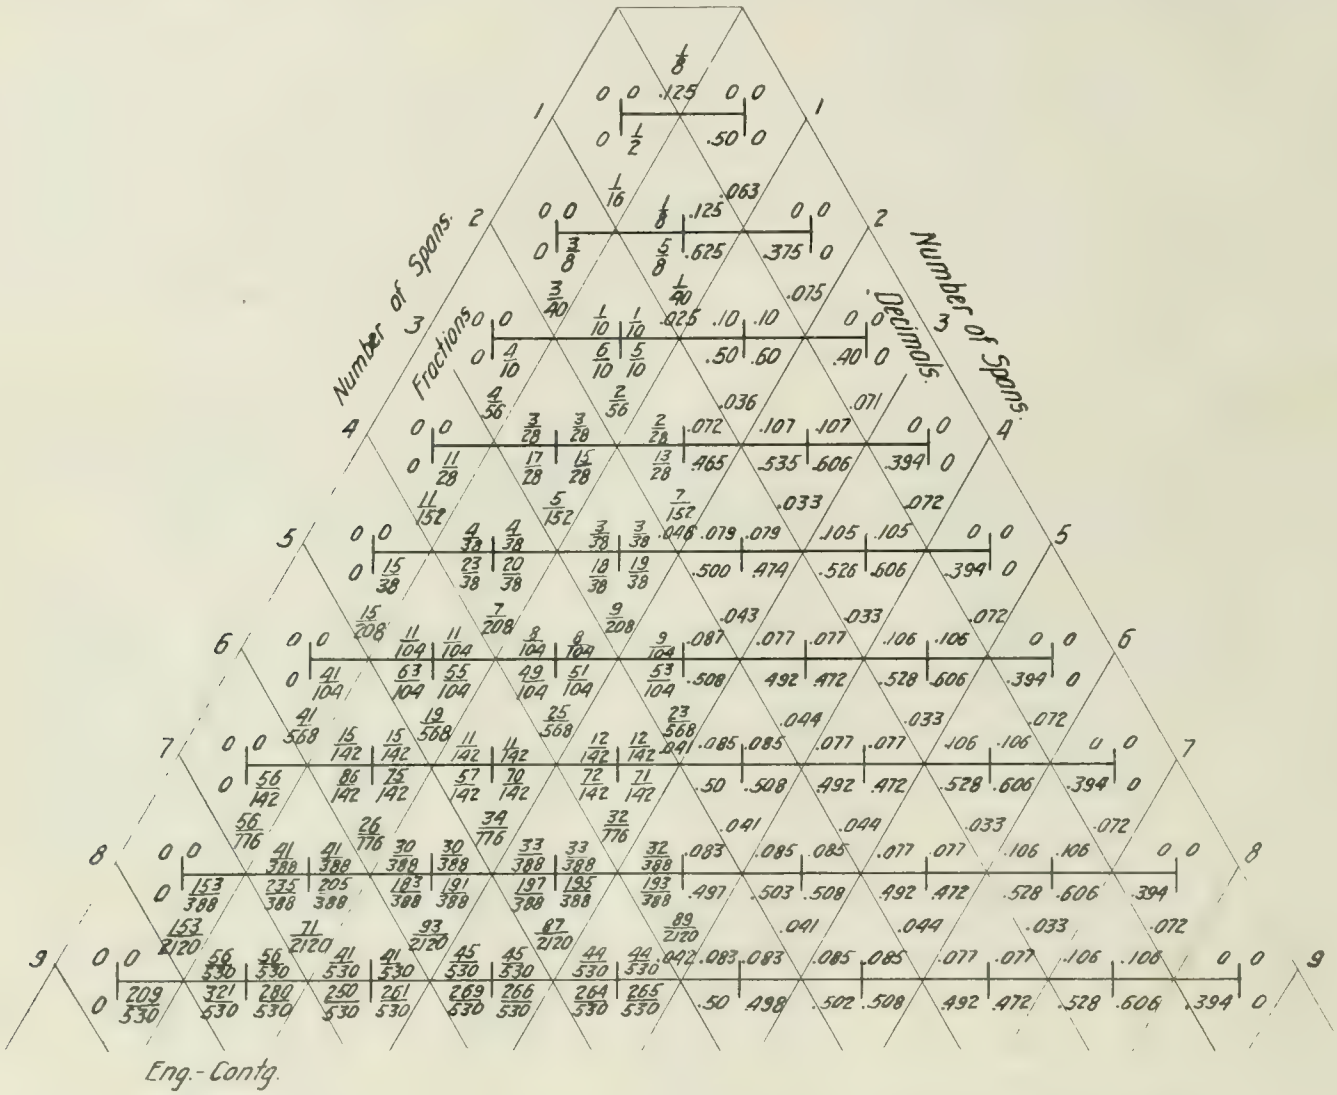

Fig. 1—Diagram for Theorem of Three Moments for Computing Reinforced Concrete Slabs.

Formulas—Theorem of three moments. Spans equal and loads equal and uniform. Starting at any support:

(1) $M_1 + 4M_2 + M_3 = -wl^2$, $M_2 + 4M_3 + M_4 = -wl^2$, etc.

(2) $V_1 = \frac{M_2 - M_1}{1} + \frac{wl}{2}$

(3) $M = M_1 - V_1x - \frac{1}{2}wx^2$, Mc = mom. at center $x = \frac{l}{2}$

(4) $Mc = M_1 + V_1\frac{l}{2} - \frac{1}{2}w\frac{l^2}{4}$, combine 2 and 1 (make $V_1 = V_1$).

(5) $-\frac{M_1+M_2}{2}$; $Mc = \frac{1}{8}wl^2$.

Substituting in (3) values of M_1 and V_1 and placing $M = 0$ x = distance out of point of inflection in terms of l.

For $M = \frac{wl^2}{12}$

$V_1 = \frac{wl}{2}$

$x = .211 = 1\text{-}5\ l.$

NOTES.

Above.—Moment factors for wl^2.
Below.—Vertical shear factors for wl.

(1st) From formula (5) average of sum of factors at supports in any span (disregarding sign) plus factor at center = ⅛ = .125.

(2d) Sum of vertical shear factors in a span = 1 and sum of factors at a support multiplied by wl equals the reaction.

(3d) The maximum distance out of point of inflection = 1-5 l in the case of a beam perfectly continuous or with fixed ends.

vertical shear factors at a support, the sum of which multiplied by WL is the reaction at that support. The left half is in common fractions derived from the formulas and the right half, which is symmetrical, gives the same fractions reduced to decimals, which better show the properties of the table. For instance starting at a beam of three spans and over and looking on the right hand side of the table we see that all end spans have practically the same corresponding factors. Similarly comparing spans next to the end we see they are the same. Also averaging the factors at the supports and adding average to factor in center we have 0.125 = ⅛ for any span. This naturally follows from formula (5) developed by combining (2) and (4) or $\frac{M_1 + M_2}{2} + Mc = \frac{Wl}{8}$

In which

M_1 = bending moment at any support.
M_2 = bending moment at next support.
Mc = bending moment at center support.
W = uniform load.

If the factors at the supports are considered equal, then disregarding negative sign.

The sum of moment factor at a support plus the moment factor in center equals — 1/8.

This rule applies to a simple beam where 0 (end factor) + 1/8 (center factor) = 1/8, and to a perfectly continuous or fixed end beam, where 1/12 (end factor) + 1/24 (center factor) = 1/8, and offers a ready means of determining the factors for any assumed degree of continuity.

Another way of looking at the principles

rule deduced from the Theorem of Three Moments.

Let Fig. 2 represent the conditions mentioned for a perfectly continuous beam.

From formula (3) the inflection point is out $0.21l$ = about the 1/5*th* point of span.

Then for Positive Movement at center consider simple beam 0.58.

$$M = \frac{wl^2}{8} = \frac{w\ (.58l)^2}{8} = \frac{0.042\ wl^2}{} = \frac{wl^2}{24}$$

Then for negative moment at the support

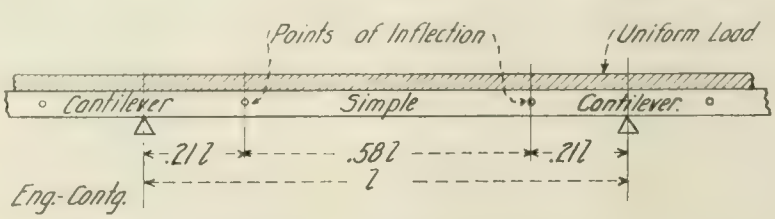

Fig. 2—Illustration of Continuous Beam Action.

consider the cantilever ends carrying their uniform load and the reaction of center span concentrated at inflection point.

$$M = \frac{w(.21l)^2}{2} + \frac{w(.58l)}{2} + 3.21l) = (.022 + .061)\,wl^2 = \frac{wl^2}{12}$$

Thus it is seen that as the inflection points are moved toward the support the degree of continuity of the beam lessens and at any point, if the moment factor of the center span is determined and added to the moment factor of the cantilever ends the sum of the two equals — 1/8.

In applying the rule in practice take the case of a T-beam which is built in a continuous manner in most structures. For full continuity the moment at the center equals $\frac{WL}{24}$ and the negative moment at the support equals $\frac{WL}{12}$. The moment at the center being one-half as much as at the support and having the advantage of a T-section for compression. Suppose we take the moment at center and support equal to $\frac{WL}{12}$, then if it is desired to utilize the T-section at center and stress the concrete up to 600 lbs. on the extreme fiber, the reverse bending moment at the end equal to $\frac{WL}{12}$ would ordinarily stress the concrete on the underside (where there is no T-section) over 1000 lbs.

In this case it is a waste of steel to reinforce the stem to develop a stress so much higher than allowable. In this case the theoretical moment at the support would be $\frac{WL}{24}$ and steel to take care of a moment of $\frac{WL}{16}$ or even $\frac{WL}{20}$ ought to be sufficient provided it is placed with proper regard to the point of inflection and proper stirrups are used.

The diagram shows the effect of continuous beams on columns. For instance, if full continuity is intended and the end beams run into columns or spandrels that will not take care of the negative moment. Then the end columns get about 3/8 of the live and dead load of a floor panel and the columns next to the end get 9/8 of a panel load or 12½ per cent more than is ordinarily allowed.

In bringing this discussion to a close it is to be noted that the theoretical moments and their use in designing is all that it was intended to discuss.

Central Water Way Board for Great Britain.—The appointment of a central waterway board for the United Kingdom was recommended in the final report of the commission appointed to make investigation into canal and inland navigation conditions of Great Britain. It was also urged by the commission that unification of waterways be immediately effected and their administration turned over to the board. The board is advised to investigate the existing conditions in regard to public interest, local assistance available, the prospects of traffic and railway competition. The first undertaking of importance will be the acquisition of British waterways now in the hands of railway companies.

Surveys have been made by W. R. Smythe, C. E., Santa Fe, N. Mex., for a reservoir project eight miles east of Stanley in southern Santa Fe county, which is to reclaim 15,000 acres. The dam will be built on a red sandstone foundation which outcrops and is never deeper than 10 ft. The dam is to be 1,000 ft. long at the top, 400 ft. at the base and it is to be 95 ft. high. Between 10,000 and 15,000 acre feet of flood waters are to be impounded.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Some Notes on Specifications for Earthwork in Railway Construction.

The following notes on specifications for earthwork in railway construction touch upon questions of classification and overhaul in an interesting manner. They were prepared by Mr. James H. Bacon of the Grand Trunk Pacific Ry. and presented in a paper read before the American Society of Engineering Contractors on Jan. 10, 1910.

Specifications in General.—The two main objects of any specification are these: (1) To define the work to be done so that any competent contractor may submit an intelligent bid. (2) To establish a guide and a standard by which the contract may be interpreted with fairness to each party.

To attain the first of these desired results, if the proposed railway line is of any considerable length or is located through a country with varying physical characteristics, the company should (1) compile complete right of way maps, profiles, estimates of quantities showing as fully as possible the character of the work. (2) Divide the proposed line into sections and ask for separate bids and make separate contracts for each section. Each section should be homogeneous so that the actual cost of performing any given class of work shall be practically constant throughout the section. The item of the transportation of supplies is included. (3) Lay great stress on the necessity of each bidder making a personal inspection of the work.

To attain the second result three cardinal principles should be observed in preparing the specifications:

(1) The schedule of prices should include every item that can possibly be foreseen with a view of reducing "force account" work and "extra items" to a minimum and of preventing either party from claiming or denying without justification that any piece of work is covered by the specification.

(2) Every item in the schedule of prices should be adequately covered by a corresponding clause or section in the specifications.

(3) The specifications should be so worded as to reduce to a minimum the possibility of difference of opinion as to which clause of the specifications any given item in the schedule of prices refers.

With these principles in view, the expression "in the opinion of the engineer" or its equivalent should be excluded as far as possible. The price to be paid should be connected with the work done by language as concise and clear as possible. The contractor should have no excuse for insuring himself against loss by bidding higher prices than the actual work justifies.

Clearing and Grubbing.—The usual specifications for clearing seem to be sufficient, but exception may be taken to a common clause which provides that no grubbing will be allowed on the slopes of any cutting where depth of cutting exceeds a certain number of feet. The latter clause arose from the former practice of carrying a deep cut through to grade as the work progressed. This obviated the necessity of grubbing such cuts, as the stumps fell into the cut by gravity. With modern grading machines this practice has changed, and the contractor finds it necessary to grub out the stumps as the work progresses. The result is, if the limit above mentioned be 4 ft., that:

(1) The contractor is paid for grubbing where the cutting is 4 ft. or less, but is obliged to do exactly the same work at the same cost without pay where the cut is over 4 ft.

(2) The difference between 4 ft. and the next greater depth being infinitesimal, disputes arise as to payments.

(3) A change in grade or alignment may require a contractor at no measureable difference in cost to do unexpected grubbing without compensation or may give him compensation where the company did not expect to pay. All grubbing should be paid for.

Classification of Excavated Material.—Following up the general principles enunciated above and especially that which requires that "difference of opinion" shall be eliminated, it is clear to the writer that there should be only three classes of excavated material, not including excavation under water, or excavation or removal of any artificial work such as old masonry, etc. These three classes should be: (1) Solid rock. (2) Loose rock. (3) Common excavation.

Common Excavation.—In many specifications the dividing line between common excavation and loose rock is determined by the "plow test"; this test should be discarded entirely as unsatisfactory. There are thousands of acres, which may in the future be crossed by railways, where the material to be moved has not the faintest resemblance to rock and where no sane man would attempt to break ground with a plow. The plow test is impossible, and the logical result, if the specifications provide this test, is that such material must be classed as loose rock.

Many of the western roads have discarded this test and specify that "all material not classed as loose or solid rock shall be common excavation." The companies using this specification specify that loose rock shall be any rock that can be removed without blasting, although blasting may occasionally be resorted to, or any rock in detached masses varying in size between given limits, and that solid rock shall be rock in masses that cannot be removed without blasting. It will be noticed that these specifications require a definition of the word "rock."

The writer submits the following specifications for the classification of excavated material:

In these specifications the word "rock" shall be interpreted to mean any portion of the consolidated material forming the crust of the earth which has a greater volume than 1 cu. ft. Unconsolidated materials, such as sand, gravel, clay, hard pan, are not rock under these specifications.

Solid Rock.—All rock in masses that cannot be removed without drilling and blasting. All boulders or detached pieces of rock that measure 1 cu. yd. or more in volume.

Loose Rock.—All rock which is loose or soft enough to be removed without blasting, although blasting may, at the option of the contractor, be occasionally resorted to. Detached pieces of rock measuring in volume from 1 cu. ft. to 1 cu. yd.

Common Excavation.—All material not solid or loose rock.

The sizes specified for boulders and detached pieces are of course subject to be changed according to varying circumstances. No tests are recommended, as the writer believes that they would serve no useful purpose and tend to cause complications.

Excavation Under Water.—This classification should be applied to all channels and pits under water which cannot be drained by ditching. The price or prices paid should be per cubic yard and should cover all material and labor, including coffer dams, necesssary to do the excavation required. There should be at least two classes—i. e., with and without coffer dams. In many cases special specifications would be necessary.

Overhaul.—Overhaul should be paid for, a price fixed by the company, per cubic yard per hundred feet beyond the free haul, and the method by which overhaul is to be calculated should be described. The price should equal the cost of the work and is therefore a variable quantity. The limit of free haul is also variable. Both price and free haul limit should be accurately fixed for each section.

Sub-Contracts.—Sub-contracts should be recognized and proper provisions made for their protection. In the face of the universal practice of letting sub-contracts it is absurd to forbid them even with the usual proviso that they may be made with the written consent of the chief engineer.

Uniform Methods of Record and Cost Keeping on Railroad Construction.*

The method of keeping costs of railroad construction work by an engineering contracting firm is one of the most important features of the contracting business. I say "engineering contracting firm" because I believe that future successful contracting business is going to be carried on by contractors that are thoroughly trained engineers. The contractor that submits a bid for a contract after having made a few meager calculations and then finally throws such calculations in the waste basket and makes a bid almost purely from guess work is destined to be sidetracked by the engineering contractor, who has made estimates of his work from systematically prepared records of cost keeping of actual work performed.

It is customary among some contractors, after having made a rough calculation of the cost of a certain piece of work, to look over their bid and say, "Well, I know this piece or section of work will be let for such and such a figure," and finally ignore all their calculations and resort to guess work. They are not willing to submit their bid as figured, for the simple reason that they know at the start their data, if any at all, are not reliable, and such being the case a guess is better than risking their calculations on poor records of previous work. Not only is it necessary for the contractor to be able to bid successfully on contract work, but he should have such engineering training as will enable him correctly to calculate the contents of all kinds of excavation. He should be able to calculate the contents of all masonry structures, not roughly, but accurately, so that when the finals are returned he will know whether the engineer in charge of his work has submitted estimates that are correct.

The contractor should have records of all cross sections and should go over his work before the grading is begun and carefully examine the ground, to see if the engineer has cross sectioned his work properly; that is, taken sections where they are needed and a sufficient number of them. It often happens that the engineer in charge of a piece of construction work is so busy, especially at the beginning of the work, that he does not have time to give his attention to the cross sectioning, but has to leave it to others who in some instances are really incompetent to do the work. The engineer never has time to examine the cross sections on the ground to see if they have been properly taken, and without such an examination neither he nor the contractor is aware of the fact that certain sections that affect very materially the contents of the excavations have been improperly taken, partly through ignorance and partly through carelessness.

The successful contractor should have as complete a record of all notes pertaining to the work as does the engineer in charge of the work. Taking a piece of railroad construction work or any construction work, let us see what notes on cost keeping and engineering records the contractor should keep, from beginning to end of his contract. One part of the contractor's office should be used for keeping and filing of all engineering records and cost data.

Let us take first the method of keeping the engineering records, as they are just as essential as the cost keeping and should be kept together. The first thing the contractor should do in carrying out his contract is to form an acquaintance with the engineer in direct charge of his work. He should tell the engineer of his plans in regard to cost keeping, stating that it will be necessary for him (the contractor) to have a copy of all cross sections, level and alignment notes. It is not likely that the engineer can furnish all the cross section notes at once, but they can be gotten as fast as the engineer takes them in the field. Let me say as a side remark that no honest engineer should hesitate to give the contractor a copy of his notes, for he should be only too glad to have a competent contractor check all his work. It should not take the engineer long to judge whether the contractor really is competent to handle engineering records and is really in earnest about his cost keeping. The engineer and contractor should at all times be on the best of terms, for an exchange of notes is of the greatest value to both.

The cross section notes should be copied by the contractor from the engineer's record in a regular book made for the purpose. A good form is published by Keuffel & Esser and numbered in their catalogue 380. If the engineer is slow in giving the cross section notes it is well for the contractor to copy the notes in a transit book, K. & E. No. 360, as fast as he can get them, and later copy all the notes consecutively in cross section book, K. & E., No. 380. These notes should be plotted on cross section paper and carefully used each month to work up monthly estimates. A planimeter is a very handy instrument and should be used by all contractors.

Before any grading work is started and in fact as fast as the engineer sets the slope stakes, good heavy stakes about 3 ft. long should be driven 1 ft. deep at each slope stake and the station number and cutting marked on same. The importance of this is obvious.

The contractor should plot a profile on heavy profile paper—plate B, 4x30—full width, so as to enable him to keep a careful record of each month's work, using a color for each month. The quantities of each month's work, both grading and masonry, should be printed on the profile in same color to show actual figures. This progress profile should never leave the office. The contractor should also plot a profile in profile book (a good form is published by the Engineering News Publishing Co.).

This profile book should be an exact copy of the office profile, although on a much smaller scale, and should be carried in the pocket at all times for reference. These profiles should contain all alignment and level notes, property lines, road and channel changes, masonry structures, clearing, etc. The contractor should have a private note book, preferably a field book, and in it keep a daily record of the progress of the work, giving the actual condition of each piece of work. He should have an office copy of all notes, such as cross sections, road and channel changes, masonry structures, clearing, etc. He should have a tape, hand level and level rod, and it would be well for him to have a transit and level combined.

Having given a general outline of the method of keeping the engineering records, we will now look to the method of cost keeping. The contractor's time keeper should keep his daily time book in such shape as will enable him to transfer his notes to a special book, which also contains the monthly estimate, as taken by the contractor himself. The monthly estimate as given by the engineer in charge should not be used by the contractor in calculating his unit costs of the work, as very often they are too approximate and not reliable enough for a close approximate of the actual cost of the work.

The cost keeping record book should be so constructed as to enable the contractor to charge all labor against the quantities of estimate, with suitable columns for prorating fixed charges and expenses, of the entire contract against each particular piece of work.

After the contract is complete and the final estimate has been received and accepted by the contractor, he should prepare a final cost keeping record book, making all chargings of the different pieces of work against the final quantities as given in final estimate.

The object of the monthly cost records is to show the contractor the progress he is making and what this progress is costing him. His daily record book or diary gives him the conditions under which the different pieces of work were done and the two together are invaluable to him not only for his present but also for future work. The final cost keeping record book will principally be used in figuring on new contracts.

*A paper by E. M. Lanehead, Morgantown, W. Va., read at the Jan. 19 1910 meeting of the American Society of Engineering Contractors.

Annual Convention of the American Water Works Association.

The thirtieth Annual Convention of the American Water Works Association will be held in New Orleans, April 26th-30th, 1910. Headquarters will be at the Grunewald Hotel, where ample and convenient arrangements have been made for the Secretary's office, meeting rooms and exhibition rooms; all on one floor. The Southwestern Passenger Association has granted a rate of a fare and one-third, plus 25c, for the round trip. Application has been made to the other passenger associations for rates. The entertainment features will be in charge of the Water Works Manufacturers' Association, and will include a visit to the new water-works and sewage disposal plants of the city of New Orleans, which have just been completed at an expense of about $28,000,000.

The usual number of papers are being prepared for this occasion. There will also be an experience meeting, at which a number of short papers will be presented and discussed, and a general talk on water-works managements. The question box will also be taken up at this session, if time permits. The full program will soon be made out, and will be announced a little later. As outlined at present, it is about as follows:

Monday, April 25th; the Secretary's office will be open for registration during the day. Tuesday, April 26th; at 10 a m the association will be welcomed by his Honor, the Mayor of New Orleans, who is also President of the Sewage and Water Board. This will be followed by the President's address, and reports of committees. The afternoon session will be devoted to continued reports of committees and reading of papers. In the evening, instead of the usual formal reception, an informal evening is proposed. This will be opened by Mr. Geo. G. Earl, who will give an illustrated lecture on the New Orleans Sewage and Water Supply. After this lecture refreshments will be served, and the floor cleared for dancing. Wednesday, April 27th; morning session, reading and discussion of papers. In the afternoon, a trip to the New Orleans Pumping Station and Filter Plant. (Lunch will be served at the Pumping Station.) Thursday, April 28th; morning session, reading of papers. Afternoon, some form of entertainment, probably a trip on the river. In the evening a theater party. Friday, April 29th; morning, afternoon and evening will be devoted to reading and discussing papers.

Mr. George G. Earl is Chairman of the local committee, of which Col. L. H. Gardner and Mr. John T. Eastwood are the other members. The exhibits will be in charge of the Water Works Manufacturers' Association, Mr. R. E. Milligan, Sec'y, 15 Broad St., New York City.

Arrangements are already being made for excursion parties from New York, in charge of Mr. F. W. Shepperd, of Fire & Water Engineering, 136 W. 22nd St.; from Chicago, under the direction of Mr. F. J. Bradley, 313 Dearborn st. Mr. Alexander Milne, Supt. Water Works, St. Catharines, Ontario, Canada, is arranging for an excursion from that vicinity, probably starting from Buffalo.

Following the recommendations of Daniel Willard, the newly elected president of the Baltimore & Ohio R. R., the directors of the company are said to have made an appropriation of $8,000,000 for immediate improvements. A considerable portion of this sum will be spent for about 30 miles of third track to be built through the mountains in the West Virginia coal territory.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Proposed Standard Specifications for Portland Cement Curb and Gutter.*

Materials.—The cement shall meet the requirements of the standard specification for Portland cement of the American Society for Testing Materials and adopted by the association (Standard No. 1).

Fine aggregates shall consist of sand, crushed stone or gravel screenings, graded from fine to coarse, passing when dry a screen having ¼ in. diameter holes, shall be preferably of siliceous materials, clean, coarse, free from loam, vegetable or other deleterious matter, and not more than 3 per cent shall pass a sieve having 100 meshes per linear inch.

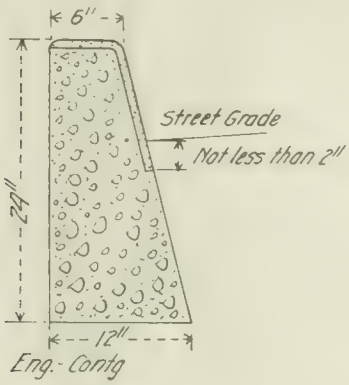

Fig. 1—Standard Concrete Curb.

Mortars composed of 1 part Portland cement and 3 parts fine aggregate by weight when made into briquettes shall show a tensile strength of at least 70 per cent of the strength of 1:3 mortar of the same consistency made with the same cement and standard Ottawa sand.

Coarse aggregates shall consist of inert materials graded in size, such as crushed stone or gravel, which are retained on a screen having ¼ in. diameter holes, shall be clean, hard, durable and free from all deleterious materials. Aggregates containing soft, flat or elongated particles shall be excluded. The maximum size of the coarse aggregates shall not exceed that which will pass in every direction a 1¼-in. ring.

Natural deposit of sand and gravel usually being out of balance, the engineer shall have the option of requiring that they be screened and remixed to agree with the proportions specified under Base, or require the determination of voids in the aggregate as it comes and have it used in the proportions specified under Base.

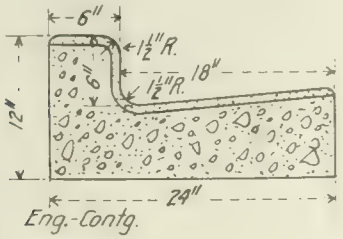

Fig. 2—Standard Concrete Curb and Gutter.

When a sub-base is required, only clean, hard cinders, slag, gravel, crushed stone or broken brick shall be used. The material shall not be smaller than ½ in. nor exceed 4 ins. in the largest dimension.

Water shall be clean, free from oil, acid, strong alkalies or vegetable matter.

The expansion joint filler shall be a suitable elastic water proof compound that will not become soft and run out in hot weather or hard and brittle and chip out in cold weather.

Sub-Grade.—When a sub-base is required the sub-grade shall be not less than 12 ins. below the finished surface of the gutter.

All soft or spongy places shall be removed and all depressions filled with suitable filling material, which shall be thoroughly compacted by flooding and tamping in layers not exceeding 6 ins. in thickness.

When a fill exceeding 1 ft. in thickness is required to bring the work to grade it shall be made in a manner satisfactory to the engineer.

When required, a suitable drainage system shall be installed and connected with sewers or other drains indicated by the engineer.

Sub-Base.—A sub-base shall be provided if required by the engineer, composed of cinders or other suitable material hereinbefore specified, which shall be rammed thoroughly to a surface at least 6 ins. below the finished surface of the gutter.

While compacting the sub-base the material shall be kept thoroughly wet and shall be in that condition when the concrete is deposited.

Forms.—Forms shall be free from warp and of sufficient strength to resist springing out of shape. All mortar and dirt shall be removed from forms that have been previously used. The forms shall be well staked or otherwise held to the established line and grade, and their upper surface shall conform with finished surfaces of the curb and gutter respectively. At least once in every 150 ft., ½-in. expansion joints shall be provided. All forms shall be thoroughly wetted before any material is deposited against them.

Dimensions.—The section of the curb shall conform with that shown in Fig. 1. The thickness at the base shall be not less than 12 ins. and the thickness at the top not less than 6 ins., with a batter on the street side of 1 to 4. The section of the combination curb and gutter shall conform with that shown in Fig. 2. The depth of the back of the curb shall be not less than 12 ins. and the depth of the face not less than 6 ins.

The breadth of the gutter shall not be less than 16 ins. nor more than 24 ins.

Construction.—The curb and gutter shall be divided into sections not less than 5 nor more than 8 ft. long, by some method which will insure the complete separation of the sections by a joint not less than ⅛ in. nor more than ¼ in. wide. At street corners the construction shall conform with that shown in Figs. 3 and 4.

Concrete.—The concrete for the curb and gutter shall be so proportioned that the cement shall overfill the voids in the fine aggregate by at least 5 per cent and the mortar shall overfill the voids in the coarse aggregate by at least 10 per cent. The proportions shall not exceed 1 part cement to 8 parts fine and coarse aggregates. When the voids are not determined, the concrete shall be composed of 1 part cement, 3 parts fine aggregate and 5 parts coarse aggregate. When natural mixed aggregates are used and the proportions of fine and coarse aggregate are not corrected, the concrete shall be proportioned so that the cement overfills the voids by at least 10 per cent. The proportions shall not exceed 1 part cement to 4 parts aggregate.

The method of measuring the materials for the concrete, including water, shall be one which will insure separate uniform proportioning at all times. A bag of cement (94 lbs.) shall be considered to have a volume of 1 cu. ft.

The ingredients of the concrete shall be thoroughly mixed dry, sufficient water added to obtain the desired consistency, and the mixing continued until the materials are uniformly distributed and the mass is uniform in color and homogeneous. When conditions will permit, a machine mixer of a type which insures the uniform proportioning of the materials throughout the mass shall be used. When it is necessary to mix by hand, the mixing shall be on a water-tight platform and the materials shall be turned until they are homogeneous in appearance and color. The materials shall be mixed wet enough to produce a concrete of a consistency that will flush readily under light tamping and which can be handled without causing a separation of the coarse aggregate from the mortar.

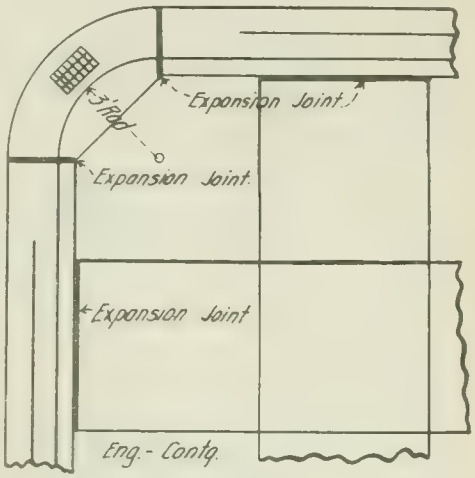

Fig. 3—Plan of Construction at Street Corners.

Retempering—that is, mixing with additional water, mortar or concrete that has partially hardened—will not be permitted.

A layer of concrete shall be deposited to the top of the gutter form and tamped, the width of the gutter, to a surface all points of which shall be at least the thickness of the wearing surface below the finished surface of the gutter. The cement placed for the curb shall be tamped and the remainder of the concrete placed and tamped to permit of the application of the required wearing surface to the face and top of the curb. After the addition of water the mixture shall be handled rapidly to the place of final deposit. Under no circumstances shall concrete be used that has partially hardened.

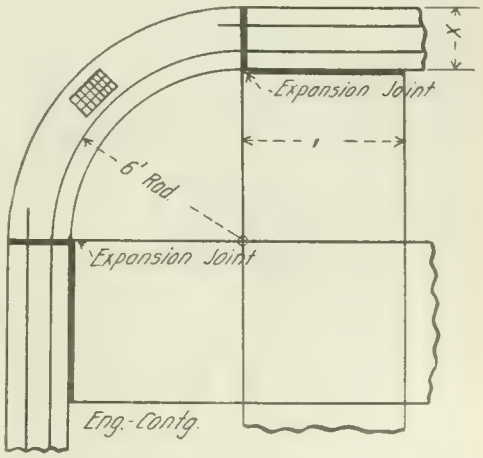

Fig. 4—Plan of Construction at Street Corners.

Concrete shall not be mixed or deposited when the temperature is below freezing unless special precautions are taken to avoid the use

*Committee report made to the National Association of Cement Users, annual convention, Chicago, Ill., February, 1910.

of materials containing frost and to protect the work against frost until thoroughly hardened.

Workmen shall not be permitted to walk on freshly laid concrete, and where sand or dust collects on the concrete it shall be carefully removed before the wearing surface is applied.

Wearing Surface.—The wearing surface shall be mixed of 1 part cement and not more than 2 parts fine aggregate, with sufficient water to produce a consistency which will not require tamping, but which can be easily spread into position. The mortar for the wearing surface shall be mixed in a mortar box. The wearing surface shall be placed immediately after mixing, and in no case shall more than 50 minutes elapse between the time the concrete is mixed and the time the wearing surface is placed.

The wearing surface on the gutter and on the top and face of the curb shall be at least ¾ in. thick. The surface and edges of the curb and gutter and joint between sections shall be finished in a workmanlike manner. All edges shall be rounded to a radius of about ½ in.

When required, the surface shall be troweled smooth. The application of neat cement to the surface in order to hasten the hardening is prohibited.

When coloring matter is required it shall be mixed dry with the cement until the mixture is of a uniform color. The quantity and quality of the coloring shall be such as not to impair the strength of the wearing surface. When completed, the curb and gutter shall be kept moist and protected from traffic for at least 1 week.

Notes on Road and Street Work.

Road Work in North Carolina in 1909.—During the year 1909 there were 403 miles of road surfaced in North Carolina, as follows:

	Miles.	Cost.
Macadam	131½	$502,490
Gravel	108½	56,700
Sand-clay	163	90,000
Total	403	$649,190

The average cost per mile of the macadam was $3,821, the highest cost per mile reported being $4,560 and the lowest $3,000 per mile. The average cost of the gravel roads was $513 per mile, the highest cost per mile reported being $1,200 and the lowest $500 per mile. The average cost of the sand-clay roads was $552, the highest cost per mile reported being $1,000 and the lowest $350 per mile. The greater number of sand-clay roads were constructed in eastern North Carolina, where there was but little grading to be done. The comparatively low average per mile for macadam roads of $3,821 is due to the fact that some of the roads reported as built and macadamized during 1909 were already partially graded. In some instances the location of a road was changed but very little, so that all that had to be done with the old road to prepare it for macadam surfacing was to widen the right of way and do a little grading by cutting down a few knolls and filling up one or two hollows. The low cost per mile of the gravel roads is also due to the fact that there was not a large amount of grading to be done before they were ready to be surfaced with gravel. Besides the above amount there was also spent in the state during 1909 $403,700 in the maintenance of roads. The greater part of this was spent in the repair of dirt roads. This makes a total of $1,052,890 that North Carolina spent on her roads during the year 1909. There were 19 out of the 98 counties composing the state that spent practically nothing in money on their roads, and what repairing was done was by the old labor tax, which requires every able bodied man between the ages of 18 and 45 to work 4 to 6 days per year in repairing the public roads. In lieu of this they could pay 75 cts. for each day they did not work. We are indebted to Joseph Hyde Pratt, state geologist, Chapel Hill, N. C., for the above information. In our issues of Feb. 2 and 9 we gave a summary of the road work done in 1909 in a number of other states.

Street Railway Construction on Paved Streets.—In 1908 the street railway track built in 1894 and 1895 in the city of Syracuse, N. Y., began to show signs of failure. The tracks laid at that time were in conformity with the best practice, consisting of 90-lb., 9-in. girder rail on timber ties spaced 2 ft. 8 ins. center to center on a 6-in. bed of broken stone ballast. As a result of the 13 or 14 years of service some points of weakness naturally developed. In some cases the wooden ties decayed, causing an uneven grade and widening of the gage. In other cases the rail itself failed because of lack of sufficient metal in the web. On the whole, the service rendered by this type of construction was satisfactory, but with the introduction of the heavier types of urban and interurban cars it became necessary to devise a stronger structure and to make some changes in the manner of street paving to conform to the greater depth of wheel flanges. As a result the Syracuse Rapid Transit Ry. Co. and the Syracuse, Lakeside & Northern Ry. Co. laid some experimental track on the plans shown in the accompanying cuts to renew the old structure. The former company constructed its experimental track with steel cross ties embedded in and upon Portland cement concrete, the 95-lb. tee rails being secured to the cross ties and underpinned with concrete throughout their lengths. The space between rails and tracks and 2 ft. outside was paved with vitrified bricks, a special brick being used next to the rail on the gage line to accommodate the flanges of the car wheels. The Lakeside road paved Noxon St. pursuant to a franchise provision, and in the railway portion of the street laid wooden cross ties on 6 ins. of concrete. The concrete was brought up to the top of the cross ties and brick pavement on a sand cushion laid to grade. A 90-lb. tee rail (American Society of Civil Engineers' standard) was spiked to the cross ties. The same type of special brick was used next to the gage line.

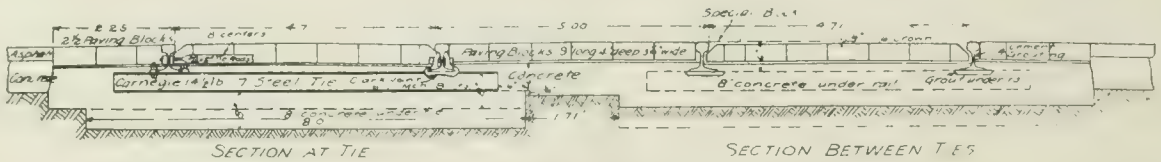

Fig. 1—Experimetal Track of the Syracuse Rapid Transit Ry., at Syracuse, N. Y.

loose and cracked wearing surfaces would be seen if workmen could be made to understand that a wearing surface will not adhere to, or form a bond with, a base covered with loam or dirt which they have "tracked" over it either through carelessness or in order to save a few steps. Clean cut joints between the slabs and expansion joints adjoining the curbs at streets and alley returns, and at frequent intervals in long stretches of walk, are absolutely necessary if broken curb stones and broken slabs in the walks are to be avoided. Expansion joints at street and alley returns can be eliminated by constructing the curbing with a "recess" into which the sidewalk slab may be laid.

Data on Street Work, Carlisle, Pa.—During 1909 two blocks, 4,400 sq. yds. of asphaltic macadam were laid on East Louther St., at Carlisle, the work being done by day labor. The old bed was so worn that 6 in. of new stone was required. After this stone had been thoroughly compacted by rolling, heated asphalt, 90 per cent pure, was forced to penetrate about 3 in. by a special sprinkling wagon; it was then covered with screenings and rolled. The cost of the 4,400 sq. yds. of asphaltic macadam was $1,069, or 25 cts. per square yard. This cost can be itemized as follows:

	Per sq. yd.
New stone	$0.07
Labor and rolling	.05
Asphalt and applying	.13
Total	$0.25

The asphaltic macadam on East Louther St., according to the annual report of C. A. Bingham, city engineer, from which these notes have been taken, has given a very satisfactory street and has proved mudless, dustless, noiseless and waterproof, with the additional advantage of being easily cleaned. Only one block was resurfaced with Tarvia during the past year. The cost of this work was 14 cts. per square yard, itemized as follows:

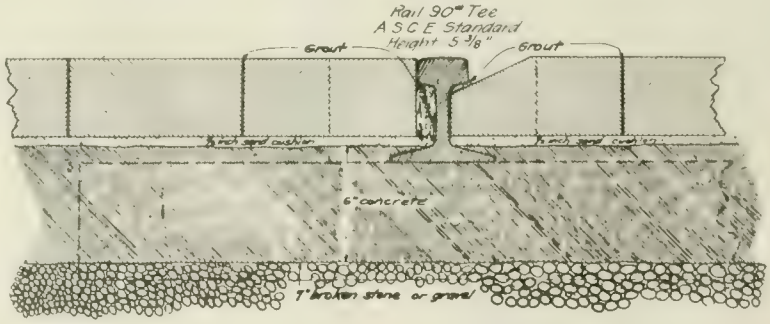

Fig. 2—Experimental Track of the Syracuse Lakeside & Northern Ry. at Syracuse, N. Y.

Hints on Constructing Cement Sidewalks

The following hints have been taken from a paper by Mr. N. E. Murray, superintendent bureau of sidewalks of Chicago, Ill., presented at the last annual convention of the Illinois Society of Engineers and Surveyors: Before constructing cement walks on a foundation that has been traveled over for several months, "pick up" the entire surface, flood and retamp it. The reason for this is obvious. On filling of this character the foot travel generally follows one well-defined line, usually in the center, which becomes solid and well packed and will not "settle" under additional weight; while the filling to either side of the center, on being given additional weight, usually settles sufficiently to cause a crack lengthwise through the walk, unless the entire surface is loosened and retamped to a uniform density before the concrete is put on. A successful contractor states that in cold weather he mixes the concrete as dry as it is possible to have it, and then puts in the base in two courses, tamping each course separately—in this way obtaining a more uniform density in the concretes, and as a result has never had to record a "failure" in his work. Better results will be obtained and fewer walks with

	Per sq. yd.
New stone	$0.09
Labor and rolling	.02
Tarvia	.03
	$0.14

About 6,000 sq. yds. of this Tarvia was laid in the previous year, and the report states that it has proven excellent for residential streets. Several pieces of plain macadam were laid during the year, the cost of 8-in. macadam being as follows:

	Per sq. yd.
Crushed stone	$0.26
Labor and rolling	.11
Carting, etc.	.04
Total	$0.41

The plain macadam streets at Carlisle need resurfacing at least every three years on account of soft limestone and the improper refilling of trenches by public service companies. This resurfacing, of which much was done last year, cost as follows:

New stone	$0.10
Labor and rolling	.06
Total	$0.16

During the year over 1,500 lin. ft. of 3. ft. brick gutters were laid along macadam streets, the unit cost being as follows: Labor, 13 cts. per lin. ft.; bricks, 20 cts. per lin. ft. In addition a concrete culvert 20 in. x 36 in. and about 200 ft. in length was laid at a cost of $1.66 per lin. ft.

Wages paid during the year in the above work were as follows:

	Per hour.
Foreman	17 cts.
Roller engineer	20 cts.
Laborers	11 cts.
Carting	25 cts.

Crushed stone cost about 89 cts. per cubic yard.

Summary of Tests Made at New York City of Machines for Cleaning Streets by the Use of Water.

The street cleaning department of New York city, as noted in our issue of Aug. 25, 1909, has been conducting tests of street flushing machines, with a view to securing data to guide the department in awarding contracts for flushing and cleaning the streets by machines or devices in which water is used. The contracts, which are to be let shortly, will call for the flushing of a large amount of street surface in the boroughs of Manhattan, Brooklyn and the Bronx. For this work the city has been divided into districts, there being six in Manhattan borough, eight in the borough of Brooklyn, and the bronx will be considered as one district. The six flushing districts in Manhattan borough are formed from the regular department of street cleaning districts approximately as follows: Flushing District No. 1 is formed from Department Street Cleaning Districts Nos. 1 and 2; Flushing District No. 2 from Street Cleaning Districts Nos. 3 and 4; Flushing District No. 3 from parts of D. S. C. Districts Nos. 5 and 6; Flushing District No. 4 from parts of D. S. C. Districts Nos. 5, 6 and 8; Flushing District No. 5 from D. S. C. Districts Nos. 7 and 10 and parts of No. 8; Flushing District No. 6 from parts of D. S. C. Districts Nos. 9 and 11. The proportion of the whole work to be done in each district is: District No. 1, 11 per cent; No. 2, 25 per cent; No. 3, 18 per cent; No. 4, 17 per cent; No. 5, 15 per cent; and No. 6, 14 per cent.

The tests, the results of which are given in the accompanying tabulation, were conducted in the 11 department of street cleaning districts noted above. In the tests in order to obtain comparative costs each machine was assumed as costing $1,000, horses were placed at $300, wages of drivers and sweepers were $800 per year and maintenance at $2.70 per day. A price of 13½ cts. per 1,000 gals. was placed on the water supplied by the city. Under the contract the flushing and sweeping up of the debris will be done as much as possible at night and it is planned to have the work begin at about 11 p. m. and continue until 7 a. m. The work will extend from April 1 to Oct. 31.

The five flushing machines mentioned in the tabulation are all operated by air pressure, with the exception of the Studebaker, which runs a rotary pump and engine. Each machine weighs loaded about 3,000 lbs.

The tests were conducted under the general supervision of Mr. A. F. Gunther, district superintendent, while Mr. E. D. Very, engineer of the department, was in charge of collecting and preparing the cost data. It is to the latter that we are indebted for the results given in the accompanying tabulation.

SUMMARY OF DATA FOR TESTS OF MACHINES FOR CLEANING STREETS BY THE USE OF WATER.

Method of Constructing Macadam with Asphaltic Oil Binder at Pasadena, Cal.

Macadam constructed with heavy California asphaltic oil as a binder has of late years come into much use in southern California for city streets and country roads. The city of Pasadena especially has a considerable amount of this kind of pavement and has found it to be hard, dustless and mudless, and one which the hardest and heaviest automobile traffic cannot ravel. The method of constructing this pavement as employed at Pasadena was described by Mr. S. J. Van Ordum, city engineer of that city, before a conventnon of the League of California Municipalities, and the matter in this article has been taken from his paper.

Preparing Base.—The roadbed is first graded, watered and thoroughly rolled with a heavy roller. Stone of a size not larger than 2½ ins. in its largest dimension and not smaller than will pass a ¼-in. screen is then placed to such a depth that after being thoroughly sprinkled and rolled with a 12-ton roller the surface shall be 1¾ ins. below the surface of the finished pavement. The depth of this base depends upon the character of the soil, drainage, character and amount of traffic upon the street. The average depth of this base under ordinary conditions is about 4¼ ins., which with the top surfacing of 1¾ ins. makes a 6-in. macadam pavement.

As the rolling of the broken stone foundation progresses, rock screenings of a size not greater than will pass through a 1¼-in. screen are spread over the surface in sufficient quantities to bind the broken stone foundation and form a true surface.

The idea in placing a binder on the base rock is to partially bind the rock so that it will not be displaced in oiling or placing the subsequent layers of rock. It is not necessary nor is it advisable to thoroughly close and seal all the voids in the rock, for the first coat of oil which is applied to the base would then be unable to penetrate the base.

Upon this base prepared as above specified is then applied liquid asphaltum at the rate of ¾ gal. to each square yard of street surface.

Wearing Surface.—A layer of crushed rock consisting of stone which will pass through a 1¼-in. screen and be retained by a ¾-in. screen is evenly spread over the rock base to such depth that, after being thoroughly sprinkled and rolled with a 12-ton roller, it is 1¼ ins. in thickness.

Liquid asphaltum is then applied at the rate of ¾ gal. to each square yard of street surface, after which a coat of crushed rock of a size which will pass through a ¾-in. screen and be retained on a ¼-in. screen is evenly spread to a depth of ½ in. in thickness.

The surface is then thoroughly watered and rolled, followed by a coating of liquid asphaltum applied at the rate of ¼ gal. per square yard. After spreading a light coating of rock screenings ¼ in. and under in size, sufficient to absorb all surplus oil and produce a uniform surface, the pavement is watered and thoroughly rolled until it becomes hard and smooth, true to grade and cross section, and free from all hollows and irregularities.

Care should be taken to have the different courses of rock carefully screened and spread uniformly over the street. If crusher run of rock is used the unequal density of the pavement will result in too little oil in one place and too much oil in another spot. The street when completed should have a surplus of rock screenings on the surface, for the sun and continued traffic will bring out the oil which combined with the fine screenings gives the street the asphalt finish.

A trench cut in an oil macadam is repaired by first thoroughly tamping the base rock to within about 2 ins. of the surface, the edges of the pavement next to the trench should then be cut and the space filled with rock and oil which had previously been mixed by hand. A light coating of screenings is then spread over the surface and the whole thoroughly tamped with a hand tamper.

The oil which has been most successfully used has been the heavy crude or topped oils from the Sunset fields near Bakersfield and contains from 75 per cent to 87 per cent asphaltum. Great care should be taken in selecting the asphaltic oil, for the success of the pavement depends to a great extent upon the character of the oil used. Especially is this true if a topped or partially refined oil is used. Refineries are negligent in topping oils and often turn out a bad product which is very hard to detect from a first class road oil. It is also economy for them to top the oil in as short a time as possible, heating the oil to a high temperature, and in so doing cracking the asphalt content.

Iron and Steel Production in 1909.—The year 1909 witnessed a wonderful revival in the iron and steel industry of the United States, and the production of the former will nearly reach the record production of 1907. According to an estimate made by E. C. Harder of the U. S. Geological Survey the production of iron ore in 1909 was approximately 51,000,000 long tons, while the production of pig iron totaled about 25,500,000 long tons. The following table shows the production in long tons of iron ore and pig iron in 1907 and 1908 and the estimated production for 1909:

	1907	1908	1909
Pig iron	25,781,361	15,936,018	25,500,000
Iron ore—			
Lake Superior district	41,638,744	28,225,412	41,000,000
Alabama	4,039,453	3,734,438	} 10,000,000
New York	1,375,020	697,473	
Other states	4,667,402	3,326,013	
Total ore	51,720,619	35,983,336	51,000,000

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

The Efficiency of Day Labor Maintenance of Chicago Sewers with Particular Reference to Cleaning of Catch Basins and Sewers.*

A classification of the work of the Chicago Bureau of Sewers is as follows: (1) Chemical work, (2) establishment of bench and street grades, (3) inspection of house drains and (4) maintenance of sewer system. This study applies particularly to the last division of the work, which is subdivided as follows:

(a) Catch basin repairs: A maintenance force consisting of a civil engineer and nine gangs, with a brick mason foreman, makes minor repairs to catch basins and sewers.

(b) Operation and repair of sewage pumping stations: Five pumping stations are maintained to raise sewage from one level to another for suitable disposal. Jurisdiction of engineer in Bureau of Engineering.

(c) Control of supply yards: Two yards containing various supplies, sewer pipe brick, cement tools, etc., are maintained.

(d) Cleaning of catch basins and sewers: Involves removal of material accumulated in catch basins, also removal of sediment and obstructions from sewers. There are five districts, each with a foreman, subforeman and force of teams and men varying from 30 to 50 individuals. The method of cleaning the catch basins varies. In some instances the material is removed by buckets and ropes and dumped directly itno large water tight trucks. In other instances it is taken out by means of long handled shovels called "spoons" and placed on the surface of the street, to be collected thereafter. The sewers are cleaned either by flushing with a hose or, if the obstruction is not removable that way, by dragging knotted ropes, wooden or iron scrapers of different dimensions from one manhole to another.

The principal part of the bureau's work consists in the maintenance of the sewer system. The expenditures are almost entirely on pay rolls, the large bulk of the employes being laborers. Approximately 50 per cent of the expenditure was for cleaning sewers and catch basins.

In seeking to determine the efficiency of the laboring forces attention was largely confined to the work of the force engaged in cleaning catch basins and sewers. Inspectors were appointed to observe the gangs with a view to reporting on the amount of time actually spent in productive labor, amount of material removed, movements of teams, aptitude of forces, etc. Observations were classified under the headings Time Working, Time Wasted, Time Waiting, and Time Away from Work.

After an amount of time had been devoted to this secret observation sufficient to form a basis for the determination of the normal activities of the force, the same men were sent out openly to make the same character of observations. Obviously the purpose of this procedure was to contrast the normal activities of the gangs with their possible activities. Such a comparison would show a loss of efficiency which might be due to incompetent direction and supervision by supervising officials of the bureau, including its district foreman. A study of the record of the material removed taken in conjunction with the pay roll expenditures could also be made to show the unit cost of such work as it actually exists and in addition the unit cost of productive labor or in other words the amount such work should cost. From a comparison of the latter figures with the former would then be developed the lack of efficiency of the force due to any and every existing condition of delinquency affecting the work.

[An itemized daily record of time worked, time wasted and time waiting, gang by gang, for approximately a month follows. Only the general summary of the inspectors is given, quoted as follows.—Editors]

Referring in a general way to the condition found in the Department of Sewers during my several weeks of both secret and open observation covering the work of cleaning catch basins, and the character of the service rendered by labor and teams engaged in this work the following is submitted:

During the secret observations we found the service of laborers to be of a very low grade of efficiency. Loafing, drinking and visiting saloons during working hours is a general custom. No effort is made to hide from the public this neglect of duty. Men stand out on the street or wherever they happen to be when a bucket of beer is drunk, evidently indifferent to any one in authority or fear of being seen and punished by some person responsible for the work of the department.

Lack of supervision and direction is apparent throughout the department, or that part of it that has to do with labor and teams cleaning catch basins. In only one instance during our four weeks of secret observations did any foreman or assistant foreman appear where a crew was at work. In this case he remained probably five minutes to hand some written instructions to the crew. During our open observations, either the foreman or the assistant foreman visited the crew several times each day. I am unable to discover any duties performed by the assistant foreman in the two districts mentioned in this report that could not be performed by a messenger boy.

The department depends entirely for its information concerning the condition of catch basins upon complaints sent in by citizens. There is no system of inspection or investigation of catch basins to occupy the time and attention of the assistant foreman. His work, as I observed it, consists in carrying a list of the complaints made out at headquarters and given him for delivery to the gangs that are working too far from headquarters to call for their instructions in person. The hours on duty are arranged by the different crews to suit their own convenience and wishes, beginning and concluding work whenever they see fit, without direction or interference from any one.

With reference to the value of services rendered the department by the teams employed in this work, I find great waste in the many useless and unnecessary trips made by teams hauling only partly loaded wagons between points of loading and various dumps. This last could be corrected were each wagon numbered and examined at the dump as to the size of load by a reliable man. This would provide an accurate record of the amount of dirt hauled by each team and serve as reliable data covering the work of each crew. Teams come and go without direction of any one, in some instances, the crew of laborers being idle for hours waiting for team to set wagon for loading.

An arrangement is in effect with all crews observed, which provides that in case two teams are used with three wagons, one of the teams makes only one load each day, the other makes two. Then on the following day the trips are arranged so that the team making two trips the day before only makes one. This in effect gives one team a full day's pay for half a day's work each day. With crews made up of two wagons and one team it is possible in almost all localities to make two trips to the dump and have an empty wagon on hand for loading after the second has left for the dump.

Referring to these conditions and particularly to the records of individual gangs, the report continues:

The foregoing extracts serve to show the character of the faults existing in the service. Attention is directed to the fact that the extraordinary condition of inefficiency is found not in one or two gangs but in every gang observed.

The extent of the normal delinquency of the force with respect to the waste of time alone is shown in Schedule I attached hereto. This is a summary of the data contained on the graphic charts covering secret observations. It shows the aggregate time in minutes of all the men watched secretly and the relation of the classified time to the total time under observation.

An examination of Schedule I shows that the amount of time wasted per gang ranges from 189 per cent to 89 per cent of the total time observed, the average being 46 per cent. There is a strong probability that if the time shown as "unaccounted for" could be classified this average would be increased to 50 per cent at last. This means that the laborers of the bureau are in the habit of wasting practically half of every day by loafing or leaving the work entirely. Schedule II, which follows Schedule I, gives exactly the same character of information. The conditions, however, are different here since the observations were made openly.

A comparison of the figures in corresponding columns of these two schedules clearly shows the effect of critical inspection on the normal activity of the force. The normal average percentage of working time is almost doubled and that of wasted time is reduced from 46 per cent to less than 14 per cent.

It might be expected that under the series of open observations the wasted time would be entirely eliminated. In a few instances this was practically the case, but in others it still amounted to about ⅛ of the 8-hour day. A part of this waste of time under open observation can be attributed to the inexcusably bad system in vogue, but the remainder is unquestionably due to the bold disregard of authority engendered by a close association with politica. influence.

Anticipating that this unwholesome but familiar condition might be encountered among the sewer gangs, provision was made for securing a basis of comparison which would be largely independent of this and other similar features affecting different work. This was accomplished by securing data from which a cost analysis of work could be made. The time of all men engaged in productive labor was segregated, reduced to dollars and cents and divided by the amount of material disposed of. The result appears as the result of productive labor or useful work per cubic yard of material removed. Where this unit cost of productive labor is compared with the actual or pay roll unit cost of labor, the difference represents the self demonstrated loss of efficiency due to any and every cause.

Obviously, if the work performed cannot be measured in units of quantity, the method fails. For this reason the cleaning of sewers is not readily susceptible of analysis, but the cleaning of catch basins, on the contrary, provides every essential condition.

Schedule III has, therefore, been prepared, utilizing this method of determining absolutely the efficiency of that part of the force so engaged.

The deductions to be drawn from this schedule are astounding. It is there shown by a succession of figures whose very uniformity attests the reliability of the observations, that the present average unit cost of cleaning catch basins is 255 per cent of what these very gangs demonstrated they could make the average cost, and 340 per cent of what several gangs showed should be the unit cost.

In other words, the gangs themselves proved that their normal work showed a loss of efficiency of nearly 61 per cent as compared with what several individual gangs actually did.

It is impossible to controvert the deductions thus drawn. The figures correspond exactly to

*Abstract of a report by B. F. Melton, Engineer, to the Chicago Commission on City Expenditures, commonly known as the Merriam Commission.

the characterizations made in the previous extracts from inspector's reports.

Item.	Schedule I. Secret Observation.	Schedule II. Open Observation.
Total time observed, hours	760	[illegible]
Time worked, per cent	[illegible]	76.4
Time wasted, per cent	46.0	13.8
Time waiting, per cent	2.3	4.3
Time, unaccounted for, per cent	11.7	5.5
Total	100	100

SCHEDULE III.

Item.	Secret Observations.	Open Observations.
Pay roll cost per cu. yd.	$5.11	$2.59
Produc. labor cost per cu. yd.	[illegible]	2.00

Dikes for Tide Lands.—The owners of northwestern tide lands have been perplexed with the problem of providing impervious dikes. In most cases, when a dike broke the destruction was started from a small hole burrowed through by a rodent. Charles N. Hudson, engineer for the Harbor Columbia Canal project, has submitted the following plan for a permanent dike. A narrow trench about 2 ft. deep is first dug along the center line of the proposed dike. In this trench a thin wall or tongue of iron or concrete is placed. Earth to the desired thickness and height is then piled on each side of the tongue to form the dike or levee. Where sheet iron is used to form the tongue it is necessary to use stokes or posts to hold the iron in position while placing the earth. As concrete does not rust it is a more suitable material for the tongue than iron. Concrete slabs 1 in. thick and any convenient width or length, say 2 ft. wide and 6 ft. long, can readily be molded. Slabs can be made during the winter season for spring dike work. In setting up the concrete tongue the slabs are set edge on edge, with broken joints held in place by means of wooden clamps while the earth is carefully put in place.

Workman's Compensation Law in Canada.—An act providing compensation to workmen accidentally injured was passed by the Quebec legislature and took effect Jan. 1, 1910. The act makes provision for all classes of workmen except agricultural laborers and seamen on board sailing vessels. The act was founded on a similar law in England and is very liberal. In case of permanent incapacity the workman is allowed an amount equal to 50 per cent of the yearly wage. In case of permanent and partial incapacity the compensation is half the sum by which the wages are reduced. For temporary incapacity, provided the inability to work has lasted seven days, a payment of half the daily wages beginning at the eighth day, is required. The law is in effect only where the capital of the income is less than $2,000. Accidents causing death are compensated by a sum equal to four times the average yearly wage of the deceased at the time of the accident. Except in case of intentional injury the compensation shall not be less than $1,000 or more than $2,000. Medical and funeral expenses are also furnished except to members of a friendly society.

Progress on the Gatun Locks.—The report of the Isthmian Canal Commission on the progress of work on the Gatun Locks shows a record amount for the month of January. During the week of Jan. 24 a total of 14,165 cu. yds. of concrete was placed. The average for the week was 2,361 cu. yds. per day. The largest day's work reported was on Jan. 25, when 2,764 cu. yds. were placed. Operation on all parts of the work are progressing favorably. At the time of the report the floor in the bay of the locks was nearing completion, all the excavation having been finished. In the second locks one of the steam shovels excavating for foundations was at grade, 18 ft. below sea level. In the east wall two of the monoliths were in the course of construction one having been finished and three forms for the center wall monolith were in the process of erection. Simultaneously work was being pushed on the sill of the emergency dam and on the sill in the east chamber.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Methods of Cost Analysis as Applied to Construction Work.*

By the very meaning of the term, cost analysis is in no sense a new idea, being merely a modern designation for good judgment based upon experience, or the analysis within the brain of the individual as to the relative cost of different classes of work, such judgment and decision being reached through an intimate acquaintance with costs, the value of the best work along various lines of construction.

Since the days when things were first built, the individual workman has accumulated a mind full of relative costs of work based upon his own impressions and experiences. Those in whose brain the idea of cost analysis, or good judgment, received its highest development, are the ones who have advanced from the position of laborer to foreman, to superintendents, and finally to the position of employers.

Many a successful contractor has been a man who, without education, has by years of hard labor and experience accumulated a knowledge of costs which has enabled him to make propositions which as examples of conservative bidding, and as evidence of the real cost of the proposition, are above criticism, and which are really nearer the truth than the engineers' estimates, prepared on the basis of data collected from preceding lettings and theoretical costs. I desire to lay emphasis upon this particular point, for herein lies absolutely all the value of cost analysis. The mere cost of a proposition when reduced to dollars and cents is of little value, except when used with the good judgment attendant upon actual experience and a personal acquaintance with the nature of the work.

The cost analysis turn of mind is not something to be acquired, unless the individual has within himself an instinctive disposition to ascertain why the results are as recorded. The laborer who advances to the position of a business of his own, no matter how ignorant and uneducated, is a man who grasps this fundamental point, and he, perhaps unconsciously, gains a relative idea of the value of work in proportion to the circumstances surrounding same; or, in other words, this man really has the advantage of not being encumbered with reports which influence his judgment, but instead, forms his conclusions entirely with regard to the circumstances and conditions under which he must work. Too often the modern idea of cost recording to be used as a basis for future operations obscures these points, and costs are used which are in no sense indicative of the actual work.

Under the method mentioned, however, whereby the gradual self-advancement of the laborer to the position of employer is secured, and wherein the knowledge must be absolutely based upon experience, the advancement of the individual is necessarily slow, as far as relates to the successful man. The individual starting in with insufficient experience is entirely at a disadvantage, and unless he meets with very unusual or fortunate circumstances the result is failure. In the old days, the artisan in any special line had accumulated within his brain all the details necessary to successfully complete any work. In our day, blue prints are supplied to the contractor, and if he cannot read a plan, or estimate the quantities from a blue print, he is very seriously at a disadvantage.

Modern cost analysis demands, therefore, not only a record of actual results, but the ability to read and interpret a plan for the purposes of applying such practical information to the problem in hand.

*A paper by DeWitt V. Moore read at the January meeting of the American Society of Engineering Contractors.

COST RECORDING.

The subject of properly recording costs is a very difficult and complicated one when applied to construction work, and is not only complicated, but in some cases is exasperating and almost impossible of application. The subject of cost recording has been covered very fully by a number of writers, with regard to its application to manufacturing plants, where we have an industry within the limits of the four walls of a building, and where the men are always in sight and subject to observation and a close check upon their output. Labor working under these conditions is largely independent of the weather, is generally of a higher grade, and the facilities for a close check upon the actual time employed are greatly increased.

In the case of construction work, a large percentage of the payroll cost will be made up of common labor, in many cases foreigners to whom it is impossible even to explain what is desired. All labor is exposed to the inclemencies of the weather, and the output of the men is thereby directly affected. The circumstances surrounding the work, and the very nature of the work itself, make it difficult to sift out the bad labor from the good, except through the medium of the foreman, and the output is measured more from the gang unit than from the individual unit. The laborer, as a result, not being hired except in especial cases for any particular line of work, is shoved around from one class of work to another, so that at the best all that can be expected is an approximate estimate of the distribution of his time and the work accomplished; and he may also at any time be placed on work where there is absolutely no unit measurement of output. The character of the work handled, the class of labor, the numerous large gangs with frequent discharges and additions of new men, serve, therefore, to complicate the work of cost analysis; and if an attempt is made to reduce the subject to too fine a point, and too much stress is laid upon it, the attention of the superintendent, foreman, sub-foreman and timekeeper is soon distracted, and the result is an increased cost. While it is an excellent thing to have the cost recorded in such shape that it may be analyzed, still if such a line of thought is carried to the extreme, resulting in an actually increased payroll, through lack of proper supervision and attention, it will hardly make up for the loss of the money.

The foregoing remarks have a special reference to the subject of the cost of the labor, but to a very large extent the same conditions exist with reference to the cost of the material and other items entering into the cost of construction. In the case of material delivered to the manufacturing plant, it is possible to properly store and protect same. It is also possible to issue same from a storeroom, with a storekeeper and a perfect system of reports as to material used. On construction work, such a refinement is absolutely impossible. It is, of course, possible to check up material received, and to protect same to the best advantage; but, nevertheless, all material is directly cut in the open, subject to damage by weather, or loss by thieving. The labor employed has direct access to the material, as it is piled around, attendant to the work, and outside of supervision by the timekeeper or foreman, and there is no check upon the material used. A carpenter will invariably saw off a short piece of board from a long, new piece, rather than draw out the nails and clean up an old board which would have answered the purpose. When the size of the gang is considered, the irresponsibility of the character of the labor, and the difficulty of watching each man all the time, make it evident that the cost analysis of the material used must

be considered from a different viewpoint than in a manufacturing enterprise.

If cost analysis in construction work is unsatisfactory, as far as labor and material are concerned, how much more so is it the case in the consideration of expense items, such as fittings and repairs, small tools, boots, paulins and other items, which are of just as much importance to the work as the labor and material. These items, insignificant in character and few with reference to the unit, are in the aggregate of tremendous importance. Small tools may be purchased, thrown down and immediately covered by the excavation of material; bolts and small tools may be stolen by the workmen; large pieces of packing wasted or the remaining supply of bolts, nails, or other material be thrown to one side and lost. These are leaks which apparently should be overcome by the proper kind of supervision, yet if too much attention is paid to this line of the work, it is both possible and probable that the construction work itself will be neglected, resulting in a decreased output or increased cost.

Cost analysis is, therefore, in connection with construction work, a subject which requires a broad-minded policy, far different from the red tape system which is possible in manufacturing. A man who may have just exactly the right turn of clerical mind, who may be exact in his accounts and correct in his reports, in the position of payroll clerk, timekeeper or stock-room clerk, in connection with a manufacturing plant, may be an absolute failure when placed upon construction work in like capacity.

While it may sound as rather a broad statement, the writer is clearly of the opinion that the construction man in the field as superintendent, foreman, material clerk or timekeeper must consider all accounts as they arise in the guise of dollars and not cents. "Penny wise and pound foolish" can have no better exemplication than in work of this kind, and yet cents must be considered where the cents occur in such a way as to be accumulative.

METHODS OF COST ANALYSIS AS APPLIED TO LABOR COSTS.

Conceding that cost analysis is just as important to the contractor as to the manufacturer the attempt must be made to overcome the difficulties and obtain just as near the true cost as the conditions, the character and importance of the work, and the cost of securing the information will justify. But in so obtaining costs in construction work there is a further difference when we compare with the factory, viz.:

While such recorded costs are of benefit, still they are also a detriment. Where no recorded cost exists the mind of the estimator, or contractor, is entirely free from any influence which might tend to make him doubt his personal recollection or knowledge of the work during the progress of construction. Where such recorded costs do exist, it is but natural that they should be referred to in making new estimates, and the influence is to subordinate the personal recollection to the black-and-white figures actually before one.

Granting that this is true of the individual who is using his own cost records, how much more is it true of the one who is attempting to formulate a proposition where he is, at least to some extent, basing his decision upon the recorded costs of others. Every individual who has collected cost data, and has occasion to refer to them, as soon as the reference is made will unconsciously have a *mental picture of the work*, and the conditions surrounding it, and the circumstances under which the work was done; but if the cost records are encumbered with a complete description of this character, the reference will be so laborious that the cost records would be of no value. It is therefore essential that any published cost records be accompanied by a brief, pointed description of the kind of work, where and when done, the weather, the equipment used, the rate of wages paid, the character of labor, etc., and even then that they be used with discretion.

The subject of cost analysis is a step forward from the subject of cost recording, or cost collection, or cost distribution, and is an extremely difficult and complicated subject. Each and every job has its own peculiar characteristics, and in the beginning of the work it is necessary to analyze the work to be done, study to determine where even the same class of work will show a different result, and therefore attempt to get as close and complete a record as possible with due reference to the different characters. As the work proceeds many unforseen conditions will arise, which will make necessary new and special distributions.

These remarks might seem to justify the conclusion that the writer believes in a complicated and extensive set of distributions on any one job, which is far from the case. It is better to reduce the number of classifications to the very minimum, and not to attempt to divide the different items into too great a number of elements. It is far better to take a general class of work, and let all of the elements which go to make up that classification be recorded therein, and then give such a complete description of the circumstances and conditions surrounding the work as will enable the formation of a mental picture. However, should the same class of work as carried under the general head require this class of work to be done under different conditions, or methods, then such a separate distribution should be carried.

With special reference to the subject of sewer construction, let us consider the effect of the above remarks. Let us suppose that we have a sewer contract for construction which is in the nature of a main sewer with branches, and which will gradually reduce in size from the out-fall to the farthermost limit of the drainage area.

In the case of the "mental-analysis-only" sort of contractor, the work will be allowed to proceed under his personal direction and the cost of the work will be determined entirely from such personal observation from day to day in connection with his book expenditures, thereby forming mental conclusions which, while probably correct, are only of value to himself, and cannot be of service even to his own organization, except by word-of-mouth instruction.

In the case of a cost collection system, where the cost of the various classes of work is kept separately for the entire job, the cost of a cubic yard of excavation will be determined as the total cost of this class of work divided by the number of cubic yards handled; and the same will be true of concrete, brick, pipe-laying, etc.

When the subject is given the proper study, however, from the question of cost analysis, it will be seen that neither one of the preceding methods is the proper one. In the first place, depending upon the size of the sewer and depth will depend the relative proportion of the sheeting and shoring of the trench, in proportion to the cubic yards of earth handled. Again, the amount of sheeting and shoring will depend upon whether the sewer is to be built of brick, concrete or pipe, inasmuch as with pipe, the pipe-laying can follow the excavation much closer, thereby reducing the amount of timber work. Again, the size of the sewer has an influence upon the cost, inasmuch as it fixes the quantities per lineal foot of trench. This, however, is not as applicable to excavation and pipe-laying as it is to concrete work. Again, there is a vast difference between the handling of wet trenches and dry excavations, both of which may have occurred on the same job, and if cost analysis does not distinguish the difference, the resulting average price is not a true indication of the value of the work. Again, many sections of the work may be surrounded by special conditions, such as railroad crossings, interference with existing sewers, pipes, conduits, etc. Or the same job may include work in improved streets and unimproved. Unless the distinction is made here, the average cost will be misleading.

The writer has found, by a long personal experience that it is impossible to depend upon the average timekeeper or clerk to make these distinctions. Generally, however, it is the case that any job that is entered into has been studied, and some attention given these points in the preparation of the estimate. Therefore, as soon as the actual construction is started it is wise to divide the work into as many different sections as it is expected will be necessary, by making separate or special sections, thereafter running such sections as though each were a separate contract or unit. While it is true that the collection of cost information is rather indefinite and hard to obtain when a construction crew is passing from one section to the next, still we have the advantage of trying as closely as possible to obtain the cost of the individual section, and we have always the summary by merely the addition of all of the sections.

Where this separation of cost is not kept at all, there is no possible way to recover the information lost. Where the cost is kept, even although in an unsatisfactory manner, some information can be gleaned and the total and average are always available. As an example, on a straight run of a sewer of the same size, it may be necessary to cross an intersecting street where there are obstructions, such as street railroad tracks, sewer pipes, gas pipes, conduits, etc., and unless the intersecting street between street lines is considered as a section by itself and a persistent effort made to determine the cost of the labor in this section, the result will be an increased average cost over the entire length, which cost would be misleading in case the information was ever referred to with reference to a proposition of a like character where there was not an intersecting street. Emphasis is laid here upon the proper study of the lay-out of the work, and the consideration of sections, as made above, as being of the utmost importance with reference to the office work of the analysis of the cost.

If the information has been secured in the manner suggested, it is at once available, and tables or charts may be prepared, showing the cost of the same class of work of the various sections, under the different circumstances. These costs may not be absolute, nor is it expected that they will be used without mental reservations; but they do at least form the basis of intelligent thought and estimating. Inasmuch as it is extremely difficult to tabulate these results in a sufficiently clear manner to be able to determine at a glance the information required, the writer considers that graphical charts are to be desired. On such a chart can be grouped different classes of work under different conditions, and different jobs under comparatively the same conditions, and the result is that information can be secured that is of great assistance.

COST ANALYSIS AS APPLIED TO LABOR AND MATERIAL AND EXPENSE.

On the foregoing we have considered labor cost principally. Cost Anaylsis implies far more. Modern writers seem to be agreed upon the fact that cost is represented by labor, plus material, plus expense. This analysis is further elaborated by the division of labor into "Direct Labor" and "Indirect Labor," or "Productive Labor" and "Non-productive Labor." Material is divided into that entering directly into the job, plus material incidental to the construction, but necessary to the performance thereof. Expense is further divided into expense items directly connected with the cost of production and expense connected with the marketing or selling of the product.

There can be no argument as to the fact that these items are the primary elements in the case of any business. However, when it comes to the application to any one particular line of business, there arise a great many different ideas as to the right method. In construction work direct labor may be considered that labor which is necessary for the performance of any particular line of work, after all materials have been delivered within a reasonable limit of the site of the work. Indirect labor is a proper charge against the cost of materials, expense, supervision, etc., etc., as appears proper. For instance, a labor item appearing as the cost of the hauling of gravel, stone or cement, in a concrete job, should appear as a material item; that is, the cost of such labor should be added to the material, in order to determine the value of the material f. o. b. the site of the work. On the other hand, the labor items incident to the hauling of an outfit, or the moving of an outfit from

job to job, the hauling of repairs and fittings, etc., are properly a general charge against the work as a whole, and therefore should appear as expense items.

It is necessary that this division be made, or otherwise there would be no common ground on which comparison can be made between any particular line of work under different conditions and circumstances. On the other hand, labor which appears directly upon the job, or which is more or less of a floating character, should be distributed from day to day to different lines of work, for the reason that *if it is at all necessary to the job,* it is necessary to each item of work, and therefore it is proper to distribute it directly to the item thereby in a broader sense avoiding any item of indirect labor immediately upon the work. This applies to engineers, pump-men, timekeepers, sub-foremen and foremen.

In construction work, there necessarily must be a certain amount of material not directly intering into and making a part of the finished work, but which is necessary to its performance. It would be a very pleasant experience if a complete record could be made, so that the amount of such incidental material used for each class of work could be determined; but all of us who have had experience know that in construction work it is absolutely necessary to supply a more or less varied character of timber, steel and other material for use as emergencies arise, and it is almost impossible to keep any record other than to know how such material has been delivered and how much salvage exists at the end of the work. Therefore, in the absence of any better method, it seems best to consider all such material as being charged directly against and forming a part of the job, giving a credit for any salvage, and charging the cost against the class of work effected.

The item of expense is a very different proposition to handle, and includes not only material in the way of incidental supplies, but also various items of expense which cannot be considered either material or labor. For instance, the material furnished and labor expended for the commissary quarters for the men, whether fixed or movable, in the way of wagons, is a direct expense chargeable against the work as a whole, and not against any one item of the work. Again, as an illustration, the purchase of pipe, and the installation thereof for water supply, and the removal thereof, and the salvage on the pipe, is an expense item. As a further illustration, the bond and liability insurance on any job is a direct expense item, depending directly upon the size of the work.

Job expense items, therefore, are of two kinds. Those which are composed of material, labor or expense which are necessary to the performance of the work, and the amount of which is irrespective of the size of the job. Second, those expense items in the way of material, labor or expense which are necessary, or depend absolutely upon the mount of work to be performed. In addition, we have indirect expense items to be charged to each job, the amount, however, being determined by the average annual amount of business. Whether it is better to distinguish between direct labor and supervising labor, is a question for the individual preference. In the writer's judgment, it is very well established that a certain amount of direct labor requires a certain amount of supervision, and therefore the supervision rendered is held by him to be a part of the direct charge.

To apportion these expense items in the proper way is a matter of great importance. We may have jobs running all the way from twenty per cent labor to all labor, depending upon the character of the work and under what conditions the work is awarded.

It is at once apparent that on any one job all items of expense should not be bunched, but rather should they be divided into the various principal elements, in order that the one job may be compared with others and an intelligent idea formed of the comparative cost.

As an illustration of such division of expense, the writer suggests in ordinary construction work the following general divisions, viz.:

First—Bond, Insurance and Interest.
Second—Petty Tools.
Third—General Expense.
Fourth—Fittings and Repairs.
Fifth—Commissary and Commissary Supplies.
Sixth—Tools and Machinery.
Seventh—Fuel and Oil.
Eighth—Special, Incidental Costs.

If these various divisions are determined on all jobs and established, as a certain percentage on the cost of labor and materials, or either, we have a direct basis for comparison between jobs of like character, but with partly similar conditions.

Bond, insurance and interest need no comment.

To the item of Petty Tools should be charged such items in the way of small tools as are easily lost, worn out or stolen.

To the item of General Expense is to be charged such items as nails, wire, bolts and also items of expense which go to make up the repairs to Petty Tools.

To the item of Fittings and Repairs should be charged all work incident to the repairs and fitting up of tools and machinery.

To the item of Tools and Machinery can only be charged the tools and machinery employed on the job on some basis of a fair rental value, or the annual depreciation, it being expected that the Fittings and Repairs account, if properly kept and carried out, will keep the tools and machinery in good working condition.

The Commissary item mentioned should be carried as a separate account for such items as tents, paulins, boots, lanterns, etc., etc., these items being of more or less importance, depending upon the character of the work, and the item being more or less of a supplemental expense item. This account also taking care of boarding house, etc., when necessary.

The term Fuel and Oil is in itself significant, it being interpreted as the fuel and oil necessary for the production of power, and in this connection, if electric power is used the electric current bills are a proper charge.

Special items incident to any particular work should be considered as items of especial nature and not allowed to affect the ordinary divisions.

Now, if some general division, not too elaborate, is made of expense items, as mentioned, and the amount of same is determined by a percentage against the job as a whole, we have one method of proper apportionment of expense items.

A great many manufacturers, contractors and writers signify a preference for the method of dividing the cost into the various unit items of work performed. But no one can claim that this is entirely satisfactory or exact. The percentage method, to all practical purposes, accomplishes the same end, and is more simple of application. To the manufacturer who is producing articles of uniform value, or articles of a uniform kind, but varying in quality, and therefore of a different value, there may be a question as to the method. In construction work no two jobs are exactly similar, and may be greatly different. Therefore, they cannot be carried strictly as departments in a manufacturing plant, for this implies different classes of work under the same executive management. They may do better compared to a number of different plants, established in different localities, under their own management, reporting to a general executive head.

The writer's contention has always been that the percentage method is fair even under these circumstances, for the higher the grade of work performed, the greater the corresponding cost of labor, inspection, supervision, investment, etc., etc. Therefore it is perfectly fair to charge a greater proportion of the general expense item against the higher grade of work, as is the case where the percentage system is used.

A very important point, however, and one that must not be overlooked if the percentage system is used, is whether the percentage shall be determined upon the cost of material, upon the cost of labor or upon the summation of the two items. Many times a job is let where the owner furnishes all the material, the contractor only furnishing the necessary labor to install. Again, the proposition may be one where the cost of materials is very large in comparison with the cost of the necessaary labor.

No better illustration could be made of these conditions than the cost of the construction of railways. In the first case, if the owner is to furnish all materials, and the contractor is to furnish only the labor, his contract will only run from $500 to $1,000 per mile, or 100 per cent labor. Whereas, if the contractor is to furnish the material, the contract may run from $6,000 to $7,000 per mile, with the labor representing only 8 to 16 per cent.

If the percentage system, therefore, is used for determination of the expense portion of cost, three methods are suggested; but after such method of apportionment of expense, or burden, has been selected, the same method must be used for all time thereafter, or the results will be of no value for use in comparison of jobs or for use in making new estimates. The three methods are as follows:

(1) Apportionment as a percentage of the labor only. This method is good, for the reason that the labor is a fair indication of the amount and character of the work done, and unless the rate of pay, or the class of labor, is extraordinary, jobs may be directly compared on this basis. This method is recommended. However, since some labor must be directly charged to material, it will be necessary to deduct this labor before arriving at the actual amount of labor entering into the work.

(2) Apportionment by percentage of material. This is not a good method, for the reason that the material is not an indication of the work done, inasmuch as while the cost of the material may be standard at the point of production, its cost to the contractor is indicated by the addition of the cost of the transportation and delivery. Therefore, no comparison can be made between the job located close to the shipping point, and located directly on a side track, as against the same class of work at a considerable distance from the railroad, where all material must be hauled.

(3) Apportionment by percentage on the cost of material plus labor. While in a great many ways this method is unsatisfactory, still it will give a fair comparative average, and it has the advantage that the inconsistencies of labor and material are to a certain extent adjusted and averaged. It also has the advantage of being the most simple of application.

The various elements of expense cost must be kept separately on each job in order that any new contract arising may receive proper consideration by a proper combination of items of expense, which will form a part thereof. A sharp distinction should be made between jobs of different character, and not coming under the same classification.

Depreciation of machinery has been handled in a great many different ways by different writers. It has been apportioned by an annual depreciation and a fixed percentage. It appears to the writer, in the construction business, that the conditions are somewhat different from those in any permanent plant. In the permanent plant, a piece of machinery is installed and unless some improvement is made in the machinery, thereby requiring its removal, it will be used for a certain definite purpose until actually worn out. The contractor, on the other hand, is continually buying, selling and trading equipment. Equipment is purchased for special requirements of the contract and then disposed of. If new machinery is purchased, charge to the Tool and Machinery Account the second-hand value of same, charging the difference to the job. Inasmuch as the Fittings and Repairs Account, previously referred to, is a direct charge against each piece of the work, and, if in addition, the machinery is properly taken care of, it will always be in condition to realize the second-hand selling value.

In conclusion, the observer who forms a judgment of the cost of one class of work merely by observation, by stop watch or like means, may determine comparisons which are valuable in the supervision of work from day to day, but he does not form any true ideas of the actual cost of the work. The cost accountant, dealing with his records, containing as they do all items of miscellaneous, or indirect,

labor; also containing as they do non-productive time, caused by moving, charges, etc., arrives at costs which may be safely used as true costs, under the conditions. The effect upon the cost account of the conditions, circumstances, weather, quantities of work to be done, area covered by the work, the general lay-out of the construction plan, etc., must be considered in the final analysis.

The following charted summary presents in condensed form the writer's idea of cost analysis as applied to construction work:

- COST.
  - 1. Material
    - 1. Actually entering into the work divided by items of different character.
      - 1. Actual Quantities.
      - 2. F. O. B. Price.
      - 3. Waste.
    - 2. Accessory or Incidental.
      - 1. Quantity.
      - 2. Price.
      - 3. Salvage and Loss.
    - 3. Labor
      - 1. Delivery to Job.
  - 2. Labor
    - 1. Direct or Productive.
      - 1. Itemized by Sections of varying character.
      - 2. Itemized by kind of work done (Gen. Div.)
      - 3. Special divisions of pay work.
    - 2. Indirect of Nonproductive. To be proportioned over the various items of Productive Labor.
      - 1. On Job.
        - 1. Supervision.
        - 2. Repairs.
        - 3. Incidentals.
      - 2. Material Delivery (A material charge).
      - 3. General Supervision.
    - 3. Yards or Shop. Direct Labor.
  - 3. General Charges. To be proportioned over cost of material or labor, or their sum.
    - 1. Direct to Job.
      - 1. Bond and Insurance.
      - 2. Expense.
      - 3. Fittings and Repairs.
      - 4. Fuel and Oil.
      - 5. Specials.
      - 6. Commissary (Where Required).
    - 2. Indirect to Job.
      - 1. Petty Tools.
      - 2. Tools and Machinery.
      - 3. Yard and Shops, Payroll and expense of general character.
      - 4. General Office Payroll and expense

A System of Cost Keeping for Engineering Construction.*

The desirability of contractors throughout the country adopting a uniform system of keeping their accounts is very great. The main advantage is that gradually all engaged in contracting work will become familiar with what it actually costs them to do their work, and the very wide variation of bids which are now submitted at almost all lettings will eventually be done away with. It should prevent all but the most reckless from making proposals below cost. If these very desirable results are finally attained, the contractor's business will become a more stable one, and one in which banking houses especially would have more confidence than they have at present.

The uniform system adopted should be simple, inexpensive to keep, and should have wide flexibility to permit its application to contracts of all kinds. The author has for a great many years been using a system deduced from the book keeping methods of our railroad companies, which he has found to be satisfactory in all respects. There are six general headings into which all contract work must be divided. They are as follows:

First.—Materials of construction.
Second.—Labor.
Third.—Supplies.
Fourth.—Plant.
Fifth.—General Expense or Administration Charges.
Sixth.—Profit.

All general heads into which any contract is classified, such as excavation, concrete, masonry, etc., must be subdivided into such detail as may be desired, keeping constantly in mind the above headings.

For the purpose of explanation it is probably better to take an example of actual work. Let it be supposed that the construction of a reinforced concrete retaining wall is to be undertaken, the work to consist of excavation, concrete and steel reinforcement. The heading "excavation" would be divided as follows:

Labor—
1. Excavating in Trench.
2. Hoisting Excavated Material.
3. Trucking.
4. Backfilling.
5. Shoring and Sheeting.

Supplies—
6. Coal.
7. Oil.
8. Water.
9. Miscellaneous.

Plant—
10. Cost Delivered.
11. Maintenance.
12. Removal.

General Expense—
13. General Expense.

Profit—
Expenditures, during the execution of the work, would be distributed as Excavation Nos. 1, 2, 3, etc.

"Concrete" could be divided as follows:

Materials of Construction—
1. Cement Delivered.
2. Sand Delivered.
3. Stone or Gravel Delivered.
4. Facing Material Delivered.
5. Lumber for Forms Delivered.
6. Cement Bags.

Labor—
7. Mixing Concrete.
8. Transporting Concrete.
9. Depositing Concrete.
10. Making Forms.
11. Erecting Forms.
12. Facing.

Supplies—
13. Coal.
14. Oil.
15. Water.
16. Miscellaneous.

Plant—
17. Cost Delivered.
18. Maintenance.
19. Removal.

General Expense—
20. General Expense.

Profit—

"Steel Reinforcement" could be divided as follows:

Materials of Construction—
1. Bars Delivered.
2. Wire Delivered.

Labor—
3. Storing and Distributing Steel.
4. Bending Steel.
5. Placing Steel.

Supplies—
6. Miscellaneous.

Plant—
7. Cost Delivered.
8. Maintenance.
9. Removal.

General Expense—
10. General Expense.

Profit—

It should be noted that in each of the above subdivisions the general headings are always included.

The "general expense" or "administration account" should be subdivided, for example, as follows:

General Expense—
1. Engineering.
2. Bookkeeper, Stenographer.
3. Timekeeper, Storekeeper.
4. Telephone, Stationery, Sundries.
5. Rentals.
6. Legal Expense.
7. Surety Bond.
8. Liability Insurance.
9. Watchmen.
10. Interest and Discount.

In preparing a bid for work of this character the cost of each one of the above items should be carefully estimated with the best data available, and the charges for the general expense, plant and profit should then be apportioned to the various items of the work as above indicated in accordance with their relative value. In this way the unit price that should be submitted for the excavation, concrete and steel reinforcement can be determined. If such a method of computing would be adopted by all competitors, then there would be but little variation in their bids, and surely the low bidder could not be very much too low. The method which is used by so many contractors at the present time of jumping at the price that they should submit is one that cannot be too strongly condemned.

When the work is started, ledger accounts should be opened with each item as above enumerated.

The general expense account should be kept separately with subdivisions as above suggested, and then at intervals, by means of journal entries, should be transferred to the excavation, concrete and reinforcement accounts, using the same percentages of apportionment which were used in making the proposal. By simply adding up all the accounts of any one class and dividing them by the amount of work done, the cost of execution at any stage of the work can readily be determined.

The books required for such a system of accounts are of the simplest character, and can be purchased at any stationery store. They consist of cash book, ledger, journal and voucher book.

The voucher system should be used. As is well known, under this system all bills and pay rolls are inclosed in a blank, on the back of which is a place for distributing the amount to the proper accounts.

If it is desirable to keep a running account with the parties with whom much business is done, their vouchers can be credited to them, charged to the voucher account, and placed among the paid vouchers.

In the case of a contracting concern carrying on a number of contracts at the same time, ledger accounts should be started with the contracts themselves, each given a number and a subsidiary set of books kept for each contractor.

In order to aid in the distribution of the pay roll a system of cards may be used, upon which are placed the amount of labor expended under each head for each day. This work is usually done by the assistant engineer from the reports of the time keeper and the foremen of the various gangs. One set of cards is used for each week. These cards are very valuable for keeping track of labor costs, checking the pay roll, and should, if properly kept up, prevent all disputes or padding of pay rolls.

As can be readily seen, the above system as outlined can be used for any kind of contract work, the headings being arranged to suit the work on hand. These headings can be subdivided to any refinement desired by the contractor.

The system is very inexpensive, as it requires no elaborate forms and no more help than is usually required. As far as the author, aided by many years of experience, is able to judge, it meets all the requirements that a uniform system of accounts can need.

*A paper by Mr. Gustave Kaufman, read at the Jan. 10, 1910, meeting of the American Society of Engineering Contractors. A previous article illustrating the various record blanks used by Mr. Kaufman will be found in Engineering-Contracting for March 13, 1907.

Diagrams for Estimating the Approximate Cost of Mill Buildings.*

It is sometimes convenient to be able to tell off hand the approximate cost of proposed buildings or the cost, if new, of existing buildings without going through an estimate of all the quantities of materials and labor.

It is not an uncommon thing to hear the cost of mill buildings placed from 70 cts. to $1 per sq. ft. of floor space, regardless of the size or number of stories. There is, however, a wide range of cost per square foot of floor space, depending upon the width, length, height of stories, and number of stories.

Some time ago I placed a valuation upon a portion of the property of a corporation, including some 400 or 500 buildings. In order

*A paper by Charles T. Main, Consulting Engineer, Boston, Mass., presented before the New England Cotton Manufacturers' Association.

to have a standard of cost from which to start in each case, I prepared a series of diagrams showing the approximate costs of buildings varying in length and width and from one story to six stories in height. The height of stories also was varied for different

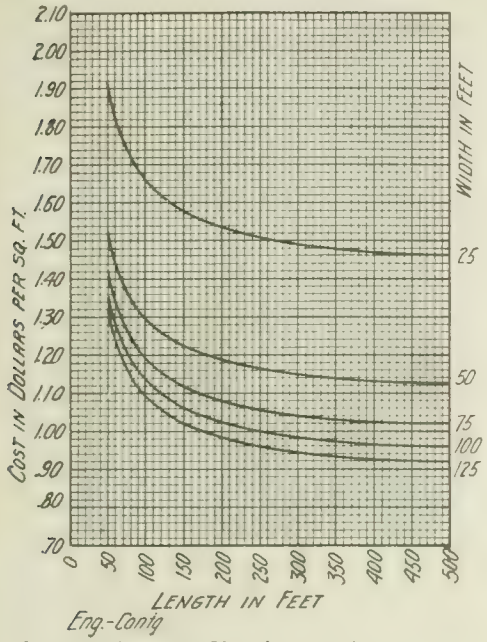

Fig. 1—Diagram Showing Estimated Cost Per Square Foot of Floor Area for One-Story Brick Buildings for Textile Manufacturing.

widths, being assumed 13 ft. high if 25 ft. wide, 14 ft. if 50 ft. wide, 15 ft. for 75 ft., 16 ft. for 100 ft. and over.

The costs used in making up the diagrams are based largely upon the actual cost of work done under average conditions of cost of materials and labor and with average soil for foundations.

The costs given include plumbing, but no heating, sprinklers, or lighting. These three latter items would add roughly 10 cents per square foot of floor area.

Use of Diagrams.—(1) The diagrams can be used to determine the probable approxi-

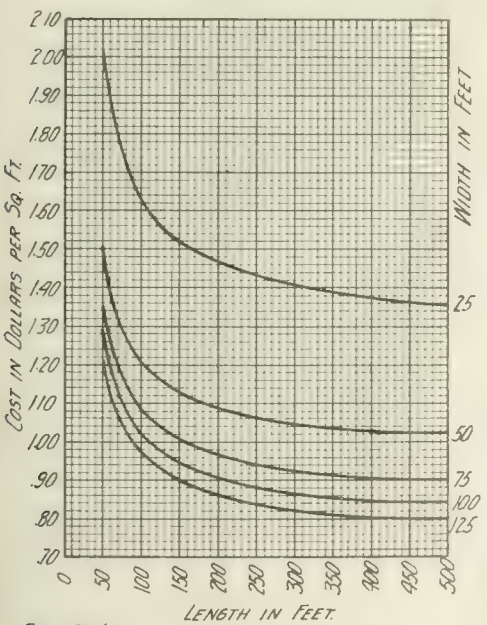

Fig. 2—Diagram Showing Estimated Cost Per Square Foot of Floor Area for Two-Story Brick Buildings for Textile Manufacturing.

mate cost of proposed brick buildings of the type known as "slow burning" to be used for manufacturing purposes with total floor load of about 75 lbs. per sq. ft., and these can be taken from the diagrams readily. For example, if it is desired to know the probable cost of a mill 400 ft. long by 100 ft. wide by 3 stories high, refer to the sheet showing the cost of three story buildings. On the curve for buildings 100 ft. wide, find the point where the vertical line of 400 ft. in length cuts the curve, then move horizontally along this line to the left hand vertical line, on which will be found the cost of 81 cts.

The cost given is for brick manufacturing buildings under average conditions and can be modified if necessary for the following conditions:

(*a*) If the soil is poor or the conditions of the site are such as to require more than the ordinary amount of foundations, the cost will be increased.

(*b*) If the end or a side of the building is formed by another building, the cost of one or the other will be reduced slightly.

(*c*) If the building is to be used for ordinary storage purposes with low stories and no top floors, the cost will be decreased about 10 per cent for large low buildings, to 25 per cent for small high ones, about 20 per cent usually being fair.

(*d*) If the buildings are to be used for manufacturing purposes and are to be substantially built of wood, the cost will be decreased about 6 per cent for large one story

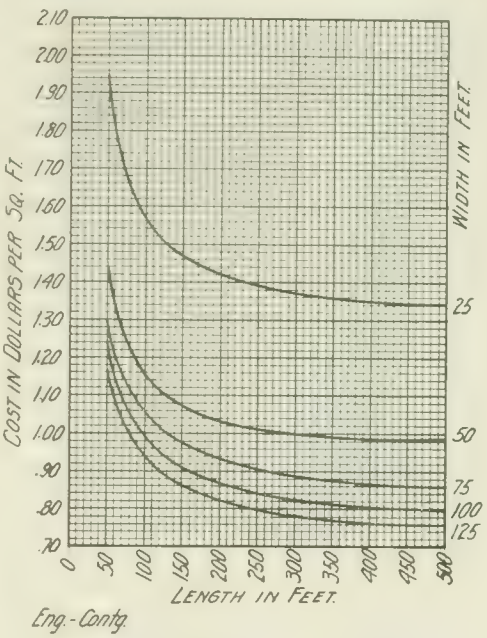

Fig. 3—Diagram Showing Estimated Cost Per Square Foot of Floor Area for Three-Story Brick Buildings for Textile Manufacturing.

buildings, to 33 per cent for high small buildings, and 15 per cent would usually be fair.

(*e*) If the buildings are to be used for storage with low stories and built substantially of wood, the cost will be decreased from 13 per cent for large one story buildings to 50 per cent for small high buildings, and 30 per cent would usually be fair.

(*f*) If the total floor loads are more than 75 pounds per square foot the cost is increased.

(*g*) For office buildings the cost must be increased to cover architectural features on the outside and interior finish.

The cost of very light wooden structures is much less than the above figures would give.

Table I shows the approximate ratio of the costs of different kinds of buildings to the cost of those shown by the curves.

(2) The diagrams can be used as a basis of valuation of different buildings.

A building, no matter how built nor how expensive it was to build, cannot be of any more value for the purpose to which it is put than a modern building properly designed for that particular purpose. The cost of such a modern building is then the limit of value of existing buildings.

Existing buildings are usually of less value than new modern buildings for the reason that there has been some depreciation due to age and that the buildings are not as well suited to the business as a modern building would be.

Starting with the diagrams as a base, the value can be approximately determined by making the proper deductions.

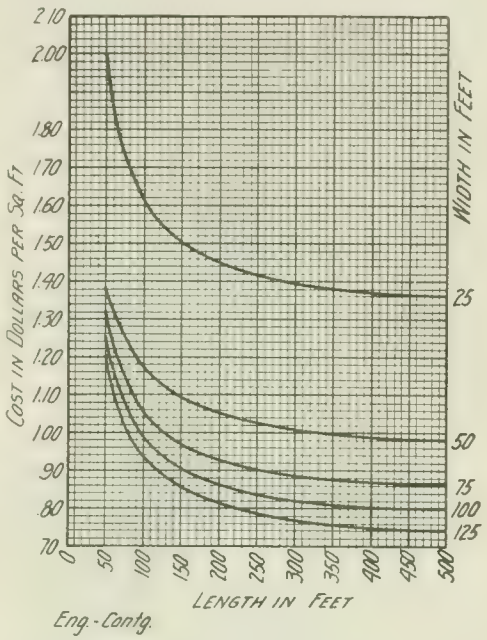

Fig. 4—Diagram Showing Estimated Cost Per Square Foot of Floor Area for Four-Story Brick Buildings for Textile Manufacturing.

(3) The diagrams can be used as a basis for insurance valuations after deducting about 5 per cent for large buildings to 15 per cent for small ones, for the cost of foundations, as it is not customary to include the foundations in the insurable value.

Basis of Estimates.—Table II shows the costs which form the basis of the estimates and these unit prices can be used to compute the cost of any building not covered by the diagrams.

The cost of brick walls is based on 22 bricks per cubic foot, costing $18 per thousand laid. Openings are estimated at 40 cts.

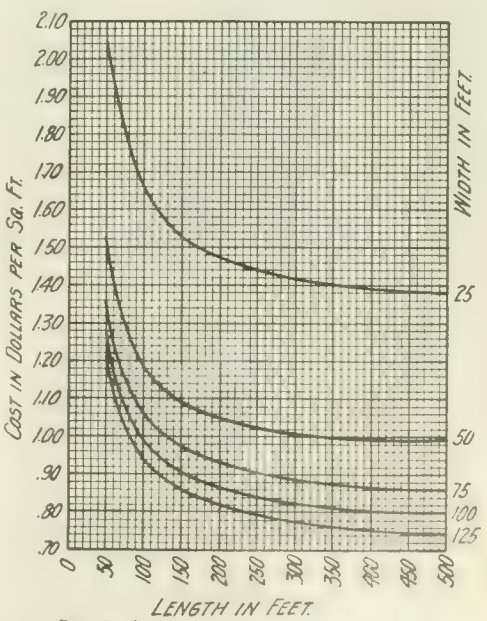

Fig. 5—Diagram Showing Estimated Cost Per Square Foot of Floor Area for Five-Story Brick Buildings for Textile Manufacturing.

per square foot, including windows, doors and sills.

Ordinary mill floors, including timbers, planking and top floor with southern pine tim-

30000	.93	.86	.84	.81	.80	.77	.91	.86	.84	.82	.81	.81	.84	.73	.70	.67	.65	.62
35000	.93	.87	.84	.82	.80	.78	.92	.86	.84	.83	.82	.81	.85	.74	.71	.68	.66	.63
40000	.93	.87	.85	.83	.81	.79	.92	.87	.85	.84	.83	.82	.86	.75	.72	.69	.67	.64
45000	.94	.87	.85	.83	.82	.79	.92	.87	.85	.84	.83	.82	.86	.76	.72	.70	.67	.65
50000	.94	.88	.86	.84	.82	.80	.92	.88	.86	.84	.83	.83	.87	.77	.73	.71	.69	.66

ber at $40 per M. ft. B. M. and spruce planking at $30 per M. ft. costs about 32 cts. per sq. ft., which has been used as a unit price.

Ordinary mill roofs covered with tar and gravel, with lumber at the above prices, cost about 25 cts. per sq. ft., and this has been used in the estimates.

Add for stairways, elevator wells, plumbing, partitions, and special work.

Deductions from Diagrams.—(1) An examination of the diagrams shows immediately the decrease in cost as the width is increased.

Fig. 6—Diagram Showing Estimated Cost Per Square Foot of Floor Area for Six-Story Brick Buildings for Textile Manufacturing.

This is due to the fact that the cost of the walls and outside foundations, which is an important item of cost, relative to the total cost, is decreased as the width increases.

For example, supposing a three story building is desired with 30,000 sq. ft. on each floor.

If the building were 600x50 ft., its cost would be about 99 cts. a sq. ft.

If the building were 400x75 ft., its cost would be about 87 cts. a sq. ft.

If the building were 300x100 ft., its cost would be about 83 cts. a sq. ft.

If the building were 240x 125 ft.; its cost would be about 80 cts. a sq. ft.

(2) The diagrams show that the minimum cost per square foot is reached with a four story building. A three story building costs a trifle more than a four story. A one story building is the most expensive. This is due to a combination of several features:

(*a*) The cost of ordinary foundations does not increase in proportion to the number of stories, and therefore their cost is less per square foot as the number of stories is increased, at least up to the limit of the diagram.

(*b*) The roof is the same for a one story building as for one of any other number of stories, and therefore its cost relative to the total cost grows less as the number of stories increases.

(*c*) The cost of columns, including the supporting piers and castings, does not vary much per story as the stories are added.

(*d*) As the number of stories increases, the cost of the walls, owing to increased thickness, increases in a greater ratio than the number of stories, and this item is the one which in the four story building offsets the saving in foundations and roof.

(3) The saving by the use of frame construction for walls instead of brick is not as great as many persons think. The only saving is in somewhat lighter foundations and in the outside surfaces of the building. The floor, columns, and roof must be the same strength and construction in any case.

Reinforced Concrete Buildings.—From such estimates and proposals as I have been able to get and from work done it appears that the cost of reinforced concrete buildings designed to carry floor loads of 100 lbs. per sq. ft. or less would cost about 25 per cent more than the slow burning type of mill construction.

TABLE III.—DATA FOR ESTIMATING APPROXIMATELY THE COST OF MILL BUILDINGS. SIZE KNOWN, BUT NO DEFINITE PLANS MADE.

Height of Building.	Foundations. Including excavation. Cost per lin. ft. outside walls.	Foundations. Including excavation. Cost per lin. ft. inside walls.	Brick Walls. Including doors and windows. Cost per sq. ft. of surface. outside walls.	Brick Walls. Including doors and windows. Cost per sq. ft. of surface. inside walls.
One-story	$2.00	$1.75	$0.40	$0.40
Two stories	2.90	2.25	.44	.40
Three stories	3.80	2.80	.47	.40
Four stories	4.70	3.40	.50	.43
Five stories	5.60	3.90	.53	.45
Six stories	6.50	4.50	.57	.47

Floors 38 cts. per sq. ft. of gross floor space. This price will include column piers, column, castings and wrought iron.

Roof 30 cts. per sq. ft., including projection, say 18 ins., including columns, etc.

Allow two stairways and one elevator tower in building over two stories high up to 150 ft long. Allow two stairways and two elevator towers up to 300 ft. long. Allow three stairways and three elevator towers over 300 ft. long.

Brick walls enclosing stairs and elevators, estimated as inside walls.

Stairs $100 per flight, per story.

Allow two fixtures on each floor up to 5,000 sq. ft. of floor space, and add one fixture for each additional 5,000 sq. ft. or fraction thereof. Allow $75 per fixture.

Add about 10 per cent for incidentals.

TABLE II.—PRICES AND OTHER DATA USED FOR ESTIMATING THE COST OF BUILDINGS.

	FOUNDATIONS, including excavations. Cost per lin. ft. for outside walls.	FOUNDATIONS, including excavations. Cost per lin. ft. for inside walls.	BRICK WALLS. Cost per sq. ft. of surface. outside walls.	BRICK WALLS. Cost per sq. ft. of surface. inside walls.	Columns including piers and castings. Cost of one.
One-story building	$2.00	$1.75	$0.40	$0.40	$15 00
Two-story building	2.90	2.25	.44	.40	15.00
Three-story building	3.80	2.80	.47	.40	15.00
Four-story building	4.70	3.40	.50	.43	15.00
Five-story building	5.60	3.90	.53	.45	15.00
Six-story building	6.50	4.50	.57	.47	15.00

From ground to first floor 3 ft. Buildings 25 ft. wide, stories 13 ft. high. Buildings 50 ft. wide, stories 14 ft. high. Buildings 75 ft. wide, stories 15 ft. high. Buildings 100 ft. wide, stories 16 ft. high. Buildings 125 ft. wide, stories 16 ft. high.

Floors 32 cts. per square foot, of gross floor space, not including columns. If columns are included, 38 cts.

Roof 25 cts. per square foot, not including columns. If columns are included, 30 cts.

Roof to project 18 ins. all around buildings.

Stairways, including partitions, $100 each flight.

Allow two stairways and one elevator tower for buildings up to 150 ft. long.

Allow two stairways and two elevator towers for buildings up to 300 ft. long.

In building over two stories, allow three stairways and three elevator towers for buildings over 300 ft. long.

In buildings over two stories, plumbing $75 for each fixture, including piping and partitions.

Allow 2 fixtures on each floor up to 5,000 sq. ft. of floor space and add one fixture for each additional 5,000 sq. ft. of floor or fraction thereof.

From the above data the approximate cost of any size and shape of building can be estimated in a few minutes. After the cost of the items given is determined about 10 per cent should be added for incidentals.

Dry Rot in Timber Structures.

A building having thick floors supported on heavy wooden beams and posts is not necessarily a building of slow-burning or mill-construction type. Architects and engineers have in many cases departed considerably from the ideas of the late Edward Atkinson and few know that an authorized manual on the subject is in existence. The fifth edition is now ready for distribution and contains data on reinforced concrete, the price being only 25 cts.*

A recent fire in a New York City factory building has called attention sharply to the fact that some essential points are disregarded in construction termed "slow burning" or "mill construction," because heavy timbers are used. Professor Ira H. Woolson of Columbia University was told by the chief of the fire department that after the fire, in the building mentioned, was under control the floors began to fall in irregular sections and soon the whole floor system was in the basement. The building was only 18 years old, 6 stories high, 200 ft. deep, with a 75 ft. frontage on one street and a 50 ft. frontage on the other side of the block.

An examination showed so many unprotected floor openings and liberal use of light wainscoting, etc., that it was in no sense slow burning, but merely an imitation of that type. A portion of the first floor was carried on steel I-beams supported by cast iron columns. The rest of the building was framed with heavy timbers supposedly in compliance with mill-building requirements. On the three lower floors the posts were of white oak and the girders of long-leaf yellow pine. In the three upper floors the posts were of long-leaf yellow pine, as were also the girders. Workmanship was first class and in all details it was apparent that an attempt had been made to erect a good structure of the mill-building type.

A careful examination showed it to be a clear case of failure by dry rot. Nearly all the posts examined showed they had been burned through for 2 or 3 feet at the upper end. The remainder of the sound wood was charred for a depth of only ½ in. to 1 in., which would scarcely have affected the strength. The yellow pine posts were in better shape than the oak and evidence of rot in the girders was slight. It was evident that the final collapse was due to burning out of dry punk wood produced by dry rot in the posts.

In the opinion of Prof. Woolson the build-

*Insurance Engineering Experiment Station, 31 Milk Street, Boston, Mass.

ing was rapidly approaching a dangerous condition, even though no fire had occurred. The following is from the report of Prof. Woolson as published in Insurance Engineering:

The majority of the heavy oak posts on the three lower floors must have retained but a small proportion of the strength they were supposed to possess. The outside shell at the top was all the sound wood that remained. The time must inevitably have come when a concentration of load on some floor due to stacking of stock or the movement of a large machine would have caused serious settlement and perhaps a collapse. The writer has never known a case of this kind before. An inquiry among insurance authorities of the city has not produced record of a similar instance, although it is probable that failures of this kind have occurred. Evidence on the subject may be secured from some of the insurance companies whose business covers the manufacturing plants of New England, where heavy timber construction is much more common than in this vicinity. It is quite apparent that this subject is of vital interest to owners of this type of building, as well as to insurance companies who carry risks upon them.

Cause of Dry Rot.—Dry rot is a well known fungus disease of wood, which is sure to develop when green or wet timber is encased so that air may not circulate around it. Most building specifications require that the ends of wooden beams encased in walls shall have an air space around them to prevent dry rot. The rules of the factory mutual insurance companies of New England specify that wooden posts shall have 1½-in. hole bored through them and two ½-in. holes crosswise near the top and bottom to prevent checking. No mention is made of this provision being a preventive of dry rot, but it is quite certain that if the posts in this building had been thus bored they would not have rotted.

The timber was doubtless only partially seasoned and the placing of the 4-in. socket caps upon it effectually excluded the air from the ends, giving the moisture no chance to escape. As a result dry rot developed, and had been slowly progressing until practically the whole cross section of the posts had been reduced to a dry punk which could be broken by the fingers and would ignite from a match. The worst feature of this kind of decay lies in the fact that it proceeds from the interior, the outside seasoned shell of the timber giving no indication of the rottenness within. It is possible that the manufacture of paper in the building may have produced a moist atmosphere which aided the decay after it had once begun.

Another interesting point in connection with the matter is that this condition has been brought about in a period of 18 years. It was about 25 years ago that the late Edward Atkinson began to advocate the merits of slow-burning mill construction in which heavy timber framing of this character was employed.

Warning.—A large number of factories and warehouses have been erected since that time of similar construction. It is important to know how many of them are getting into a dangerous condition by this slow method of deterioration. If the posts of such buildings have been bored as described above, they are probably in as perfect condition today as when installed, but, unfortunately, all building specifications have not made boring of posts a requisite, and where buildings were erected, as this one was, not conforming to slow-burning construction, it is very likely this provision of post protection was seldom employed. The soundness of posts in such buildings today will depend upon their degree of dryness when installed, the snugness with which the caps fitted, as well as the atmospheric conditions of the building, whether dry or damp, and other things, such as painting, etc. It is well known that painting of timber before it is thoroughly seasoned is conducive to dry rot.

Fortunately the condition of such posts can easily be ascertained by boring a half-inch hole through them.

While yellow-pine will yield to dry rot under favorable surroundings, still it is not so susceptible to the disease as oak, and it is known that certain rot fungi will attack hardwoods and not attack resinous woods like pine. It may be that the yellow-pine timber in this building was less affected by the rot than the oak, because the particular fungus which caused the trouble would not thrive in pine, or it may have been much better seasoned than the oak. At least it is encouraging that the yellow-pine apparently resisted the disease best, for the day of oak construction is nearly gone, and the large proportion of such constructions in the past 20 years has probably been of pine.

In discussing the matter the editor has the following to say:

One requirement of the early specifications for slow-burning construction was that the heavy wooden posts should be bored lengthwise and crosswise near each end, to provide ventilation and thus avoid dry rot. Neither posts nor beams were to be painted under about three years, to allow ample time for seasoning of the wood. An alternate requirement for floor beams was to use two sticks of the necessary strength, bolted together, with an air space between. The test of time has proved the wisdom of those precautions, as well as the other original requirements for this type of construction. So-called failures have been due to violations of the principles of mill-construction.

Some years ago there was an organization that went by the name of The American Society of Irrigation Engineers. Two or three annual meetings were held and some thin proceedings printed. In one of the volumes was a discussion of the value of trestles in which posts and girders were made of several pieces having good air space between for the very purpose of avoiding dry rot. Not only did engineers engaged in irrigation work recognize the danger of dry rot in large timbers, but technical literature is full of references to it. The matter is not of recent knowledge, but dry rot and its danger has been known for centuries. It is therefore criminal for designers to neglect to provide means to prevent it. The danger of collapse being a real one, it behooves the occupants of all heavy timber framed buildings to make an inspection of the interior of each post and girder.

Annual Meeting of the Connecticut Society of Civil Engineers.

The annual meeting of the Connecticut Society of Civil Engineers was held at New Haven, Conn., Feb. 7 and 8. The report of the retiring president, F. J. Easterbrook, showed substantial numerical and financial gains for the past year. The total membership of the association numbered 297, against 286 at the same time last year. The meeting was opened by the president in business session on Feb. 7. Following a banquet in the evening a day was spent in the hearing of papers and discussions. The attendance was large and great interest was displayed in the final session.

In his speech before the business session President Easterbrook strongly advocated the establishment of an association library. A movement in this direction is anticipated. The appointment of committees includes one to frame a resolution to present to the Connecticut representatives in congress, providing for an appropriation for the purchase of a large testing machine.

A paper by Mr. Benjamin S. Hinckley, engineer for the New York, New Haven & Hartford R. R., on "Problems Handled by the Test Department of a Large Corporation," was read by the secretary in the absence of Mr. Hinckley. The duties of the test department of a corporation as an aid to the purchasing department were pointed out and illustrated. A number of interesting slides were used to show the results of various kinds of tests. An interesting talk on civic conditions abroad was given by Mr. Frederick L. Lord of Hartford, Conn. The beautifying of the municipality was largely dealt with, views of various styles of trolley waiting stations, lighting posts, trolley poles, etc.; all built with a view to making the city beautiful being shown.

Mr. Charles S. Shandler read a paper on "Dams Approved by Henry F. Potter," now deceased, describing the construction of dams built under the supervision of Mr. Potter. Some dams on the Statucket River, built by Mr. Potter between the years 1860 and 1870, are still in serviceable condition. A paper on sea walls by Mr. George A. Arrah was also read. This paper was printed in our issue of Feb. 16, 1910.

LETTERS TO THE EDITOR.

The Kutter-Sanborn Alphabetic Order Tables.

Sirs:—On page 65 of the Jan. 19, 1910, issue of your valuable magazine mention is made of the Kate E. Sanborn arrangement of C. A. Cutter's alphabetic order table. Can you explain briefly what this system is, or else furnish a reference whereby I may avail myself of this information? I am familiar with the Dewey decimal system, and am much interested in this classification which apparently is a supplement to same. Assuring you that any information you may be able to give me will be highly appreciated, I am,

Very sincerely yours,

W. W. JOURDIN.

El Paso, Tex., Feb. 3, 1910.

(To secure authoritative information our correspondent's inquiry was taken up with the librarian of the Chicago Public Library and we print below the reply received.—Editors.)

Sirs:—Replying to your inquiry of the 8th inst., we beg to say that the Cutter alphabetic order tables were designed to give author-numbers to books, made up of the first letter of the author's name and certain figures representing the other letters in his name. Books bearing these author-numbers, if arranged first alphabetically by the letters, and then in the numerical order of the numbers following the letters, will always stand in the alphabetical order of the author's names.

In Mr. Cutter's original tables the vowels and the letter "S" were followed by the next letter of the name instead of immediately by a figure (as Abbot, Ab2). Because many who used the tables disliked this feature he procured the assistance of Miss Kate E. Sanborn to prepare a table in which the vowels and "S" are treated as the consonants are in his own table, that is, the initial letter is followed by a figure. The tables are carried out to three figures.

The Cutter-Sanborn Alphabetic order tables may be purchased of the Library Bureau, 168 Wabash Ave., Chicago, Ill., for $2.50. A pamphlet is included, giving directions for their use. An Article on "How to Use the Cutter Book Numbers" may be found in the Library Journal, Vol. 12, pp. 251-252.

Other material about the subject is fragmentary and hardly worth listing.

Yours very truly,

C. B. RODEN,
Assistant Librarian,
The Chicago Public Library.

Chicago, Feb. 15, 1910.

Per Capita Cost of City Government at Des Moines, Ia.—The accompanying tabulation taken from the annual report of the city of Des Moines, Ia., for the fiscal year ending March 31, 1909, shows the per capita cost of government in that city during the fiscal year, the figures being based on a population of 100,000. In passing it may be noted that the figures are for the first year under which the city has been governed on the commission plan:

	Maintenance.	Improvement.	Total.
General government	$ .61	$ .01	$ .62
Protection of life and property	2.37	1	2.47
Health and sanitation	.30	.23	.53
Highways	1.18	1.08	2.26
Libraries	11	18	[illegible]
Recreation	18	1	.25
Miscellaneous	.13	...	.13
Cemeteries	16	[illegible]	.23
Public Debt—			
Interest	.33	...	.33
Principal	...	.06	.06
Outstanding debt obligations	1.76	...	1.76
	$7.14	$2.12	$9.56

Long Term Rainfall Observations.—Observations of temperature and rainfall for a period of 95 years are given in the last annual report of Mr. L. M. Hastings, city engineer of Cambridge, Mass. The observations were taken at New Bedford, Mass., by Mr. Rodman and son and are valuable as being carefully taken and complete. They are given in the report in the form of a diagram and an examination of this shows that "climate" as indicated by daily average temperature has changed but little in the period, if a number of years be considered. The diagram shows that the average annual temperature for the 95 years was 48.370° F., while the average annual precipitation for the period was 46.72 ins. The elder Mr. Rodman began the taking of these observations in 1813.

Cost of Maintaining Horses at Des Moines, Ia.—The Department of Streets and Public Improvements of the city of Des Moines, Ia., during the fiscal year ending March 31, 1909, had under its charge 23 horses, of which 20 were used in street cleaning work. The cost of maintaining the horses was as follows:

	Total.	Per horse.
Feed used, including amount on hand Apr. 1, 1908	$2,794.47	$121.50
Shoeing	620.10	26.96
Drugs, etc.	29.17	1.26
Veterinary service	9.00	.39
Care of horses	876.25	38.10
Total	$4,328.99	

The item care of horses includes the $854.75 as salary of the barn man.

The construction of an electric railway from Cordele, Ga., to Daphne, a pleasure resort eight miles east of the city on the Seaboard Air Line railway and Flint River, is proposed. Citizens of Cordele are interested in the project.

The Butte Street Ry. Co. of Butte, Mont., is planning to extend its Englewood line at Butte a distance of 1¼ miles.

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Institute of Mining Engineers.
March 1-5. Annual meeting at Pittsburg, Pa. Secy., R. W. Raymond, 29 West 39th St., New York City.

American Railway Engineering and Maintenance of Way Association.
March 15-17, 1910. Annual convention at Chicago, Ill. Secy., E. H. Fritch, 962 Monadnock Block, Chicago, Ill.

American Society of Engineering Contractors.
Feb. 24-26, 1910. Annual convention at Chicago, Ill. Secy., Daniel J. Hauer, Park Row Building, New York, N. Y.

American Water Works Association.—April 26-30, 1910. Annual convention at New Orleans, La. Headquarters, Gruenwald Hotel. Secy., J. M. Diven, Charleston, S. C.

Illinois Association of Municipal Contractors.
Feb. 24-26. Annual meeting at Chicago, Ill. Secy., Orie T. Dunlap, Edwardsville, Ill.

Indiana Sanitary and Water Supply Association.
Feb. 25, 1910. Annual meeting at Indianapolis, Ind. Headquarters, Claypool Hotel. Secy., F. C. Jordan, Indianapolis, Ind.

Iowa Association of Cement Users.
March 9-11, 1910. Annual meeting in Cedar Rapids, Ia. Secy., Ira A. Williams, Iowa State College, Ames, Iowa.

National Association of Cement Users.
Feb. 21-25, 1910. Annual meeting at Chicago, Ill. Secy., Geo. C. Wright. Address all communications to Edw. E. Krause, Asst. to the President, Harrison Bldg., Philadelphia, Pa.

Notes from Technical Societies.

Illinois Water Supply Association.—The annual meeting of this association, of which Mr. Dabney H. Maury of Peoria, Ill., is president, will be held at Champaign, Ill., March 8 and 9, 1910. The following papers will be read and discussed: "Experience With Deep Well Pumps," F. C. Ainsbury, Champaign, Ill.; "Relation Between Typhoid Death Rate and Water Supplies of Illinois," Edward Bartow, Urbana, Ill.; "Water Supplies from Lake Michigan," W. C. Bouton, M. D., Waukegan, Ill.; "The Operation of Mechanical Filters," J. H. Brewster, Indianapolis, Ind.; "The Possibility of Pollution of Shallow Wells," C. B. Burdick, Chicago, Ill.; "Quality of the Waters of the Mississippi System," R. B. Dole, Washington, D. C.; "Legislation in Relation to Stream Pollution," H. M. Ely, Danville, Ill.; "A State Bureau of Municipal Information," J. W. Garner, Urbana, Ill.; "Use of Ozone in Treatment of Western Waters," W. F. Monfort, St. Louis, Mo.; "Action of Mississippi River Water on Metals," W. F. Monfort, St. Louis, Mo.; "Filtration of Water Supplies," J. L. Pearse, Chicago, Ill.; "Water Works Franchises," M. H. Robinson, Urbana, Ill.; "A City Water Supply from Shallow Wells," O. T. Smith, Freeport, Ill.; "Rate of Flow of Water Into Wells," A. N. Talbot, Urbana, Ill.; "Comparison of Hydrated Lime With Ordinary Lime in Water Treatment," C. E. Thomas, Chicago, Ill.; "Should Water Companies Furnish Private Services Free to Patrons Up to and Including the Meters?" E. P. Wheeler, Lake Forest, Ill.; "Significance of the Term Alakalinity in Water Analysis and the Determination of Alkalinity by Means of Indicators," E. W. Washburn, Urbana, Ill.; "Disinfection of Water," C. E. A. Winslow, Boston, Mass.

Iowa Cement Users' Association.—The following is the program of the convention to be held in Cedar Rapids, Ia., March 9-11, 1910. Headquarters will be at the Montrose Hotel: Wednesday afternoon, 1:30 p. m., Address of Welcome, Mayor M. J. Miles, Cedar Rapids. Response, J. C. Burch, Iowa Portland Cement Co., Des Moines. President's Address, Geo. H. Carlon, Oskaloosa. "Cement in Government Irrigation Work" (illustrated), C. J. Blanchard, U. S. Reclamation Service, Washington, D. C. "Permeability of Concrete," F. M. Okey, Iowa State College, Ames. Appointment of Committees. Thursday morning, 9 a. m.—"Effect of Cold on Cement," G. P. Dieckmann, Northwestern States Portland Cement Co., Mason City. "History of Cement and Its Uses," H. M. Herald, Assistant City Engineer, Burlington. "Cement Sidewalks and Floors," Jesse Hines, Greenfield. "Steam Curing of Cement Products," G. E. Tathwell, Cedar Rapids. Thursday evening, 8 p. m.—"Cement in Street Work," C. T. Wilson, City Engineer, Waterloo. "Surface Finishing of Cement Work," P. P. Comoli, Sioux City. "Modern Manufacture of Portland Cement" (illustrated), G. P. Dieckmann, Mason City. "Specifications for Cement Tile," A. Marston, Iowa State College, Ames. Reports of Committees. Friday morning, 9 a. m.—"Concrete Work in Freezing Weather," W. B. Wallace, Cedar Rapids. "Concrete Bridge Construction," T. H. MacDonald, Iowa Highway Commission, Ames. "Manufacture and Use of Cement Tile," P. H. Atwood, Armstrong. Illustrated address, R. I. Humphrey, National Association Cement Users, Philadelphia.

Personals.

Mr. J. C. Dunn, Contractor, formerly of Cleveland, O., has opened an office at Room 308, Ellsworth Bldg., Chicago, Ill.

Mr. William Meier, of Chicago, Ill., a civil engineer for the Chicago, Milwaukee & St. Paul R. R., was accidentally killed by drowning Feb. 14.

Mr. D. W. Hays, Engineer, Truckee-Carson project, has resigned from the Reclamation Service to enter private engineering practice at Reno, Nev.

Mr. James A. Green of Chicago has opened offices at 226-228 La Salle street, of that city, where he will engage in irrigation and hydraulic engineering and construction.

Mr. Everett M. Alvord has resigned the office of General Superintendent of the Missouri, Kansas & Texas R. R. to accept the position of General Manager of the Midland Valley R. R.

Mr. George F. Samuel, Assistant City Engineer, Chicago, Ill., will occupy the position vacated by City Engineer John Ericson, as acting engineer, during the latter's leave of absence.

Mr. Thomas H. Carters, a civil engineer of Portland, Ore., died Feb. 13. He was engineer in charge of construction of the Astoria & Columbia River R. R. and was formerly vice-president of the system.

Mr. William Arthur of Omaha, Neb., has been appointed valuator in the buildings division of the physical valuation department of the Nebraska Railway Commission. He will take charge of the office March 1.

Mr. H. M. Chapin, formerly with the New York Central Lines and the Cambria Steel Co., and Mr. T. J. Bryson, formerly with the American Bridge Co. and the Cambria Steel Co., have formed a partnership under the firm name of Chapin & Bryson and will engage in the practice of architectural and civil engineering. Their offices will be in the Nettleton Bldg., Ashtabula, O.

Mr. C. de Vere Fairchild, Terminal Engineer of the Grand Trunk Pacific Ry., has retired to his winter house on the Isle of Pines. Mr. Fairchild has engaged extensively in engineering throughout the last eleven years. During the last three years he has had charge of the extensive terminal improvements of the Grand Trunk Pacific at Ft. William, Ont. It is expected that after a vacation of some length he will again take up professional work.

Mr. F. J. Benning, formerly holding a position with the Pittsburg Railways Co., has been appointed to the office of Superintendent of Construction of the Cincinnati Traction Co. Mr. Benning will take charge of the extensive track construction and replacement work begun by the Cincinnati Traction Co. Mr. E. A. Berry, Engineer of Roadway, who has had entire charge of engineering and construction work, will be relieved of this part of the work, remaining in the capacity of Engineer of Roadway.

Lieut.-Col. Henry A. Allen, senior member of the engineering firm of Henry A. Allen & Co., of Chicago, Ill., has been appointed to the new position of Consulting Engineer for the Department of Public Works of that city. Col. Allen will be remembered as being one of the engineers appointed by President Taft to decide on the question of type of the Panama canal. He graduated from the United States Naval Academy in 1887 and for eleven years was managing engineer for the Allis-Chalmers Co.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Power From Exhaust Steam.—Paper, 6x9 ins., 15 pp. American Regenerator Co., Monadnock Blk., Chicago, Ill.

This booklet describes the American Regenerator, a device for the conservation of the heat energy of exhaust steam. Cuts and tables accompanying the discussion relative to the application of the regenerator show how the saving is affected.

Tartex.—Paper, 6x9 ins. Barrett Manufacturing Co., Chicago, Ill.

This company is sending out a sample of "Tartex," which is a new reinforced waterproofing felt. A few remarks on the qualities of "Tartex" accompany the sample.

Draft and Driers.—American Blower Co., Detroit, Mich.

This firm sends in a number of pamphlets describing appliances made and sold by them for inducing draft in power plants and for ventilation, as well as for drying plants for laundries, lumber kilns, etc. A great deal of practical information is given and a number of valuable tables are presented. For men who preserve these pamphlets a loose leaf binder is provided.

Sewer Facts. — Paper, 4¾x7¾ ins., 60 pp. Western Clay Products Publicity Bureau, Kansas City, Mo.

This book is a well written attack on concrete sewers.

Power Transmission Machinery.—Cloth, 4½x7¼ ins, 270 pp. Jones & Laughlin Steel Co., Pittsburg, Pa.

This is a new complete hand book on power transmission. It contains a number of tables giving horsepower of belts and line shafts, with tables and other useful information on wheels, belt tighteners, etc. Tables are given of properties of sections with sizes. The book is profusely illustrated.

Brass Well Screens.—Paper, 3¼x6¼ ins., 8 pp. E. E. Johnson, St. Paul, Minn.

This pamphlet describes the Johnson brass well screen. It contains illustrations, price lists and scales showing the sizes to order for screening out different grades of sand in the well.

Underground Conduit Construction. — Paper, 3½x6½ ins., 32 pp. American Conduit Co., 501 Marquette Bldg., Chicago, Ill.

Contains a highly instructive article on the installation of electric light and telephone wire conduits in city streets. Many diagrams and views are used to show details of trenches, manholes, building connections, etc. Some handy diagrams and tables on the cost of concrete per cubic yard are included. The Bitumenized Fibre Conduit, a product of this company, is also described.

You-Ree-Ka.—Paper, 5¼x8 ins., 12 pp. Henry Kroder Co., Passaic, N. J.

Describes the You-Ree-Ka Ventilating apparatus. Diagrams and views are used to aid in describing installation and operation.

Conveyors.—Paper, 6x9 ins., 39 pp. Weller Mfg. Co., Chicago, Ill.

A supplement to Catalog No. 19 of this company, containing revised net price lists on spiral screw conveyors and all fittings, conveyor buckets, winches, pulleys, pulley chains, sprocket wheels, corn cleaners and corn shellers.

Derrick Fittings.—Paper, 6x9 ins., 23 pp. The National Equipment Co., Chicago, Ill.

This bulletin furnishes complete information about guy, tower, stiff leg and revolving derricks and convertible derrick fittings made and sold by this company. All derricks are described with the aid of diagrams. Order lists are furnished, and where practical are accompanied by list of prices. Cuts of all fittings are shown.

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The principal railway construction contract of the week was let by the Santa Fe and calls for the construction of 100 miles of new line in Texas from Lometa to Brady. The contract was secured by Levy & Owens, Galveston, Tex., the C. H. Sharp Contracting Co., of Kansas City, Mo., and Morey-Faulhaber Co., St. Louis, Mo. Among the smaller contracts which have come to our notice, are the following: W. R. Falker Construction Co., Rogers, Ark., 40 miles' extension of the Arkansas, Oklahoma & Western R. R., in Arkansas; Wade & Clower, St. Paul, N. C., an extension of the Virginia, Carolina & Southern R. R. in North Carolina; McNichol Paving & Construction Co., Philadelphia, 3rd and 4th track work at Valley Forge, Pa., for the Reading Ry.; Gust Freeden, Norway, Mich., 4.6 mile mine spur at Ishpeming, Mich., for the Lake Superior & Ishpeming Ry.—The U. S. House of Representatives has passed, without a murmur the River and Harbor Bill carrying an appropriation of something like $45,000,000.—A large municipal contract is now being advertised by the City of Portland, Ore., The contract calls for the construction of a second pipe line to Bull Run, estimated to cost about $1,629,000.—Prospects look bright for the commencement of work on the Western Maryland extension from Cumberland, Md., to New Haven, Pa. The company has asked legislative leave to issue about $15,000,000 of stock to build the extension, which will be 83 miles long.—The Missouri, Kansas & Texas R. R. is getting in line with the other roads and is planning to expend a considerable sum this season for betterments. In fact it is said that the company is planning to spend $5,000,000 in improving its line through Kansas, Texas and Oklahoma. In the latter state several stretches of double track will be laid. —The U. S. Senate is still discussing the Senate bill to appropriate $30,000,000 for the completion of the U. S. Reclamation Projects already begun; some of the senators oppose the bill for fear that part of the appropriation will be used to start new irrigation projects.—Here is some little dope on what the railroads do not intend to do at the present time: St. Louis, Iron Mountain & Southern Ry.: "Reports relative to extensive improvement work along the main line of the St. Louis, Iron Mountain & Southern Ry. from Poplar Bluff to Little Rock, Ark., are erroneous, as no such expenditure has been authorized." Rock Island Lines: "We have no immediate expectation of double tracking the line between Topeka and Herington." Michigan Central R. R.: "There is no truth in the statement that this company proposes building an additional track from Buffalo to Detroit at the present time." Gulf, Colorado & Santa Fe Ry.: "The report of the contemplated extension east of Oakdale, La., is premature."

Flinn's Partner.

State Senator William Flinn, of Pittsburg, Pa., is not less well known as a contractor than he is as a politician. In the latter capacity in one of Pittsburg's hot municipal campaigns he was largely the chief issue, one party holding him responsible for everything bad that had happened in the city for years, including the overflowing of the Monongahela River, and the other party claiming that he was responsible for everything good that had happened. Flinn at that time was a member of the firm of Booth & Flinn, and the fact was taken advantage of by his opponents, as is told in the following manner in a recent issue of the Saturday Evening Post: At a mass meeting of colored citizens an impassioned orator assailed Flinn and charged him with all sorts of high crimes and misdemeanors, and in his ecstasy of denunciation wound up with: "An', I ast you, who was it what shot down that great man, Abrum Linkum? I ast you dat. It was Flinn." "Hol' on, Mistuh Speakah," broke in a Flinn man. "It wasn't no man named Flinn what shot Mistuh Linkum." "Who was it, den?" shouted the orator. "Booth." "Well," yelled the speaker triumphantly, "what's de diffrunce? It was one of de firm."

An Old Time Road Builner.

Just 100 years ago there died in England a road builder whose work antedates even that of Macadam and Telford. He was not a pioneer of good road construction, in as much as he developed no new system of building highways as did Macadam and Telford, but nevertheless his work was a great advance over that of his predecessors. This man's name was John Metcalf. He was born in 1717 and before taking up road construction work he was successively a fiddler, soldier, horse-dealer and carrier. When about 25 years old he had the misfortune to lose his eyesight through illness. His first road work was in 1765 when he took a sub-contract for constructing three miles of new road between Boroughbridge and Harrogate in England. In this work, as in all his other work, he relied entirely on trusty foremen for carrying out his plans. His first piece of work was so successful that his services were in much demand. In the counties of Lancashire, Derbyshire, Cheshire and Yorkshire alone, he constructed over 180 miles of road, the work in some instances involving the erection of many bridges, the building of retaining walls and culverts at the crossing of difficult bogs.

Street Improvement by Proxy.

Engineering schools nowadays devote some little time to giving the student experience in the every day problems which will confront him in actual practice. The School of Engineering at the University of Wisconsin in particular does considerable in this line, and in this it is ably assisted by the Civil Engineering Society, which is composed of students taking the course in civil engineering at the university. Recently the society issued the following notice: "On Friday evening, in the engineering auditorium, bids for the improvement of University Ave. will be opened, the contract let, the street improved, and the contractor paid. All within two hours' time. Those interested in the difficulties and form necessary to improve a street should attend this meeting." Members of the society were assigned various positions, such as mayor, aldermen, city engineer, contractors, etc., and each acted his part. The bids were opened by the mayor, tabulated by the city engineer, and the contract awarded. The contractor then went ahead and "improved" the street, all within the two hours' time, students acting as foremen, workmen, etc.

The U. S. house of representatives has passed the rivers and harbors bill, carrying an appropriation of something like $45,000,000. One feature of the bill of interest to Illinois is the vesting of authority in the secretary of war to appoint a board whose members are to be composed of four engineers of the army and four civil engineers taken from civil life, to cooperate with the Illinois authorities in securing a suitable waterways in conjunction with the development of water power by Illinois between Lockport and Utica, for which Illinois has already authorized an appropriation of $20,000,000. The president of the board is to be the same one who was president of the board of five members authorized under an act of March 2, 1907, to examine the Mississippi river below St. Louis and to report to congress a project for a 14-ft. channel.

The U. S. senate is now considering the bill authorizing the issuance of $30,000,000 worth of certificates for the completion of irrigation projects already begun. The supporters of the bill pointed out that in a number of cases reservoirs had been completed, while the ditches to distribute the water had not been constructed. The chief opposition to the bill seems to be the fear that the department might be tempted to enter upon new schemes before the completion of the present enterprises, and thus soon involve the government in further obligations.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ARKANSAS.

The Arkansas, Oklahoma & Western R. R. has partly completed surveys for the projected 40 mile extension from Rogers to Huntsville. The capital for construction has been secured and work was started on Feb. 1, the W. R. Felker Construction Co., Rogers, Ark., being the contractor. W. R. Felker, Rogers, Ark., is president and M. Hays, Rogers, Ark., is chief engineer.

FLORIDA.

The Florida Ry. Co. has decided to extend its line from Live Oak to Fernandina, and has awarded the contract for the work to the Florida Construction & Realty Co., Dyal-Upchurch Bldg., Jacksonville, Fla. T. P. Alston, Live Oak, Fla., is General Superintendent Florida Ry.

GEORGIA.

We are advised that nothing further has been done on the projected line of the Georgia & Florida Ry., from St. Clair to Blythe, Ga., than to complete the surveys. No decision has been reached as to when construction contracts will be let. W. A. Swallow, Augusta, Ga., is Chief Engineer.

IDAHO.

Surveys have been made and the capital has been secured in part for the construction of a 36 miles electric railway in the vicinity of Idaho Falls, Idaho. The date for awarding construction contracts is uncertain, nor has the chief engineer been selected as yet. The company which is to operate this road was incorporated recently with a capital stock of $1,000,000. J. L. Miller, Idaho Falls, Idaho, is president.

ILLINOIS.

The Hammond, Chicago Heights & Southern Traction Co. is projecting a 30 mile line from Hammond to Momence, Ill., and is planning to have construction work started at once. Ward & Orr, Chicago Heights, Ill., have the contract. Joseph Orr of the construction firm is vice-president; E. J. Kennedy is chief engineer, and W. S. Reed, 1145 First National Bank Building, Chicago, Ill., is president.

The Peoria Railway Terminal Co. is planning the construction of 4½ miles of track in Peoria this spring. The work will be done by the company by day labor. Geo. P. Paradis, Peoria, Ill., is chief engineer.

INDIANA.

Stock subscriptions are being taken for a projected railway to extend from Terre Haute, Ind., to Marion, Ill., and to be about 250 miles long. The company which is to operate the line has not been organized as yet, and it is intended to get about $500,000 in stock subscriptions before this is done. As proposed the road is to run in a general northeasterly and southwesterly course, terminating at the city of Terre Haute, Ind., as its northerly terminus, and at or near Marion, Ill., as its southerly terminus, with a branch line from a point on the main line near Fairfield to the city of Mt. Vernon in Jefferson county, Ill., and to run into, through or across Vigo county, Ind., and the counties of Clark, Crawford, Lawrence, Richmond, Wayne, Jefferson, Hamilton, Saline, Franklin and Williamson, in the state of Illinois. The proposed route has been under consideration for a long time and at several times there has been considerable money spent for surveys and some work started. Henry H. Knipe, 211 North Cross street, Robinson, Ill., in interested.

KANSAS.

The Oklahoma-Kansas Ry. Co. is planning the construction of an electric railway from Galena, Kan., to Holtonville, Okla., via Baxter Springs, Kan. and Rellnin Park, passing through the lead and zinc fields of Oklahoma. The projected length of the line is 23 miles. Surveys have been made from Baxter to the Mission Mines and it is planned to let construction contracts for this portion of the line in April. The capital for construction has not been secured as yet, nor has the chief engineer been appointed. Dr. Charles M. Jones, Baxter Springs, Kan., is president and M. C. Harper, Baxter Springs, is the promoter.

MARYLAND.

The Frederick R. R. Co. has completed surveys and has secured the capital for the construction of a 15 mile extension. Oscar B. Coblentz, Frederick, Md., is chief engineer and W. S. Taylor, Frederick Md., is general manager.

MICHIGAN.

Gust Fredeen, Norway, Mich., has been awarded the contract for constructing a 4.6 mile spur line to the Cleveland-Cliffs Iron Co.'s mine at Ishpeming for the Lake Superior & Ishpeming Ry.

MONTANA.

The Whitefish Polson Electric Ry. Co. is projecting a 60 mile line to extend from Whitefish to Polson, passing through Kalispell and Somers. Surveys are now under way and construction work will be commenced as soon as these are completed and the necessary capital secured. F. E. Marsh, Kalispell, Mont., is chief engineer. Joseph A. Edge, Kalispell, Mont., is interested.

The Gallatin Valley Electric Ry. Co. has completed surveys and has secured the capital for the construction of a 27½ mile extension from Bozeman to Three Forks. Contracts for constructing the extension will be let soon. R. M. Hart, Coeur d'Alene, Idaho, is president. N. C. Van Natta, Bozeman, Mont., is chief engineer, and Charles B. Anderson, Bozeman, Mont., is secretary.

NEW JERSEY.

The M. P. McGrath Contracting Co., 409 Trust Bldg., Easton, Pa., has been awarded the contract by the Delaware, Lackawanna & Western R. R. for fourth-tracking four miles of main line from Port Morris to Chester Junction, N. J.

NORTH CAROLINA.

Wade & Clower, St. Paul, N. C., have been awarded the contract for constructing a 30 mile extension of the Virginia & Carolina Southern R. R. from St. Paul, N. C., to Elizabethtown, N. C. Surveys for the extension are now being made and the capital for construction has been secured. A. W. McLean, Fayetteville, N. C., is president and J. L. Neill, Fayetteville, is chief engineer.

OHIO

Jones Brothers, railroad contractors, 608 Second National Bank Bldg., Cincinnati, O., want 15 team outfits for scraper work in Ohio.

The Minster & Loramie Ry. Co., recently incorporated, projects the construction of a trolley line from Loramie to Minster to a connection at the latter place with the Western Ohio Electric Ry. The company has not as yet effected its permanent organization. F. D. Carpenter, Lima, O., is interested.

OKLAHOMA.

Contracts will probably be let about April 15 for the construction of a portion of the projected 250 mile line of the Sallisaw, McAlester & Southern Ry. M. J. Smith, McAlester, Okla., is chief engineer.

OREGON.

Surveys have been made for the first 97 miles of the projected line of the Coos Bay, Oregon & Idaho R. R. and the capital for construction has been secured. The company, however, is not quite ready yet to let construction contracts. The first 97 mile section will bring the road from Coos Bay to Roseburg; from the last place it is to extend to Boise, Idaho, crossing Oregon. The total projected length is 600 miles. F. A. Haines, Marshfield, Ore., is chief engineer and Francis H. Clark, Marshfield, Ore., is president.

PANAMA.

The Secretary of War now has under consideration the construction of a railroad near the coast along the Pacific slope on the Isthmus of Panama. The projected length is 274.4 miles and the road would be built by the Panama R. R. for the U. S. government. Surveys for such a road were made by W. F. Shunk in 1893.

PENNSYLVANIA.

Surveys have been made and the capital has been secured for the construction of the projected 31 mile line of the Clarion & East Brady Electric Ry. Co. The route is from Clarion through Reidsburg, Sligo, Rimersburg, Phillipson to East Brady. Construction contracts are to be let early this spring. George F. Arnold, Clarion, Pa., is president.

The McNichol Paving & Construction Co., Betz Bldg., Philadelphia, Pa., has been awarded the contract for constructing a third and fourth track for the Philadelphia & Reading Ry. between Valley Forge and Perkiomen Junction, Pa. The work is located at Valley Forge, Pa., and includes 150,000 cu. yds. of rock excavation and 7,000 cu. yds. concrete masonry. None of the work is to be sublet.

SOUTH DAKOTA.

The Aberdeen Street Railway Co. of Aberdeen, S. D., is planning to construct four miles of line this year and two or three miles next year. About $70,000 of stock has been sold and the company proposes to let constructing contracts early in March. The chief engineer has not been selected as yet. Charles N. Herreid, Aberdeen, S. D., is president and general manager.

TEXAS.

The Atchison, Topeka & Santa Fe Ry. has awarded contracts for constructing 100 miles of new line from Lometa on the San Angelo branch to a point 25 miles west of Brady, the successful contractors being as follows: C. H. Sharp Contracting Co., Kansas City, Mo., 40 miles; Morey-Faulhaber Co., St. Louis, Mo., 30 miles; Levy & Owens, Galveston, Tex., 30 miles.

WASHINGTON.

The Lower Yakima Irrigation Co., Downs Bldg., Seattle, Wash., has awarded a contract for the concrete lining of its canal, and work has already been commenced. It is expected to line from eight to ten miles of the canal this spring.

WISCONSIN.

The Minneapolis, St. Paul & Sault Ste Marie Ry. is planning to build a cut-off between Owen and Spencer, Wis., also a cut-off between New Richmond, Wis., and Withrow, Minn. The work will be ready to sub-

mit to contractors for bids within three weeks. Thos. Greene, 317 Second Ave., South, Minneapolis, Minn., is chief engineer, Minneapolis, St. Paul & Sault Ste Marie Ry.

CANADA.

Bids are asked by A. J. McGee, secretary-treasurer, Temiskaming & Northern Ontario Ry. Commission, 25 Toronto St., Toronto, Ont., until noon, Feb. 28, for all and every kind of labor, tools, machinery, and other plant, service and material whatsoever necessary for the due execution and completion of, in a thorough and workmanlike manner, all the grubbing, grading, embankment protection, clearing and culverts necessary for the construction of a cut off on the main line of the Temiskaming & Northern Ontario Ry. between M. P. 60 and M. P. 61. S. B. Clement, chief engineer, North Bay, Ont.

The Arnprior & Pontiac Ry. Co. has partly completed surveys for its projected 75 mile electric railway from Fitzroy Harbor to Graham's Bay, from Fitzroy Harbor to Campbell's Bay, and from Fitzroy Harbor to High Falls. The capital for construction has not been secured, nor has any date been set for letting contracts. The railway is to be constructed in connection with proposed development of the Chats Falls. Louis Simpson, Ottawa, Ont., is president Arthur H. N. Bruce, Ottawa, Ont., is chief engineer.

MEXICO.

F. V. Lister & Co., 20 Don Juan Manuel, City of Mexico, is carrying out the contract for the Cia Baucaria de Fomento y Bienes Raices de Mexico, for constructing that portion of the Durango-Llano Grande extension of the National Railways of Mexico from kilometer 926 to 973 inclusive. The work includes 65,343 cu. meters of earth excavation, 1,006,181 cu. meters of rock excavation, 1,018,512 cu. meters of embankment, 10,598 cu. meters of stone masonry and the following bridges: K. 960 1-17′ I beam, K. 963 4-17′ I beams, K. 964 1-160′ plate girder, 2-30′ plate girders (K. 966), K. 967 1-30′ plate girder, K. 971, 1-17′ I beam. The work is to be completed in 18 months. The award of the contract for this work was noted in our Feb. 9 issue.

Power Developments, Levees, Drainage and Irragation Works.

ALABAMA.

Leo K. Steiner, of the banking house of Steiner Bros., Birmingham, Ala., wishes to let a contract for completing part of Lock No. 3 on the Tombigbee River in Alabama. The original contract was let by the U. S. government on Dec. 4, 1907, the total amount being $350,000. The amount of work done is about $100,000.

COLORADO.

We are advised that only preliminary work is contemplated at present in connection with the Randal Reservoir, filed for the Palmer estate, for the irrigation of lands east of Colorado Springs, as noted in our Feb. 9 issue. E. C. Van Diest, Colorado Springs, Colo., is the engineer.

The Greeley Construction Co., A. A. Howard, superintendent, Greeley, Colo., has the contract for constructing the McGrew Reservoir, as noted in our last issue. This reservoir is the largest of several in the Greeley-Poudre district, and the earthen dam which will be constructed will be about three miles long, 26 ft. at its greatest height, 16 ft. across top, and will contain approximately 500,000 cu. yds. of dirt. It will require about one year to complete the above and the work will cost $100,000. The frost or frozen condition of the ground has just about left it, and the Greeley Construction Co. began active operations on February 21 with about 100 teams of mules and as many men. The camp is already established and dirt will fly soon.

The Austin Mfg. Co.'s New Era Graders and Contractors Dump wagons will be used on the work.

Contracts for the remaining reservoirs and ditches have been let, the Knowlton Construction Co. having all the ditch work. Contracts for the concrete work on the dam which is estimated to cost about $100,000, will be let by D. A. Camfield and S. H. Shield, of the Camfield Development Co., Symes Bldg., Denver. The Greeley-Poudre district which was organized by Canfield and his associates will redeem and water 125,000 acres of otherwise valueless land.

C. F. Tew is attorney for the district, John R. Wortham is District Engineer and C. E. Latham is trustee for the District, all having offices in Greeley, Colo.

GEORGIA.

As previously noted in this paper bids are being asked until noon, March 9, by Col. Dan C. Kingman, U. S. engineer, Savannah, Ga., for dredging in Club and Plantation Creeks, Ga. The work to be done consists in dredging the canal, approximately 450 ft. long, connecting Club and Plantation Creeks, 50 ft. wide at the bottom and 7 ft. deep at mean low water, and the dredging and straightening of Plantation Creek, to the before-mentioned dimensions, beginning at the western mouth and proceeding eastward as far as the available funds will permit. The work requires the dredging of 110,000 cu. yds., chiefly of marsh mud, the depth of which, where the canal and cut-off are to be made, varies from 8 to 11 ft. Below this, and to the project depth, there appears to be a bed of stiff mud or clay. It is believed that all of this material can be readily removed with an ordinary dredge or either the hydraulic or the dipper type.

IOWA.

Bids are asked until 1:30 p. m. March 2, by H. P. Lods, Dallas County Auditor, Adel, Ia., for constructing Drainage District No. 8, the work including the construction of a ditch having a 24-ft. bottom, a ½ to 1 slope, an average depth of 6½ ft. and an extreme depth of 11.1 ft. The ditch will require 272,500 cu. yds. of excavation. In addition there will be 11 dams, spile and earth fill in dams 12,625 cu. yds. Bids will also be opened on March 3 for a considerable amount of tile work in District No. 15 .

Bids are asked until noon, March 16, by the Board of Supervisors, Louisa County acting on behalf of Drainage District No. 12, at the office of the county auditor at Wapello, Ia., for work divided in sections as follows: Section 1, 111,000 cu. yds. of excavation, 6 acres of clearing; Sec. 2, 154,000 cu. yds. excavation, 3 acres of clearing; 127,000 cu. yds. of excavation, 12 acres of clearing; 87,000 cu. yds. of excavation, 30 acres of clearing. H. W. Baker will also be found in this issue.

MONTANA.

Plans have been made for an irrigation system for 20,000 acres of land north of Twodot, Mont., and contracts will be let some time this summer. The work will include the construction of three dams 125 ft. in height and 150 ft, in length; two miles of flumes; three miles of pipe line and twenty miles of main canals. The supply will be obtained from the streams draining the Little Belt Mountains. Lilles & Hatch, Billings, Mont., are the engineers and John Montall, 219 Gilfillan, St. Paul, Minn., is in charge of the work.

MISSOURI.

Bids are being asked by the supervisors of Blackwater Drainage District No. 1, Robert J. Grover, secretary, Warrensburg, Mo., until noon, March 10, for clearing right of way and excavating main ditch and straightening Blackwater Creek. The excavating work consists of a ditch 27 miles long, containing 1,000,000 cu. yds. of earth. The ditch is to be 3 ft. wide at the bottom, with an average depth of 12 ft. and a one to one slope. The laterals consist mostly of farm ditches, ranging from 3 ft. to 5 ft. wide at the bottom and from 3 ft. to 10 ft. deep. These contain about 225,000 cu. yds. of earth. The payments are to be made in cash each month. The labor conditions in the vicinity are normal. The above work was noted under Bids Asked in our Feb. 16 issue.

OREGON.

Bids are now being asked by the Water Board, Frank T. Dodge, superintendent, Portland, Ore., for furnishing materials and labor for the construction of a steel conduit from Headworks to Mt. Tabor, practically parallel with the present Bull Run conduit, a total approximate distance of 24 miles, and consisting of 52,915 lin. feet of 52-in. and 75,379 lin. feet of 44-in. steel pipe and specials in place. Bids for the work are to be opened March 8, as stated in the official advertisement elsewhere in this issue. The approximate statement of quantities is as follows: 195,000 cu. yds. earth excavation and refilling; 5,500 cu. yds. loose rock; 1,500 cu. yds. solid rock; 25,000 cu. yds. gravel backfilling; 40,000 lin. ft. of 3-in. drain tile; 40,000 ft. B. M. lumber; 26,000 cu. yds. excavation for roadway; 30 acres clearing and grubbing; 21,145 lin. ft. of 52-in. steel pipe, ¼ in. thick; 29,657 lin. ft. of 52-in. steel pipe, 5-16 in. thick; 1,338 lin. ft. of 52-in. steel pipe, ⅜ in. thick; 775 lin. ft. of 52-in. steel pipe, 7-16 in. thick; 75,379 lin. ft. of 44-in. steel pipe, ¼ in. thick, including also 134 angles for the 52-in. pipe, requiring total approximate length of 1,655 ft. of curved pipe. 206 angles for the 44-in. pipe, requiring total approximate length of 970 lin. ft. of curved pipe; 206 manholes; 60 4-in. air valves with 4-in. gate valve; 41 8-in. blow-offs with 8-in. gate valves; 2,360 lin. ft. of 8-in. steel blow-off pipe; 60,000 lbs. steel for trestles; 480 cu. yds. concrete; 1,085 lin. ft. of boxing for 52-in. pipe; 1,290 lin. ft. of boxing for 44-in. pipe; 1 Venturi meter for 52-in. pipe; 1 Venturi meter for 44-in. pipe.

UTAH.

There will probably be some delay in letting the contracts for construction of canal of Upper Blue Ranch Irrigation District (successor to Upper Blue Bench Canal & Reservoir Co.), because of a move to consolidate this work with that of Blue Bench Irrigation District No. 1 immediately adjoining on the south, and thus build one large canal instead of two smaller ones as originally planned. The result of these negotiations will not be known until the location survey of the latter district is completed, probably about April 15th. The West Bench Irrigation District, across the DuChesne River from the Blue Bench, is also planning to build their canal this season; as is also the Fruitland Irrigation District of Westerdahl, Utah. The Dry Gulch Irrigation Co., of Roosevelt, Utah, has expended to date the sum of $230,000 and has its main canals, six in number nearly completed. The company expects to expend about $100,000 more on their lateral systems, headgates, drops, etc. The New Hope Irrigation District of Independence, Utah, expects to complete its canal system this season. The District is jointly interested with the United States government in 14 miles of main canal, and this portion has been completed at a cost of $23,000 for their district's portion; the remaining 10 miles to be built alone is not difficult work and will be constructed for an additional $10,000. Ed. F. Harmston, Roosevelt, Utah, is chief engineer for all of the above work.

The Mississippi Western Construction Co., of Meridian, Miss., organized to build a railroad from Meridian to Natchez, Miss., is planning to begin work in March.

The Union Pacific R. R. is reported to have purchased between $300,000 and $400,000 worth of property between 9th and 12th, on the south side of Jackson, at Omaha, Neb., presumably for a new Union Pacific freight house and yards.

The Missouri Pacific Ry., M. L. Byers, chief engineer, maintenance of way, St. Louis, Mo., is stated to be having surveys made for reducing grades and taking out curves in the line south from Nebraska City, Neb.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Commercial and Industrial Association of Selma is taking steps to form a company to build a wharf at that city. O. E. Young, Selma, is to prepare plans and estimates.

The Birmingham Southern R. R. has about completed its extension to the mines of the Tennessee Coal, Iron & R. R. Co., near Wylam. Over 6 miles of line have been graded and track laid, with 90 lb. rails. The work involved some difficult pieces of construction, requiring many deep cuts and fills. Jones & Brewer, Birmingham, Ala., Wallace Bros., of Ensley, and the Grant Construction Co., of Birmingham, were the contractors.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Fort Smith, Van Buren & Eastern Interurban Co., has an application before the city council of Van Buren for a street car franchise. The company wants a 50-year franchise to operate a car line over seven of the principal streets of the city.

Preliminary surveys are stated to have been started for an interurban line from Rogers to Bentonville and Gentry. J. D. Houseman, St. Louis, Mo., is interested.

H. C. McCluer, Nashville, Ark., chief engineer of the Memphis, Paris, & Gulf R. R., with a corps of 20 engineers, has begun surveys for the extension of the line from Murfreesboro to Pine Bluff, Ark.

The Fort Smith Light & Traction Co., J. Walter Gillette, general manager, Fort Smith, is planning to at once begin work on a 1 mile extension.

The Louisville & Nashville R. R. has completed several miles of grading on the extension of the line now under construction from Falco, Ala., to Rome. Work, it is said, will be completed by March.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Twin Peaks Improvement Club of San Francisco, has appointed Lincoln E. Hackett, C. L. Bennett, C. T. Collins and E. F. Kearney to act in conjunction with the Eureka Valley Improvement Club to secure a new car line to connect these districts. A franchise for an electric line in Eureka Street is favored, to take the place of the cable line running over the steep Castro street hills.

Steps are being taken by the Holton Interurban Ry., Holton, for an extension from El Centre to New River, a distance of nine miles.

Surveys have been completed, the capital has been secured, and construction work is under way on the projected line of the Ontario & San Antonio Heights R. R. The C. E. Woodside Co., Los Angeles, are interested.

Residents of the eastern part of the city of Long Beach have petitioned the city council for the erection of a $75,000 pier at Devil's Gate.

The Southern Pacific is said to be planning to double track its road between Bakersfield and Mojave this season. This means that about 46 miles of road would be double tracked but not through the tunnels.

J. P. Snook and E. S. Brown, Sacramento real estate men and owners of the Bossen and Marcuse ranches, have awarded a contract to the Thor Dredging Co. to build a levee around the Bossen and Marcuse ranches, located near Marcuse Station in Sutter county. The levee will inclose 4,000 acres.

The Solano county supervisors have granted August Stremmell and other San Francisco capitalists a permit to construct a wharf at Glen Cove, on Carquinez straits, midway between Vallejo and Benicia. The company is organized to erect a summer resort and bathing place at that point. Darby Layden, San Francisco, has been awarded the contract to build the wharf.

The Nob Hill Tunnel Association of San Francisco has petitioned the supervisors to take action to construct a tunnel under Nob hill. The estimated cost of the work is about $375,000.

Plans are to be submitted to the city council of Alameda for the enlargement of the municipal wharf at the foot of Oak street, and the construction of a ware house on it. I. N. Chapman is city engineer.

The trustees of the Yolo Basin Drainage District are securing consents of property owners for the construction of a canal through Yolo basin to drain overflowed lands. As soon as this is done surveys will be started for the canal which is to be 10 ft. deep and 350 ft. wide and will cost about $150,000. W. E. M. Beardsley, Broderick, is a member of the board.

The Patterson Water Co. has been incorporated with a capital stock of $200,000 and plans to develop water for hydraulic, irrigation and domestic use on the Patterson ranch, a 20,000 acre tract in Stanislaus county. The directors are Vance McClymonds, S. E. Smyth and C. C. Hamilton, all of Oakland.

During the month of January a progress of 213 lin. ft. was made in the tunnel being driven through the Santa Ynez Range to furnish the city of Santa Barbara with a permanent water supply. It is expected that 275 lin. ft. will be driven in February. The Santa Ynez river will be dammed and the water run through the mountain tunnel a distance of about three miles. Much of the stratum consists of shale, with occasional adobe, which makes the timbering problem an unusual one. Lee M. Hyde, Santa Barbara, is the engineer.

The Cotton Land Co., recently organized by W. I. Hollinsworth, W. J. Hole, Louis Evans, H. V. Blenkiron, D. M. Martin and W. J. Burton, all of Los Angeles, has purchased 30,000 acres of land along the Colorado river. The plans include canal and levee construction, the building of a railroad through the property from Topock, on the southern boundary to the north line, the providing of good wagon roads, and the laying out of the town of Cottonia. Contracts for 11 miles of canals and 15 miles of levee have already been let to W. J. Burton, of Los Angeles.

According to a statement made by Chief Engineer Kallright of the San Diego & Arizona R. R., the line has been completed south of the Tia Juana river to Tia Juana, Mex. Work is progressing well on the Robert Sherer & Co. contract eastward from Tia Juana. The first of several big cuts has been completed and approaches have been started for the tunnel to be cut through the mountain at the head of Mantanuco Canyon.

The Southern Pacific Ry. Co. has surveyed 600 miles of branch lines in northern and northeastern California, southern Oregon and western Nevada to cost about $24,000,000. The new mileage as surveyed is as follows: California Northeastern Ry. Co., 90 miles; Oregon Eastern Ry. Co., 150 miles; Modoc Northern Ry. Co., 80 miles; Goose Lake & Southern Co., 160 miles; Fernley & Larsen Railway Co., 120 miles. E. E. Calvin, San Francisco, Cal., is vice-president and general manager of the Southern Pacific.

According to reports from Marysville, Cal., the Western Pacific Co. is making arrangements to lay a line of track on the Brown's Valley grade which will be raised a few feet and widened out considerably.

According to reports current at Vacaville, Cal., Southern Pacific engineers are securing data for the construction of a line in Southern Colusa County, from Rumsey to Colusa Junction. The new line would shorten the route between San Francisco, Cal., and Portland, Ore., considerably, making it unnecessary for trains to travel by way of Davis and Woodland.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Preliminary work and surveys may be made shortly for a scenic tramway up Flagstaff mountain, near Boulder. Col. Lewis Ginger, Colorado Springs, who is back of the project to build a scenic road up Cheyenne mountain, near that city, is also interested in the Boulder project.

The Northwestern Terminal Co., which is backed by D. H. Moffat, Denver, president of the Denver, Northwestern & Pacific Ry., is preparing to begin work on the construction of its belt line around the city of Denver.

Amended maps of the Rio Blanco Canal system projected in Rio Blanco and Routt counties have been filed in the office of the State Engineer at Denver. The estimated cost of the project is about $3,500,000 and it will include: The Trappers Lake reservoir, which is to have a dam 60 ft. high and will hold 887,690,000 cu. feet of water. It is estimated that it will cost $60,000 to construct it. The North Fork of the White River is to supply this reservoir with water. The Marvine Lakes reservoir will also have a 60-ft. dam, and will have a capacity of 458,349,500 cu. ft. Marvine creek is the source of supply named, and $75,000 the estimated cost. The pass Butte reservoir is the largest of the group. It is to have a dam 185 feet in height and a capacity of 4,781,275,000 cu. feet of water. The North Fork of White River and Milk Creek, a tributary of the Williams fork of Bear River, are named as the sources of supply. This reservoir is to cost $1,440,639.50. A. L. Fellows, 435 New Century Bldg., Denver, Colo., is the engineer.

C. C. Rogers, Pierce, C. F. Finley and A. Finley, Fort Collins, have filed maps with the County Court at Greeley for three reservoirs to be supplied from Lone Tree Creek. Reservoir No. 1 has a capacity of 91,883,100 cu. ft., and will cost $28,000; No. 2 has a capacity of 24,400,000 cu. ft. and will cost $6,000; and No. 3 has a capacity of 82,101,120 and will cost $26,000.

The Commonwealth Power & Electric Co., of Georgetown, is planning the construction of a power plant on the Grand River near Georgetown for the development of 10,000 H.P. The dam will be 70 feet in height above present low water, 120 ft. long at water level, 158 ft. on top and with the natural fall of the streams to the power house will give a total head of 106 feet. The water will be carried to the power house, a distance of 5,000 ft. from the dam, through a 10x12-ft. tunnel through solid granite. Frank A. Maxwell and C. D. Runkle of Georgetown, are interested.

John F. Church and associates of Denver are stated to have acquired a number of water rights and reservoir sites on the Little Colorado river in northern Arizona, between Springerville and Holbrook, from the St. John's Irrigation Co., the Meadows Reservoir Co. and the Urall Reservoir Co. It is said that between $800,000 and $1,000,000 will be spent by the Denver men on irrigation projects in this stretch of country.

The Colorado Southern Irrigation Co., which is being financed by the Trowbridge-Niver Bond Co. of Chicago, has purchased from the Hill Land and Investment Co. of Denver 25,000 acres of land along the Arkansas River in Pueblo and Fremont counties. The company plans to construct a $12,000,000 irrigation system in the Arkansas valley, which will bring about 300,000 acres of land under ditch, and this is the first move in that direction.

The farmers living in the Golden-Littleton district have voted in favor of the large irrigation project to be built by the Camfield

Construction Co. of Denver to supply water to the Henrylyn and Golden-Littleton districts. The project will cost about $4,000,000 and the actual work of construction will start in a short time. D. A. Camfield, president of the company, was recently in Chicago for the purpose of placing the bonds.

Stockholders of the Vanskike Ditch Co. held a meeting at Fowler on Feb. 21 to vote appropriations for making extensive repairs to the canal.

The Denver, Laramie & Northwestern R. R. Co., recently incorporated, as mentioned in our last issue, has taken over the holdings of the Denver, Laramie & Northwestern Ry. Co., a $5,000,000 corporation. The new company has been incorporated by the stock holders of the old company for $30,000,000, of which amount $22,500,000 will be issued in bonds for building 750 miles of road. The company is planning extensive improvements in Wyoming, with 200 miles of construction work promised for the coming summer. The company expects to build into Laramie this year. The old company was authorized to build only to the Colorado-Wyoming state line. E. A. Buck, Denver, Colo., is chief engineer.

Advices from Denver state that it is reported there that the Gould interests have taken over the uncompleted New Mexico Central R. R. and will use it as one of the links in a new line they are to build from the gulf of Mexico to the Pacific coast. It is said that the New Mexico Central will be extended east of Albuquerque to Roswell and thence northward to Durango. At this point it will connect with the D. & R. G. In the meantime it is also said that the Southern Pacific has completed all its surveys north from Gallup, N. M., and that it is ready to begin building toward Farmington in the near future. This project has been under way for some time and rights of way and terminals have been secured all along the proposed line.

The Colorado & Southern Ry., H. W. Cowen, chief engineer, Denver, Colo., is reported to have engineers in the field laying out a direct line between Pueblo and Denver, which will reduce the present grade from 4 per cent to 3 per cent, and will be several miles shorter than the present route. The new line would necessitate the construction of a tunnel 3,200 ft. long, about a mile east of Palmer.

The work of enlarging the undercut section of Gunnison tunnel was advanced during January as follows: From the east portal 825 lin. ft. and from the west portal 815 ft. Only 48 ft. of the undercut section remained to be enlarged to the end of January.

It is reported that the Atchison, Topeka & Santa Fe R. R. Co. is considering the construction of terminals in Denver, Colo., estimated to cost several million dollars.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Board of Trade of Americus, Ga., is taking steps to secure the construction of an interurban line from Americus to Ashburn, with Brunswick, Ga., as the ultimate terminus.

The Gainesville Midland Ry. is stated to be about to start surveys for an extension from Gainesville, Ga., to Knoxville, Tenn. At present the road operates a main line of 42 miles from Gainesville to Athens, and a line of the same distance from Gainesville to Monroe, via Winder. E. B. Eppes, Gainesville, Ga., is general manager.

The City Council of Atlanta has granted the Georgia Railway & Electric Co. of Atlanta, franchises for four new lines in the city.

Work is to be started shortly to complete the trolley road from Jackson to Indian Springs. The line will be 5 miles long and most of it has been graded. Capt. W. F. Smith, Jackson, Ga., is interested.

The Georgia, Southwestern & Gulf R. R. has purchased the Albany & Northern Ry. and will extend it from Albany, Ga., to St. Andrews Bay, Fla., on the Gulf of Mexico. J. S. Crews, Albany, Ga., is general manager of the Albany & Northern Ry.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A proposition has been made to the City Council of Rexburg, Idaho, by Mr. De Coster, of Victor, Idaho, representing the people of Teton basin, regarding the formation of a company to develop electric power, and suggesting that Rexburg, St. Anthony and other towns join with them in the erection of a mutual plant that would furnish light and power for the entire district.

The city of Idaho Falls is considering purchasing a power site at Broadway on the Snake river and erecting an electric plant, capable of developing 1,500 h. p. Edward P. Caltman is mayor.

The Boise & Western Ry. Co. has filed application for right of way over government land in the United States Land office at Boise, Idaho, together with location surveys for a portion of its projected line. The officers of the company are as follows: Col. C. E. S. Wood, president; James McI Wood, secretary; William Hanley, Burns, Idaho; C. W. Mallett and J. W. McCullock, Ontario; Drake C. O'Reilly, Portland, Ore., are directors.

It is reported that track laying is progressing rapidly on the Pittsburg & Gilmore Ry., from Leadore down to the Lemhi Valley and it is expected that steel will be spiked into Salmon, Idaho, by April 1. It is planned by the company to have the line completed to Stanley Basin by another year and providing the Boise-Butte end of the line is pushed with similar energy a meeting will be made at the head of the Salmon river, completing the road from Salmon to Boise.

The Central Idaho Railroad Co., with headquarters at Salt Lake City, Utah, and Pocatello, Idaho, has filed articles of incorporation at Salt Lake City, Utah. The company, which is capitalized at $220,000, will construct a branch line of the Oregon Short Line, from Owinza, a station of the O. S. L. Ry., through Lincoln county, northwest through Big Wood River Valley to the divide between Boise and Big Wood River Valleys, then through Boise, and Middleton to the Payette Canyon county, where connection will again be made with the Oregon Short Line. W. H. Bancroft is presiden; J. A. Reeves, vice-president; C. H. Jenkinson is treasurer; G. K. Smith is secretary; all of whom are directors.

An ordinance has been passed in Moscow, Idaho, granting the Spokane & Inland Empire Ry. Co. a franchise and right of way from its present terminal to Main and Sixth streets, in the southern part of that town.

The Idaho Northern Ry. is reported to have secured the necessary capital for the construction of an extension from Emmett up the Payette River to Smiths Ferry. E. H. Dewey, Nampa, Idaho, is President and General Manager.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Green & Sons Paving Co., of Chicago, Ill., has been incorporated with a capital stock of $30,000, to engage in a contracting and construction business, the incorporators being Louis L. Dent, Ernest Peacock and John H. Cummings, Jr.

The Newkirk & Powers Construction Co., Joliet, has been awarded the contract for grading for the enlargement of the East Joliet Yards of the Elgin, Joliet & Eastern R. R. Fourteen sidetracks will be laid in the rear of the McKenna mills, north of the Maple Street crossing, giving an additional switching space sufficient for the accommodation of 900 cars.

The Chicago, Burlington & Quincy R. R. is planning a number of improvements for its Galesburg division this season. The first to be started will be the double tracking of the road between Galesburg and Knoxville, 6 miles, and Galesburg and Henderson, 7 miles.

The Peoria Southern Ry. Co. has been incorporated with a capital stock of $2,500 and headquarters at Peoria, and proposes the construction of a line from a point in or near the City of Peoria, in a generally southerly direction to a point in or near the City of Pekin, in Tazewell County. The Peoria Northern Ry. Co. has also been incorporated with $2,500 capital stock and proposes the construction of a line from a point in or near the City of Peoria, in Peoria County, in a generally northerly direction to a point in or near the village of Bureau, in Bureau County. The incorporators and first board of directors of both companies as as follows: H. E. Chubbuck, General Manager, Illinois Traction System, Peoria, Ill.; W. H. Carnahan, Champaign, Ill.; H. J. Vance, Peoria, Ill.; H. C. Dillon, Peoria, Ill., and W. J. Achelpohl, Peoria, Ill.

Wallace Treichler, C. E., Rock Island, Ill., has started surveys for an interurban line from Galesburg to Muscatine, Ia. The surveys are being made for Buffalo Prairie parties.

H. E. Chubbuck of Peoria, General Manager of the Illinois Traction system and the Western Railways & Light Company has been elected vice president and general manager of both companies. The Western Railways & Light Co. controls city railway lines and light companies in Wichita, Kas., Galesburg, Quincy, Ottawa and a number of other cities. The head office is in Peoria.

The Cleveland, Cincinnati, Chicago & St. Louis Ry. (Big Four) is planning to erect a new round house at Mattoon this year.

Becker & Son, Lafayette, Ind., have set up their dredge boat and have begun with their ditch contract for the Nixon Special Drainage District of Clinton, Ill. It will require several months to complete the contract.

Track Elevation Departments of the Chicago & Alton, Rock Island, Sante Fe, and Michigan Central R. Rs. at Joliet, Ill., have completed nearly all details for the work and active construction will be started and the project rushed to completion as soon as the weather permits.

The Chicago, Rock Island & Pacific Ry. has started work laying 100-lb. rails on its Illinois Division. Steel for 113 miles of line has already been ordered.

A number of contractors have been in Cairo recently for the purpose of placing bids for completing the grading for the Cairo & Thebes R. R. Grading between Cairo and Santa Fe will be taken up and finished as soon as settled weather in spring comes on. Among the contractors bidding on the work were D. B. and C. W. Lacy of Anniston, Ala.; R. H. McRoberts of Mattoon; W. S. Smith and W. H. McDonald of Memphis, Tenn.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Grading work is to be resumed shortly on the projected line of the Terre Haute, Merom & Southwestern R. R., and it is planned to have the track laid into Prairieton not later than May. At present the road is graded for more than 28 miles southwest from Terre Haute and the concrete abutments for all bridges are completed. Three miles of track is laid and bridges for seven miles are built. It is probable that steps will be taken to extend the line as far as Merom the coming summer. Donn M. Roberts, City Engineer, Terre Haute, is in charge of the work.

The Gary & Interurban R. R., of Gary, has placed orders for the material for its 5th avenue route in Gary, and as soon as the material arrives will rush the contruction work. The branch will be about three miles long. T. G. Hamilton is chief engineer.

Attorneys Embree & Embree, representing the petitioners have filed a petition with the County Circuit Court at Princeton asking for the construction of a levee on the Indiana side of the Wabash river from New Harmony to the mouth of the Patoka river at East Mt. Carmel, thence up the Patoka river on both sides to Dongola, a small village near the Pike county line. The total length is estimated at 82 miles and the total amount of land effected at 200,000 acres. The cost is estimated at about $350,000.

Reports from Indianapolis, Ind., state that the Cleveland, Cincinnati, Chicago & St. Louis R. R. Co. is to construct car shops at Beech Grove, near that city, to cost about $1,000,000. Improvements have already been made at that

place by the "Big Four" amounting to $2,000,000.

Board of Public Works of Fort Wayne, Ind., has instructed Harry G. Hogan, city attorney for the city's share of the work incidental to the elevation of the Pennsylvania R. R. tracks through that city. Construction work will be started in April.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The stockholders of the proposed Des Moines & Sioux City Interurban Ry. Co., are to hold a meeting shortly to devise ways and means to bond the road so that work can be started. J. W. Reed, Ida Grove, Ia., is President.

The Sioux City, Crystal Lake & Homer Ry. Co., Joseph Foye, President, Sioux City, is to have work started early this spring on electrifying its line. At present the road is operated by gasoline power.

The Chicago, Rock Island & Pacific Ry. is stated to have had plans drawn for a cut-off from Atlantic to Council Bluffs, which would reduce the running time between Omaha and Chicago. The proposed cut-off would be in a straight line southwesterly from Atlantic to Council Bluffs. The distance over the main line from Atlantic to Council Bluffs is now 65 miles, but the proposed route, in a line between the two points, would be slightly over 45 miles.

The supervisors of Muscatine County, Muscatine, are taking steps for the construction of a levee along the north side of Cedar River in Orono and Pike Townships.

Surveys are being made of the Des Moines River at Eldon above and to Ottumwa for the purpose of demonstrating the advisability of a dam just above Eldon to be used for power for the city and surrounding country. Mayor Frank Shane, Eldon, is interested.

The Central Interurban Co. has been incorporated with a capital stock of $10,000 and proposes to build and operate interurban lines in Iowa. The company recently asked a franchise at Des Moines. The incorporators are J. B. Green, W. P. Clark, J. H. Phillips, W. M. Taylor and C. R. Keyes of Des Moines.

The Chicago & Northwestern Ry. is planning the expenditure of $250,000 this year for improvements at Hawarden. These will include the erection of a complete and modern roundhouse, a new 80 ft. turntable, new coaling sheds and several miles of new trackage.

It is generally believed in railroad circles that the Chicago, Rock Island & Pacific R. R. will double track its line from Iowa City, the present terminus of the double tracked line on to Des Moines, Iowa, this summer.

The Commercial Club of Marengo, of which C. M. Beam, is secretary, is taking steps to secure the construction of the proposed railroad from Waterloo, Ia., south to tap the coal field of Keokuk and Mahaska counties.

The Chicago, Milwaukee & St. Paul Ry. Co. is planning improvements at Cedar Rapids, Ia., to cost $50,000. The work includes the construction of a new roundhouse, yard office, coal chute and sand drying house.

The Charles City Western R. R. Co. of Charles City, has been incorporated with a capital stock of $300,000 of which $100,000 already has been subscribed by the promoters. The street car service for Charles City is to be in connection with the interurban.

The Supervisors of Muscatine County, Muscatine, have decided to establish Drainage District No. 12 and to build a levee there.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

J. E. Snedeker, Osawatomie, Kan., division superintendent Missouri Pacific Ry., has announced that the road bed of the line in the vicinity of Salina, Kan., would be improved.

The Motor Grand Traction Co., of Belleville, which proposes the construction of an interurban railroad line between Chester, Neb., and Wichita, has let the financing of the road to a firm of bankers and brokers at Montreal, Canada, and it is thought that the building of the new line will now be pushed as rapidly as possible.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Saginaw-Bay City R. R. Co. has applied to the State Railroad Commission for authority to increase its capital stock $1,100,000 and to issue bonds to the amount of $5,000,000. This company is the result of the consolidation of the Bay City Traction & Electric Co. and the Saginaw Valley Traction Co. The latter company is planning to lay several new tracks in Saginaw.

The Benton Harbor Interurban line has secured practically all the right of way for its projected extension from Eau Claire to Dowagiac and it is said that construction work will be started in May.

The Lake Superior & Ishpeming Ry. Co., R. C. Young, Chief Engineer, Marquette, Mich., has asked the City Council of Ishpeming for permission to erect a trestle and to make a fill, extending over and north of West Division Street, for the proposed railway line to the Cleveland-Cliffs Iron Co.'s North Lake properties.

The Lansing & Northeastern Construction Co., mentioned in our last issue, is making good progress in the construction of the grade for the Lansing-Owosso line. Grading is well along between Morrice and Shaftsbury and one steam shovel is at work north of Morrice. T. A. Atwood, Caro, Mich., is president of the construction company.

Construction work on the Blaney & Southeastern R. R. extension in Schoolcraft county is nearing completion. The line is to extend from Blaney to Germfask, connecting at the latter place with the Manistee Ry. Edwin P. Radford, Hermansville, Menominee county, is chief engineer.

Maps of the route on the Detroit & Bay City R. R. between Bay City and Caro have been filed at Bay City. The route runs straight east on the eighth quarter line to Quanicassee, thence to Akron and on to Caro, a distance of 30 miles. The grading on the low lands on either side of the Quanicassee river has been completed in order that the progress of constructing the road will not be interfered with in the spring by high water. This road, as previously noted, is being built by Handy Bros., coal operators, Bay City.

An ordinance is before the city council of Sault Ste. Marie, requesting the local street railway company to extend its line north on Ashmun street to 12th avenue.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

An ordinance has been before the Council Committee on Streets of St. Paul, requiring the Twin City Rapid Transit Co. to build and operate a car line on Maryland Street, from Dale to Rice Streets, in St. Paul.

The Northern Pacific Ry., W. L. Darling, Chief Engineer, St. Paul, Minn., is said to have definitely decided to build a double track this season from St. Cloud to Little Falls, and perhaps to Staples. It has also determined to straighten out the track from Sartell to Rice.

Announcement has been made by officials of the Minneapolis & St. Paul & Sault Ste. Marie Ry. that it was proposed to expend $8,000,000 in improvements during the present year. Three million will be expended on the Chicago division. The rest will be spent in improving the main line, although a good share will be put into the Thief River branch to Duluth. Thos. Green, Minneapolis, Minn, is Chief Engineer.

The Duluth, Missabe & Northern Ry. Co. has six crews at work near Silica, Minn, grading for double tracking the Coleraine line and for the new line which will be built from Hibbing to Silica. Preparations are also being made for grading for the new 26 track yards to be built at Hibbing to receive all the ore sent to Duluth via the Coleraine branch.

The Hill City, Mississippi & Western R. R. which runs from Swan River to Hill city, 20 miles is reported to have been sold to the Armour Packing Co. for the purpose of obtaining shipping facilities for the large pail and tub factory which the company will establish at Hill City.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The directors of the Green Bolton Levee and Improvement Association have decided to begin work on the proposed levee as soon as the weather will permit. Charles Hercules, St. Charles, Mo., is interested.

The city council of Kansas City, Mo., is considering appropriating $2,000 for the defraying of expenses for making a preliminary survey of the Kansas City, Memphis & Springfield R. R. into that city.

The Chicago, Burlington & Quincy R. R. Co. is planning the improvement of its Hannibal division. The work includes relaying the sections between Elsberry and Old Monroe and West Alton and St. Louis, Mo., with 90 lb. rails, and the north end of the division between West Quincy and Burlington with 85 lb. rails.

Sam T. McDermott, of Kansas City, Mo., has made a proposition to the citizens of Buffalo to build a railroad from that place from some point on the Frisco. He agrees to build the road if the citizens of Buffalo and Dallas county would purchase the right of way of the old Laclede and Fort Scott R. R. Co. that is now owned by A. B. Lovan of Springfield.

St. Louis Items.

BY A. B. KOENIG.

F. M. Skene, 606 Victoria Bldg., St. Louis, Mo., has an outfit to let for concrete work, pile driving, etc.

The L. J. Smith Construction Co. have shipped a part of its extensive outfit that they had at work on the Outer Belt R. R. in Kansas City, Kan., on to their new Santa Fe work in Arizona and California.

The Missouri, Kansas & Texas Terminal Co., which is asking the Municipal Assembly for a franchise to establish a terminal system in the North End, has filed a brief with City Counselor Walther, questioning the authority of the Assembly to regulate switching rates. The brief declares the Assembly has no such right, and that any provision put into the bill now pending in the House of Delegates would be illegal. Walther had already given an opinion to the railroad committee of the House, saying the Assembly has authority to make provisions for switching rates, and that any provision of the franchise on that subject accepted by the terminal company will constitute a binding contract. After getting the brief, according to a member of the House committee, he still maintains his position. He doubts the authority of the Assembly to regulate rates except through a franchise contract. A maximum rate of $2.00 a car has been put into the Katy bill by the House committee, and the measure will come up for passage at Tuesday night's meeting. The rate applies only to freight originating and consigned to points on the Katy's terminal system and to shipments consigned through the Katy terminal from one railroad to another, but not consigned to or received from the Katy Railroad. The bill considers the Katy terminal as the Katy Railroad under another name, and specifically prohibits any switching charge for car freight handled by the railroad constructing the terminal. When the House committee first declared its intention of prescribing switching charge limitations, the terminal company protested that it could not accept the franchise if passed. The rate considered then was $1.00 a car. On investigation, the committee decided to allow $2.00 a car and make limitations as to what freight should be so charged. The company while still protesting the rate has changed its reasons. Instead of declaring it cannot accept the franchise, it protests the provision is illegal. The switching regulations will likely remain a part of the bill, and if the terminal company accepts the bill it will be required to do so in writing, and a bond shall be filed with

the city register in the sum of $50,000 within ten days. A cash bonus of $140,000 must also be paid into the city treasury at or before the expiration of ten days after it becomes effective, else it will cease, by its own provisions to exist as a franchise. It has not yet been decided whether the bill to grant the Terminal Railroad Association additional facilities in the Ranken tract shall include switching regulations. The franchise is only an extension of the present rights of the Terminal Association, but some members of the committee say it will be a contract when accepted by the Terminal, and any provisions to regulate switching rates or abolish the bridge arbitrary would be legal.

Henry Schweitzer has resumed work at Hillsboro, Ill., on the Big Four R. R.

A meeting was held at La Grange, Mo., on Feb. 12, for the purpose of considering a proposition looking to the formation of a levee district in the Mississippi Bottom between La Grange and West Quincy, Mo. Most of the land owners concerned were present. J. H. Nelen, Deputy Labor Commissioner of Missouri, who has been preparing a special report for that department on the question of drainage and levee in swamp land of the state, was present by invitation, and addressed the meeting. He pointed out the results that had been derived from leveeing the land in various parts of Missouri. His talk was illustrated by maps, which he had prepared for the special report. J. B. Taylor, L. D. Mitchell, W. E. Oyster and others spoke, after which a committee was appointed for the purpose of investigating the feasibility of the proposed levee and to ascertain other information on the subject.

The Missouri Bridge Co., 3118 East 15th St., Kansas City, Mo., secured the contract to build the Interstate Railroad from Kansas City to St. Joe, Mo. They will be ready to sub-let this work within a month.

The Iron Architectural Steel Contractors' Association will not increase the scale of wages paid to employes. This was decided Sunday afternoon when members assembled in the headquarters of the Building Industries Association. About 90 per cent of the contractors in the line of business in St. Louis attended. The union iron and steel workers gave an ultimation to the bosses several weeks ago, demanding an increase of 20 per cent over the present scale. If this were refused, the union declared, it would call men out on strike June 1. The bosses say that the demand is inopportune and without reason. The union men assert the increase is made necessary by the high cost of living. The bosses drew up an agreement yesterday and all members signed it. The agreement binds each contractor to refuse the union's demand and to stand by each other through the fight. A defense fund has been raised, and the fight, if it comes will be conducted through the building industries association. The granitoid, concrete and paint contractors already have declined to consider a raise their employes asked, and have appointed a committee representing each branch to solicit funds to resist a strike.

McCann Bros. Construction Co. are now at West Frankford, Ill.

Sims Bros. have moved their outfit to Hanson, Ky.

Within the next week A. B. Koenig is going to West Baden Springs to rest up for a few days.

Rust & Swift were awarded a contract by the Burlington R. R. for about 2,800 ft. of river enbankment and protection at Ft. Bellefontaine, Mo. The water of the Missouri has baffled the construction crews and engineers of the Burlington R. R. for many years and now a sudden inroad of the currents has made necessary quick work in protecting their bridge at this point.

J. A. Perdue has finished his contract with the Carden Bottom Levee Board on the Arkansas river and is in the market for more work. Pine Bluff, Ark., will catch him.

H. G. "Shorty" Wells, of Maney Bros. & Co., came to town the other day just in time to get one of our new cards just off the press. As usual Shorty was there at the starting.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city of Lewistown, Mont., voted Feb. 15, on granting a franchise to John L. Bright for an electric railway from Lewistown to Kendall. A proposition has also been made to the city by S. W. Gebo for the construction of electric lines from Lewistown to Kendall and Hobson.

Advices from Lewistown, Mont., state that surveyors of the Chicago, Milwaukee & Puget Sound R. R. have started active work on the proposed line from the Bitter Root to the Musselshell, either at Terry or Melstone.

L. W. Hill, president of the Great Northern Ry. Co., has, it is said, authorized the statement that a branch railroad will be constructed during 1910, from Montak, N. D., to Glendive, Mont., where it will make a connection with the Northern Pacific, giving the territory two direct routes to the Twin Cities.

Surveys have been completed by the Beaverhead Ranch Co. for a proposed canal from a point on the Big Hole river to the bench near the company's ranch a few miles north of Dillon. It is proposed to build a dam on the Big Hole river and conduct water by means of the canal to reclaim about 10,000 acres of arid land.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Dr. H. E. Batlin, of Albany, has been elected a director of the Callanan Road Improvement Co. of Albany, to succeed the late J. H. Callanan, who was killed last May in the explosion at the company's quarry at South Bethlehem. The other directors were all re-elected as follows: H. C. Callanan, J. R. Davidson, C. W. Mead and F. P. Hitchcock. The company has a number of contracts for state road improvement work.

The state assembly has passed the bill appropriating $500,000 for a site and the construction of a power house for the capitol and education building.

The Westchester & Northern R. R. Co. has been incorporated at Albany, N. Y., with a capital stock of $1,000,000 to build and operate a steam railroad from Danbury, Conn., to White Plains, serving as a connecting line for the New York, New Haven & Hartford Ry.

Work on the projected line of the Rome & Osceola R. R., Rome, N. Y., has been resumed and contracts for 13 miles of the light grading are being let to farmers along the right of way, the remaining 9 miles, which is steam shovel work, to be let to big contractors. Three miles of the right of way was graded last fall and it is expected to have the entire right of way graded and ready for steel by 1911.

Final arrangements are stated to have been partically completed for beginning construction work on the New York Connecting Ry. which is to connect the New York City terminals of the Pennsylvania R. R. and the New York, New Haven & Hartford R. R., and is to be built by the two last mentioned companies. It will take two years to build the new line which will cost over $15,000,000.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

All right of way is stated to have been secured between Pomeroy and Cincinnati, for the first section of the Pittsburg, Pomeroy & Cincinnati Traction Co.'s projected line, and it is believed that construction work on this section will be started early in April. When completed the road will be 467 miles long, divided into two sections, Pittsburg and Pomeroy, Cincinnati and Pomeroy. The acquiring of the Cincinnati & Eastern Interurban line, 20 miles long, gives the new traction line an inlet into the heart of Cincinnati, the other terminus being at New Richmond. A. O. Kirschner, Cincinnati, O., is the promoter.

The Southeastern Traction Co. is considering extending its line from Crooksville to New Lexington, and from that place to Lancaster. Steps are to be taken at once to secure the necessary right of way.

A $100,000 subway is to be built at North Main Street, Niles, by the Erie R. R. Co., the Baltimore & Ohio, the Mahoning Valley Street Ry. Co. and the city of Niles.

The Pennsylvania R. R. has been making surveys through Wooster preliminary to laying a third track between Smithville and Millbrook.

The Baltimore & Ohio R. R. has been making soundings in the lake on the river frontage at the old ore docks of the company at Lorain, preliminary, it is said, to the preparation of plans for the construction of modern ore docks at the mouth of the river.

According to an announcement of William Cotter, President of the Cincinnati, Hamilton & Dayton R. R., that company had closed contracts for $8,000,000 worth of improvements to be made during 1910. One-fourth of this amount will be used to improve the Cincinnati terminals; $1,000,000 for new yards and warehouses in Toledo; $3,000,000 for new rolling stock, including 30 locomotives, and the balance in road betterments. F. H. Alfred, Cincinnati, O., is Chief Engineer.

R. B. Gordon, of Celina, O., has been awarded the contract at $33,000 for dredging the Wabash river from a point in Mercer county about four miles east of the state line to the bridge spanning the stream in Wabash township at New Corydon.

Engineers on the Lake Shore & Michigan Southern Ry., Samuel Rockwell, chief engineer, Cleveland, O., have completed a survey for a new route to obtain a minimum grade from Ashtabula harbor to Carson six miles south. The route, beginning at a point near the new shipyard site, will follow the valley of the Ashtabula river for more than three miles and then gradually rise to the Carson yards. Should the line be built, ore trains in leaving Ashtabula, will make a great saving in power in reaching the elevation of the Carson yards.

Construction work on the proposed line of the Ohio River & Northern Railroad Co., which was abandoned during 1908 on account of the panic, will be resumed and rushed to completion this spring. As projected the route is from Lorain, on Lake Erie, to West Point, Wellsville and up the Ohio river to East Liverpool, Smith's Ferry and Midland, Pa., and eventually to Pittsburg, Joseph Ramsey, Jr., 15 Wall street, New York, is interested.

The Toledo & Indiana Ry., which recently passed into the hands of C. F. Niles, Toledo, receiver, representing the majority of bond holders, has filed articles of incorporation with the secretary of state thereby taking the first step toward the reorganization of the company. The initial capital is $10,000.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Harry Bradford, El Reno, Okla., has asked a franchise at Altus, Okla., aand proposes to construct an electric street railway in Altus, provided the city will furnish the power, the city to receive one-half of the proceeds of the line in return for the power furnished and the franchise.

The Commissioners of Oklahoma at Oklahoma City, have been petitioned to have preliminary surveys made with a view to straightening 12 miles up the course of the North Canadian River.

Dr. H. E. Colby, Gotebo, Okla., has asked the city of Mountain View for ten miles of right of way for his projected line of railroad from Fort Worth to Denver, the proposed route crossing Southwestern and Western Oklahoma. It is proposed to have the line pass through Lawton, Weatherford, Thomas, Taloga and Mountain View.

Promoters of the Cherryvale, Oklahoma & Texas R. R. have succeeded in financing the project and, according to reports, construction work will be started on the right of way at once. The road was chartered to build southwest from Caney, Kan., through Pawhuska, Blackburn, Perry, Guthrie, and Geary, Okla. G. A. Masters, Perry, Okla., and Senator

Porter, Caney, Kan., are promoting the project.

C. C. Jones of Oklahoma City, one of the promoters of a line of railroad from Wichita Falls, Tex., to Lawton, has submitted to the chamber of commerce of Lawton a proposition whereby he guarantees to build the road within a year.

Surveys are to be started at once, it is said, for the construction of the proposed line of the Denver, Kingfisher & Gulf R. R. from Oklahoma City, Okla., to a connection with the Kansas City, Mexico & Orient R. R.

The Osage & Western R. R. has permanent locations underway west from Vinita. The company is now said to be ready to begin actual construction and is only waiting for the towns along the proposed route to sign up the the honus contracts. E. J. Noonan, Wimer Bldg., Vinita, is Chief Engineer.

Construction work in the continuation of the Capitol Hill line of the Oklahoma City Traction Co., to connect Oklahoma City and Moore is progressine rapidly and over five miles of grading work has been completed. It is expected that by March 15 all of the grading work will be completed and track laying started. John Shartel, Oklahoma City, is President.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Albany & Interurban Ry. Co. has been incorporated with a capital stock of $25,000 and headquarters at Albany, and proposes to construct a line from Albany to Sweet Home, by way of Brownsville and Holley, and from Albany to Sweet Home by way of Lebanon. The incorporators are P. A. Young, C. E. Sop and Joseph M. Hawkins.

Engineers of the Canby Canal Co. of Canby, have completed surveys to Molalla for the projected electric railroad through from the Willamette River at Canby. An excellent route was found with practically no heavy cuts or fills and in no place is there a curve greater than 30 degrees.

It has been announced that the Oregon Trunk Ry. will this year extend its line to Klamath Falls, practically giving the Hill interests a connection with San Francisco, in that by running a short line to Alturas, Cal., a connection could be made with the Western Pacific, now under construction through the Sacramento Valley. An application has been filed with the Department of the Interior at Washington, D. C., for the right of way through the Klamath Indian reservation. L. W. Hill, St. Paul, Minn., is president of the company.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The McNichol Paving & Construction Co., Philadelphia, Pa., has been awarded a contract by the Philadelphia & Reading Ry. for grading and concrete work in connection with the construction of bridges. The railway will add two tracks to its present two-track system from Norristown to Reading. The contract awarded is for grading between Valley Forge and Perkiomen Junction and for the concrete work on abutments and piers along that section of the line. One portion of the work will consist of cutting through 50 feet of solid rock. The contract amounts to about $175,000.

Public meeting will be held shortly by citizens of Altoona to take action on the applications of the Johnstown & Altoona Street Ry. Co. to run its cars through Altoona over the tracks of the Logan Valley Ry. Co. The company proposes to construct a line between Altoona and Johnstown.

The Lehigh Valley Transit Co. of Allentown, is said to be considering making a belt line out of its road in Hellertown. This would be done by extending the road through Leithsville, Springtown and Pleasant Valley to connect with the Philadelphia line at Quakertown.

The Philadelphia & Suburban Elevated R. R. Co., S. S. Neff, President, Philadelphia, which now has an application before the Governor for a charter, is said to have secured the necessary financial backing to carry out the proposed Broad Street subway and its elevated extensions of Lehigh Avenue and Germantown Avenue, at Philadelphia. The company's engineers have for months been at work preparing plans especially for the terminal at Broad and Filbert Streets.

William Ludascher, Philadelphia, has applied to the Dock Department of that city for permission to build two piers on his property between Westmoreland and Ontario. He desires to build one pier 140 ft. wide and another 83 ft. wide.

M. P. McGrath, president of the M. P. McGrath Contracting Co., of Easton, Pa., has incorporated his business under the laws of the state of New Jersey for $125,000. The officers are: President, M. P. McGrath; secretary and treasurer, J. F. Mooney. The company intends to carry on the same class of work as heretofore, namely, railroad work and concrete construction.

The Pittsburg, McKeesport & Westmoreland Street Ry. Co. has taken over the franchise of the Peter Creek Street Ry. Co. and is planning to proceed with construction work early in the spring.

M. S. S. Hershey, the chocolate manufacturer, is reported to have surveyors in the field laying out a trolley line from Hershey through the Northwestern part of Lebanon county.

The Lehigh Valley Railroad Co. is reported to have decided to construct a road from Hazel Creek Junction to White Haven, Pa., to cut off the run to Penn Haven to be for passenger and freight traffic. E. B. Ashby, New York, N. Y., is chief engineer of the company.

A Committee of property owners along the proposed right of way of the extension of the New Park and Fawn Grove R. R., to Delta are to hold a meeting to take up the matter of furnishing right of way for the project.

The Philadelphia & Reading Ry., Wm. Hunter, chief engineer, Philadelphia, Pa., has plans underway for four-tracking Mahanoy Plane with a view to doubling its capacity so that much of the soft coal traffic may be diverted from the Catawissa branch, which is a single track from Milton to East Mahanoy Junction. Work on the contemplated improvements will be commenced about June.

The Committee on Corporations of the Maryland Legislature has made a favorable report on the bill to authorize the Western Maryland R. R. to finance the extension of the road from Cumberland to New Haven, Pa. While new stock might be issued at par without further authorization from the Legislature, the plan of issuing it below par, which is authorized in the pending bill, necessitates such sanction. At a hearing before the committee this morning Mr. George R. Gaither, representing the railroad, said that probably $15,000,000 will be issued. The new stretch is to be 83 miles long and will be completed in about two years according to Mr. Gaither. H. R. Pratt, Baltimore, Md., is Chief Engineer.

South Carolina Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Greenville, Spartanburg & Anderson Ry. Co. has applied for a charter for an electric railway to be built from Spartanburg, S. C., to Greenville, S. C. The project is backed by the Duke interests.

The Spartanburg & Greenville Ry. Co. has been chartered with a capital stock of $100,000 and headquarters at Greenville, S. C., and proposes to operate an electric railway between the city of Greenville and the city of Spartanburg. The officers of the company are: Charles W. Ellis, president; H. H. Price, vice president, and C. H. Yates secretary and treasurer. The road is to be 31 miles in length and starting at the city of Greenville it will pass through the townships of Butler and Chick Springs in Greenville County and Spartanburg in Spartanburg County.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Atchison, Topeka & Santa Fe Ry. is said to have decided to locate the shops for its Texico-Coleman cut-off line at a point about 15 miles south of Lubbock just on the edge of the cap rock, the beginning of the great plains. At that point a branch line will diverge, going due south to Tahoka, Lynn County, and La Mesa, Dawson County, a territory now without transportation facilities. The construction near the site of the shops will be somewhat expensive, since a cut some nine miles long will have to be made in getting the road onto the plains. The maximum depth of the cut will be 80 ft.

The Bowers Southern Dredging Co. of Galveston, is now employing three dredge boats on its contract for cutting a channel at Arkansas Pass. The last dredge boat to be employed came from the Southwest Pass of the Mississippi River. It is estimated that the work will be complete in about seven weeks.

W. T. Eldridge, Sugarland, President of the Sugarland Ry., has acquired 8,600 acres near Sugarland and will install a drainage and irrigation system.

The Rivers' and Harbors' committee of Congress has voted to adopt Houston's proposition to subscribe $1,250,000 toward the completion of the Houston ship canal. As soon as the appropriation is made by the federal government work will be started, creating districts at Houston for the purpose of voting bonds for the city's share of this work. Mayor H. B. Rice, of Houston, has already named committees to take action on the matter.

The charter of the Gulf Coast & Provident City Ry. Co. has been approved and filed, granting the company the right to construct a railroad from Pierce, in Wharton County, to Provident City, a total distance of 35 miles. The incorporators of the new company. The company was mentioned in our issue of Jan. 26.

Construction work is progressing rapidly on the Texas Central R. R., west of De Leon, for a distance of 75 miles, and a contract for 200,000 cross ties has been placed with William Cameron & Co., Inc., Waco, Tex.

A proposition is reported to have been made to the citizens of Monahans, Grand Falls and Fort Stockton to run a branch of the Texas and Pacific to Fort Stockton, a distance of 58 miles, forming a junction with the survey of the Kansas City, Mexico & Orient. B. S. Wathen, Dallas, Tex., is Chief Engineer of the Texas & Pacific Ry.

Track laying on the Coleman-Texico cut-off of the Santa Fe R. R. reached Jim Ned creek, 23 miles north of Coleman, on Feb. 10. Further track work will be delayed until the bridge is completed.

The Houston Electric Co. of Houston is planning to extend its South end street car line out Fannin St. through the properties of W. B. Sharp and David Hannah.

C. L. Hopkins, cashier of the State Bank and Trust Company of San Marcos, representing a syndicate of capitalists, has asked the City Council for a franchise to construct a street railway system in the city. The franchise asked provides for trolley lines to be run to the depots a loop through the West End, going out San Jacinto St. and returning on Belvin St.; also a loop taking in the several schools of the city.

The Caro Northern Ry. has ordered preliminary surveys made for the construction of an extension from Mount Enterprise to Pine Hill, connecting with the Timpson & Henderson R. R. John C. Saner, Caro, Tex., is President.

Preliminary surveys for the Waco, Belton & Georgetown R. R. have been completed. The proposed road is to be built by Belton capital if the International & Great Northern can not be interested to build the line.

A preliminary organization is to be perfected shortly at San Marcos for the building of the San Marcos-Luling interurban line. Eastern capitalists are reported to have become interested in the project which is being promoted by Judge B. G. Neighbors of San Marcos and Joseph Jennings of Martindale.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City Council of American Fork has been considering the application of Abel J. Evans of Lehi, and S. L. Chipman of American Fork, for right of way through the city for an electric railway.

During the month of January 425 lin. ft. were excavated in the Strawberry Tunnel of the U. S. Reclamation Project in the Strawberry Valley. The material encountered was a combination of blue limestone and sandstone, which is difficult to drill and requires a great deal of powder to break it. The tunnel is over 19 per cent completed. J. L. Lytel, Provo, is Project Engineer.

The Union Pacific Ry. has filed an application in the Land Office at Salt Lake City to change its right of way through portions of Weber and Morgon counties for a distance of 7 miles, 1¼ of which is in Morgan county and 5½ in Weber. The purpose of the application is to secure a better grade for the railroad track through the Weber canyon, and it is the intention of the officials of the road to construct a new track on the north side of the Weber river when the application is granted. The right of way desired lies through the mountains to the east of Ogden, and some of the land asked for is unpatented government land. The proposed new line will give the road a 1 per cent grade for its eastbound trains, and besides double track facilities in and out of Ogden.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City Council of Norfolk, Va., is considering granting a franchise to the Portsmouth Traction Co. of Portsmouth, Va., for extending its tracks in certain streets in Colonial Pl., in the former city. As soon as the franchise is granted the traction company will begin construction work.

Surveys are under way, it is said, by the engineers of the Virginian Ry., for the construction of a connecting link from Moneta, Va., to Bedford City and thence northward to a connection with the Norfolk & Western and the Chesapeake & Ohio Ry. H. Fernstrom, Norfolk, Va., is chief engineer of the Virginian Ry.

The Norfolk Terminal Ry. Co., Norfolk, Va., mentioned in our last issue, as being incorporated with a capital stock of from $50,000 to $150,000, will also construct a $1,000,000 union station and office building to be used jointly by the Norfolk & Western and the Norfolk & Southern Rys. L. E. Johnson, Roanoke, Va., is president of the company.

The Virginian Ry. Co. is planning the construction of a number of improvements at Roanoke, Va., which will include the construction of shops and roundhouses. H. Fernstrom, Norfolk, Va., is chief engineer of the company.

Plans have been completed for the construction of the Mill Mountain Incline Ry., at Roanoke, and contract for the work will be let at once.

The City Council of Richmond has granted the Richmond & Henrico Ry. Co. permission to begin actual track construction in Marshall St. and North 5th St. Material is already on the ground.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Yakima Inter-Valley Electric Ry. Co., Henry Lombard, President, Miller Bldg., North Yakima, is considering constructing a gasoline motor line betwen North Yakima and Yakima City. The line would be about 4 miles long and would cost about $100,000.

The Guggenheim interests are planning to begin work March 1 on its power plant at Concrete. A concrete dam 160 ft. high is to be placed across a deep gorge on Baker River, a mile above the Washington Cement Company's plant. This will form a lake six miles long and one and one-half wide and the water will be 150 ft. deep at the dam. A reenforced concrete flume will be built to the power house 4,500 ft. away, with a fall of 150 ft., where the water will turn large turbines to develop 25,000 HP. Simon Guggenheim, Denver, Colo., is interested.

Mathew Dow, Seattle, has been awarded the contract for constructing the new $160,000 dock at Seattle, for the Grand Trunk Pacific Ry. The new dock, which is to be the Seattle landing place of the Sound and ocean-going steamships of the Grand Trunk Pacific will be 625 ft. long and 177 ft. wide, with a building three stories in height, surmounted on the water side by a tower 80 ft. high. The building and wharf will be entirely of timber construction, being erected directly over the water, on concrete piling. Blackwell & Baker, Seattle, are the architects, and James H. Bacon, harbor engineer, will be in charge of the work for the Grand Trunk Pacific.

The Pluvius Development Co., composed of Seattle and Wenatchee capitalists, has started work on its irrigation project in Spring Canyon, on the Columbia river, 17 miles north of Almira. It proposes to irrigate 1,000 acres. The company has acquired control of a natural basin containing about 640 acres, draining approximately 20,000 acres, which will be used for a reservoir.

Port Angeles Power & Electric Co., of Port Angeles, has been incorporated with a capital stock of $30,000, the incorporators being Frank MacKean, R. H. Bethel, George D. Brown, William Tyrrel and Julian R. Becker.

The Yakima Water Users' Association has completed its organization and has elected F. A. Wiggings, of Toppenish, secretary and treasurer. The purpose of the association is to promote the work of construction of the high line canal in Kittitas, Yakima and Benton counties and Toppenish.

Work has just been commenced on the No. 2 tunnel on the Deschutes R. R., about two miles south of Horseshoe Bend, which is 1,000 ft. in length. It is expected that the job will be completed by August.

The Seattle-Tacoma Power Co., Morton Ramsdell, Manager, Tacoma, is to spend $500,000 for the enlargement of its Snoqualmie Falls plant. The first installation will be 10,000 H. P. All the apparatus has been ordered and the company has already begun work preliminary to the construction of the plant. The development will be made by diverting water from the Snoqualmie River at a point about 100 ft. from the existing dam at the falls on the east bank of the river, opposite the original plant. From the new intake and headwork the water will be conveyed through a concrete-lined tunnel 12 ft. in diameter driven through solid rock a distance of nearly a quarter of a mile to the forebay, another large rock excavation. Seven-foot steel pipes, 550 ft. in length, lead from the bluff and down to the new power house. The power house will be built of reinforced concrete. The tunnel, headworks and other construction require a large amount of rock work and for this the power company has already installed a big compressor plant driven by electric motors from the old Snoqualmie power house and has 10 Ingersoll pneumatic drills at work at the present time.

The Northern Pacific Ry. has practically secured all right for its 44-mile Point Defiance line and construction work will be started in the near future. The work will include the construction of a 900-ft. tunnel.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Great Northern Ry., A. H. Hogeland, chief engineer, St. Paul, Minn., is said to be planning taking up shortly the work of building double track from Brookston to Swan River. The line would be about 30 miles long and would cost about $200,000. Plans for this work were made in 1907.

Supplies and tools for the commencement of work on the Chicago & Northwestern Ry's. new line from West Allis north for a distance of 40 miles, are being received at Wauwatosa, and it is planned to begin grading work shortly. It is said that about 8,000 men will be employed. John R. Marsch, 181 La Salle street, Chicago, Ill., has the general contract.

The Engineering Department of the Minneapolis, St. Paul & Sault Ste. Marie Ry. has submitted plans to the City Officials of Superior, Wis., for subways under the 21st St. and Belknap St. tracks of the Soo. The 21st St. subway will be 510 ft. long and will cost about $63,000.

Winston Bros., of Minneapolis, Minn., have shipped 13 car loads of construction tools to Beaver Dam, Wis., for work on the new right of way for the C. & N. W. Ry., which passes about two miles south of the city. The tools were unloaded there and will be hauled to the site of their camp, which will be located somewhere along the line.

The LaCrosse & Winona Traction Co., a Minnesota corporation with $100,000 capital and $75,000 interest in Wisconsin has filed a statement to do business in this state. N. J. Ferris of LaCrosse is the Wisconsin representative.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

According to an announcement of the Canadian Minister of Public Works Canada does not propose to construct the Georgian Bay Canal as a public work. It is probable that the Georgian Bay Canal will be started by a British firm which will have aid from Canada in the form of a guaranty of interest on bonds to the amount of $100,000,000.

The Canadian Pacific Ry. has announced that it will build 300 miles of new road this season in Sackatchewan, Alberta and southern British Columbia, at a cost of $10,000,000.

Stockholders of the proposed Highland Street Railway line at Albuquerque, N. Mex., have accepted propositions of J. H. Barrett, of Pittsburg, Pa., to build the line. According to the proposition the citizens of Albuquerque are to furnish $15,000 in paid up stock. This sum is to be turned over to Mr. Barrett for construction. A. W. Hayden, Albuquerque, N. Mex., is interested.

A bill is to be introduced shortly in Congress to encourage a project for the construction of a railway connecting New York and other cities in this country with the principal points of Chili and Argentine. The project is being promoted by former Senator Henry G. Davis, Elkins, W. Va.

The Fairmont & Clarksburg Traction Co., of Clarksburg, W. Va., has secured the necessary capital for the construction of its projected 20-mile line from Clarksburg to Weston, passing through Mount Claire, Lost Creek and Janelew. Surveys are to be started at once.

Advices from Asheville, N. C., state that the W. T. Weaver Power Co., which is constructing a $400,000 power plant on the French Broad River about two miles below Marshall is making considerable headway with its preliminary work and when the weather opens the company will begin actual construction on the dam. The plant will develop about 3000 HP.

The Rutland R. R. is to build a $60,000 boiler shop at Rutland, Vt.

The Territorial Engineer of New Mexico has approved the application of Levi A. Hughes of Santa Fe, N. Mex., for the surplus waters to fill a reservoir at the junction of Cieneguilla, Bonanza and Santa Fe Rivers, 14 miles south of Santa Fe. The reservoir to have a capacity of 22,611 acre feet and the waters are to reclaim 18,000 acres on the La Bajada grant. The dam is to be 155 ft. high and is to cost $155,000. It is to be of concrete.

Vernon L. Sullivan, Territorial Engineer of New Mexico, has granted the application of George T. Lambert, Dorsey, N. Mex., for permission to use the waters of Tinaja Creek to irrigate 2,500 acres of land at a cost of $45,000. The engineer also granted the appli-

cation of E. A. Clayton, Artesia, N. Mex., for the waters of Runyon Springs.

Commercial club of Biloxi, Miss., is advocating the construction of a railroad from Biloxi to Gulfport, Miss.

The Gainesville Midland Ry., now operating between Gainesville, Ga., and Athens, Ga., is to have surveys started at once for the construction of an extension from Gainesville to Knoxville, Tenn. E. B. Eppes, Gainesville, is General Manager.

The Western Maryland R. R. Co. has purchased property for the extensive improvement of the terminal facilities at Hagerstown, Md. Work of razing the present structures on the property has already been started. H. R. Pratt, Baltimore, Md., is chief engineer of the W. M. Ry.

Surveys are now under way for the construction of the proposed line of the Greenville, Spartanburg & Anderson Ry. Co., from Anderson to Greenville .W. D. Neves, Greenville, N. C., is Engineer of the company, which was mentioned in our January 19th issue.

The Southern Pacific has completed its southern extension to the Santiago river, 1,004 kilometers from Guaymas, Mex., and construction work is to be pushed to Tepie a distance of 96 miles. The distance between Santiago river and the end of the Southern Pacific in Jalisco is 271 kilometers, including the barranca link, which will require two years to construct and will cost about $5,000,000. Sixty-one kilometers of the Southern Pacific in the state of Jalisco, from Oredain, the junction with the National Rys. are now in operation.

The Hendry & Knight Co. of Tampa, Fla., owning extensive docks along the river front in the Garrison section of Tampa, is having estimates prepared for the construction of additional wharfage eastward from the docks now leased to the Penn and Mallory Line Steamship Companies to the lift bridge which connects the mainland with the Seaboard terminals on Seddon island. The company proposes to extend the docks 500 ft. to the east of the Penn line docks.

Officials of the Grand Trunk have filed a petition for a charter for the Southern New England Ry. Co., to be operated in connection with the Grand Trunk System. As proposed the new line will start at Palmer, Mass., a station on the Central Vermont Ry., which is also controlled by the Grand Trunk, and pass through Webster, Mass., Woonsocket, Valley Falls, Salyesville and Pawtucket, R. I., to Providence. Locations surveys for the road will be filed before July 1, 1911.

Huntley, Church, Boyington & McCoy of Spokane, Wash., and Billings, Mont., who have the contract for double tracking the Northern Pacific between Billings and Huntley, Mont., 13 miles, have sublet portions of the work to the following: James Ryan, A. J. Sullivan and J. Werlen of Billings, Mont., and Fred Johnson of Spokane, Wash. The work is to be completed by June 1.

Representatives of different townships interested in the construction of the proposed railroad from Alcolu, through Florence to Georgetown, recently held a meeting in the courthouse at Florence, S. C., where it was decided that the townships should provide for the survey of the line. A bill is now before the legislature providing for the incorporation of the Florence Construction Co., Florence, S. C., which will take up the matter.

Advices from Augusta, Me., state that the Kennebec Development Co., of which O. H. Briggs is President, is planning to begin work in the spring on the construction of three large dams in the Kennebec River. The three dams will be constructed at Indian Pond, Me., a short distance below Moosehead Lake's outlets, where the two outlets come together. Below the falls, at the outlet of this pond, this dam will stand, rising till the water will not only flood out the long stretch of quick water between the east outlet and Indian Pond, but this pond itself will be buried by 125 ft. of water. Below this dam will be built an other 123 ft. high, its highest level just on a level with the tailings of the up-river dam, which in its turn will afford a reservoir for another holding of water and double the capacity of 30,000 HP. allowed by the first dam. Still farther down the river toward the Forks the third dam will be built, also rising to an elevation of 123 ft. Each of these three dams will create a horse-power of 30,000. The total of the reservoir system, as planned, will approximate 56,000 acres.

The Stone-Webster Engineering Corporation, constructing engineers, Stone & Webster Bldg., Boston, Mass., at the end of December, 1909, had construction contracts amounting to $11,341,000. The location and amount of these contracts were as follows: Montana, $3,650,000; Washington, $3,341,000; Rhode Island, $284,000; Massachusetts, $51,000; California, $50,000; New York, $274,000; Georgia, $100,000; Florida, $518,000; Texas, $3,073,000. The classification of the work was as follows: Water powers, $4,140,600; interurban railways, $2,607,700; street railways, $777,700; steam power station, $940,000; buildings, $2,495,000; miscellaneous, $380,000.

The Lincoln Traction Co. of Lincoln, Neb., has asked permission of the City Council of Lincoln, to extend its lines over certain streets. The company agrees to begin construction by Aug. 1, and to complete one mile of track by Jan. 1 next.

According to a statement of George Pittenger, president of the Board of Trade, of Asbury Park, N. J., plans are under way for the building of an electric trolley railroad between Trenton and that city. The proposed road will run from Asbury Park to Freehold through to Hightstown via Englishtown and Jamesburg, and from Hightstown to Trenton, via Allentown, a distance of 41 miles. All the necessary rights of ways and other concession are said to have been obtained and sufficient capital is stated to have been interested to assure the success of the project Work on the road is to be commenced within a short time.

Citizens of Bullett County, Kentucky, have petitioned the Louisville Ry. Co., T. J. Minary, President, Louisville, Ky., to extend its lines between 14 and 15 miles further. The cost would be from $12,000 to $15,000 per mile. The farmers, it is understood, agree to give the company free right of way.

The Babahoyo & Guaranda Electric R. R. Co. has been chartered under the laws of West Virginia, with a capital stock of $1,380,000, and headquarters at Baltimore, Md. The company proposes to construct a railroad 40 miles long in Ecuador, South America, and to own and operate manufactories and engage in a general development business in that country. The Government of Ecuador is said to have guaranteed the principal and interest on 6 per cent bonds running 33 years to the amount of the authorized capital stock. The railroad will open up a rich timber and fruit section. The incorporators are: Julio H. Cardon, of Guayaquil, Ecuador; Benjamin F. Patterson, James G. Pugh, Martin H. K. Paulsen and John B. Timmerman, of Baltimore, Md.

The Chicago, Burlington & Quincy R. R., F. T. Darrow, engineer, maintenance of way, Lincoln, Neb., has announced extensive improvements this year for the Omaha and Lincoln divisions. The work on the Omaha division consists of double tracking between Lincoln and Waverly, the ballasting of 65 miles of road between O'Neill and Sioux City and extensive bridge rebuilding and track betterment. On 85 miles of the main line in the vicinity of Lincoln will be laid new 90 lb. steel rails. West of Lincoln for 100 miles new ballast will be put on the track. The Denton cut-off, the Milford line and several other branches also come in for a large share of new work.

Surveys are under way by a number of eastern capitalists for the construction of the proposed railroad to run from Greeneville, through Parrottsville to Newport, Tenn., where a connection will be made with the Knoxville, Sevierville & Eastern R. R.

The Mexico, Oaxaca & Yucatan Ry. Co., incorporated with a capital of $1,000,000, has filed its articles of incorporation at Lincoln, Neb. W. C. Seaver of New York City is president of the proposed road. The company proposed to build a line through Nebraska from Omaha through Douglas, Sarpy, Cass, Otoe, Johnson and Pawnee counties, thence through Kansas, and to have general offices at Omaha, Topeka, Joplin, Mo., Ft. Smith, Ark., Pascagoula, Miss., and Mobile, Ala. The length of the proposed railroad, including branches, is estimated at 1,314 miles.

A bill is before the State Legislature of Maryland to incorporate the Washington, Marlboro & Drum Point Railway Power & Lighting Co. Under the proposed law this company is empowered to construct and maintain a railroad in Calvert and Prince George counties. It is to run from a point where the Washington, Baltimore & Annapolis road enters the District of Columbia to the Potomac river, and at some point at or near where the Patuxent river empties into the Chesapeake Bay. The company is authorized to construct branch roads and may consolidate with other roads. The incorporators are: Francis S. Carmody, Richard N. Ryan, C. A. M. Wells, Robert W. Wells, E. A. Fuller, C. Francis Owens, Francis E. Baker, William C. Carroll, M. Hampton Magruder, Charles C. Mayer, and Reese Carpenter.

A bill has been introduced in the Massachusetts Legislature providing a plan for the improvement of Boston Harbor by the enlargement of harbor facilities by great railroad terminals on the East Boston flats, with a marginal railroad about the entire East Boston water front. The principal features of the plan are as follows: The construction of a $1,200,000 dock on Commonwealth flats every five years until ten have been built; a marginal railroad, connecting the new docks with the principal railroad lines; a new immigration station in East Boston; two large dry docks; dredging the Bird Island flats and the Governors Island channel and improving the port to accommodate the largest ocean-going vessels afloat. Henry M. Whitney, a leading capitalist of Boston, Mass., is behind the plan.

The Union Dock & Railroad Co. of Morgantown, W. Va., has been incorporated with a capital stock of $100,000 and proposes to construct switching tracks at docks at Morgantown. The incorporators are George C. Sturgiss, S. A. Posten, R. L. Morris, A. Rightmire and Robert A. Vance of Morgantown.

The South Carolina & Western Ry. of Hartsville, S. C., has been organized with a capital stock of $500,000 and proposes to build a road from McBee and Hartsville to Darlington and Florence. The route has already been surveyed and it is said that construction contracts will be let shortly. Samuel Laurence, Hamlet, N. C., is interested. W. R. Bonsal, Hamlet, N. C., president of the North & South Carolina Ry., is also interested.

The capital stock of Florida Ry. has been increased from $2,000,000 to $4,000,000, the increase being made for the purpose of extending the line from Live Oak, Fla., to Ferandina, Fla., via Jacksonville, and equipping the road with rolling stock. The extension of the road will be built as fast as possible. Frank Drew, Live Oak, Fla., is President.

An Editorial Review of the Work of the Sixth Annual Convention of the National Association of Cement Users.

The National Association of Cement Users justified its existence at the convention just closed. The papers were of a high order and the members present manifested great interest in the meetings. Nearly all the papers will appear in ENGINEERING-CONTRACTING, so no mention of the contents is required at this time.

There were nine sessions and each was devoted to the work of one of the sectional committees. An extra session was held on the evening of Washington's birthday, the exercises consisting of an address on George Washington by Hon. John E. W. Wayman, State's Attorney for Cook County, Illinois, and music, followed by an informal reception.

At the regular sessions a general discussion lasting an hour and a half commenced at 9 a. m., on the subjects to be reported upon by the committee to report that day. At half past ten the reading of papers commenced and the discussions on the papers generally kept the members interested until noon when the committee report was received. This precipitated more discussion, the effect every day being to hold the members in session until about 2 o'clock when adjournment was had until 8 o'clock. After reading and discussing the set papers for the evening, discussion on the report was generally resumed and the time for adjournment was generally long past eleven. This meant from eight to nine hours work daily for five days, on the part of the visiting members, meals at irregular hours, and a visit of an hour or two each afternoon to the Cement show on the part of some. The convention formally ended Friday night, Saturday being given over to sight seeing.

It seems but fair to call attention to the work done in order to show the estimation in which the visitors held the papers and discussions. An attendance of about 300 was shown by the registration book and fully 200 were present at each session. This was unexpected, for the program was so arranged that men interested in only one or two subjects could absent themselves from sessions where other subjects were discussed. It was brought out that all the members were interested in practically every phase of the cement industry. A proposal to hold concurrent sectional meetings would undoubtedly have been voted down. This seemed to be the sentiment among the members though not discussed on the floor.

The arrangement of the program was open to criticism for the reason that the discussion early in the morning before a committee reported was practically duplicated after the report was presented. The arrangement was made with the idea that the committee would receive suggestions for the report. Practically, however, the time was not well spent. It would be well at future conventions to have committee reports made at the 9 o'clock session to be followed immediately by discussions limited to one hour, after which the papers for the day can be read and the discussion following the papers can be a general discussion on the day's work. No reports should be presented at evening sessions but the general discussion could be resumed each evening after papers are heard.

A feature at each convention is the presentation and discussion of proposed standard specifications. At the convention just closed considerable opposition developed to the alleged misuse of the word "Specification" in connection with these papers. It was held that as prepared they should be termed "Recommended Practice," or, "Proposed Regulations" carrying the endorsement of the association. A dictionary definition of the word specification is: "A definite, particularized, and complete statement." From the nature of things such exactness cannot be attained by the so-called specifications of the association and each one contains clauses recognizing the necessity for the exercise of judgment when local conditions render it impossible to adhere to the strict letter of the standard specification. At every meeting when the amendments to the proposed standard specifications came up, the discussions were sustained and vigorous. Each year amendments are made and seem to be rendered necessary because of particularity of statement. The result is that each year the so-called specifications become less dogmatic and consequently less authoritative because misnamed. They should be set forth frankly as being merely guides for specification writing and thus will become popular in all sections of the country. The present system of attempting each year to change the specifications in minor details to suit the ideas of men who could not make them fit in some certain locality, is doing much to bring into disrepute the work of a number of earnest disinterested workers. Several hours were wasted in discussion of sidewalk specifications. Specifications were proposed and adopted for drain tile and for concrete pavements, two documents from which much trouble is presaged the coming year.

The committee on concrete and reinforced concrete made a progress report and indicated lines along which further research work must be done and called attention to lack of data on tests of slabs. At the request of the chairman, representatives of papers present at the convention agreed to make public his desire to obtain information on slab tests. It is known that hundreds of contractors, architects, engineers and manufacturing companies have made tests, the results of which, if made public, would be of great value so the committee hopes the men who have the data will send them to Mr. A. E. Lindau, National Bank of Commerce Building, St. Louis, Mo.

The committee on proposed standard building regulations for reinforced concrete presented the proposed regulations adopted by a small majority last year and considerable discussion ensued, principally over the clauses relating to steel. They were finally amended to omit the words "High Carbon Steel," and in place was substituted "High Elastic Limit Steel," as expressing properly the purpose underlying the use of high carbon steel. This section now reads:

> High Elastic Limit steel shall have an elastic limit of from 50,000 to 65,000 lbs. per sq. in.; an elongation in per cent in an eight (8) inch test piece of $\frac{1{,}000{,}000}{\text{ultimate strength}}$; and shall be capable of being bent cold 180 degrees in a radius of four (4) diameters.

The proposed building regulations as they now stand are admirable and should be adopted at as early date as possible by the thousands of cities in the United States without such safeguards. The result will be a lessening of the number of failures reported and good design will no longer be the exception.

The report on insurance was valuable and the report and discussion on fireproofing brought out little that was new. Parties to whom inquiry blanks were sent did not reply as they should so the committee was given further time. The discussion did bring out the fact that recommendations for fireproofing must recognize the different uses to which buildings will be put, for fireproofing is ex-

Copyright 1910, by the Myron C. Clark Publishing Co. All Rights of Republication Reserved.

pensive. The discussions on handling, mixing and using concrete brought out the fact that more care is exercised than ever before and grading of aggregates is a subject commanding the attention of even laborers. Long mixing has a value just beginning to be realized and accelerated hardening by steam curing is the rule in factories turning out blocks, tile and architectural concrete work. Waterproofing is as yet a subject on which no man cares to be committed to an opinion. The treatment of concrete surfaces bids fair to rouse interest at the next convention after all the members have had an opportunity to read the full report of the committee handling that subject. As usual in conventions much of the talk was not true discussion but a surprisingly large number of valuable "kinks" and trade secrets were brought out. The various committees of the association are annually collating practice to be some day digested and edited so that, when added to the valuable data produced in the discussions, the training of competent workmen will be a short matter. The proceedings of the association this year it is estimated will fill two 500-page volumes, or nearly double the number of pages of the 1909 Proceedings.

Expansion joints cropped up frequently as a subject for discussion. When and where to provide for expansion did not seem to be known and a few reported cases were remarkable, leading to the conclusion that some cracks are caused by expansion and some by contraction. The air temperature at the time of putting in the concrete is, no doubt, a large factor in this important matter and one to which little attention has been directed. Upon first approaching the subject a man believes that practice in providing expansion joints would largely depend upon locality, there being wide ranges of temperature between the different sections of the country day by day. It is believed that in the warmer portions of Texas and California other methods are adapted than prevail in Maine or North Dakota. Inquiry, however, indicates little difference in practice and information as to troubles encountered is strangely similar. One thing was plainly brought out and it was that on the question of provision for temperature changes in minor structures nearly everything at present is guess work. The working methods of the association lead to a well founded belief that within a short time the element of guess will be largely removed.

The extremely interesting papers on floor construction were valuable contributions. Their character was such that little discussion on the floor was called out but written discussion is expected after the papers are printed. Mr. McMillan presented formulas for plate, or "girderless" floors and showed photographs of buildings in course of erection with floors designed by his theory. Professor Gillespie gave one evening an address on columns which was held by many to be the best during the convention. It tended to prove that cement is the cheapest reinforcing material for concrete columns. The spirally wound column was declared to be inefficient as compared with columns of very rich concrete reinforced with longitudinal steel only. The discusson following his address tended to confirm his conclusions. An entire day was given over to concrete houses for dwellings, etc., and the advance in artistic taste with lowering of cost for this class of work is remarkable.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Method and Cost of Constructing a Concrete Block Warehouse.*

The accompanying photograph shows a one-story concrete block warehouse recently erected by the writer at Austell, Ga., for the purpose of storing cotton, cotton-seed, fertilizers, feed-stuff, and for general storage purposes. The outside dimensions are 51 ft. 4 ins. by 122 ft. 8 ins. and is divided into three rooms each 40 ft. by 50 ft. in the clear, the walls are 14 ft. high and the ceiling height in each room varies from 10 ft. 6 ins. to 13 ft.

The footings are of 1:3:6 concrete, under the outside walls they vary from 3 to 5 ft. in depth, 12 ins. wide on top with an inside batter of 3:24; under the inside walls they vary from 1 to 3 ft. in depth, are 9 ins. wide on top and have a batter of 1:12 on each face; all footings were carried down to a firm hard red clay.

View of Concrete Block Warehouse at Austell, Ga.

The floors are 4 ins. thick consisting of 2½ ins. of 1:3:6 base and 1½ ins. of 1:2½ top, for the top granite screenings were used instead of sand.

The outside walls are laid up with 8x8x20 in. and 24 in. rock face hollow concrete blocks made of a Hercules block machine, the corners are all panel face return blocks showing 20 ins. on one side and 10 ins. on the other, alternating vertically. Plain face blocks alternating 12 ins. and 24 ins. were used at the doorways, one vertical face edge of each block being slightly recessed, when made in the mold, to permit its entrance into the backs of the 8 in. channels that were used for door frames. The division walls were built from plain face 8x8x24 in. hollow blocks and were tied into the outside walls by passing the end block of every second course through and showing it on the outside as a panel face or end, the block above and below on the outside wall being a panel face.

At the south end of the building which faces a street the central half of the outside wall was carried four courses higher than the rest of the wall with panel face blocks and was coped with a course of 7x11 ins. egg and dart stone 4 ft. long which in turn was capped with a 5x11 in. stone having a 3 in. Ogee mold edge, the combination making a very pretty coping and front. The remainder of the outside walls were capped with the Ogee coping 6x11 ins., the division walls being capped with a plain square edge 6x11 in. stone, the cope and cap stones ranging in length from 18 ins. to 4 ft. laid to break bond with the building stone. The window sills and lintels are 8x9½ ins. by 4 ft. 7 ins. and were made in the same block machine, as were also the coping stones.

The windows of which there were only two are metal frame swing sash equipped with wire glass. The six doors are tin covered (iron clad) fire proof doors, endorsed by the Insurance Underwriters, sliding or rolling on a level track, the track being fastened by bolts passing clear through the wall, the door frames, as before mentioned, are made from 8 in. channel irons and are fastened to the wall by hook bolts which engage the hollow spaces in the blocks, three bolts being used on each side; into the back of the top channel was cast the lintel in place, it is 8x10 ins. by 8 ft. of 1:2:4 concrete and contains no reinforcement other than was considered necessary to prevent shrinkage cracks, the channel being sufficient to carry the load.

The roof is covered with tar and gravel Barrett Specification, with galvanized iron flashings, roof boarding is of 1 in. pine rough boards, joists are 2x8 in. pine 18 ft. long lapped and spiked together on beams which are 6x10 ins. made up from 3 pieces of 2x10 in. pine 10 ft. and 20 ft. long spiked together, there are two of these beams in each room running longitudinally of the building, supported in the center by 12x12 in. concrete posts cast in place on the ends they are supported by solid concrete blocks projecting inside the building; the joists rest directly on the beams and at the walls they are fastened to stringer pieces which are also supported by projecting wall blocks. All the drainage from the roof passes through the wall on one side, the roof of each room sloping towards one corner; the two first adjoining rooms slope to adjoining corners thus permitting the supporting blocks for the beams in the division wall to pass through and project on both sides and be uniformly loaded, the same being true of the other division wall where the high sides of the roof coincide; the water is conducted through 4x8 in. flat down spouts to an open concrete gutter at the side of the building which leads to the street drain; at each doorway on this side of the building is a concrete platform for the use of wagons unloading or loading, and the water is carried through the platforms by the use of concrete sewer

*Arranged from an article furnished us by John Wm. Ash, Engineer and Contractor, Austell, Ga.

pipe. The other side of the building is to be served by a spur track, the building being only 15 ft. from the main line of the Southern Railway.

Each room is ventilated by a 24 in. "Dixie" ventilator placed on the center of each roof.

The blocks for the outside walls were all made of the following proportions: facing 1 part Portland cement to 2 parts of granite sand, to which was added a specified amount of waterproofing compound: backing or body of block 1 part cement 3 parts of clean coarse sand and 2 parts of stone from 1 in. down to ¼ in. or small gravel; where no stone or gravel was used the proportion was 1 cement to 4 parts coarse sand, about ½ in. of facing material was used on the back of the blocks which was easily placed on account of the machine being of the down-face type, coping and capping stones were made of the same proportions.

Five men were used in the block shed, four men making blocks and carrying them out and 1 man mixing material; after becoming accustomed to the work the regular days work for ten hours was 100, 24 in. and 125, 20 in. blocks besides carrying out the blocks made the day before; on blocks requiring no facing this was generally increased by about 20 or 25 blocks.

During the erection, the blocks were wheeled directly from the curing yard to the building on wheelbarrows, and up easy runways to the top of the scaffolding, this required two men to keep three masons supplied, one man and a boy kept them supplied with mortar.

Upon the completion of the building after a heavy rain it was found that considerable dampness showed through the blocks on the inside principally near the top and upon investigation it proved to be soaking through the capping and mortar joints which contained no waterproofing, the mortar was made of 1 cement to 3 granite sand, and it was also discovered that several batches of concrete had been made up without using and waterproofing, as there were quite a number of these blocks scattered through the building it was decided to go all over the building with a waterproof wash, which not only accomplished the desired result but improved the appearance of the structure. Below will be found a complete itemized account of the entire cost:

	Total.	Cu. yd.
595 cu. yds. exc. and grading	$ 83.80	$0.139
Concrete Footings (53 cu. yds.):	Total.	Cu. yd.
Labor	$ 44.00	$0.830
Cement	84.80	1.600
Stone	62.30	1.175
Sand	26.50	0.500
Total	$217.60	$4 105
Forms:		
Labor	$ 11.20	$0.211
Material	11.75	0.221
Total	$ 22.95	$0.432
Grand total	$240.55	$4.537
Concrete Floor (5,000 sq. ft.):	Total.	Sq. ft.
Cement	$149.60	$0.0249
Sand	28.25	0.0047
Stone	84.70	0.0141
Labor	53.85	0.0089
Total	$316.40	$0.0526
Forms:		
Material	$ 3.25	$0.0005
Labor	5.75	0.0009
Total	$ 9.00	$0.0014
Grand total	$325.40	0.0540
Molding Blocks (4,485) and 548 ft. Capping and Coping.	Total.	Block.
Labor	$205.45	$0.0431
Waterproof and cement	409.65	0.0806
Sand	68.80	0.0144
Stone	27.00	0.0036
Pallets	45.55	0.0096
Total	$756.45	$0.1513
Laying Walls:	Total.	Sq. ft.
Laying (masons at 35 cts. per hour)	$153.55	$0.0314
Pointing	57.25	0.0117
Tenders and block wheelers	50.50	0.0104
Cement	55.90	0.0111
Sand	15.45	0.0031
Scaffolding, labor and materials	32.25	0.0066
Total	$364.90	$0.0743
Miscellaneous and General.		Total.
Windows, doors and ventilators and down spout		$ 311.25
Labor placing same		35.85
Roof lumber		171.28
Labor laying		37.85
Tar and gravel in place		208.50
Door frames in place		63.25
Concrete gutters, posts, platforms, sills and lintals		47.80
Extra waterproofing of walls		33.65
Miscellaneous labor and material		14.65
Superintendence at block shed		65.00
Superintendence on building		236.00
Total		$1,225.08
Grand total		2,996.18

The cost figures given by Mr. Ash include only the totals named; the extension of these totals to get unit costs has been made by the editors, and in one or two respects they call for explanation. In giving the cost of molding blocks it will be noted that 548 ft. of coping are included in the totals. To permit extension of these totals we have assumed this coping to be equivalent to 274 24-in. blocks. Similarly in figuring the unit costs of laying walls we have figured the total area of a wall 14 ft. high for a 51-ft. 4-in. by 122-ft. 8-in. building. The building being one-story has a floor area of 6,000 sq. ft. which divided into the total cost of $2,996 gives a cost of 50 cts. per sq. ft. of floor area.

A Method of Long Span, Light Floor, Reinforced Concrete Construction, With Comparative Costs.*

While there has been no doubt of the economy and practicability of reinforced concrete for massive construction and where heavy loads are carried, the advisability of its use for light floor loads, especially if the spans are long, has been questioned even by those who favor its use in other instances. The dead weight of the material itself has often operated against its use, especially where the carrying capacity of the soil required the unit pressure to be kept to the minimum, or from other like causes.

We all agree that clear spans of 40 or 50 ft. in buildings are not usual and are generally avoided on account of their increased cost; hence a description of such a span, with its cost as compared with steel girder construction for the same span, is of interest.

While the author does not wish to take any credit for originality in the design of this floor, as the same general scheme has been used many times before for shorter spans, it is because of the unusual length of the span that its details become an important factor in the design.

The spans in question form the floors over the swimming pool and gymnasium of the Turngemeinde Club House, Philadelphia, and are 53 ft. 1⅞ ins. clear span. There are two floors with these spans, of an area of about 4,700 sq. ft. each, having five girders on the first floor and six on the second floor, spaced 13 ft. 9 in. centers. Those of the first floor are only 36 ins. deep below the joist, on account of head room. The top portion or T-head is 5 ft. 4 ins. wide and 14 ins. thick. These girders are reinforced with twenty-one 1⅛ in. square twisted bars, bent as shown by Fig. 1. The stirrups are 1x⅛ in. flat iron, bent and spaced as shown by Fig. 2. Great care was taken to place the bars accurately in position, and the bottom bars were supported in the bottom of the molds on cast cement chairs, while the spacing of the bars and stirrup was maintained by iron rods and the wiring of one bar to the other.

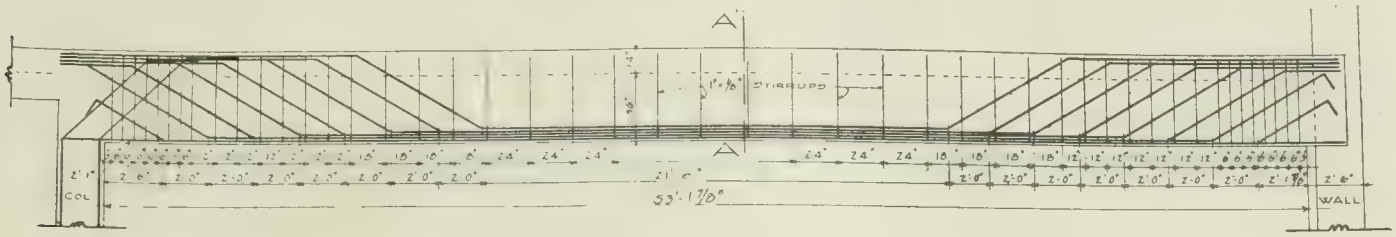

Fig. 1—Longitudinal Section of Long Span Girder.

The floor panels between the girders consist of 5x12 in. concrete joists, with a 2-in. reinforced concrete slab over same, and 12x12-in. plaster block centers between each joist, thus making a flat ceiling between girders. The joists are reinforced with one 11-16-in. square twisted bars and eight ¼-in. stirrups. In the top of every third joist were placed two ¾-in. square twisted bars over the girders to act as tie. These rods were only 5 ft. long but two were used in each case, lapped in the center so as to project beyond the T-head into the joists. The slab is re-inforced with ¼-in. rods run in both directions, 12 ins. on centers or thereabouts.

The girders supporting the auditorium floor, on account of the higher ceiling, are 43 ins. deep, with T-head, 4 ft. 9 ins. wide. The reinforcement in the bottom consists of eighteen 1⅛-in. square twisted bars, bent the same as shown for first floor.

Each floor is designed for a live load of 120 lbs. sq. ft., as the top floor is an auditorium and the floor below a gymnasium.

There seemed to be some doubt amongst the members of the building committee as to the advisability of constructing such long span of reinforced concrete, and one of the committee went so far as to offer to increase his subscription to the building fund by a very large amount, in order to pay for steel girders, but the amount offered was insufficient to pay the extra cost, so the girders were built as originally designed, of reinforced concrete. in order to obtain the actual difference in cost, we designed the girders of Bethlehem steel girder sections, reinforced with top and bottom cover plates and fireproofed. The size of the steel girders was 30 ins. deep, 200 lbs. per foot, with two cover plates on each flange,

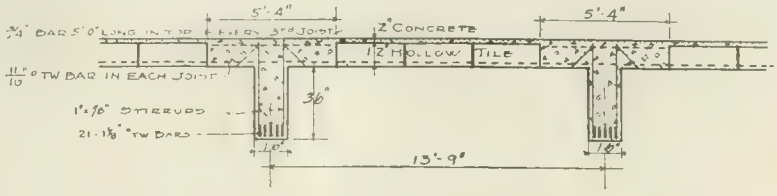

Fig. 2—Transverse Section of Long Span Girder.

*A paper by Emile G. Perrot, read at the annual convention of the National Association of Cement Users, February, 1910.

one ⅝x15 ins. and one ½x15 ins. We obtained bids from the building contractor for the difference in cost of these girders, we having likewise made an estimate of the difference in cost. The contractor's price for them was $6,500 additional to his contract price, although our estimate of the difference was somewhat less, being $4,664, based on prices obtained from outside sources. Taking our figures as a base, as there are 5,400 sq. ft. in the two floors, the difference in cost for the structural steel, fireproofed, is 50 cts. a square foot more than the reinforced concrete, with no increased advantage.

The weight of the structural steel for a girder as compared to the weight of reinforcing steel is as follows: Total weight of steel girders, with strap iron reinforcement for fireproofing and bearing plate, about 17,000 lbs. Total weight of reinforcing steel in one reinforced concrete girder, 36 ins. deep, 5,500 lbs.

This shows that it takes about one-third the amount of steel for reinforced concrete as compared with structural steel for girders and beams. The amount of saving in concrete would be the overhanging portions of the T-head, which amounts to 2¼ cu. yd. per beam, when the extra thickness of concrete on the girders is taken into account due to the wide flanges on the steel girders; likewise there would be additional plaster blocks necessary to take the place of the T-head omitted, the cost of which would have to be deducted from the saving effected by omitting the T-head.

The sub-contractor for the reinforced concrete work gave the cost of the plaster blocks, delivered at the job, as 14 cts. per sq. ft., and setting of same, including the nailing on of a fine wire screen at each end to prevent the concrete running into the hollow part of the block, as 3 cts. per square foot additional.

The plaster block weighs 25 lbs. per sq. ft., as compared with 40 lbs. per sq. ft. for terra cotta tile, which costs the same price as the plaster block but which are not as easily handled, being only 12 ins. long, whereas the plaster blocks are 3 ft. long and can be sawed to fit any position.

The walls of plaster blocks are about 1½ ins. thick, and there are two cells in each block, separated by a vertical wall in the middle which strengthens the block, so that traffic can take place over them and during the time of pouring the concrete.

Immediately before pouring the concrete, it is necessary to thoroughly soak with water the plaster blocks, as they absorb a considerable quantity of water from the concrete if not thoroughly wetted; in fact the parts of the floor where the blocks occur and where they do not, are clearly marked during the earlier stages of the setting of the concrete by the difference in its color, the concrete which does not come in contact with the plaster requiring more time to set.

For moderate spans, the use of concrete joists with either the plaster block or tile filler are desirable, where a flat ceiling is sought and the load light.

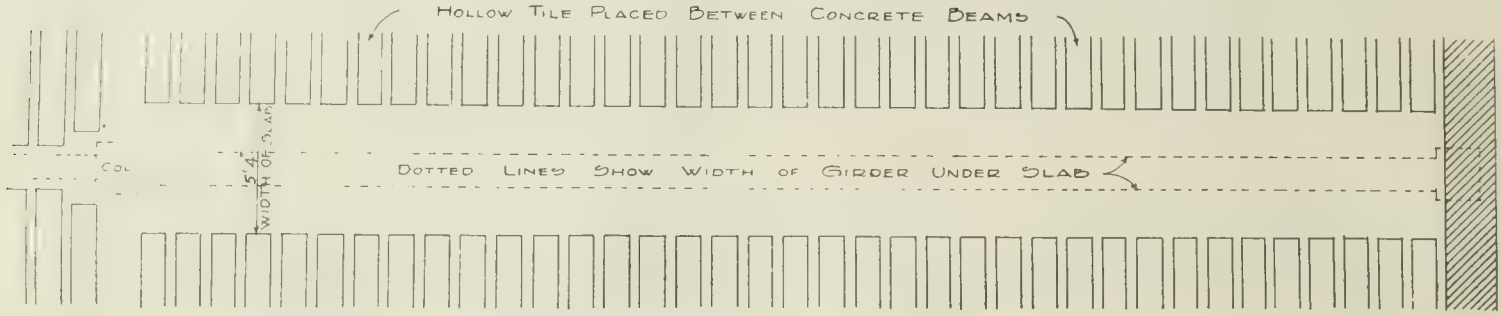

Fig. 3—Plan of Long Span Floor Construction.

A Method of Heating Broken Stone in Wagons for Concrete Work.

BY ROY H. BROWN.*

During the construction work on a recent power development it became necessary in order to carry on winter concreting, to devise some way of heating materials more economically than the usual methods. Our summer method of measuring materials was to charge a single horse dump cart at the crusher bin with the measured proportion of rock. From the bin the cart was driven to the sand pile where enough sand was added to complete the load. Thence the cart went to the mixer where cement and water completed a batch.

Of course one could heat sand and water to any degree but the problem was to find a way of heating the rock quickly and cheaply. It was solved satisfactorily to every one in this way. Taking some 1¼-in. pipe and cast tees a frame was made consisting of a set of 18 pipes crossing to and from the respective headers; ⅛-inch holes were drilled every 1 in. on one side of the pipes. A piece of canvas was riveted to the top of the frame of pipes and one header was connected to a boiler under pressure of 80 lbs. steam. A block and tackle was then attached to the set of pipes. This enabled the operator to move it quickly.

When work began in the morning the cart charged with rock and was driven under the heater. The operator lowered it directly on the cold crushed stone and turned live steam on for ½ min. by his watch. He then raised the heater ready for the next cart.

The rock was thoroughly warmed. All pieces of ice melted and when warm sand and warm water were added, a batch of concrete was mixed that set nicely in the coldest weather. In fact in looking at the finished wall one cannot detect the difference in the concrete mixed during weather of a temperature of 25° and that placed in summer.

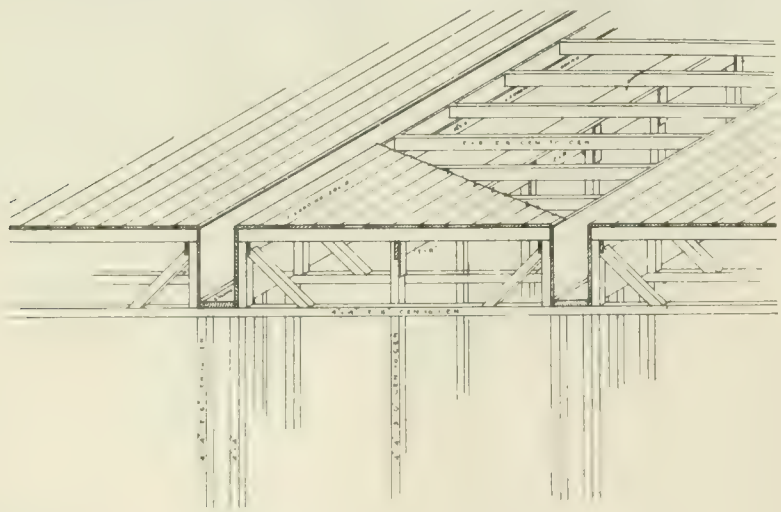

Fig. 4—Form for Constructing Long Span Girder.

*Madison, Me.

Concrete Barges for Dredges for the Panama Canal Work.

Work will be commenced shortly, according to the Canal Record, on the construction of three concrete barges, to be used in supporting the dredging pumps for the hydraulic excavating and pumping plant of the Pacific division of the Panama canal. They will be built near the site of the hydraulic pumping station at a point on the canal, nearly opposite Corozal.

Each of the barges will be 64 ft. long by 24 ft. wide, and will have a depth of 5 ft. 8 ins. The interior beams and columns will have a spacing of 10 ft. longitudinally and 8 ft. transversely. Wooden forms will be used in their construction and the barges will be launched sidewise. Two interior longitudinal walls will extend throughout, with a bulkhead at each end, forming an interior compartment 40 ft. long by 8 ft. wide. The interior form which will be built in collapsible sections, so that the latter can be removed readily as the work advances. The frames for the hull will be constructed first, and the preliminary work will consist of the erection of supports on which wooden forms will be placed.

The wall construction will consist of one layer of ½-in. mesh No. 12 wire cloth; ½-in. transverse rods spaced 8 ins. on centers, and ½-in. longitudinal rods spaced 12 in. on centers, all securely fastened to the reinforced concrete frame work described above. The side walls and bottom of the barge will then be formed by laying on several coats of plaster made of Portland cement mortar, and troweled down to a hard surface. The plaster will be laid on first from the outside, and an additional coat laid on from the inside, so as to thoroughly cover the ½-in. mesh and steel rods.

The deck of the barge will consist of concrete slabs 3½ ins. thick, having spans of 10 ft. in length and 8 ft. in width, reinforced with ½-in. rods, both longitudinally and transversely. Wells are provided for pumping.

The dredging pump, motor and equipment, weighing approximately 60,000 lbs., will be located near the middle of the barge. The maximum draft of the barges when loaded, will be about 3 ft. They can be moved readily from one place to another in the channel, and each will be equipped with four mooring bits situated a few feet back from each corner, secured to the barge by long bolts imbedded in the concrete of the side columns and diagonals.

The barges will be erected on cribbing built for the purpose, and launched from ways, on the west bank of the basin, a short distance south of the Miraflores lock site.

Methods and Cost of Sinking the Brier Hill Concrete-Lined Shaft, Michigan.*

The Brier Hill shaft is being sunk to a depth of 850 ft., and on Aug. 1, 1909—the date of this paper—it was completed to a depth of 692 ft. It is expected that in the future the shaft will be sunk deeper as the conditions of the ore deposits demand.

The shaft is being lined throughout with concrete. Concrete was adopted for safety and permanence, to avoid the danger of fire and the expense of timber replacements. It

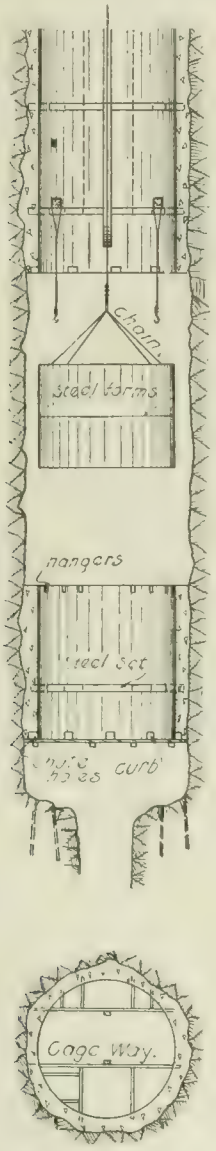

Fig. 1—Sections of Brier Hill Shaft Showing Method of Placing Concrete Lining.

was not used for the purpose of excluding water, as the amount of water in the surface gravel and in the rock measures passed through is inconsiderable. A circular section was adopted so as to use the concrete in compression and avoid the necessity for reinforcement. Even with a circular section there might be conditions of ground which would require the use of reinforcement in a shaft lining but these conditions did not appear in this shaft, except at some points in the roofs of the shaft stations at the different levels.

The shaft is 14 ft. in diameter and is divided into seven compartments respectively for a cage, a 6-ton skip, a ladder way, a pipe way, two balance ways and a compartment which can be used for a small cage or other purposes as later requirements demand. The cage will be large enough for a car to carry mine timber. Fig. 1 illustrates the division of the shaft into compartments. For the conditions presented this circular section is quite as economical of space as any rectangular section would be.

The hoisting of the large cage and the skip will be done by independent drums. The plant is of the ordinary geared hoist form with two cylindrical drums in tandem but operated by a 2,200 volt alternating current motor by means of a rope drive. Attached to each cylindrical drum is a conical drum on which is a rope leading to a counterbalance. The conical drum is designed so that the hoisting rope as well as the cage or skip is practically always in balance. This method of hoisting has the advantages of a simple and efficient method of using electricity, a practically perfect balancing of the dead weights, and requiring shaft space for only a single skip. Safety attachments will prevent excessive speed in lowering and insure the stopping of cage and skip within safe limits at the top and bottom.

Steel sets have been put in 10 ft. 8 ins. between centers, as shown in the plan and vertical section of the shaft Fig. 1. The main horizontal members are composed of 8-in. channels 13¾ lbs. to the foot placed on edge. These sets support the runners or guides of the cage, skip and balance roads, the ladders, pipes and wires and have nothing to do with bracing or reinforcing the concrete. Between the sets are studdles of steel channels to which the wooden runners for the cage are bolted. The vertical members are attached to the horizontal pieces in such a way as to allow for expansion and contraction due to changes in temperature. Ship channels are provided to guide the skip and there will be hardwood pieces attached to the skip to run in the channels. The severest strains to which these sets might be subject would arise in case the hoisting rope broke and the safety catches of the cage operated. While definite data in regard to these strains were not available the sets were figured with the expectation that in case of such an accident, the strains would be transmitted by means of the studdles, to other sets above and below and that four of five sets would withstand any probable strains from this cause. The ladders are built of steel and the ladder way and skip compartment are to be lined with galvanized corrugated sheet steel.

The shaft is to serve a territory which has been explored and partly developed by drifts from another shaft. Some stoping has been done and there are drifts at a depth of about 400, 500 and 600 ft. from surface. It was therefore feasible to make a preliminary opening throughout the entire length of the shaft by raising from these levels and sinking from the surface and the bottom level. This opening was made 6 x 8 ft. The timber used was afterwards recovered and used for other purposes. The ledge is about 60 ft. below the surface, the overburden consisting of gravel and hard pan. After the preliminary opening in the upper part was completed a timbered shaft 20 ft. square was sunk to the ledge. The sets of this shaft required diagonal bracing. Excavation was then carried down for a short distance in the rock and concreting started at a depth of about 79 ft. below the surface. The concrete from this point to the surface was put in during the winter of 1908. The rock, sand and cement were hauled to the shaft by teams from various points. The method of concreting was proved to be a success and further work was suspended until spring when the mixing plant was amplified by the addition of a cement shed with runway from the railroad siding, bins for rock and sand, a crusher on top of the rock bin, and a tram road above the bins leading from the sand pit and rock piles at another shaft. The drawings in Fig. 2 illustrate the arrangement. A car with a cross division in it is used to measure the sand and broken rock for a charge and tram them to the hopper of the mixer. The mixer is set below the surface and a tunnel 35 ft. long connects the mixer pit with the shaft. The mixer dumps the concrete into a kibble which stands on a tram car in the tunnel. The car is trammed to the shaft and the bucket lowered. As with the preliminary opening no mucking was necessary for the upper 600 ft., it was cheaper to bring the rock from another point than to shovel and hoist the rock from the shaft. The accessibility of the material suitable for concrete was a favorable feature of the situation. The mixing plant is available also for foundations and other building operations.

It was aimed to mix the material for the concrete in the proportion of 1 part of cement, to 3 of sand and 6 of stone. The sand contained a varying amount of gravel and the fines in the stone varied. Tests of the voids were made by the engineers from time to time and the proportion of the ingredients in the mixture was changed to correspond.

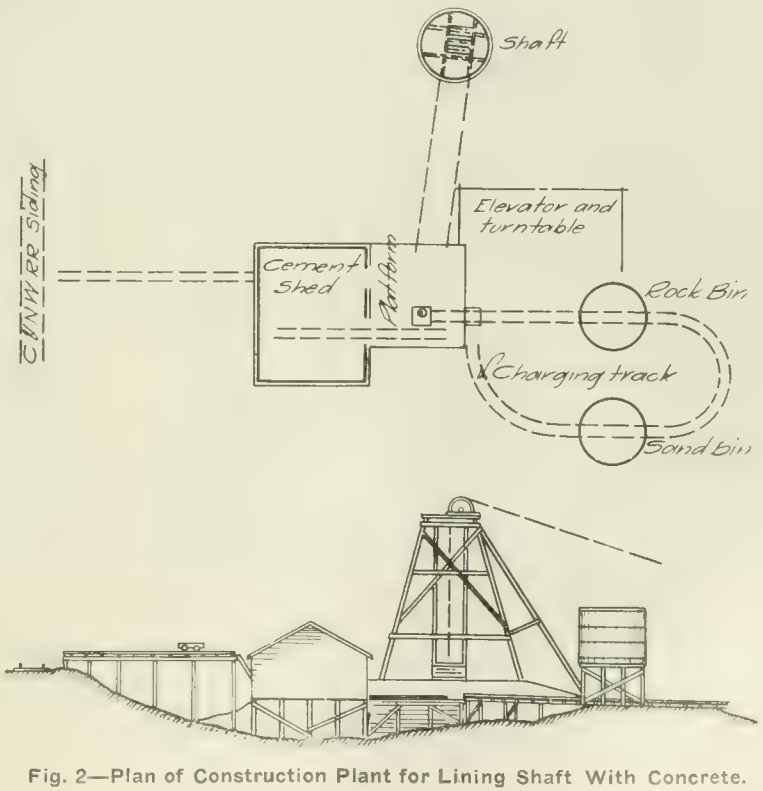

Fig. 2—Plan of Construction Plant for Lining Shaft With Concrete.

The plans for the completed shaft in the rock called for an average concrete lining of 18 ins. thickness with a minimum at any point of 6 ins. No attempt was made to trim the walls smooth as the irregularities of

*Arranged from a paper by William Kelley, Vulcan, Mich., in the Proceedings of the Lake Superior Mining Institute for 1909.

the rock are the support for the concrete. On the other hand too great irregularities in the excavations entail a waste of concrete. Measurements of the actual excavation taken by the surveyors every 3 ft. vertically give an average thickness of the concrete of a little over 19 ins. This is equivalent to a little less than 3 cu. yds. of concrete to a vertical foot of shaft.

Steel forms were used in concreting. These are made of ⅛-in. sheet steel with appropriate bracing as illustrated in Fig. 3. Four forms are used in the circle and in two of the joints pieces of timber or "filling blocks" give space to facilitate the collapsing of the forms after the concrete is set. One round of four forms has a height of 5 ft. 4 ins. and two rounds are used. The outside of the forms is smooth and is painted with black oil each time they are used.

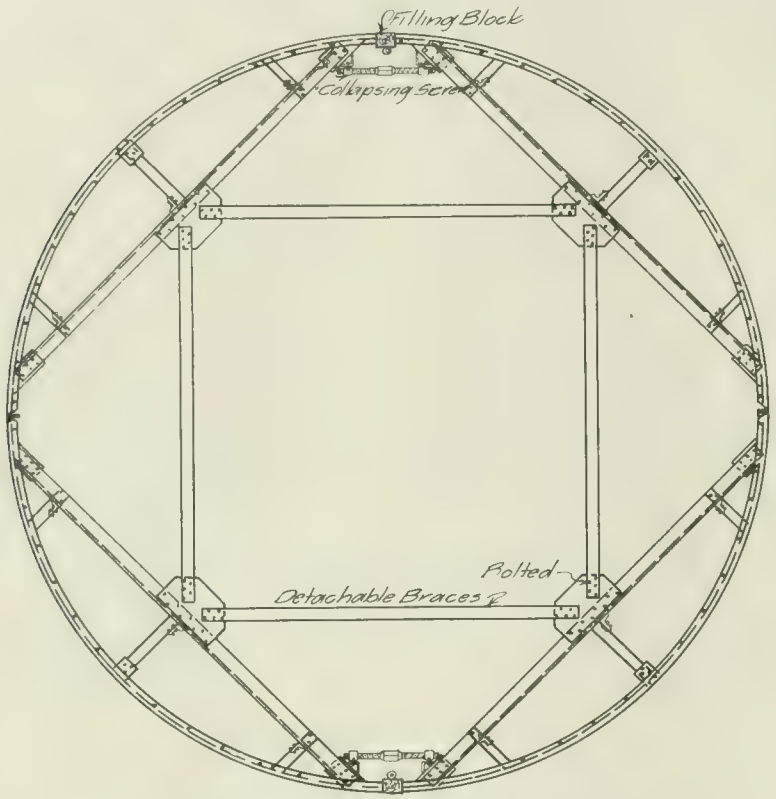

Fig. 3—Transverse Section of Steel Form for Lining Concrete Shaft.

After the excavation of the shaft to the proper size has been carried downward for a distance sufficient to put in three or four sets of steel a platform or "curb" is laid on the outside edge of the shaft all around near the bottom at the proper distance from the concrete above to allow for the number of sets proposed. One round of forms is then set upon this platform. Empty boxes are put in at the bottom to form "chute holes" for putting concrete into the form below at the proper time and a platform of 3-in. plank is laid over the top of the form. The concrete is then lowered in the kibble, dumped on the platform, slushed off and tamped in around the outside of the forms, completely filing the space between the forms and the rock. Before the concrete is quite up to the edge of the top of the forms, boxes are put in just inside the forms to core out hitches for the steel sets. As soon as the concrete is set the forms are collapsed by taking out the vertical strips of wood or "filling blocks" in the two openings. The round of forms is attached to the hoisting rope by chains, hoisted up and suspended from the steel framework in place above. A set of steel is then lowered, laid in the hitches left in the concrete and cemented in. The round of forms is lowered upon this new set, expanded to the proper size and the second round of forms is set up and bolted to the first so that this time concrete is deposited for a height of 10 ft. 8 ins. This can be done in an 8-hour shift, and 12 hours is sufficient time for the concrete to set so that it is possible to concrete 10 ft. 8 ins. of shaft and put in the steel work in considerably less than two days. As the space between the steel sets is 10 ft. 8 ins. and in starting only half this amount of concrete is put in before a set is laid, the work is joined to the older concrete above by one round of forms of 5 ft. 4 ins. This is filled through the spaces or "chute holes" left by the empty boxes previously mentioned.

No attempt was made to make a record of speed. The best work was done in September and October, 1908, which resulted in the excavating (enlarging the original opening) concreting and putting in the steel of 138 2-3 ft. of shaft or an average of 69 1-3 ft. a month. At that time the men were working two shifts a day or eleven shifts a week of 10 hours each. Six men constituted the regular shift in the shaft either for excavating or constructing. In addition to the shaft work proper three stations have been cut out and concreted.

In keeping the record of the cost, the shaft has been divided into three parts; from surface to ledge, 62 ft., from top of ledge to seventh level, 549.5 ft., and from the seventh level down, ultimately, about 238.5 ft. The following is the cost:

SURFACE TO LEDGE—62 FEET.

	Per ft.
Preliminary excavation	$ 13.07
Final excavation	18.19
Steel shaft frames	7.90
Steel forms	.83
Temporary surface structures and equipment	10.18
Construction	56.29
Estimated charge for compressed air	1.00
Total per foot	$107.43
Estimated salvage on shaft timbers	.50
Estimated salvage on temporary surface structures and equipment	2.95
Net total per foot up to date	$104.01

LEDGE TO 7TH LEVEL—549.5 FEET.

Preliminary excavation	$ 18.46
Final excavation	15.10
Steel shaft frames	7.90
Steel forms	.83
Temporary surface structures and equipment	10.18
Construction	25.26
Estimated charge for compressed air	1.00
Total per foot	$ 78.73
Estimated salvage on shaft timbers	.50
Estimated salvage on temporary surface structures and equipment	2.95
Net total per foot up to date	$ 76.28

FROM 7TH LEVEL DOWN—85.84 FEET COMPLETED.

Preliminary excavation	$ 25.67
Final excavation	23.13
Steel shaft frames	7.90
Steel forms	.83
Temporary surface structures and equipment	10.18
Construction	20.93
Estimated charge for compressed air	1.00
Total per foot	$ 89.64
Estimated salvage on shaft timbers	.50
Estimated salvage on temporary surface structures and equipment	2.95
Net total per foot up to date	$ 87.19

The item "Construction" includes the handling of the steel forms, depositing concrete, and setting and erecting the steel frames. These figures include estimates of power and every charge except for general management and engineering. The cost of this circular concrete lined shaft is about the same as a rectangular shaft of the same capacity with steel framing. The small additional cost over a rectangular shaft with timber framing is abundantly justified by the increased safety and permanence. Credit is due to Mr. F. L. Burr for the details of the design and construction.

Comments on Contracting for Concrete Bridges with Description of a form of Cost Recording.*

Contractors should keep complete cost records, showing the distribution of cost against the separate items that go to make up the structure; and such cost records should show the complete cost to date at regular and frequent intervals, i. e., daily or semi-weekly. The contractor should be able at any time to turn to his records and quickly ascertain the cost on each separate item of construction. Such a cost record is essential to a proper understanding of the cost of the structure, is valuable in determining the rating of the foreman in charge, and is the only safe basis for determining bids on future work.

To illustrate in greater detail, let us assume that a small concrete bridge is to be publicly let to the lowest bidder, and that its estimated cost is perhaps $10,000, which must not be exceeded. Some eight or ten bidders may appear, of whom one or two will usually be all that have had any previous experience, and only one perhaps will have kept detailed records of cost. All the others bid on a gamble. John Smith, who has never before built a concrete bridge, but who has had some experience in building a rubble retaining wall, estimates the total measure of concrete in the bridge at 2,000 cu. yds., and, recalling that the actual ingredients contained in a yard of concrete are perhaps a dollar's worth of cement, a little steel, and some gravel from the creek, believes that he can build the structure for $4 per yard, or a total of $8,000. Since this is well within the engineer's estimate, he adds a liberal margin of 10 per cent profit, overlooks all floods and contingencies, forgets about insurance and overhead charges, and perhaps lands the job, and the engineer being also inexperienced, estimates his next proposed bridge by this last one, and thus makes his next estimate on a still lower basis, for he does not wish to appear foolishly high in the eyes of the contractor or the Board. Thus the matter of bids is on a continual down grade, whereas the bidder who estimated his work properly, including all items at a reasonable allowance, bid $18,000, including 25 per cent profit, to which he should be entitled when the dangers of washouts and inclement weather are not otherwise taken into consideration. In view of the engineer's estimate, the high bid, although undoubtedly the best bid, seems foolishly high by contrast.

The contractor who thus estimates his work safely, uses an estimate sheet as follows, Fig. I, in which each and every item that goes to make up the cost of a highway bridge is included:

What each of the items represents in actual cost is known only to the experienced contractor and cannot be given here because it would

Total Field Cost.

Fig. 1.

be of local value only and would be found misleading for any other field. But even the novice in estimating will come far nearer the truth by making a guess for each item and then taking the total, than if he bases his price on the yardage of concrete alone.

There is a popular notion also that the cost of a concrete bridge may be estimated roughly by multiplying the span in feet by the width of roadway by $2. In other words that the cost approximates $2 per sq. ft. of roadway projected on the span. But this is a dangerous rule, because it gives only the lowest approximate cost for very favorable conditions, and may vary several hundred per cent. The height of the bridge from bed of stream to roadway affects the cost quite as appreciably as the span or roadway. Yet the above rule-of-thumb makes no allowance for height or for numerous other elements that go to make up the cost of the bridge and which vary from place to place. The only safe way to give an estimate on a concrete bridge is to draw it to scale, compute its contents, and then follow the estimate sheet. The contractor who has made a specialty of concrete bridge erection can usually approximate the cost of a proposed bridge by its similarity to some other bridge which he has erected and of which he recalls the details of cost. There is no other safe way.

The low bidder previously referred to, who secures the contract, goes happily to work. Firm in the belief that he has a paying contract, he takes his time on excavation, overlooking the fact that a dollar saved on a profitable contract is just as good as a dollar saved on a losing contract, until he nears the completion of the bridge, when he happens to find by subtracting his bills still to be paid from his money available, that he is already on the wrong side of zero profits. Then begins a scramble to save all he can, just at the very time when most consideration should be given to true lines and good finish, and as a result the bridge that would have been a monument to its designer and to its builder is made an artistic failure because of a profitless contract. Concrete bridges will never attain their deserved success by such methods. And if a contractor will not avail himself of information from more experienced men that will enable him to bid safely, he ought to be everlastingly lambasted by the engineer when he tries to skimp on the wind-up. To the end that he may not again forget!

A desirable form of cost record for concrete bridges is shown in the accompanying forms, Figs. 2 and 3. The foreman in charge is required to send to the office at frequent and regular intervals, say nightly or semi-weekly, a complete, distributed statement of all costs incurred on the work since his last report. This statement of cost is for materials actually delivered on the work to be used in the structure, and for indebtedness incurred for labor, freight, supervision, sundries of any kind whatever actually delivered to the foreman. The form is shown in Fig. 3, and is preferably bound in book form with alternate sheets punctured for removal; and a carbon sheet is provided so that the foreman may retain in book form the duplicates of reports sent in. Each report should have the total cost to date carried forward.

Upon receipt of this report at the office, the totals of each column are transferred to the cost ledger as shown in Fig. 2. A glance at the last sum entered in each column will show the total expenditure for that item to the date of the last report, and thus a statement of cost may be kept complete to within two or three days, regardless of whether materials are pur-

used by the office or the foreman, and whether on credit or for cash. The estimated cost of each item should be entered at the extreme foot of each column in red ink. A comparison of the last entry with the estimated cost at the foot of the column will show when an item exceeds its estimate. And since the items in a bridge are usually completed consecutively, a danger signal is thus provided calling attention to this contract. Each item may in turn be divided into its constituents of yardage or board feet, and the amount accomplished be reported each time. But for the average foreman the system then becomes too elaborate to be practical. A careful following of the cost ledger with the occasional visits to the bridge will enable the contractor or field superintendent to determine whether or not the foreman is handling the work properly.

While the foreman should be encouraged to keep a record of the total cost, and should be expected to become thoroughly informed as to the cost of the various items, yet he should not be permitted to have access to the detailed estimate or to the contract price. The foreman is supposed to build a concrete bridge for the contractor, who is making a specialty of concrete bridges, at the lowest possible cost consistent with good workmanship. He should neither be pinched nor pampered by a possible erroneous estimate. He should not be permitted to know, at least not until after completion, whether the contract results in a profit or a loss. He should be given to understand what quality of workmanship is desired, and then should be encouraged to maintain that at the lowest possible cost; but he should not be swerved from his purpose by possible gain or loss.

Since the contract price is usually a matter of record, and will probably become known to the foreman in spite of efforts to prevent it, it is well to start the cost record with a charge of 10 or 15 per cent for office and traveling expenses, in order that the foreman may not gain an exaggerated idea of his importance, since he otherwise invariably overlooks the fact that there are other expenses to be borne besides the actual field cost. The knowledge that he has made a few hundred dollars on the field cost of a bridge frequently converts a good foreman into a bad contractor.

Method of Laying Concrete Under Water Using a Tremie; Detroit River Tunnel.*

When reviewing the great number of subaqueous structures designed and constructed by engineers in the past, one cannot fail to note the hesitancy and diffidence, with which they have approached the problem of depositing concrete under water, and how they apparently have resorted to this expedient, by way of compromise, where none other seemed available, except at an unjustifiable expense. The reasons are obvious; the chief difficulty among the many presenting themselves, being to convey the mass of semi-fluid concrete mixture through the water to its place of deposit in such a manner as to preserve the mixture intact and prevent segregation of its integral parts, which would leave only an inert mass of aggregate. As a consequence the application of the method has been very limited, and the experience gained equally so. Various expedients and devises have been adopted for solving the problem, the principal ones being the use of bags, drop bottom buckets and tremies, all subject to objections peculiar to each.

Laying concrete under water by means of bags involves the use of divers in placing the bags, and is accordingly cumbersome, slow, and expensive; the results are not wholly satisfactory and the method should be classed as obsolete.

Neither is the use of drop bottom buckets all that could be desired; even with the greatest care it is not possible to prevent the mass from dropping a short distance through the water, which thus set in motion has a tendency to remove the cement from the aggregate and produce a lean concrete in spots, where a uniform and homogeneous structure is the ideal sought for. Irregular cleavage lines in the concrete are likely to occur, which objection is also applicable to the use of bags.

The depositing of concrete by means of tremies has heretofore presented difficulties which have not always produced satisfactory results. A tremie is nothing more nor less than a long tube reaching from the place where the concrete is to be deposited, to the surface of the water above, its upper end being provided with a hopper for receiving the mixture; as fast as the concrete escapes at the lower end of the tube it is replenished at the upper end, thus flowing in a continuous stream.

Theoretically this is the ideal way of laying concrete under water, but when reduced to practice the object has not proved so easy of accomplishment. The difficulty has principally been to control the flow of the concrete through the tube and prevent the water from the outside to rush into the tube from below, thus washing the concrete and separating the cement from the aggregate, losing the charge; the concrete would be liable to run out either too fast or too slow. Generally the concrete has been deposited in layers of various thicknesses, governed by the position of the mouth of the tremie with reference to that of the layer below. This also of necessity results in a certain amount of motion of the concrete through the water, with attending loss of cement.

These difficulties were successfully overcome in the construction of the Detroit River Tunnel, more than 100,000 cu. yds. of concrete having been deposited in water by means of tremies; the operation extending over a period of part of three seasons, 1907, 1908 and 1909.

In order to describe the methods used and convey a correct understanding of same, it will first be necessary to give a short description of the tunnel itself and more particularly the subaqueous part of same.

This tunnel is of double track, built for the use of the New York Central System of railway lines, passing under the Detroit River and connecting the City of Detroit, Mich., with the town of Windsor, Canada. It is built as two separate tubes with a center wall between each with an over head clearance of 18 ft. above top of rail, and a length of 8,360 ft. from portal to portal. It consists of three sections, the westerly approach tunnel on the American side, 2,135 ft. long, the section under the Detroit River proper, or subaqueous section, 2,625 ft. long, and the easterly approach tunnel on the Canadian side, 3,600 ft. long.

The westerly approach tunnel and adjoining end of the subaqueous section is on a 2 per cent gradient and the easterly approach tunnel on a 1½ per cent gradient. The subaqueous section has a level grade of some 1,000 ft. merging into the approaching gradients through long vertical curves at either end. It also has a short horizontal curve of 2 degrees curvature at the westerly end. The portals are approached through long open cuts at both ends of the tunnel.

The approach tunnels on both sides of the river were driven through a formation of plastic blue clay by means of shields. The same clay formation extends across the river and overlies bed rock which is found at a depth of some 10 to 30 ft. below the tunnel structure.

The subaqueous section was built on a unique and novel plan never heretofore used, which proved highly successful both as to cost, speed of construction, and safety. It consisted in excavating a trench in the bottom of the river, of the required width and depth, into which steel tubes were sunk; these were thereupon encased in concrete laid under water, pumped out and then lined with concrete on the inside. The whole operation proved to be very simple and easy of execution.

The top of the tunnel structure generally follows the bottom of the river; at the middle it even projects a few feet above the bottom; at the deepest part it is 41 ft. 9 ins. below the surface. The bottom of the structure at this point is about 74 ft. below the surface of the river.

The excavation of the trench was done with an ordinary clam shell dredge, well in advance of the sinking of the tubes. The tubes were circular in form with a diameter of 23 ft. 4 ins. and were arranged and sunk in pairs, one tube for each track; they were built of ⅜-in. steel plates. They were spaced 3 ft. apart between the shells and reinforced on the outside by a series of transverse steel partitions or diaphragms, 12 ft. apart. These diaphragms extended all around the tubes and were approximately of rectangular shape with an extreme depth of 30 ft. 4 ins., and extreme width of 55 ft. 8 ins., thus extending beyond the steel shell 3 ft. at the bottom, 3 ft. on the sides and 4 ft. on the top of the tubes. They were strengthened by means of double angle irons riveted along the edges; wooden sheathing running lengthwise of the tubes was bolted along the vertical edges of the diaphragms. The tubes were built in lengths of 262 ft. 6 ins., and were provided with temporary wooden bulkheads at the ends so that they would float when launched.

For the purpose of sinking the tubes they were equipped with four buoyancy cylinders attached on top, which enabled the tubes when filled with water to be kept in suspension at any point, lowered to the final resting place by means of floating derricks and connected up with the tubes already sunk.

Before sinking, a platform was built in the bottom of trench at the proper level temporarily to support the ends of the tubes. When in their final position the tubes would underneath be from 5 to 7 ft. from the bottom of the trench depending upon how near the correct level this was excavated. The diaphragms crosswise of the tubes and the wooden sheathing on the sides parallel with the tubes would then present in exterior view a series of pockets open at the top and bottom, but with enclosed sides and ends. Into these pockets concrete was poured by means of three tremies, one placed in the middle between the two tubes and one on the outside of each tube, between the steel shell and the wooden sheathing.

The mode of procedure in placing the concrete was generally, first to concrete in the bottom to the under side of the diaphragms, thus sealing the pockets and affording support for the tubes. The buoyancy cylinders holding the tubes in suspension could then be removed, and each pocket filled with concrete in one continuous operation, forming a monolithic mass of a thickness of 3 ft. on the sides of and between the tubes, 4 ft. to 4 ft. 6 in. on top of the tubes, and a thickness of 5 to 7 ft. underneath the tubes, varying with the irregularity of the bottom.

Generally every other tube length was provided with an extra strong bulkhead at the extreme end, capable of resisting the full hydrostatic pressure when the tubes were pumped out, in order to give access to the interior and permit the placing of the concrete lining.

The equipment used for the purpose of placing the subaqueous concrete consisted of a "tremie scow," so called, especially designed and built for the purpose. This scow was 35 ft. in width, 155 ft. in length and 9 ft. 9 ins. in depth, with a free board of about 4 ft. It was equipped with 4 spuds, one in each corner, of 20 ins. square 90 ft. long Oregon fir timbers, and necessary spud hoists. The object of these spuds was to hold the scow steady during concreting, and prevent any rocking motions caused by waves, or the wash from passing steamers. The scow was further held in position against the current by anchors and was equipped with deck hoists for handling. On one side of the scow was built three towers 82 ft. high above the deck, one for each tremie; the front of these towers served the purpose of leaders (similar to those of a pile driver) for the tremie pipes, which could be hoisted clear out of the water or lowered down to the bottom of the trench, as required. There were three concrete mixers, one for the middle tremie with a capacity of about 30 cu. ft. to the batch, and two concrete mixers, one for each of the side tremies with a capacity of about 20 cu. ft. to the batch. The equipment further consisted of an air compressor, a dynamo and an electric conveyor for con-

* Paper by Carl Hoff read at the 1910 convention of the National Association of Cement Users.

veying cement to the charging floor from scows alongside the tremie scow, three hoisting engines for the tremies, two large derricks with hoisting engines for unloading gravel, and a 150 HP. boiler.

Gravel was used for mixing the concrete in preference to broken stone; it was of size grading from that of small walnuts downwards. Mixed with approximately the proper amount of sand it was found and pumped out of the river near Port Huron, Mich., some 60 miles away from the tunnel site and transported in boats or barges down the Detroit River to the tunnel. The tremie scow was designed particularly for the purpose of handling and mixing this gravel as cheaply as possible. The gravel was unloaded directly from the boats to the tremie scow and used up about as fast as unloaded. To this end the tremie scow was equipped with two heavy derricks located about at the quarter points of the scow on the opposite side to that of the tremie towers. These derricks were operated by large hoisting engines located on the deck of the scow, the gravel being unloaded by means of clam shell buckets and discharged into two hoppers located 32 ft. above the deck of the scow, immediately behind the towers. From these hoppers the gravel would fall over inclined screens into receiving bins, being thus screened by gravity, the sand running off into one bin and the gravel into another. There was one sand bin and one gravel bin for each tremie. The bins for the center tremie were of about twice the capacity of the others, because this tremie had to deposit approximately twice as much concrete. The screens below the unloading hoppers were four in number, two for each hopper, inclined in opposite directions so that the gravel would feed one-half to the bin of the side tremie, and one-half to that of the center tremie. The sand and gravel bins were placed a few feet above the charging floor which was located 11 ft. above the deck of the scow, and was on a level with the top of the charging hopper of the concrete mixers. Through gates in the bottom of the bins the proper amount of gravel and sand could be drawn into the charging hoppers. This floor was large enough to hold a sufficient quantity of cement for one pocket. The water tank was also located on this floor, from which water was piped to the mixers.

The concrete mixers were placed directly on the deck and when tilted would discharge into self dumping buckets, placed in the hull of the scow directly in front of the mixers; these buckets could be hoisted up to any point where the receiving hoppers of the tremies might happen to be located and discharged their contents into same.

The total amount of concrete in one pocket was about 342 cu. yds., of which approximately one-half had to be deposited through the center tremie and one-fourth through each of the side tremies.

Each tremie consisted of a 12-in. diameter spiral riveted steel pipe of No. 10 metal 80 ft. long, made in 20 ft. lengths provided with external flanges for bolting up. The upper end of the tremie pipe was suspended from a frame, to which was attached a hopper for charging the tremie, the hoppers with frames running between guides attached to the front of the before mentioned towers. The tremie pipes, hoppers and all could be raised and lowered by means of steel hoisting ropes leading over sheaves at the top of the scow. The buckets in the hold of the scow upon receiving a charge from the concrete mixers were hoisted up inside the towers until they reached the tremie hoppers, which would engage them and trip them forward, discharging their contents into the hoppers; then they would reverse and go down, to their place in the hold of the scow. These buckets ran between guides located inside the towers immediately in the rear of the guides of the tremie hoppers. The concrete in passing from a mixer into the bucket would discharge over an apron which the bucket would trip forward every time it descended and trip back out of the way when hoisted up. The tremie hoppers were provided with a small platform on the outside and a railing around same where a man could stand and watch the concrete in the tremie, whether it was running out too fast or too slow, and give signals accordingly to the engineer who ran the corresponding engine.

The working force for operating the tremie scow when the process of concreting was going on, was 32 men, on an average. The operation was as follows: The tremie scow was anchored across the tunnel tubes in the trench, so that the tremies when lowered into place would come in the middle of a pocket, as already stated, one tremie between the tubes and one on the outside of each tube between the steel shell and the sheathing. The spuds were then lowered to the bottom and forced down sufficiently to take up a considerable load from the scow and prevent any rocking motions. The three tremie pipes were lowered into position until their lower ends rested on the bottom of the trench; the water inside of the tremie tubes would of course be at the level with the water outside. Meanwhile the boat loaded with gravel would be placed alongside the tremie scow on the opposite side. The gravel with its mixture of sand would then be unloaded by means of the clam shells and derricks, and dropped into the hoppers previously described, falling over the inclined screens, the sand and gravel shooting off into their respective bins, from which they would in turn be drawn, as required, into the super-hoppers of the concrete mixers, cement added, and the charge shot into the mixer, where the necessary water was added in the usual way.

A wadding of cement sacks was at first placed in each tremie on top of the water to prevent the concrete from dropping through while filling the pipe. A batch of concrete was discharged from the mixer into the bucket in the hold of the scow and hoisted up until a projecting arm on the receiving hopper of the tremie would cause the bucket to tilt forward and discharge the contents into the tremie hopper and on top of the wadding, the bucket immediately returning to its original place to receive a new charge, already in the process of mixing. When this hopper was about half filled, the tremie and hopper would be raised a trifle, permitting the water in the tremie to escape at the bottom as the weight of the concrete pushed the wadding downwards through the pipe. Meanwhile fresh batches of concrete were being dumped into the tremie hopper. In this manner the tremie was filled with concrete until the wadding reached the bottom and the concrete commenced to run out of the pipes. As fast as the concrete ran out at the lower end of the tremie pipe, fresh concrete would be added at the upper end of same, this process going on until the whole pocket was filled.

This wadding of cement bags was used only at the beginning of the work. It was soon found that one or two very dry batches of concrete would serve the same purpose, and this was used practically throughout the work in charging the tremie at the beginning of an operation.

The concrete except as noted in charging the tremies, was mixed very wet, much more so than would be permissible in concrete deposited in the air. No difficulty, however, was experienced on this account. The gravel showed no tendency to segregate from the mixture, probably because the mass was always in a slow and uniform motion, and when it reached its place of deposit the mass would be under a heavy hydrostatic pressure, that may have had the effect in connection with the loss of weight on account of buoyancy, of making segregation more difficult.

It should be particularly noted that the mouth of the tremie was always buried in the concrete from 2 to 5 ft. forming an effective seal which at all times prevented the outside water from forcing itself into the tremie. It was the duty of the inspector on the platform of the tremie hopper always to be on the look-out that the tremie was full of concrete. If the concrete showed a tendency to run out too fast he would signal the hoisting engineer to lower the tremie and thus choke off the flow; if the concrete did not flow fast enough he would order the tremie raised until the concrete would flow more rapidly.

It is a fact, that after a week or so, when the men on the concrete scow had become thoroughly familiar with their duties not a single charge was lost in depositing more than 100,000 cu. yds. of concrete. The concrete when deposited would take an exceedingly flat slope, in fact practically seek its own level. Occasionally a small mound would be built up around the mouth of the tremie, but the least agitation of same would cause this mound to spread out to a practically level surface. As soon as a pocket was finished the concrete scow was shifted to the next one. No pocket was ever started unless the necessary materials of sand, gravel and cement were on hand to complete it.

In depositing the concrete divers were employed for inspecting the progress of the work, and report when a pocket was completed.

The time required for filling one pocket usually ran from four to seven hours. The largest amount of concrete placed by the tremie scow per day was three pockets or 1,025 cu. yds., working 16 hours. This includes the time required for replacing the gravel boats, alongside the tremie scow. These boats generally held enough gravel for one pocket. The amount of concrete that could be placed depended mostly upon the supply of the gravel. Usually three pockets were concreted in two days, that is one pocket one day and two pockets the next.

As previously stated, the bottom of the trench was first filled with concrete to the under side of the diaphragms; this generally required from four to five days, sometimes a little longer, for each tube length.

The length of time of mixing a batch was usually from 2 to 3 mins. The time for the concrete to reach its place of deposit from the mixer would of course vary greatly, but the average time was probably about 8 mins. with a minimum of 5 mins. and a maximum of 15 mins. The velocity of the flow of concrete in the tremies would average from 14 to 15 ft. per minute. The extremes probably running from 7 ft. to 25 ft.

When the work first commenced the side tremies were made of 10-in. pipe as against 12-in. for the center tremie. This was done because the amount of concrete passing through each of the side tremies was approximately only half of that of the center tremie. After the first section had been completed all three tremies were made 12 ins. in diameter for the sake of convenience, as by that time it was found that the flow of the concrete could be absolutely regulated to suit the requirements.

The wear and tear of the tremie pipes proved very insignificant, the full set of tremies having been renewed only once.

The concrete was mixed in the following proportions: In the bottom of the trench below the diaphragms it consisted of 1 part of cement to 4 parts of sand and 8 parts of gravel. The concrete in the pockets consisted of 1 part of cement to 3 parts of sand and 6 parts of gravel. Gravel of small walnut size was used in preference to crushed stone as it was thought it would cause the concrete to flow easier in the tremies, besides gravel makes a denser concrete than crushed stone.

In some of the pockets at the joints between two sections the concrete was made in the proportion of 1 part of cement to 2 of sand and 4 of gravel. The reason for making the concrete in these pockets richer was simply a matter of precaution, taken to insure a tight joint, the steel work not fitting together as closely as intended. When the tubes were pumped out no water came through these joints, showing that the 1:2:4 concrete was practically impervious to water, although subject to a hydrostatic pressure of about 25 lbs. per sq. in.

For the purpose of determining the quality of the concrete, 6-in. cores were taken out by means of a Davis Calyx drill for the full height of the center wall between the steel tubes. These cores show a remarkable degree of uniformity of the concrete and of high quality both as to density and strength; in fact a better grade of concrete was obtained than would be possible in the open air. It should be noted in this connection that this concrete was compressed and set up under a hydrostatic pressure of from 16 to 30 lbs. per

sq. in., at the top and the bottom of a pocket respectively.

The crushing strength of this concrete when one year old, ran from about 2,800 lbs. per sq. in. minimum, to 4,000 lbs. per sq. in. maximum 1:3:6, according to tests made upon cores taken from the center wall.

A word should be said with respect to the time of setting or hardening of the concrete; this is, to be sure, a debatable subject. However, the consensus of opinion among the engineers connected with the work, including the writer, based upon such tests as could be made by divers, seemed to be that the initial set was acquired in about 10 hours, after the concrete was deposited, and the final set in twenty hours; after 40 hours the concrete was very hard, so that it would ring when struck with an iron bar.

Regarding the matter of laitance, hardly any was observed that would affect the quality of the work; this might be expected considering the manner in which this concrete was deposited, whereby the great mass of it would never come in contact with the water at all.

It may not be amiss to point out the three essential elements that contributed to the successful results in depositing the subaqueous concrete of the Detroit River Tunnel; they are as follows:

First, dividing the exterior of the tunnel tubes, by means of the longitudinal sheathing and the diaphragms, into compartments or pockets. This produced still water, which is absolutely essential for laying concrete under water, and permitted the filling of one pocket at a time with one monolithic mass of concrete. This arrangement further limited the lateral flow of the concrete, as it emerged from the tremie, to the confine of the pocket and reduced the washing out of cement by the water to an absolute minimum, in fact the loss of cement appeared to be negligible.

Second, the use of an equipment complete in every detail and equal to any demand made upon it, more especially an active or quick acting rig for handling the tremie pipes promptly as occasion required.

Third, mixing the concrete so wet, that it would readily flow in the tremies, and the flow controlled by keeping the mouth of the tremie at all times buried in the concrete at a sufficient depth thereby at the same time keeping it sealed and preventing the water from rushing in from the outside.

The demonstration of these highly successful results on such a large scale suggest possibilities of the application of this method to various kinds of engineering works, other than subaqueous tunnels. Numerous instances will undoubtedly from time to time present themselves where this method could be used to advantage, not only as an expedient of construction, but at a great saving in cost over prevailing methods, especially where large and expensive cofferdams would be avoided. The subaqueous concrete of the Detroit River Tunnel was deposited at a considerably less expense, including the cost of the plant, than similar work could have been done for on land.

It may perhaps be permissible, in conclusion, to venture a few suggestions of such applications.

Structures, now frequently built of cyclopean concrete blocks, such as dock and quay walls, break waters, etc., could in many instances be built "in situ" by using steel forms constructed on the compartment or pocket principle, which would result in obtaining monolithic and massive blocks, or sections of structure of far greater magnitude, than otherwise possible. The steel forms could be built extremely light and left in place, or heavier and detachable to permit their being used over again, as economy and expediency might dictate. If piles were required for providing a proper foundation they could be driven after the excavation was done to the required level, the forms set over them and then imbedding them in the concrete.

Similarly drydocks, light house foundations and bridge piers could be constructed, always, of course, depending upon local conditions and circumstances as to the applicability of the method.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

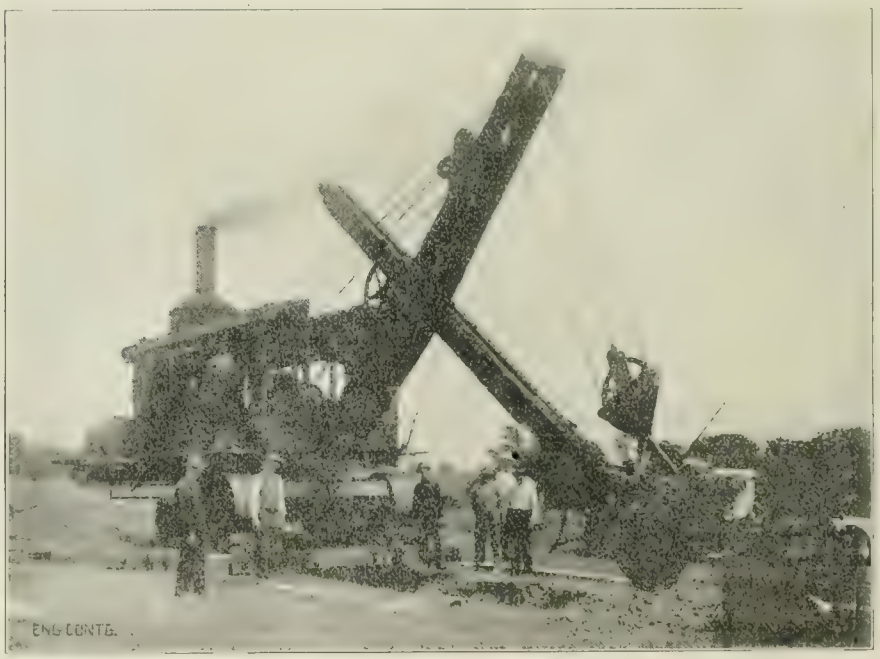
Method of Trenching for a Sewer at Auburn, N. Y., Using a Revolving Steam Shovel.

Interesting and in some respects novel methods of using a revolving steam shovel were employed recently in trenching for some 13 miles of sewer at Auburn, N. Y. The sewer ranged from 5 ins. in diameter for laterals to 24 ins. in diameter at the disposal works. Vitrified pipe was used and the trenches were dug ordinarily 1 ft. wider than the diameter of the sewer; the average depth of trench was 9 ft., and the maximum depth was 19 ft. The material trenched was clay and glacial drift with embedded boulders for the most part, but pockets of quicksand were encountered at places. Generally, the upper 3 to 5 ft. were good digging with the harder material underneath. The quicksand pockets were excavated by hand as was also the stonier parts which had to be blasted.

In going through quicksand, sheeting was necessary; 2-in. cull oak sheeting was used and altogether some 3,000 lin. ft. of trench in quicksand and other wet places were sheeted. The sheeting was set upright and was braced with screw extension braces. Where the shovel was used the width between sheeted trench sides was about 4 ft.

The shovel used was one manufactured by the Vulcan Steam Shovel Co., of Toledo, O., and is known as that company's No. 1 revolving shovel. It has a full circle swing; the accompanying view shows the shovel at work. This shovel weighed 35 tons mounted on traction wheels as shown. It was equipped with a ¾-cu. yd. dipper, and a dipper handle 27 ft. long, or long enough to dig a 16-ft. trench.

Referring to the illustration it will be noted that the shovel was operated on its own traction wheels, and not, with traction wheels unshipped, on a timber frame work on rollers. This mode of operation was permitted by the narrow trench which the wheels could straddle. A rather special timber platform trackway was used, however, for the shovel to travel on. This trackway platform was made in three sections; each section was 8 ft. wide and 16 ft. long and consisted of 12 x 12-in. x 16 ft. timbers bolted together with blocks between. Each section was thus a sort of grid of timbers, over which track planks could be laid for the traction wheels. There was a U-bolt hook in the center of each grid or section to which a length of chain was attached, and on the underside of the dipper handle, just back of the dipper, a hook was fastened. By attaching the chain to this hook, the shovel lifted and swung the timber section as desired. As indicated above, three sections were used, placed lengthwise across the trench side by side. The shovel stood on two sections; when an advance was to be made, the third section was placed close in front, the track planks laid on it, and the shovel run ahead. The advance left the rear section free to be picked up and swung ahead in its turn. The track planks were 8 ft. long, 4 ins. thick and 8 ins. wide, and were moved and placed by hand. It is stated that each move took from 4 to 5 minutes.



View of Revolving Steam Shovel Digging a Sewer Trench at Auburn, N. Y.

The plan of work was to lay the pipe close up with the opening of the trench and to backfill with the shovel directly, and this plan was followed except where the trench was held up by boulders which the shovel could not remove without previous blasting. In a word, when all went well, the shovel deposited each dipperful excavated in the trench at the rear as back-fill. When, however, rock or boulders were encountered, the shovel was not held up, but went ahead and deposited the excavated material at the side of the trench.

From the preceding paragraph it will be seen that no very exact figures can be given of the shovel work proper. Progress was figured in feet of completed sewer per day, and this was from 20 ft. to 150 ft., with occasional spurts of well up to 200 ft. per 8-hour day. The manufacturers of the shovel write regarding progresses as follows:

> The material consisted of blue clay interspersed with boulders from 3 ins. to 36 ins. in diameter, and was very hard to dig. The shovel excavated it without much trouble and was economical with fuel and water. The shovel excavated per 8-hour day from 90 to 125 lin. ft. of trench, 4 ft. wide and from 4 to 10 ft. deep; it excavated from 50 to 75 lin. ft. of trench 4 ft. wide and from 10 to 14 ft. deep; 22-in. by 24-in. tile was laid in place, while the

shovel was working, and the back-fill put in on top of the tile with the shovel. The back-filling was accomplished by excavating the material in front, swinging through a half circle and depositing it in the trench after the tile had been laid.

for the purpose of loosening the strong toe at the portal of the tunnel. After each charge was loaded it was mucked for about 3 ft. back of the charge, then tunnel packed completely to the portal.

The time taken to load the shot was 15 hrs.

Record Excavation on the Panama Canal.—On Feb. 3, seventeen shovels working in the central division excavated an average of 186 cu. yds. each per hour during the eight-hour day. Although the total number of hours under steam was 136, the number

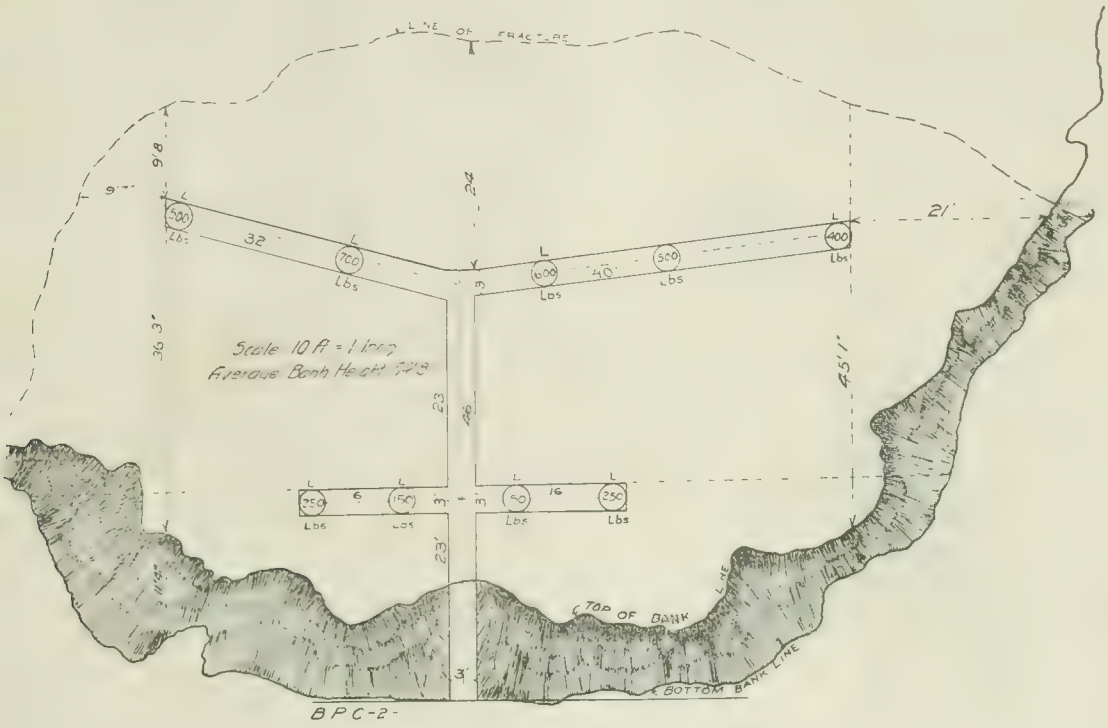


Fig. 1—Plan Showing Arrangement of Tunnels and Charges for Making a Large Blast at St. Helena, Oregon.

A gang of about 20 men was worked. On the shovel there was an operator, and a fireman. Two to three men were required to guide the sections of shovel platform during swinging, and to bring forward and place the track plank. The bracing gang consisted of 4 men placing the sheeting and timber, 2 men placing and screwing up the extension braces and 1 man on the bank carrying planks and braces from the rear when loosened to the front and handing them down to the man in the trench. The pipe-laying gang consisted of 2 men laying pipe, 2 men lowering pipe, 2 men mixing and supplying mortar, and 1 instrument man. All pipe was laid by instrument as the shovel and its operation prevented the stretching of lines. About 1,200 lbs. of coal were used by the shovel per 8-hour day.

The work as described was done by the Rochester Construction Co. of Rochester, N. Y., and occupied from May to December, 1909.

Method of Making a 14,280-Cu. Yd. Blast in Basalt Rock With Some Data on Costs.

The accompanying sketch and view show the method of making a large blast in the crushed stone quarry of the Columbia Contract Co., at St. Helena, Ore. This company is now getting out the stone for the jetty at the mouth of the Columbia river. The rock being quarried is a basaltic formation. It weighs 175 lbs. per cu. ft. and has a specific gravity of; its other properties are, wear 1.8 per cent, hardness, 18.8 and toughness 22. The sketch Fig. 1 shows the plan of the tunnels and the arrangement of the charges. The explosive used was No. 2 formula M. V., bag Trojan powder and the charge was 3,500 lbs.

The shot broke on the exact fracture line as was calculated and shown on drawing. The loading of the shot was also proportioned as shown. It was the intention in loading this shot to shatter the entire formation as much as possible in order to put it through a crusher with the least possible expense, and the work after the shot showed that practically the entire excavation could be handled with steam shovel with scarcely any bulldozing necessary. The first double T was driven 45 min., and the cost of loading was $58. The cost of explosives was, $358.75, making a total cost of $416.75. Exclusive of tunnel driving, the cost of the blast was thus $416.75 ÷33,736 tons = 1.236 cts. per ton. The volume of rock broken was 14,280 cu. yds. so that the cost per cubic yard was slightly less than 3 cts. The blast was loaded and fired under the direction of J. C. Costello and H. Bronstein of the Trojan Powder Works. We are indebted to Mr. Costello for the information from which this account has been prepared.

of hours that the shovels were actually loading was 93 hours and 20 minutes. The total number of cubic yards excavated was 25,274. The excavated material dumped on cars made 1,397 loads.

The Chicago, Burlington & Quincy Ry., according to reports, is to at once let contracts for 60 miles of grading in Natrona and Fremont counties, Wyoming. Headquarters on the construction work on the Kirby-Orin extension will be at Casper, Wyo. T. E. Calvert, Chicago, Ill., is chief engineer.

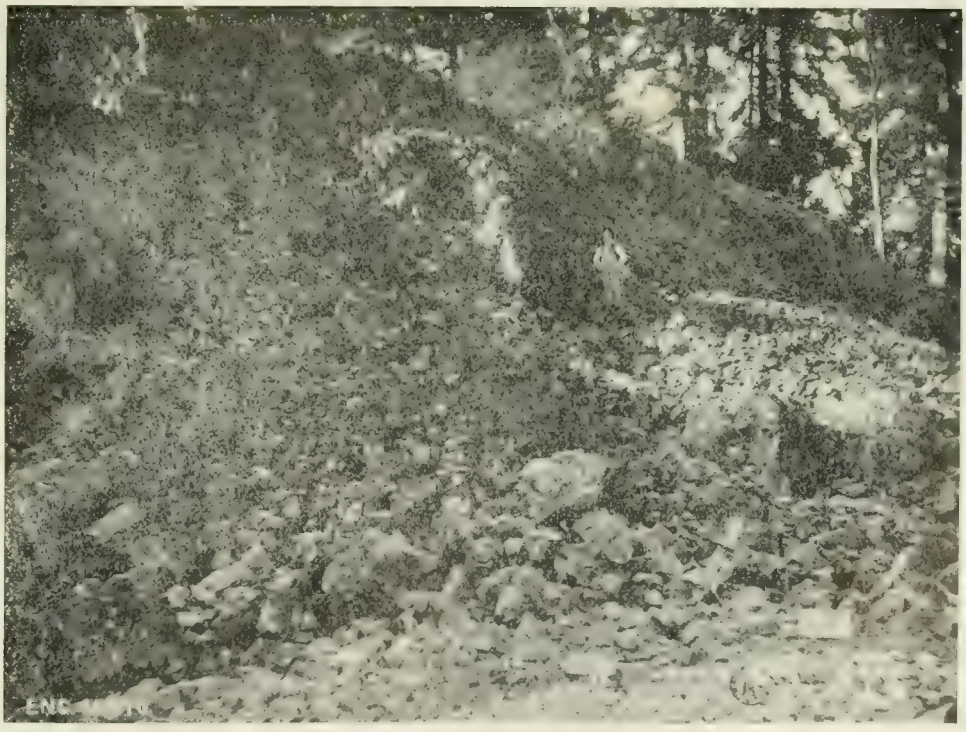

Fig. 2—View of Face of St. Helena Quarry After Blast.

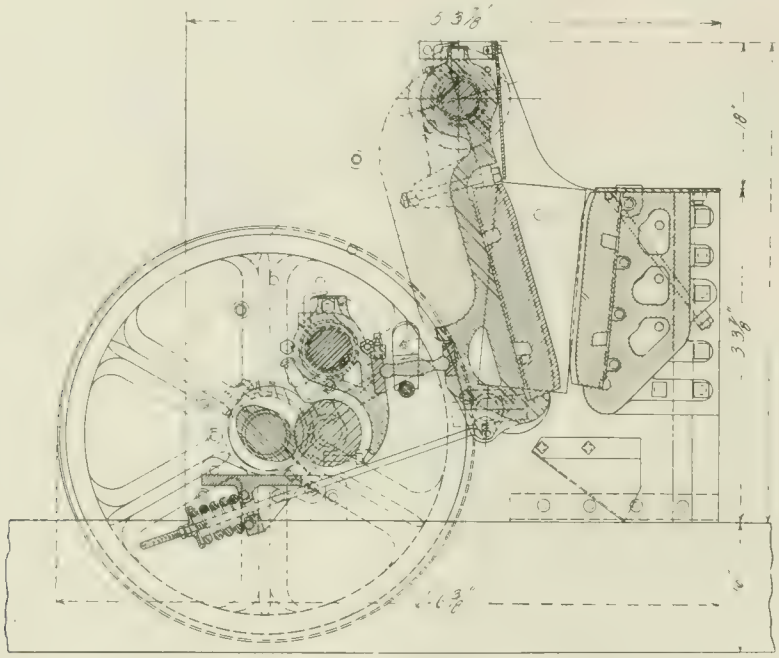
A New Jaw Crusher Designed Particularly for Contractors' Use.

A crusher for contractors' use has to fulfill different requirements than are intended for general quarry use. A contractor's crusher should be of large output, remarkably light in weight, convenient to handle and above all very durable. Particular attention has been paid to these qualities in designing the crusher illustrated in the accompanying cut. A notable feature of this machine is its practically all-steel construction. The main frame or side plates are of rolled steel plates. The large casting that forms the front of the machine, which part is termed the stationary jaw, is of grey iron. The moving or swinging jaw is a steel casting. The tumbler or large lever casting is also of steel. The fly wheels and pedestals are of grey iron. The main cam shaft and the anti-friction roller are steel forgings. The anti-friction roller revolves in boxes made of special bronze material. All shafts from which castings are suspended are of steel. The cheek plates are of special hardened steel, while the toggle seats are also made of special steel.



A New Jaw Crusher for Contractors.

This steel construction makes the machine of tremendous strength in comparison with its size. The feeding mouth is lower, in fact, than in other crushers of equal size. This means that a large saving is effected in delivering stone into the crusher. The crusher will turn out from 150 to 200 tons of crushed material per day of 10 hours. Its weight is 12,500 lbs., and it is furnished either stationary, as shown in the illustration, or with regular mounting and with elevator and screw attachment as may be desired.

In this crusher the power is exerted upon the moving jaw through the rolling action of the double cam-shaft, anti-friction roller, tumbler and toggle. As the cam shaft is elliptical in shape every revolution of the fly wheels means two movements of the moving jaw. The advantages claimed for this feature is that the crusher need only be driven one-half as fast as other crushers to produce the same results and as friction has been reduced by the reduction of speed, the possibilities of wear have been reduced proportionately. This crusher is built by the Good Roads Machinery Co., Kennett Square, Pa., and is known as the No. 4½ Champion.

At a public meeting held at Buffalo, Wyo., Feb. 21, $35,000 was raised for the construction of a railroad by the Wyoming Railroad Construction Co. of a line from Buffalo to Clearmont on the Chicago, Burlington & Quincy R. R. It is said that active work will be commenced April 1.

Method of Making a Steam Shovel Cut of Two Lifts in One Lift.

BY H. MORTON STEPHENS.*

During September, 1909, the E. Purcell Construction Co., secured from the Winston-Salem South Bound Ry. Co., a contract for the construction of part of the above railroad, embracing sections 22 to 30 inclusive. Section 22 is located in the town of Lexington, N. C., on the Southern Ry. The balance of the work runs south through a rolling country, and with the exception of section 22, the work is comparatively light, and with few exceptions would be a team proposition, except for the long hauls.

The outfit was unloaded from a spur track to a cotton mill, and within 100 ft. of the center line on section 22. The outfit consisted of two Model 60 Marion shovels, seven dinkeys, cars, rails, etc., and at the point where it was unloaded there would be a 36 ft. cut, consequently as part of the track, etc., was unloaded it was laid, and materials hauled ahead over same to the grade point at the south end of this cut. This left all necessary track in place for hauling material from the shovel on its first lift. In one week this shovel, which we call No. 1 was operating.

It was decided to send shovel No. 2 to the extreme southern end of the work on section 30, a distance of nine miles, and then work north. This shovel, with the necessary equipment of dinkeys, cars, rails, etc., moved this distance in ten days over the average North Carolina dirt roads.

The first and second cuts taken out by this shovel, contained about 52,000 cu. yds., and were taken out in the usual 8 ft. lift manner. The specifications of the railroad company called for a 20 ft. road bed and 1 to 1 slopes in cuts and would not allow the contractor for the additional width, made necessary by the use of a Model 60 shovel, which requires when using a dinkey track in the bottom of the cut on the last lift a 26 foot road bed.

As the remaining six miles alloted to this shovel were all practically two-lift cuts averaging about 13 ft. in depth, and as some of the cuts were about 3,000 ft. long, it was apparent that some scheme had to be devised whereby this extra unpaid for material would not have to be moved.

Upon investigation it was found possible to raise the boom on the shovel by simply taking out the links or loops in the boom support guy rods or hog rods, at the end where they are attached to the yoke at the apex of the A-frame. It was also found necessary to make two plates to fit on the rim of the swinging circle, at the corners of the aperture in the same under the boom, in order to reduce the angle and prevent the cutting of the cable which operates the swinging circle. This raising of the boom, etc., was accomplished in about two hours.

The shovel then started in on a single track cut about 3,000 ft. long, with an average depth of 9 ft. The deepest cut was 15 ft., and was taken out in one lift by lowering the dinkey track 1½ ft. With the boom raised in this manner it was possible to dig a 13½ ft. lift, and when cuts are, say 16 ft., it is possible to take them out in one lift, by excavating a trench for the dinkey track about 3 ft. deep. The material coming from this trench to be placed inside the slope stakes, and later taken out with the shovel.

By this method one trackage layout is sufficient for a cut of the above nature. There is no moving back, and there is very little extra material taken out even with a road bed specified to be only 20 ft. wide. The shovel is a little faster acting with the boom raised, as described, and there is no additional wear and tear on the machinery.

The material encountered is almost all stiff clay, with a small amount of loose rock. This shovel has averaged about 25,000 cu. yds. per month, and has only had one break down, this being a very small matter. Shovel No. 2 is under the direct supervision of Mr. J. E. Powell, who is superintendent for the E. Purcell Construction Co. The boom on shovel No. 1 has not been raised, as all of the work mapped out for it is very heavy and practically all double track. This is also a Model 60 Marion, and has shown some very high monthly outputs; in one month it moved 36,000 cu. yds., and in another month a little over 40,000 cu. yds. This shovel is under the direct supervision of Mr. E. Mays.

It is not claimed by the author that the arrangement described is any new wrinkle, but it is the first time he has seen it used, and never having noticed any article written in reference to it he hopes this one may prove of some value.

*Resident Engineer Winston-Salem South Bound Ry., Lexington, N. C.

First Annual Convention for the Standardizing of Paving Specifications.

This convention was held pursuant to a call issued by Mayor Busse of Chicago, as noted in previous issues of ENGINEERING-CONTRACTING. Headquarters were at the La Salle Hotel. Little time was wasted in preliminaries and all entertainment features were left to the evening hours. A number of delegates, however, preferred to work all the time, so there were evening sessions of some members of all committees. The convention was dominated by the idea of business and the earnestness displayed was remarked by every one.

Mr. Frank T. Fowler, superintendent of streets, Chicago, was temporary chairman, and Mr. John B. Hittell, chief engineer of streets, Chicago, was temporary secretary. The convention was in session from 10 a. m. of February 21 to noon of February 26. On the first day the organization consumed a greater part of the time and on the second and third days the committees worked behind closed doors, no salesmen of materials or contractors being permitted to be present. This rule was carried out on the inspection trips to view pavements in the vicinity. On the afternoon of the third day a full meeting was held to consider all reports ready and on each of the remaining days two open meetings were held to discuss committee reports.

Ninety-four delegates were present, representing forty-four cities. The work was completed at a too late hour to get the reports and recommended specifications in print this week, but in a later issue all the specifications will be printed with comments.

Surveys for the projected line of the Covington & Big Bone Traction Co. from Covington, Ky., to Big Bone have been completed by J. J. Weaver, C. E., Covington, Ky., and preparations are under way for the construction of the line.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Concrete Pavement Construction at Richmond, Ind.

The first concrete pavement in Richmond, Ind., was laid in 1896, and is still in service without having required any expenditure for repairs. The natural soil under this first pavement is gravel, so no sub-base was put in. The concrete was proportioned 1-2-5 and deposited 5 ins. thick after ramming, with a top surface 1 in. thick proportioned 1 to 2. It was cut into blocks about 5 ft. square and the surface pitted with an ordinary lug roller. Extreme care was used in all the processes, particularly the minor ones. The pavement gave such satisfaction that during the last eight or ten years small additional amounts have been constructed each year.

In this pavement work various plans of construction have been used, the principal variations consisting in the material for aggregate, thickness of concrete, construction with and without a top surface, thickness to top surface, size of blocks, thickness of joints and material used therefor. In a paper read at the recent annual convention of the National Association of Cement Users, Mr. Fred R. Charles, City Engineer of Richmond, described the developments of the method of concrete pavement construction at Richmond, as follows: One roadway was cut in blocks 8 to 10 ft. square; another in blocks 30 to 40 ft. square; all joints between the blocks, both cross and longitudinally being 1 in. wide and filled with paving pitch. The defect of this method consists in the chipping of the concrete edges at these joints, principally the longitudinal ones. Our experience seems to show the blocks should be as large as possible in order to reduce the number of joints, and that the joints should be as thin as can be made. On the other hand, we find that blocks 10 to 15 ft. square are about as large as can be made without developing temperature cracks in our climate. These latter however, apparently do not injure the pavement, beyond detracting from its appearance, as cracks that have existed for years show no enlarging, and the pavement up to and over the cracks is as solid as elsewhere. Corrugating or grooving the surface is also objectionable for the same reason as are the joints; the edges of the grooves afford an opportunity for the concrete to chip and spawl off by the action of horses hoofs, etc. Also the grooves catch and collect the dirt, interfering with the cleanliness of the pavement, and rendering it more difficult to sweep. Possibly the corrugations afford slightly better foothold for horses, but I think even here the advantage is exaggerated. We obtain a very good surface by using 1 part cement to 2 parts hard-grained, coarse sand, screened through a No. 4 screen; then trowel down to remove all holes, air spaces, etc., and "raise" with a cork or wood float, giving a rough gritty surface, in which horses can maintain their footing as securely as on a cement filled brick, an asphalt, or wooden block pavement when damp. For ordinary traffic pavement we find excellent results are secured by the use of 5 ins. of 1-2-5 concrete, and a top surface 1½ ins. thick, mixed 1 to 2. For automobile travel nothing could be more satisfactory. Of course it is trite and unnecessary to say that care must be used in selecting good aggregate material, proportioning properly to reduce voids to a minimum, and securing good workmanship in all the operations of mixing, placing and finishing the work. I am a firm believer in "wet mix," for this, as well as for most other concrete work. Place this concrete on a well prepared foundation, using suitable straight edges and templates cut to the required crown of the street; tamp or jostle to make a compact mass, leaving the surface rough to provide attachment for the top layer; cut joints through the concrete every 10 to 15 ft. and fill with sand. Before the concrete begins to set, place thereon the top surface, composed of 1 part cement to 2 parts hard, coarse sand, trowel and float, cutting joints directly over those in the concrete, using a small radius "jointer" to leave as thin a joint as possible, and finally finish by means of a "float," leaving the surface as rough as possible. This gives a roadway very suitable for our use. For heavier traffic, 6 ins. of concrete and 2-in. top surface is advantageous. We have also had good results by making the pavement homogeneous, that is, without the top surface. Make the concrete somewhat richer in cement; and quite wet. Tamp until free mortar flushes to the top, then finish with trowel and float. For this purpose the concrete should be free from large stones, as with a large stone at the surface, if one end becomes worn loose, a large leverage is afforded to tear the remainder of the stone from the concrete. As remarked before, the disadvantage of concrete is its lack of toughness, whereby exposed edges of joints and corrugations are prone to chip and wear off. For this reason joints ought to be reduced to a minimum, and especially longitudinal joints should be eliminated wherever possible.

Road Engineering.*

Public sentiment for the improvement of public highways is becoming widespread throughout the South, and there is now but very little difficulty in arousing a community to see the advantages of improved roads and to create in that community a desire for them. There is, however, a woeful lack of appreciation amongst a large majority of those who are now favoring and asking for good roads, in regard to the method of construction of these roads and the ability that is required in constructing them. Too many have the idea that most anyone can build a road, especially if he knows how to do a little surveying; while, in reality, it is just as important that a competent engineer should have the supervision of the construction of our public roads as it is that a competent engineer should be in charge of the construction of our railroads.

Roads must be located; must be graded so as to permit of hauling a maximum load at all times, and prevent wash; they must be thoroughly drained and finally surfaced with suitable material to give them a hard, smooth surface, which will depend upon the location of the road, the amount of travel over it, the cost of material, etc. This surfacing material may be macadam, sand-clay or gravel. These questions of road construction must be solved by a road engineer; for he is the one, and the only one, who can solve them practically, economically, and to the best advantage to the community. Mistakes are costly, and in many instances good roads work has received a very serious set-back by the unwise expenditure of money that had been raised for good road construction, by the bad location of the road or by the poor surfacing of the same. Men who have not been trained to work out such problems are not capable of taking charge of improved road construction. The demand for engineers who are capable of handling these problems is increasing every day, and it will continue to increase with the increased amount of road construction throughout the South, and as the counties and townships realize more thoroughly that to employ a competent road engineer to have charge of the construction of their roads is the wisest and cheapest expenditure that they can make. When a county or township issues fifty to one hundred thousand dollars, or more, of bonds for good road construction, the people desire that this money shall be spent so that it will build as great a number of miles as possible of improved road suitable to their county. In order to accomplish this they should employ a road engineer to plan out their work, and then hold him responsible:

1. That the road is located in the right place.
2. That it is graded properly.
3. That it is thoroughly drained.
4. That it is surfaced with material suitable to the traffic that will go over it.
5. That culverts and bridges are put in the right places and constructed of suitable material.

These are engineering problems that require skilled men to solve them, especially as there is usually a minimum amount of money to accomplish a maximum amount of work. It will often be found to the advantage of a county to employ a road engineer from outside the county, so that he will not in any way be influenced by local opinion in regard to the location of the road. It will be found that the problems to be solved in road construction will vary in nearly every district, so that each road has to be treated as an entirely new problem.

Not only should the road work in the different counties of the South be under the general supervision of a road engineer, but there should also be a road engineer in charge of the actual construction of the road.

I believe it is to the interest of every Southern State to have a highway engineer, who will have general supervision of the engineering problems connected with public road construction throughout the state. He and his assistants should work out for the county authorities and the county road engineer the best kind of road to build in that county, where it should be located, how it should be drained, and take up any other problems that might come up relating to the construction of the road. This is one form of state aid to counties in good roads construction that will prove one of the best investments that any state can make, for it will mean the saving of thousands and often hundreds of thousands of dollars to the different counties, and any saving to a county or township means a saving to the state.

*From Bulletin No. 3 of the Southern Appalachian Good Roads Association, by Jos. H. Pratt, State Geologist of North Carolina, Chapel Hill, N. C.

Method and Cost of Road Surfacing With 2-in. Concrete Cubes.

During the past year a new type of road surfacing was employed in the construction of a section of state highway in Monroe county, New York. This surfacing consisted of 2-in. concrete cubes made from Portland cement and gravel or shale and moulded in machines specially built for the purpose. The idea of using these cubes was evolved by Mr. J. Y. McClintock, county engineer of Monroe county, and the New York State Highway Commission authorized the expenditure of $2,250 for the purpose of making a preliminary demonstration. At the recent annual convention of the National Association of Cement Users, Mr. George C. Wright, consulting engineer, Rochester, N. Y., described the methods employed in constructing and laying these cubes, his information in the main being taken from a report of Mr. McClintock to the State Highway Commission.

The cubes were placed in a section of the Ridge Road northeast of the city of Rochester, N. Y. On this section the original trap rock surface 2 in. thick was completely off at the center and nearly so at the side of the 16 ft. macadam roadway, leaving exposed a good solid lower course of rather large size broken Medina sandstone resting on good gravelly foundation.

The existing surface was somewhat rough and knobby, and over this was spread as thin a layer as possible of screened gravel, which

was rolled down with a 12-ton roller, so that in spots it was 2 in. thick and in other spaces the over knobs it was no measureable thickness The resulting surface had a crown of about 4 in. in 16 ft. width.

On this bed so prepared was placed directly a wearing coat of 2-inch cubes for a width of 15 ft., being laid close together by hand, the edges being held up temporarily by 2-in. planks laid lengthwise with the road. On the cubes was spread a small amount of fine, somewhat loamy, gravel, which was broomed in, after which the heavy roller was slowly passed over the whole of the surface, forcing the cubes to take a full bearing on the supporting gravel. The edges and roller wheel was supported by the planks, then the side-planks were pulled up and moved ahead and coarse gravel ¾-in. to 1½-in. was placed along the sides next to the cubes on the shoulder for a width of about 2 ft. Outside of this a finer gravel spread, feathered off to a width of about 3 ft.; more of the fine loamy gravel was spread on the top and broomed and flushed in until the space between the cubes was thoroughly filled. The gravel on the shoulders was wet and the whole surface thoroughly rolled with the heavy roller.

A stretch of road 1,800 ft. long was surfaced with cubes. On 1,600 ft. Portland cement gravel concrete cubes were used, and on 200 ft. vitrified shale cubes 2¼-ins. in size were used. For a length of 100 ft. a concrete sunken curb 6 ins. by 9 ins. in dimension was used in place of the gravel shoulders. On a 100 ft. length the joints between the cubes were filled with Portland cement grout instead of the fine loamy gravel. For 60 ft. on which the joints were filled with the fine gravel, light asphaltic road oil was sprinkled over.

A machine for making cubes which is an adaptation of the ordinary cement brick machine was furnished. This machine made 68 cubes at one operation, resting on a wooden tray, and the tray was carefully placed on a drying rack without disturbing the freshly made cubes. The cubes remained in racks 24 hours and were then dumped in a pile. This pile was thoroughly sprinkled twice each day.

The number of cubes made was about 7,000 upon the first day but within a few days the same gang was able to make with ease 26,000 of the cubes. Various sizes of screens were tried from ½ in. to 2 in., but it was found that the ½-in. screen gave a product that could best be handled in the machine. Experience showed that the concrete had to be rather dry in order to avoid settling and bulging of the cubes before the concrete set. Seven men and a foreman did all the work. The amount of cement used averaged 2 2-10 bbls. to a cubic yard of concrete. The area covered with cement cubes was 2,652 sq. yds. upon which was laid all of the 730,000 cubes manufactured, except about 5,000 kept for repairs. The cost of cement cubes laid was as follows:

	Per sq. yd.
Cement, 0.088 barrels	$0.121
Cost of factory	0.107
Labor of manufacture	0.161
Gravel, 50c per cu. yd	0.024
Carting	0.027
Laying	0.072
Total cost per sq. yd. laid	$0.512

There was placed on shoulders 219 cu. yds. of gravel covering 1,800 sq. yds., costing $2.12 per cubic yard rolled in place, or 26 cents per square yard.

In considering these figures as the basis for estimating cost it is obvious that there might be reductions made in cost of cement by using a reduced quantity, and in reduced cost of carting, the cost of the factory might be disturbed over many more square yards, and the cost of labor reduced by use of concrete mixer and other labor-saving devices. The cost of gravel in pit is usually nearer 10 cts. per cu. yd. than 50 cts. which was paid here. The cost of laying was very much reduced as the men became experienced, and this could be still further reduced by paying for it on the basis of piece work.

Grading work was started Feb. 15 between Fort McCoy and Palatka, Fla., on the connecting link of the Ocola & Northern Ry. between Ocola, Fla., and Balataka.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Some Notes and Figures on the Valuation of the Water Works Plant at Richmond, Ind.*

In presenting the subject covered by this paper, it is necessary to give a brief history of the Richmond plant. This company was incorporated in 1883, with a capital stock of $250,000. A franchise was granted by the city, and a contract made for 7 years covering hydrant rental. The plant was put in operation in 1885 and carried a bonded indebtedness of $200,000. On Sept. 21, 1892, a new contract was made for 20 years. The plant in 1885 comprised a brick pumping station, 2½ miles from the center of the city, containing a 4,000,000 Holly pump, two 80 HP. boilers and necessary piping; a 10,000,000-gals. reservoir with bouldered inner slopes, located one mile beyond the pumping station; a 20-in. main connecting the reservoir and pumping station; an infiltration gallery 300 ft. in length; a 20-in. main to the city; and a distribution system with 20 miles of mains from 6 ins. to 16 ins. in diameter, 170 Mathews hydrants with 6-in. branches, and about 80 valves. Since the installation of the system in 1885, three additional galleries have been built aggregating 1,225 ft. in length, and a 16-in. cast iron siphon line 3 miles in length conveys water to the pumping station from a large dug well. Another Holly pump of 6,000,000 gals. capacity was installed in 1894 and two boilers added. The reservoir has had the bottom and inner slopes cemented, and the distribution system has been gradually extended. All parts of the plant have been kept in good condition, and Mr. Dabney H. Maury, who was recently engaged by the city, reported that "the plant as it now stands is in almost every respect above the average for cities of the size of Richmond." Its present length of mains is 37.34 miles of cast iron pipe from 3 ins. to 20 ins., and 3 miles of wrought iron pipe from ¾ in. to 3 ins. in diameter. This does not include 4,713 ft. of 20-in. pipe from pumping station to reservoir. On July 1, 1909, there were 312 Mathews hydrants, 2,360 meters, 4,281 service attachments in use, 23 fire lines and 112 free services for supplying water to school buildings, hose houses, drinking fountains, flush tanks, etc. The consumption for the year, same date, was 778,000,000 gals., of which 351,000,000 gals. were metered. The estimated free water was 60,000,000 gals. for the year.

In March, 1908, a fire occurred in a downtown business block originating in a large stock of paint, and after several hours' work, was gotten under control with a loss of $60,000. Thirteen streams were used under direct pressure. As a result of this fire, the Commercial Club took up the matter of additional fire protection, covering a second main, another pumping engine, an additional hose company, more fire apparatus, and a building code, following very closely the requirements of the State Fire Inspection Bureau's conditions by which Richmond could be placed in Class 2.

A conference was arranged between the Board of Public Works and the water company, and a proposition was made by the latter to cover above requirements, provided a new contract was entered into, the rates therein to be practically as heretofore. The Board of Works considered the proposition unsatisfactory and decided to employ an expert engineer to review the situation. Mr. Maury, of Peoria, Ill., was engaged by the city, and the company retained Mr. John W. Alvord of Chicago. The city desired the company to give it such data as would enable it to obtain the value of the plant. Being confident that the city was acting in good faith, and wishing to convince a doubtful public that it was not seeking a return on an inflated stock and bond issue, the company opened its books for examination by the city's accountant. The action of the company met with hearty approval, and it was agreed that the engineers should work in conjunction in securing the inventory of the plant. There could then be no dispute on the items of facts. Any differences arising would be on valuation only. The preliminary work of the engineers consisted principally in checking and tabulating the data furnished by the maps, records and inventories of the company. Information as to character of excavation, street pavements, etc., was obtained from the city engineer. The work of the accountant consisted in reviewing and auditing the receipts and expenditures from 1904 to 1909, and in examining the investment or plant from date of organization, to see if the entries therein were properly charged to such account. The company has always been conservative in entering up the cost of improvements on the plant account, and depreciations has been taken care of by charging repairs and replacements to the repair account. Under this system, the books of the company on July 1, 1909, showed the plant valued at $553,331.

The report of Mr. Maury was made to the Board of Works in November, 1909, and included a complete inventory of the plant, valuation of same, report of the expert accountant, and recommendations for betterments. In determining the present value of the plant, Mr. Maury and Mr. Alvord took into consideration the cost of reproducing the property, which plan seems to be growing in favor as a most equitable one. Two years were estimated as necessary to complete the new plant, and two more years to secure a revenue equal to that acquired by the existing plant at the end of the same period. Under this method, the cost of reproduction of the physical property is given as follows, in Mr. Maury's report:

Mr. Maury's recommendations for better-

*Extracts from a paper by Howard A. Dill read at the annual meeting of the Indiana Sanitary and Water Supply Association.

Description.	Cost of Reproduction.	Depreciation.	Present worth.
Preliminary costs	$ 10,000 00	$ 1,088.00	$ 8,912.00
Real property, water rights and rights of way...	37,400.00	.....	37,400 00
Interest on real property, etc., during 1½ years construction	2,805.00	.....	2,805.00
The distribution system	328,436.39	27,094.12	301,342.27
The reservoir	50,508.44	3,737.62	46,770.82
Pumping station	65,517.55	13,956.12	51,561.43

ments cover a new pump, suction well, increase of water supply, a 20-in. main to the city, additional mains to improve circulation, and additional valves and hydrants, the total being estimated at $139,000. Mr. Maury estimates that the present net earnings would yield 8.34 per cent on the physical value of the plant, 6.94 per cent on the valuation including going concern value, and 5.18 per cent on $857,188, which includes the above physical and going concern values, and the amount invested for betterments as recommended.

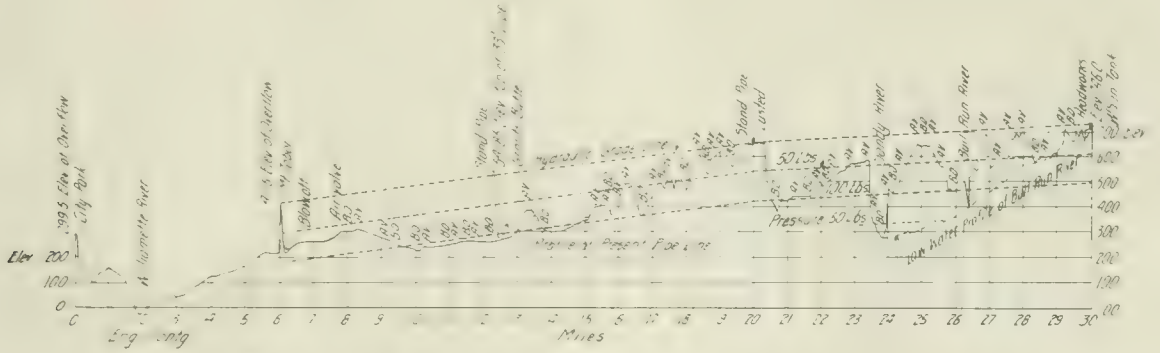

Fig. 1—Profile of 24-mile Steel Pipe Line for the Portland-Oregon Water-Works.

As the Board of Works, to whom the report was submitted in November, was to retire Jan. 1, 1910, no action was taken, except to make a report to City Council, in which it highly commended Mr. Maury for his excellent report, but took exception to the going concern value and charges for depreciation.

The report of the Board of Works claimed, that as the contract of the company expires in 1912, there should be little, if any, allowance made of the plant as a going concern. Some confusion seems to have existed between good will and going concern value. Even if all rights of the present company ceased at any definite period, the going concern value would still exist, for if the city undertook to reproduce the property, it would sustain a loss in revenue estimated by Mr. Maury and Mr. Alvord as $110,825, before the new plant acquired a business equal to that of the existing plant.

The Board of Works, in commenting upon the estimate of depreciation, contended that as the ordinary average annual rate of depreciation on water works plants, taken as a whole, is about 2½ per cent, the same per cent should be applied in this case, and figuring the average investment for the 24 years of the company's existence as $500,000, determined the depreciation July 1, 1909, as being $300,000. And yet the plant is regarded as one of the best of its size.

What will be the outcome of the investigation, the writer cannot state, but it is certain that the friendly action of the city and the company has greatly improved the situation locally, and whether the city purchases the plant, or enters into a new contract, it is certain that the recent valuation has facilitated the adjustment of any differences that may have existed.

Structural Features of a 24-Mile Steel Pipe Line for the Portland, Ore., Waterworks.

The accompanying drawings illustrate the main structural features of one of the longest steel pipe lines for water supply that has been planned in recent years. The line will be 24 miles long; 10 miles 52 ins. in diameter and 14 miles 44 ins. in diameter. It extends from headworks on Bull Run river to the Mt. Tabor reservoir of the Portland, Ore., waterworks. Figure 1 shows a profile of the line, redrawn from the bidding plans and the following data are taken from these plans and form the specifications. Because of the importance of the work we believe that these data are worth study. The engineer of the work is Mr. D. D. Clarke, chief engineer, water board, Portland, Ore.

The steel plates used in the manufacture of the pipe shall be made by the open hearth process, and shall be of the grade known as "soft." The ultimate tensile strength of the steel shall be between 52,000 and 62,000 lbs. per sq. in. The elastic limit shall not be less than 31,000 lbs. per sq. in. The elongation shall not be less than 25 per cent in 8 ins. when measured longitudinally, and 22 per cent when measured transversely, and there shall be a reduction of area at the point of fracture of not less than 50 per cent. The steel must not contain more than 0.05 per cent sulphur, 0.04 per cent phosphorous, 0.10 per cent silica, and 0.5 per cent manganese.

The chemical requirements for rivet steel shall be the same as those specified for the steel plates. The steel shall be "soft" and shall have a tensile strength of between 48,000 and 58,000 lbs. per sq. in.; test bars shall be round, 8 ins. long between measuring points, and of a diameter equal to the full diameter of the rivets. The elastic limit shall not be less than 29,000 lbs. per sq. in., and with an elongation of not less than 26 per cent and with a reduction of cross-sectional area at the point of fracture of not less than 50 per cent.

All plates and rivets must be kept free from rust and be kept under cover from the time of their manufacture until the pipe is dipped and coated. At the place of manufacture the plates must be loaded under cover upon suitable covered cars satisfactory to the engineer or his authorized representative. They must at no time be exposed to the weather or to moisture, and must be delivered under cover at the pipe shop. In case of accidental rust, either during transportation or the process of manufacture, the rust must be removed from the plates at once by brushing with stiff brushes and scrubbing them with diluted acid, followed by mopping or brushing with a saturated solution of soda or other suitable alkali to remove the acid; this to be continued until all the rust has been removed. The alkali must then be washed off and the plates thoroughly dried.

The steel pipe shall be in part 52 ins. and in part 44 ins. in the internal diameter of the inside courses. The thickness of the sheets will vary from ¼ to 7-10 in. The edges of the plates must be properly planed or cut to true lines and beveled for calking all around and at the end of each course where the lap of the longitudinal seam occurs, the plate must be reduced by cold hammering or planing, or both, to a fine edge, through which one of the rivets of the round seams must be driven to insure tightness. In addition to this rivet, still another rivet must be driven through the three thicknesses of the plate at such joints.

All longitudinal or straight seams are to be double riveted, and the round or circular seams single riveted. The length of the rivet

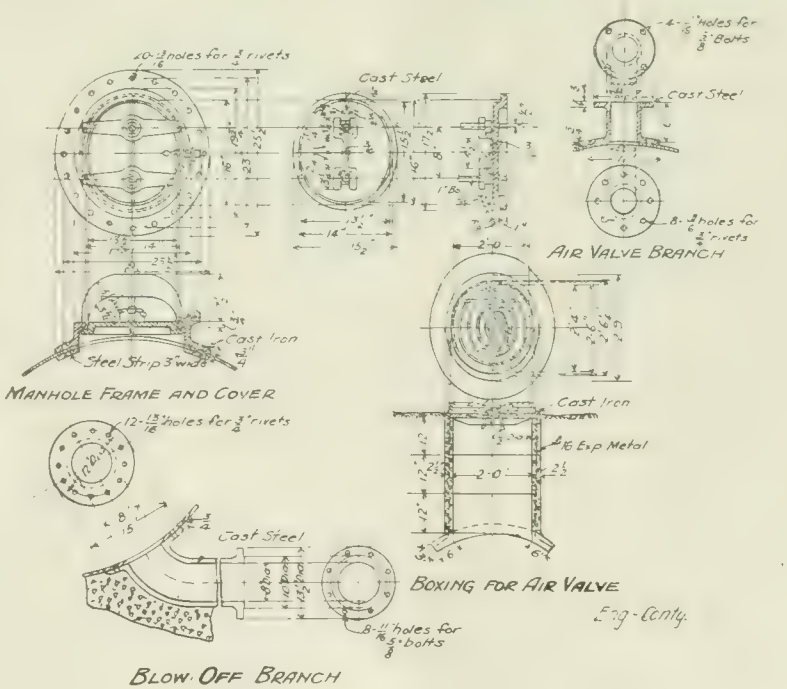

Fig. 2—Details of Air Valve, Manholes and Blow-offs for Steel Pipe Line.

shank shall be such that the height of the finished head shall not be less than 0.6 of the diameter of the rivet hole. Shop riveting must be done with hot rivets by steam, compressed air or hydraulic machinery, capable of exerting a slow pressure sufficient for the formation of perfect rivet heads. The rivet holes must be punched from the side of the plate which is to be placed in contact with another, and all burrs caused by the punch on the lower side of the plate must be removed by countersinking. No drift pin shall be used in forcing rivet holes to coincide at any seam or lap, and all plates will be rejected in which the said holes cannot be made to receive a rivet of the specified diameter with such slight

drifting or reaming as will not, in the opinion of the engineer, materially reduce the strength of the plate.

The plates must be of such dimensions as to admit of being rolled into shapes that will produce what is known as the taper joint pipe, the small end of each section having the full inside diameter called for in each size of pipe. The longitudinal seams will alternate to the right and left, but not more than 6 ins. from a true line along the axis of the pipe, and when laid, they must be on the upper half of the pipe.

Where angles and curves occur in the alignment and grade of the pipe line, the plates must be cut and punched to the required lines for forming a slight oblique angle at the circular seams, of as many courses as may be needed to produce the given total deflection, or curvature in each locality. As soon as riv- ed, the pipe shall be properly calked, both inside and outside, in a workmanlike manner, by the most approved pneumatic machines. All calking to be done by round-nosed calking tools, no split calking being allowed.

Each section of the pipe after completion and before being coated, shall be subjected to a hydrostatic pressure of at least 1½ times its normal working pressure as shown on profile of pipe line, and must, during said test, be absolutely free from leaks or fracture. Unless otherwise directed by the engineer, all pipe for use under 50 lbs. pressure or less shall be tested to 75 lbs. per sq. in.; all pipe for 50 to 100 lbs. pressure shall be tested to 150 lbs. per sq. in.; all pipe for 100 lbs. pressure and above shall be tested to 225 lbs. per sq. in.

Before the pipe sections are coated, they shall be thoroughly cleaned by the sand blast, or other equally efficient means, so as to show in all parts the grayish-white color of the metal. After the above described cleaning and inspection, which must be done under cover, every pipe shall be coated with "Mineral Rubber Coating," or such other material equal thereto in all its qualities, as hereinafter specified. The coating must be free from blisters and bubbles, and must not be affected by exposure nor by the action of the soil or salt water. It must strongly adhere to the pipe under all circumstances, and must not become soft enough to flow at a temperature of 150° F., nor brittle enough to crack or scale off at freezing temperature.

The pipes before being dipped must be clean and free from rust, and no pipe shall be coated unless examined and approved by the inspector immediately before the process of coating begins. They shall be dipped in a bath of the "Mineral Rubber Coating," heated to 400° F., or more, and shall receive a uniform coating not less than 1-16 in. in thickness. While in the bath the pipe shall be so manipulated,

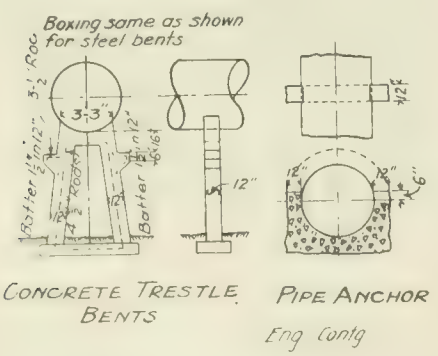

Fig. 3—Details of Concrete Trestle Bent for Steel Pipe Line.

scraped, brushed and redipped, if necessary, in accordance with the directions of the inspector, as to give a sound and perfect coating. After the pipes have been removed from the dipping tank they shall be set vertically while cooling. Proper facilities for handling the pipes and allowing all surplus material to drip off shall be provided by the contractor. The cost of all labor and material involved in the coating of the pipes must be included in the price bid for furnishing and laying said pipes.

At intervals of approximately 500 ft., the contractor shall place on the steel pipe, manholes with covers, gaskets and bolts complete as shown by Fig. 2. The openings for said manholes shall be elliptical, with clear major and minor diameter of 16 ins. and 14 ins. respectively; the joints between the frame and cover must in all cases be made watertight by facing the abutting surfaces and inserting a suitable gasket of sheet copper or lead. Estimated number required, 206. The manholes shall be connected with the pipe by means of steel rings 3 ins. wide, and not less than ⅜ in. thick, placed on the inside of the larger courses and riveted to the steel pipe and flanges of the fittings by hot rivets of suitable size. After the riveting is done, the edges of the sheet shall be chipped and calked on the inside, so that the joints may be perfectly watertight.

Air valves 4 ins. diameter are to be placed on the pipe at points indicated on the profile. The valves are to be of the pattern known as the "Crispin Automatic Air and Vacuum Valve," or some other approved model, with ½ in. bibb. Cast steel branches having flanges to conform to the circumference of the pipe at one end, and the other end to fit the flanges of the valve, shall be used for attaching them to the pipe. Between the check valve and the casting on the pipe there shall be placed a 4 in. double flanged gate valve. Each air valve is to be protected by a concrete well and iron cover, as shown on the plan. Where the pipe is located within 30 ft. of the hydraulic grade 3 in. galvanized iron stand pipes with a 3 in. service cock near the pipe may be substituted for the air valve, if directed by the engineer. These stand pipes to be boxed in with a box filled with sawdust.

Blow-offs 8 inches in diameter are to be placed at the bottom of the pipe in depressions as shown on the profiles. Each blow-off shall be furnished with sufficient 8 in. extra heavy Kalamein pipe, properly laid to point of discharge. Each blow-off, manhole, air valve, gate valve, and other fixture on the pipe, unless otherwise specified, is to be provided with a box of sound cedar plank of suitable dimensions.

In laying the pipe in the trench the pipe sections shall be so handled as to cause the least possible injury to the coating, and if any damage is done, it shall be repaired immediately with Mineral Rubber Field Paint. Before laying, the ends of each length, for a distance of 3 ins., must be carefully scraped inside and outside, and the coating entirely removed, to insure a perfect contact of the steel. Two lengths of pipe must then be riveted together and lowered into the trench, or placed on the grade prepared to receive the same. When lowered into the trench the bottom of the trench shall be to grade shown on profile, and must be free from water.

Field riveting for connecting lengths of pipe, specials, etc., shall be done as far as practicable, in the manner specified for shop riveting. The smaller end of the double length will be forced into the larger course of the pipe already laid, and properly riveted together, the two plates being set up tightly against each other with a set tool. As soon as each joint is riveted and calked it must be thoroughly cleaned and painted with Mineral Rubber Field Paint.

After the pipe has been laid in the trench it must be plugged at the ends and tested with hydrostatic pressure in convenient sections, of such lengths as the engineer may direct, to at least 1½ times the pressure, to which it shall be subjected under the natural working pressure when in operation. Calking must be continued until the pipe is tight at this pressure. Unless otherwise directed by the engineer, all pipe used under 50 lbs. pressure or less shall be tested to 75 lbs. per sq. in. All pipe used under 50 lbs. to 100 lbs. pressure shall be tested to 150 lbs. per sq. in., and all pipe used under pressure exceeding 100 lbs. pressure shall be tested to 225 lbs. per sq. in.

At such points as shall be designated by the engineer, steel trestle bents shall be erected for the support of the pipe at crossing of small water courses or marshy ground. These trestle bents will ordinarily be placed at intervals of 12 ft. and will be supported upon concrete foundations of suitable dimensions. The dimensions of these bents shall conform to the plans to be furnished by the engineer, and the material of which they are constructed shall conform to the standard specifications for structural steel for bridges adopted by the

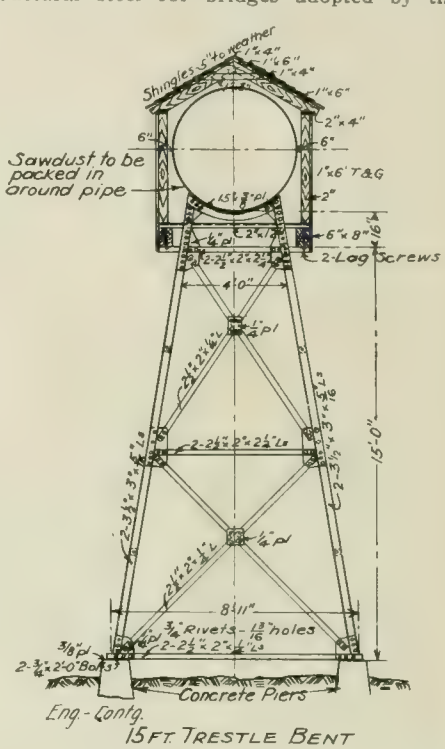

Fig. 4—Details of Steel Trestle Bent for Steel Pipe Line.

American Society for Testing Materials, and shall be subject to the tests therein provided.

Massive Concrete Work.—A recent estimate of the number of cubic yards of concrete needed in the construction of the Pedro Miguel and the Miraflores locks of the Panama Canal discloses some huge amounts. The following, taken from the estimate summaries, will give an idea of the size of the work:

Pedro Miguel Locks:	Cu. yds.
Lock	641,164
Approach walls including core connections with dams	275,002
Total	916,166
Miraflores Locks:	
Approach walls	304,689
Forebay	169,810
Upper lock	481,944
Lower lock	473,756
Total	1,430,199
Miraflores Spillway:	
Main dam	55,000
Piers and foot bridge	4,000
Abutments	1,000
Channel walls	13,000
North approach walls	2,000
Total	75,000

Cast Steel Swing Circles for Steam Shovels.—The extensive work on the Culebra cut of the Panama Canal has given the opportunity for some interesting experiments. Some time ago a swing circle for one of the steam shovels made in a solid casting of cast steel, was mounted in the place of the usual structural steel one. The shovel was worked hard in the Culebra cut for about a year when it became necessary to put it in the shop for repairs. At the same time an examination of the cast circle was made to see how it had stood the heavy wear. The inspection proved a surprise, the circle being in excellent condition and in no need of repairs. For a similar class of work during an equal amount of time structural steel circles will have served out their usefulness and be in need of rebuilding.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Methods of Filing and Indexing Drawings and Photographs, Board of Water Supply, New York City.*

One employe in each office shall be held responsible for the proper filing of the drawings, and he alone should be allowed to put away drawings. In each office *all* drawings received from other offices should pass first through the hands of a designated employe, possessed of sufficient knowledge, who will see that each drawing is properly introduced into the system of filing and indexing or otherwise attended to.

Drawings are filed in plan cases provided for the purpose and indexed on 3x5 in. cards kept in convenient cabinets. Cases and drawers are numbered. Plan cases have been designed on the unit system.

Besides bearing a file number to show where it is filed, each drawing is given an accession number which distinguishes it from all other drawings and, consequently, is the convenient and certain designation for the drawing in computations, correspondence or conversation. Accession sheets contain complete description and record of every drawing made or acquired by an office of the bureau for permanent filing. There is a double space across the accession sheet for each drawing. Headings are shown by Fig. 1.

An accession number is given to a drawing as soon as it is well started—at any rate as soon as any computations are made relating to it. The exact title and description can be filled out on the accession sheet when they are determined. The tracing of a drawing is given a different accession number. As near the lower left-hand corner of the tracing as possible, usually in the margin, is placed the word "References" followed by the accession numbers, one or more, of the drawing or drawings from which the tracing has been made. For example, if a tracing is made from Acc. 2,000, it will be endorsed "References" Acc. 2,000. If made from 2,000, 3,000 and 4,000 it will be endorsed "References" Acc. 2,000, 3,000 and 4,000. The brown paper studies will be endorsed "Traced as Acc. ———." The same record must be made in the "Remarks" column of the accession sheet. If a drawing is revised or changes or additions made in it, it should be given a new accession number and endorsed with the date of the revision. One should be endorsed "Revised from Acc. ———" and its predecessor should be marked "Superseded by Acc. ———." The same note should be made on the Accession sheet under "Remarks" and on the cards of the index. Revised drawings and prints of any kind upon which additional work is drawn are accessioned like new drawings.

Generally all drawings should be reaccessioned if lines are added or changes made on them, but drawings that show progress (progress diagrams), that is, drawings that are intended to be revised from time to time, should retain their original accession numbers and should be endorsed with the date of the latest change. The cross index cards should be similarly endorsed and also the accession sheets. All previous editions of each drawing should be endorsed "Revised to" (the latest date).

Temporary accession sheets, properly numbered on the line for each drawing, will be kept in each drafting office, on which the draftsman can make entries as needed. When a temporary sheet is filled, a new sheet properly numbered in advance is substituted. The filled sheet is promptly checked and corrected, and then sent to headquarters or some other office having a large flat-platen typewriter, where it is neatly copied in triplicate. One copy, with the original, is returned, the second sent to the appropriate department office and the third retained at headquarters. These copies are kept in suitable loose-leaf covers. After filing the final accession sheets and copies, the temporary sheets are destroyed.

In headquarters department when a study, a map or a similar original drawing is to be accessioned, the designer or plotter takes it to the plan clerk and fills out the accession sheet so far as possible; the file clerk puts on the proper file number. "Description" should be filled out sufficiently for the drawing to be readily recognized when called for. Under "Title," if the title is not determined, shall be written in pencil the name of the individual to whom the drawing is charged. If the title is determined, it shall be entered and the name of the individual placed under "Remarks." An employe shall keep track of all drawings thus charged to him. Likewise, draftsmen shall go to the plan clerk for file and accession numbers for tracings.

Under no circumstances shall a file or accession number be changed except by the plan clerk, who shall make corresponding changes on the accession sheets and the index cards. Every drawing, wherever found in an office, should show by its numbers or other endorsements that it has become a part of the system. Any drawings lacking the plan clerk's marks should be followed up to see why they have not been introduced into the system.

Contract drawings, besides accession and file numbers, are numbered consecutively in each contract set, as follows: "Contract No. 12, Sheet 20, Sheets in set, 45." For general use, contract drawings are lithographed to 11 in. in height, folded as necessary, and bound in pamphlets 8½x11 ins. like contract. Such lithographs, of course, bear the same designating numbers as the tracings from which they are made. Similarly, "working" drawings are photographed to about 7½x11 ins. and blueprinted for convenience and economy on sheets 11x14 ins., thus avoiding the use of larger sheets in the field.

Blue prints and black prints may be given out by the plan clerk when authorized and no record need be kept, unless a print is stamped on its face "File Copy." In using prints for studies, employes should be especially careful to see that when lines are added or other changes made, they are reaccessioned like new drawings, if they are to be kept. The plan clerk, when receiving drawings, should observe file and accession numbers to see that the rules have been followed and to find out whether other copies of the same drawing have previously been received and are on file.

Drawings charged to individuals will be called for at the end of a month, memoranda being sent by the plan clerk to each such individual weekly for drawings falling due during that week. Drawings may be renewed at the end of the month, if necessary. Individuals will be held strictly responsible for drawings charged to them and must afford the plan clerk every facility for locating them at any time. Drawings should not be passed from one individual to another in headquarters office without going through the plan clerk's hands to have proper changes made on the records. It will aid in keeping track of a drawing, while outside the files, to attach a slip of paper reading: "Charged to Mr. ———. Do not remove or borrow."

Detail "working drawings" required under contracts for construction purposes are signed by the chief engineer. Such drawings must be prepared sufficiently in advance of the time when they will be needed to avoid delay to the field engineers and the contractor. If additional information is needed and is not received from the field early enough to allow ample time for the preparation of the drawing, the designing engineer responsible should send a request for the information, stating the time when it will be needed.

Working drawings are marked with the number of the contract in the same manner as the contract drawings. Most working drawings will be explanatory of some contract sheet. Each such working drawing is to be marked with the number of the sheet which it modifies with a letter to indicate its place in the order of progress, as follows: The first working drawing made to explain Sheet 26, Contract 12, is marked, "Contract 12. Sheet 26A. Working Drawing." Later working drawings explaining the same contract sheet shall be marked "26B," "26C," and so on.

Working drawings containing standard details applicable under several contracts will be marked in the upper right-hand corner "Working drawing," without a contract number, and will be designated by their accession numbers. If, under any contract, working drawings become necessary which cannot be considered the modification or explanation of one of the contract drawings, such sheets will be designated by their accession number only, but should contain, in the upper right-hand corner: "Contract No. ———. Working drawing ———."

If changes should become necessary on any signed tracing, especially a tracing which is to be lithographed, the assistant engineer in charge of the drafting room or the designing engineer (including architect, mechanical engineer and landscape engineer) who first gives orders for such change shall put a large blue-pencil cross over the department engineer's signature or the other signature which makes the tracing finally authoritative, thus indicating that it is to be changed. Such cross shall not be removed until the changes have been completed, checked by the designing engineer, and accepted by the party whose signature is crossed. Changes on important tracings which have been signed should be made only for weighty reasons. All errors which can be discovered by checking must be eliminated before the final signature is obtained.

The accession number is put in ink on each drawing in its lower right corner. The entry is made on the accession sheet as directed below.

Under Title, write the title of the drawing in full, excepting the two lines which appear on all drawings made in Board offices: City of New York, Board of Water Supply.

Under Description, write, briefly, enough about the drawing to tell what it shows. Do not repeat what is in the title, but supplement it. Abbreviations which can be readily interpreted may be used here.

In the column headed Purpose of Drawing, use the following abbreviations:

L Land plan, or map.
P Preliminary drawing or study.
C Contract drawing.
W Working drawing.
E Estimate cross-section, progress diagram or similar drawing.
R Record drawing (of completed construction work).
Z Foreign drawing used for reference.

*Extracts from a paper by Alfred D. Flinn read before the Boston Society of Civil Engineers, Jan. 27, 1909, and published in the Journal of the Association of Engineering Societies for October, 1909.

....Department..... ...Division Section..... Date..... 19 No.....

Accession Number	Title	Description Note principal features of drawing	Date	Purpose of Drawing	Scale H-Horizontal V-Vertical	Kind of Paper. Size in Inches	Where File: Case	Where File: Drawer	Index Under	Remarks

Under "Kind of Paper and Size in Inches," use the following abbreviations on the upper line, and on the lower line write the outside dimensions of the drawing:

W	White paper.
B	Brown paper.
T	Tracing cloth.
T P	Tracing paper.
W P	White print.
G P	Gray or green print.
B P	Blue print
Black	Black print
Lith	Lithograph.
Cr-Sec	Cross-section, paper or cloth.
T Cr-Sec	Tracing cross-section, paper or cloth.
Pro	Profile paper.
T Pro	Tracing profile paper.
Neg	Vandyke negative.
M	Mounted on cloth (to be written after other designation).

The column headed "Where File" should be filled *in pencil* with file number as soon as the drawing can be given a place in one of the plan cases. If the drawing should ever be put into another plan case, the numbers on the accession sheet should be changed at once, also the corresponding numbers on the drawing and on all index cards.

In the column headed "Index Under" shall be written a word, to be put on the index card, under which a person would naturally or properly look when searching for the drawing.

The different departments are designated by letters in filing, indexing and accessioning drawings, and have distinguishing colors for index cards. Foreign drawings, meaning those originating outside of this Board's jurisdiction, are designated by an X.

Divisions use their department colors and are designated by an additional initial. For example:

Northern Aqueduct department, **NE**
Esopus Division of ditto, **N**

Each field department office and division will accession all its drawings independently, each having a series of numbers beginning at 1 and using its department and division letter. In headquarters, only one series will be used, the numbers being assigned by the Drafting division. Thus: 491, S 5,440 and R 721 indicate drawings originated in the Headquarters, Southern Aqueduct and Reservoir department offices respectively, and NE 299 is the accession number of a drawing originated in one of the offices of the Esopus division of the Northern Aqueduct department. Division offices will supply section offices with accession numbers by sending temporary accession sheets properly numbered in advance. Section office drawings will be accessioned as though they originated at division offices; that is, a section office will not have an independent series of numbers, but will use blocks of numbers in the division series.

Two indexes are provided for drawings in Headquarters office. First, an index by accession numbers on Form 256 E, with Form 270 E printed on the back, the cards being arranged by accession numbers; and, second, an alphabetical index in which the cards are written under local terms, elemental topics, a predominant feature of the drawing or the most likely subject by which the drawing will be asked for. Several cards may be in the second index for the same drawing. The main card will be of the color of the department in which the drawing originates or is received from a source outside the Board's offices, and the cross reference cards are white. All cross references should be noted on the main card, so that all cards may be readily located in the index. The following form is used for this index:

A TO Z INDEX

TITLE

	ACC.
DATE	SIZE
PURPOSE	FILE
SCALE	KIND

All drawings in each department and division office shall be indexed on "Subject" cards, the distinguishing color of the department where the drawing originated being used. All of these cards are kept in the same index. The guide cards are buff colored.

Cross-references are made in sufficient number to insure the finding of the drawing, plain white cards being used. Index cards are typewritten so far as practicable.

Drawings or copies of drawings from other board offices, if filed in the office where received, are indexed on "Received" cards of the color of the department from which they come, these cards being kept as a separate index. In the Headquarters accession sheet of the department from which they come, note under "Remarks" as follows: Hqs. Copy Case .....Dr.....

Should any drawing be sent to another office for permanent or temporary filing, or taken from its files for any other purpose for any considerable length of time, a proper note should be made on the back of its index card. Receipt should be taken for any drawing leaving its file.

Division engineers may, if they see fit, devise methods of indexing their section office drawings so as to distinguish them from those originating in division offices.

If any drawing which has been given an accession number be destroyed or sent *permanently* from the office in which it was filed, a note of the facts shall be made in "Remarks" column opposite the correct number on the final accession sheet.

Photographs (negatives) are to be of uniform sizes, 6½x8½ ins. for outdoor work and 7x10 ins. for copying drawings. For special work suitable sizes may be permitted. Finished photographs for the official file at Headquarters office are to be printed on 8½x11 ins. heavy mounted Velox, platinum or other paper giving a permanent black or gray picture on white ground. Photographs for department files may be like those for Headquarters, or blue prints.

Each department and each division is to number the negatives taken by its own photographer in a series of its own, beginning at 1 and using the department abbreviations and division initial, and to keep an index of photographs by numbers with the necessary cross-references. Negatives taken by the official photographer are to be numbered in another series, using the abbreviation Hdq., with the initial of the department in which the photograph was taken. Each negative is marked in the lower right-hand corner with the date and accession number. Negatives are stored in Headquarters office.

Official files of photographs in Headquarters and field department offices are kept in standard 8½x11 ins. letter file drawers. Files are divided, so as to keep photographs of real estate, construction progress photographs and photographs for accident and damage cases separate. Each class should be subdivided by metal-tip guide cards, according to locality or subject. In each subdivision the pictures should be arranged in chronological order. An "Out" card should be used if a photograph is taken from the file.

LETTERS TO THE EDITOR.

Bidding Prices for Clearing Land.

Sirs: Some of your readers may be interested in the following items: Some weeks ago I called for tenders for the clearing of 20 acres of land. The object was to show the suitability of the land for factory sites; the bidders were therefore requested to figure on cutting down the smaller trees and the underbrush close to the ground, but were to be allowed to cut the larger trees from 12 to 18 ins. above the ground. All the wood had to be burnt or removed. About 11 acres were covered with tamarack and spruce trees of fairly large size, but very few trees being more than 12 ins. in diameter 18 ins. above ground. Nine acres were covered with close underbrush of alder with a few small birch trees and poplars. The land is situated about two miles from our city and there is no summer road to it, but it may be reached in the winter by driving on Lake Superior along the shore.

Nineteen tenders were received with prices ranging from $15 to $57 per acre; the lowest bidder failed to enclose a marked check with his tender so that the contract was awarded to the next lowest bidder, who offered to do the work for $17 per acre and finish the work before May 1. The other bidders submitted the following prices:

3 Contractors	$18 00 per acre
1 Contractor	19.00 per acre
1 Contractor	19.50 per acre
4 Contractors	20.00 per acre
2 Contractors	24.00 per acre
1 Contractor	25.00 per acre
1 Contractor	29.00 per acre
2 Contractors	30.00 per acre
1 Contractor	40.00 per acre
1 Contractor	57.00 per acre

The highest bidder offered to finish the work on June 15, or in practically four months. He evidently intended to do the work alone and figured to clear one acre every five days.

The wages in our locality are $2 for ordinary laborers for 10 hours, and $2.25 to $2.50 for good axe-men. The tamarack and spruce would make good cordwood, but the other wood is of no value. The sleighing is very good and there is little work of any kind being done now, so that laborers are plentiful.

Two years ago, I had 70 acres of land cleared in the same vicinity but with a lighter growth of birch and poplar, and I specified that all trees over 4 ins. in diameter should be left standing. This work was done for $9 per acre.

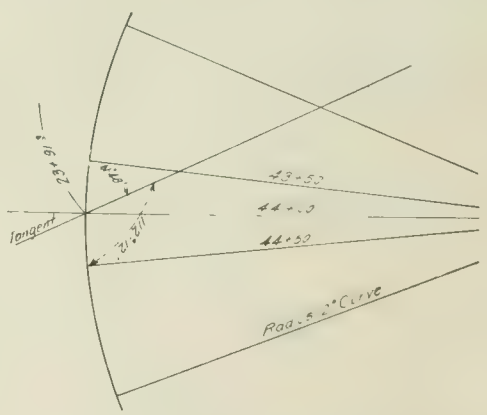
Yours truly,

J. ANTONISEN,
City Engineer.

Port Arthur, Ont., Feb. 19, 1910.

How Should the Draftsman Read These Notes?

Sirs: I desire to submit to you a sketch and explain a matter to settle a controversy in which I find myself engaged. A few days since I made a working sketch or detail outline as shown for the draftsman. We crossed a 12° curve with a tangent, the intersection being at Sta. 44 + 00 on the curve, our Station being 23 + 91.3. I measured the chordal angles between the curve



stations and showed both angles clearly on the map I made; the angles being, respectively, 61° 48′ and 112° 12′, a total of 174° 00′, or 6° less than 180°, which latter of course would have been the sum of the tangent angles.

My map was on a scale of 50 ft. to 1 in. and was accurate, but was only intended as a presentation of a copy of my field notes in an intelligible manner so the draftsman could make his map. Both angles were shown clearly as taken to 50 ft. chords, so that 3° 00′ added to each would have made a tangent angle at that point. In making another map the draftsman marked in only the one angle 61° 48′, the chord angle, as the tangent angle when he should have used 64° 48′. I measured the chordal angles because the 12° curve stakes were on the ground and thus got an absolute check, whereas to obtain tangent angle I would have to turn two angles, one depending on the other. While I do not claim my method to have been the only correct one, I maintain that it was not wrong because by adding my angles the officeman would have clearly seen my work and methods. Kindly give me your opinion.

Yours truly,

J. M. P.

Sutphen, W. Va., Feb. 12, 1910.

(The importance of checking can never be too strongly impressed upon engineers and their assistants. The sketch shows that the

transitman turned in his notes in such a way that the draftsman had an opportunity to add the angles and thus ascertain whether they were chordal or tangential. The draftsman is at fault. The instrument man, however, might have added a word or two to his sketch by way of explanation. In sending in such sketches the writer has found it is not always best to make them to scale, but it is well to exaggerate the details and add a few words in writing when such explanations will assist. —Editors.)

Rifling Delivery Pipe to Prevent Settling of Sand in Making Fills by Hydraulic Dredge.

Sirs: I notice in your editorial of Feb. 16, 1910, a reference to the settling of sand in pipes in connection with hydraulic filling of low land. You may be acquainted with the fact that on many such pipe lines used for filling in California angles are riveted spirally on the inside of the pipe at intervals, to set up a whirling motion in the mixture of water and sand or gravel, which obviates in a great measure the difficulties you speak of. Another point which might be of interest is that the same crude rifling has been much improved, and rifled pipe is used for pumping crude oil. Water is mixed with the oil and it is found that a water skin sets next to the pipe and is kept next to it by the whirling motion produced by the rifling. In this way the coefficient of friction in the pipe is very much lower than it would be for oil in a plain wrought iron pipe. Trusting that this may be of interest to you, I am,

Yours very truly,
LANGDON PEARCE,
Assistant Engineer, Sanitary District of Chicago.

Chicago, Ill., Feb. 23, 1910.

(In Cairo the material pumped was purely sand with a very small admixture of fine gravel. In the work done where the pipes had angles rivetted inside there was so little sand and gravel that the thinner mud formed a skin coat to reduce friction and also protected the metal from undue wear. The placing of angles in the pipes at Cairo was considered but given up because of the abrasive character of the material, although the cases in California both for mud and oil were known of at the time. If any readers can add to this subject we will be glad to hear from them. Less is known about pumping sand than is known about pumping mud.—Editors.)

Some Observations on Sheeting a Cofferdam.

Sirs: I am sending you a view of work being done at present on the excavation of a foundation for the center pier for the new street car and traffic bridge which is to cross the Bow River at this place. The work is in the hands of the Provincial Government, and is to replace the old wooden bridge which spans the river a short distance west of the new work, in line with Fourth street, East. I think the view is of interest, as showing clearly the details of construction of the cofferdam, and the difficulties encountered by the men during the progress of the work. The view is a general view of the excavation, within the cofferdam, on February 12, 1910. It will be seen that there are two rows of wooden sheet piling. The piling was driven 3½ ft. apart, clear, and consisted of 6-in. material tongued and grooved.

The material into which the piling was driven consisted largely of very clean gravel of different sizes, but packed hard, so that the piling drove very slowly, sometimes advancing but a small fraction of an inch at a blow. The result was that the sheeting did not drive straight, and also it separated in the course of its descent. Before much progress was made in the excavation the water started coming in very quickly, and this necessitated the use of one large pumping engine and shortly two. The space between the rows of piling was filled with fine soil, but in many places, in an endeavor to stop the numerous leaks, the soil was taken out, and replaced by packing it hard with heavy rammers. At this time, although the men were working only about 8 ft. below the surface of the river ice, there was from 1 to 2 ft. of water in the bottom of the excavation.

It is interesting to note the behavior of wooden sheet piling in this instance, and to note how imperfectly it kept the water out of the excavated area. It is probable that as the advantages of steel sheet piling become better known here, it will be used more for this class of work, replacing the wooden piling which is somewhat unsatisfactory for obvious reasons.

Yours very truly,
L. E.

Calgary, Alta., Feb. 19, 1910.

The Dam Failure at Dansville New York.

Sirs: Having read in Engineering-Contracting of Feb. 2, 1910, an article signed Q. E. F., in which an explanation of the failure of the Dansville dam was offered, the writer has been moved to give his views on the subject.

The failure of this little dam has caused considerable comment by the engineering press, the reason for which is a much greater mystery to the writer than is the cause of the failure. If before the dam had failed a much greater amount of space had been devoted to an explanation of why the dam did not fail there would have been much good done.

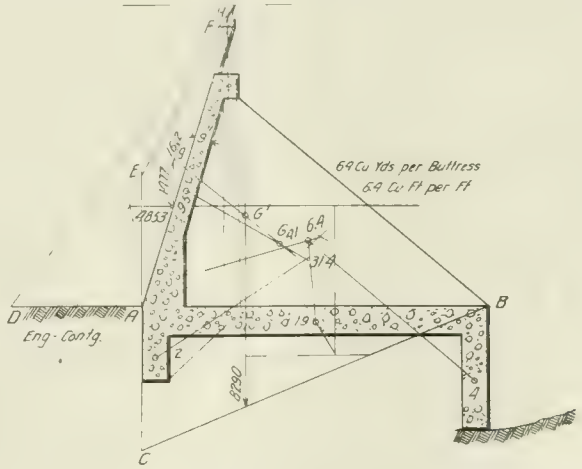
The remarks of Q. E. F. indicate the only possible explanation of why such defective structures are constantly being built, and afford the strongest argument for governmental or state control of all water power developments.

The idea of designing a dam for a soft bottom so that it will act as a beam supported by the abutments, while suited to office building construction, would hardly do for a dam. Dams are built as arches where the abutments are depended on to resist the endwise thrust of the water but such dams are only suited to solid rock bottoms. To design a dam for a soft bottom along the lines suggested by Q. E. F. would mean that, even though the abutment could be made sufficiently strong to resist the down stream thrust on the dam, the beam action would remove all weight of structure from the river bed and unless watertight sheet piling were driven along the upstream side, the water would soon break under and wash out the graved. This thing happened to a dam 60 ft. high built in the east. It was a buttressed dam, built over soft bottom. The water washed out a hole underneath about 50 ft. deep, but the shell of the dam, being very stiff, stood like a bridge, and the builder pointed with pride to this feature of the dam.

While stiffness of structure is an inherent defect in all concrete dams, it is to be regretted; the ideal dam is the one that will settle with the materials in the river bottom. All river bottoms, not solid rock, will settle some, and therefore the idea of making the dam a beam is to insure its undermining.

A safe dam for soft bottoms must consist of three distinct parts: The water raising part, the water tight sheet piling along the upstream edge and the extension mat along the down stream edge of the dam. The first is a part of every dam, but the Dansville dam lacked the two other parts.

A reference to the accompanying sketch of the Dansville dam will indicate the direction and extent of the several pressures acting on the structure at the time of the failure. The trapezoid AEHI is the diagram of vertical water pressure with its center of gravity at g. This diagram (as are all the others) is drawn so that, taking concrete at 145 lbs. per cu. ft., it represents an equal area of concrete. The trapezoid ADFI represents the horizontal down stream push of the water. At G' is the center of gravity of all dam materials and the vertical water weight. The weights acting at this point equal 8,290 lbs. per foot of dam. At the center of gravity of the trapezoid ADFI, 4,853 lbs. act, tending to slide the dam down stream. Owing to the fact that the wall of the Dansville dam along the down stream edge extends deeper than the up stream wall, the water will react on the bottom of the dam and tend to lift or float it. This pressure will be practically the full static pressure due to the full head at the up stream edge and will have some value at the down stream edge, the exact amount of which can not be accurately calculated. To be conservative, however, this pressure has been assumed as zero at B, giving the triangle ABC as the diagram of upward pressure. The amount of this pressure is 6,270 lbs. per foot of dam. Then 8,290 — 6,270 = 2,020 is the effective weight of all materials and superimposed water.



That is, the coefficient of friction between the dam's base and the gravel would have had to have been six times what it could possibly have been to prevent slipping. In all probability the earth was washed out as indicated in the sketch, thus decreasing the friction. Taking these things into consideration and the fact that when the water was over the base of the dam, that part of the concrete lost 62.5 lbs. per cu. ft., and that a vacuum must have formed under the overpour, it seems strange that the

dam did not fail much sooner. The only way to account for its remaining a single day is that there must have been more or less earth piled along the up stream edge and no doubt the flow of water was so small that there was slight undermining until at about the time of the failure.

R. C. BEARDSLEY,
Consulting Engineer.

Cleveland, O., Feb. 11, 1910.

Percentage Bidding from the Contractor's Point of View.

Sirs: Continuing on the subject of percentage bidding referred to editorially in your issue of February 9th, perhaps the best method of illustrating some of its objections may be afforded by basing various bids on the contract cited in the article.

We will assume, first, that the contractor relies on the engineer's judgment of quantities and that the engineer's estimate is advertised as follows:

100,000 cu. yds. of rock at $2.50...$250,000
300,000 cu. yds. of earth at $.75 ... 225,000

Total $475,000-100%

The contractor's estimate is:

100,000 cu. yds. rock at $2.25.....$225,000
300,000 cu. yds. earth at $.80..... 240,000

Total $465,000-98%

On completion of the work, the quantities of earth and rock being transposed, the contractor's payment amounts to:

300,000 cu. yds. rock at $2.45.....$735,000
100,000 cu. yds. earth at $.73½..... 73,500

Total $808,500

the item prices being 98 per cent of the engineer's cost.

Under the unit system the final payment would be:

300,000 cu. yds. of rock at $2.25.....$675,000
100,000 cu. yds. of earth at $.80..... 80,000

Total $755,000

Thus the percentage system would cost the city $53,500 more than the unit system, and as an instance of how it would guard the people it is not convincing.

Again, using the engineer's estimate as the 100 per cent base and the other figures assumed in the article as the contractor's estimate, we have:

100,000 cu. yds. of rock at $1.75..$175,000
300,000 cu. yds. of earth at $.50.. 150,000

Total $325,000-68⅓%

and the final payment, applying the percentage to the items, amounts to:

300,000 cu. yds. rock at $1.71.....$513,000
100,000 cu. yds. earth at $.51¼..... 51,250

Total $564,250

Under the unit system the final payment would be:

300,000 cu. yds. of rock at $1.75.....$525,000
100,000 cu. yds. of earth at $.50..... 50,000

Total $575,000

In this case the contractor loses $11,000 by the percentage system, although his final payment is 20 per cent greater than the engineer's estimated cost; and considering his low price on rock it is fair to assume that he anticipated his price of 50 cts. on earth would more than offset any loss he sustained in the rock, so that his actual loss would be still greater. Under the unit system he would have received $100,000 more than the engineer's estimate (not $50,000, as the editorial states—the earth item being omitted); but even at that he would lose money if the work were in a populated section.

Now, assuming that the contractor had reason to doubt the engineer's quantities and estimated the work would contain 200,000 cu. yds. of rock and 200,000 cu. yds. of earth, under the percentage system he would be unable to get the contract at any fair price, as his estimate, based on the correct quantities, would necessarily be higher than that of a competitor who was not aware of the conditions.

Unbalanced bids which result in a greater cost than estimated are the fault of the engineer, and as an employer is responsible for the acts of his agents, the municipality should bear the burden of such errors and not shift it to the contractor by means of a system calculated to put him on the defensive. Under the unit system he is assured of receiving his price for the work and under the percentage system he is not, if the items vary materially.

The practice of putting the contractor on the defensive is overdone, especially in municipal work, with its one-sided contracts, "club" clauses, penalties and protective methods. In the Borough of Brooklyn, where the percentage system is now in vogue for sewer contracts, a recent report stated eleven cases of unbalanced bids in the two years 1906 and 1907, before the adoption of the percentage system, "resulting in an apparent slight loss to the city." In these two years about 200 sewer contracts were let, approximating $2,000,000, and the slight loss resulting from those eleven unbalanced contracts would hardly seem to justify the adoption of a method to safeguard the people and put the contractor on the defensive. The report of the president of the Borough of Brooklyn for the year 1907 contains a table of the average item costs on 24 sewer contracts let under the percentage system in that year and also the contractor's average bids. In the report for 1908 the Chief Engineer of the Bureau of Sewers says:

When the percentage system of bidding was inaugurated the matter of fixing a price for lumber was given considerable attention. The market price of lumber was high at the time the contract was made and the cost of placing it in the trench was added to the price of lumber rather than to the price of excavation. Experience has shown that in making up percentage bids the cost of placing the sheeting should be added to the cost of excavation and not to the cost of the lumber.

Notwithstanding the fact that the cost of driving the sheeting is now placed on the pipe, the following table shows the engineer's estimate to be reduced on all items. The figures for 1909 are on average of the engineer's cost in about 20 contracts recently advertised.

Item.	Engineer's Estimate, 1907.	Contractor's Bid, 1907.	Engineer's Estimate, 1909.
6-in. pipe	$ 1.00	$ .95	$ .71
12-in. pipe	2.20	2.28	2.06
15-in. pipe	2.70	2.52	2.25
18-in. pipe	3.00	3.00	2.56
24-in. pipe	3.90	4.06	4.08
Sheeting and bracing	30.00	29.53	18.00

It is evident from these figures that the engineer's faith in his cost data is not absolute, but that the tendency is to reduce costs to approach the contractor's bid. The method of arriving at costs is described in the 1907 report as follows:

In preparing such estimates the engineer has to assume that the contractor will have to purchase his materials in the open market and pay the average price for cartage, etc.; also that he will be satisfied with a reasonable profit. All of these things are variable. A contractor may have materials on hand for the work or contracts which enable him to obtain his materials at greater advantage than the engineer can allow for. He may have men and plant which he wishes to keep employed, whether he makes a profit or not, in order that the cost of maintaining the plant may not be at a loss, or he may think that the work offers extra risk and that this should be insured by figuring at a larger profit.

Indeed, it may be stated that where bids all agree nearly with the engineer's estimate there is ground for suspicion that the contractors are taking the engineer's estimate and adding their profit and not figuring for themselves.

All contracts are more or less of a gamble, and the contractor assumes all the risk attendant on the performance of the work. The odds are sufficiently against him when he gambles on the quantities, but his objection is not based so much on the estimate of quantities, as your article states, but on the cost affixed to those quantities which denies him the opportunity to bid as his best judgment dictates.

You apparently miss the greatest objection to the system when you say it might be held to when exact knowledge might be an argument for unit bids, for in the event of an exact estimate the percentage system would be as good as any other. It is because of the impossibility of securing this exact knowledge in advance that the system is objectionable, and while it may prevent a contractor from unbalancing his bid, the final results may prove that the engineer unbalanced his quantities, which is quite as objectionable.

In connection with this acknowledged uncertainty as to final quantities there appeared recently in the Engineering Record a news item to the effect that exact contract quantities instead of approximate estimates must now be furnished to bidders of municipal work in Salt Lake City, and the item states further that the City Engineer has resigned. He doubtless appreciated what he was up against.

The objections to the percentage system are most admirably expressed in an article on the subject by Mr. H. P. Gillette in Engineering News, Nov. 19, 1903, which concludes as follows:

Our argument, in a nut shell, is that the percentage method of bidding will often result in a "heads I win, tails you lose" contract. The method is justifiable only where the engineer has an exact knowledge of cost and where he is fearful of receiving unbalanced bids. It seems to us that these two conditions are mutually contradictory, for the engineer need not fear an unbalanced bid where his surveys and computations have been so carefully made that his estimates of unit quantities are perfectly reliable, but if his surveys have not been so carefully made as to insure perfect reliability in the quantities, then it is altogether likely that his estimates of unit costs are as unreliable as his estimated quantities. Under the first assumption he has nothing to fear from unbalanced bids; under the second assumption he himself is quite likely to unwittingly unbalance the bids in his estimate of costs, thus doing the very thing that he seeks to avoid by using the percentage method of bidding.

And surely the fact that it is less tiresome than to listen to the reading of itemized bids and more fitted to the mental capacity of some public officials cannot be considered a good argument for its retention.

Yours very truly,

C. A. CRANE,
Secretary, The General Contractors' Association.

New York, N. Y., Feb. 24, 1910.

Special Convention of the American Society of Engineering Contractors.

A special convention of the American Society of Engineering-Contractors was held in Chicago at the La Salle Hotel for three days, February 24 to 26, inclusive. An invitation had been received from the Cement Products Exhibition Company to hold a convention during the Cement Show and the railroads gave special rates.

More than sixty members registered and steps were taken to organize a Chicago chapter, an Indianapolis chapter having already been organized. Two sessions were held to listen to a paper on Concrete Bridges by Mr. Luten, which was read by the author, and one on Concrete Chimneys by Mr. Carl Weber, read by the secretary, owing to absence of Mr. Weber. Trips were made to the steel works at Gary, Ind., to the track elevation work in the cities of Chicago and Evanston and to the Southwest Lake and Land Tunnel under construction by Geo. W. Jackson, Inc. The convention closed with a dinner on Saturday night at the La Salle Hotel. The regular annual convention of the society will be held late in the summer, the time and place to be selected by the executive board.

Personals.

Mr. Charles E. Waddell has opened offices for general engineering practice at 78 Patton Ave., Asheville, N. C.

Mr. G. Hamilton Holmes has taken offices at 78 Patton Ave., Asheton, N. C., where he will engage in general engineering practice.

Mr. Nelson O. Tiffany, Jr., following the dissolution of the partnership of Tiffany & Gail, will engage in the profession of civil and contracting engineering, with offices at 13 Erie County Bank building, Buffalo, N. Y.

Sir Robert W. Perks, the noted English engineer, will take charge of construction of the Georgian Bay Canal. Sir Robert was engineer in charge of construction of the Manchester Ship Canal, also of the Rio Janeiro Quays and of the Argentine and Chito Railway.

Mr. W. A. Hoyt has been selected by the U. S. Government to have charge of the design and construction of some large buildings at Rock Island Arsenal. Mr. Hoyt for over ten years past has made a specialty of reinforced concrete work. He was chief designing engineer for the Argo, Ill., plant of the Corn Products Company and has lately completed the erection of a concrete bridge at Cedar Rapids, Ia.

Mr. George A. Kyle has been elected to fill the office of Vice-President and General Manager of the Oregon Trunk Line. Mr. Kyle was formerly Chief Engineer of the road. Mr. Kyle, who has had wide experience in engineering and organization work, was employed for two years by the Rhodes syndicate as engineer in the Transvaal gold mines. He was also for a time with the Alaska Central Railway construction work and with the Grand Trunk Railway in Canada.

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of Engineering-Contracting—Contract News—Engineering World—The Dirt Mover.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The principal railway construction contract of the past week appears to be the one secured by Roach & Stansell, Memphis, Tenn. This contract calls for constructing the line of the Kansas City, Mexico & Orient from San Angelo to Eldorado, Tex. Other railroad contracts of the week include the following: Marco Lavorgna, Canton, Me., constructing the 8-mile steam railroad for the Elizabethtown Terminal R. R. from Westport to Elizabethtown, N. Y.; Archie Mason, Portland, Ore., for constructing a 4-mile extension of the State Portage Ry. at The Dalles, Ore.; the Patton-Gibson Co., Atlanta, Ill., for reconstructing a section of the Katy track from Aloho to Limestone Gap, Okla., the contract amounting to about $500,000; John F. Dolan, 160 Broadway, New York, for grading work at the classification yards of the D., L. & W. Ry. at Scranton, Pa.; and Joseph H. Sands, Roanoke, Va., for constructing the 9-mile Petersburg, Va., cutoff for the Norfolk & Western. Ry.—Four large contracts for work on the New York State Barge Canal are now being advertised. These are Contract No. 21, calling for 2.43 miles of canal; Contract No. 39, for 10.84 miles of canal; Contract No. 73, dredging 15 miles in the Champlain Canal; and Contract No. 78, constructing 1.23 miles of dike on the Oswego Canal.—Bids are said to be already in the hands of the officials of the Grand Trunk Pacific Ry. for constructing 135 miles of branch line from Tofield to Calgary, Alberta.—Bids are now being asked for these pieces of railroad construction: The Algoma Central & Hudson Bay Ry. is calling for bids for clearing, grading and bridge work on 31 miles of line in Ontario; the Intercolonial Ry. is calling for bids for constructing 9 miles of line between George's River and Sidney Mines, N. S., and the Brownwood North & South Ry. is calling for bids for constructing 18 miles of line between Brownwood and May, Tex.—Plans for the merging of nine large power companies in Michigan have been presented to the Railroad Commission of that state. The ompany will be known as the Consumers Power Co. and will ask permission to issue $35,000,000 in gold bonds.—It begins to look s though the government would revoke its permission previously given the city of San Francisco for obtaining a water supply from the Hetch Hetchy Valley. The Geological Survey and the reclamaiton service have reported to the Interior Department that it is not necessary that Hetch Hetchy Valley, in Yosemite National Park, should be available to San Francisco for the purpose of a municipal water supply. Secretary Ballinger accordingly has requested the mayor and supervisors of the city and county of San Francisco to show cause why the permission previously granted by the Interior Department for the contingent use of the Hetch Hetchy sites should not be revoked. These officials have been given until May 1 to make reply.

Town Meetings in Boston.

Boston, which recently began doing business under a new charter, has revived the old New England scheme of holding town meetings. The scheme was inaugurated by Mayor John F. Fitzgerald within a few days after his installation, and was made necessary by the fact that under the new city charter it is provided that the mayor and council shall make out the general appropriations for municipal improvements within 30 days after their inauguration. In order to do this town meetings were held in eight sections of the city for the purpose of hearing the wants of those neighborhoods. The mayor and his nine councilmen attended each meeting and heard what the citizens had to say. The purpose of the meeting was clearly set forth by the mayor in his address, in which he said: "We came here to listen to the wants of this neighborhood. You know the provisions of the charter and the necessity of care but haste in these appropriations. In order to expedite business we shall hear representatives of regular organizations first and then individuals. Gentlemen will be brief and rapid and will please confine themselves strictly to the points they wish to make." The scheme worked well, so well indeed that it is to be continued. As a result of it a great deal of time has been saved, and the mayor and council know exactly the various local demands. Of course all of these wants cannot be met, for the council has only about $2,000,000 at its disposal, and each district wanted about that sum.

An Engineering Feat.

We have not yet been accused of being nature fakers, and consequently it is with some misgivings that we reprint the following newspaper account of a truly remarkable "engineering feat": "English sparrows by a remarkable engineering feat rescued a wounded member of their flock from drowning in a rain conductor from the roof of a piazza of a house in the city of Montclair, N. J. During a sudden downpour one sparrow, crippled so that it could not fly, fell down in the pipe. Immediately the whole flock sat down in the gutter near the opening of the pipe, damming the water. Soon the gutter filled. Then, at a signal, the sparrows hopped out together and the great flood of water filled the pipe to overflowing, raising the imprisoned bird to the crest, and it fell to the ground." Now that it has been found that English sparrows, heretofore believed to be of no use whatever, can apply themselves to useful work, it is time to make public the discovery of a Texas contractor regarding bed bugs—the English sparrow of the insect world. This Texas contractor has found a use for bed bugs. He has found that their presence in a grading camp was extremely useful in causing the men to get up early in the morning.

Swamp Land in Missouri.

There promises to be much swamp land reclamation work in Missouri in the near future if the recommendations of the State Labor Bureau are carried out. This bureau has been making an investigation of the swamp and overflow land in the state, with a view to stimulating the land owners to a determination to protect and reclaim the swamp land. According to the special report of the bureau the Missouri alluvial deposits are as deep as the soil in the valley of the Nile and when reclaimed are as productive as the Egyptian land. It is estimated that at the present time in the valley of Missouri streams, including the Mississippi River, there are over 3,500,000 acres of overflow and swamp land that may be reclaimed or protected from overflows and made to produce as abundant harvests as ever were produced in the fields of the Nile valley. In other words, states the report of the bureau, the overflow land of Missouri is capable of sustaining the entire present population of the state.

Funds for U. S. Irrigation Projects.

The bill providing $30,000,000 for the completion of irrigation projects now under way construction by the U. S. Reclamation service has been advanced another stage by the U. S. Senate. As recommended by the Senate committee on finance, the bill is to be so amended as to make the government directly responsible for the payments of the certificates of indebtedness. The proposed amendment will authorize the secretary of the treasury to transfer from time to time from the general to the reclamation fund such amount as may be necessary to complete the projects, providing the aggregate shall not exceed $30,000,000. The secretary is to be authorized to issue certificates bearing not to exceed 3 per cent, the proceeds to be used to reimburse the treasury for the advances made. Ultimately the government is to be reimbursed from the reclamation fund.

Residents along the Belair Road are asking that the United Railways Co., of Baltimore, Md., to extend its line down that road.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ARIZONA.

The Evans Mines & Smelter Co., Newton Evans, President, Laughlin Bldg., Los Angeles, Cal., has completed surveys and has secured the capital for the construction of a 50-mile ore carrying road from Bill Williams Fork to Mohave Gap. No construction contracts will be let as the work will be done by the company.

CALIFORNIA.

The Humboldt & Eastern R. R. is projecting a railroad 175 miles long to extend east to the Sacramento Valley across Humboldt, Trinity and Shasta Counties. Location surveys have been made and the construction capital has been secured in part. The company intends to place engineers in the field about March 15th or 30th, depending on the weather conditions, to complete the detail work, preliminary to inviting contractors to bid on construction. Wm. O. Clark, Eureka, Cal., is President and J. N. Lentill, Eureka, Cal., is Chief Engineer.

ILLINOIS.

The Sterling & Northern R. R. Co., recently organized, proposes to construct a 40 mile line from Sterling via Emerson, Colita, Milledgeville, Carroll and Savannah. Most of the capital for the construction of the line has been secured and surveys for the line will be made shortly. There will be no construction work before May. Wm. Usborne, Sterling, Ill., is chief engineer and promoter.

INDIANA.

Bids are asked by the Board of Public Works, Henry W. Becker, clerk, Fort Wayne, Ind., until 2 p. m., March 16, for the city's portion of the track elevation work. The work will be awarded under two contracts—the one under improvement resolution No. 1 taking in all of the city's work at Calhoun St. and the other under improvement resolution No. 2 comprising the work of elevating the tracks at Fairfield Ave. and Broadway. Certified checks for $2,100 for the work at Calhoun St., for $700 for the work at Fairfield Ave. and $1,200 for the work at Broadway are required with the bids.

KANSAS

The Wichita, Kinsley, Scott City & Denver Air Line R. R., which projects a 350 mile line from Wichita, Kas., to Denver, Colo., has completed its surveys for part of the line and has secured the capital for construction. Construction contracts are to be let about May 1. T. E. Luttgerding, El Dorado, Kas., is chief engineer, and W. F. Brown, Iuka, Kas., is president.

MISSOURI

Ware & Spencer, Railroad Contractors, Bosworth, Mo., have 30,000 cu. yds. machine and wheeler work to let; short haul, 17 cts. per cu. yd.; 1½ cts. for overhaul after 500 ft.

The Manning, Wellman & Judd Construction Co., of Ottumwa, Ia., promoters of a projected 7½ mile electric railway from Moberly to Huntsville, Mo., will at once let contracts for constructing the line. Surveys have been made and $150,000 of capital has been secured. Chas. A. Wellman, Ottumwa, Ia., is interested.

NEW YORK.

Plans are under consideration for the construction of an electric railway from Oyster Bay, L. I., to Farmingdale. As projected the line will be about 14 miles long. Surveys have not yet been made. Raymond Smith, Oyster Bay, N. Y., is interested.

OHIO.

The Cincinnati, Hamilton & Dayton Ry., Frank H. Alfred, Chief Engineer, Cincinnati, O., has not yet reached a decision concerning its projected improvements in Cincinnati. The company has been awaiting developments of the proposed Union Station, which has been under consideration by the various railroads and interests in Cincinnati.

Construction work is to be started April 1 on the projected line of the Cincinnati, Portsmouth, Pomeroy & Pittsburg Ry. The projected length of this road is to be 438 miles and its route is on the Ohio side of the Ohio River from Cincinnati, O., to Pittsburg, Pa. A. E. Cox, Huntington, W. Va., is Trustee, and C. P. Anderson, Huntington, W. Va., is Chief Engineer. This road has been mentioned several times in these columns.

OKLAHOMA.

The Patton & Gibson Co., Ltd., Pittsburg, Pa., and Atlanta, Ill., has the contract for the Stringtown, Fellico and Limestone Gap revisions on the Missouri, Kansas & Texas Ry., in Oklahoma. The contract includes 500,000 cu. yds. earth excavation, 270,000 cu. yds. rock excavation and 12 concrete bridges. About 100,000 cu. yds. of team work has been sublet to W. C. Williams, Kansas City, Mo. None of the other work is to be sublet. Patton & Gibson started work on Feb. 15 and now have four steam shovels on the job.

OREGON.

The contract for the construction of the extension of the State Portage Ry. has been let to Archie Mason of Portland, Ore. The work consists of about 30,000 yds. of grading, 300,000 ft. B. M. of bridging and four miles of track laying. The new terminal at The Dalles will consist of an incline track down to low water, laid on top of a pile and plank bulkhead filled with rock, any other form of construction being liable to destruction by ice. J. P. Newell, 32 Washington Bldg., Portland, Ore., is engineer for the State Portage Ry. Commission.

TENNESSEE.

Surveys have been made for the projected 30-mile line of the Westmoreland & Redboiling Spring R. R. As projected the road is to extend from Westmoreland, Tenn., on the Louisville & Nashville R. R., to Redboiling Springs, passing through Lafayette. The capital for constructing the line has not been secured as yet, and the time for awarding construction contracts is uncertain. W. A. Smith, Lafayette, Tenn., is President and A. J. Bright, Nashville, Tenn., is Chief Engineer.

TEXAS.

The W. & C. R. R. Co. is building a new line from Blocker to Carthage, Tex. Montgomery Bros., Marshall, Tex., have the contract and have moved their outfit out to the work. Walker & Ervin, Marshall, Tex., are the Engineers.

The Dallas Traction Co., E. L. Lancaster, general manager, 334 Commerce St., Dallas, Tex., will let construction contracts April 1 for two miles of line in Dallas, Tex.

Bids will be received at the office of Brooke Smith, president of the Brownwood North & South Ry., Brownwood, Tex., until 2 p. m., March 10, for clearing, grubbing and grading about 18 miles of standard gage railroad between Brownwood and May, Tex. Profile, etc., at office of Brooke Smith. John Meade, Brownwood, Tex., is chief engineer.

The contract awarded the Morey-Faulhaber Construction Co., Chemical Bldg., St. Louis, Mo., as mentioned in these columns last week, is on the San Saba extension of the Gulf, Colorado & Santa Fe Ry. The work begins at Lometa and extends 230 miles west. The contract includes approximately 850,000 cu. yds. of earth excavation, rock excavation and embankment, wood trestles, concrete masonry, stone masonry and piling. None of the work has been sub-let as yet, but part of it will be in the near future.

Roach & Stansell, North Memphis Savings Bank Bldg., Memphis, Tenn., has been awarded a contract by the Kansas City, Mexico & Orient Ry. for constructing its line from San Angelo to Eldorado, Tex. The contract includes approximately 400,000 cu. yds. of earth excavation and 200,000 cu. yds. road excavation. Roach & Stansell will do the work with their own forces; they are now at work and expect to complete the contract by Oct. 1, 1910.

As stated in our last issue, the Atchison, Topeka & Santa Fe Ry. has awarded contracts for over 100 miles of new line on the Gulf, Colorado & Santa Fe Ry., the contractors being Morey-Faulhaber, Chemical Building, St. Louis, Mo.; Levy & Owens of Galveston, Tex., and the C. H. Sharp Contracting Co., Sharp Bldg., Kansas City, Mo. The contractors will build the line complete with the exception of track laying and surfacing, which will be handled by the railroad forces. F. Merritt, Galveston, Tex., is chief engineer, Gulf, Colorado & Santa Fe Ry.

UTAH.

The Logan Rapid Transit Co., recently incorporated with a capital stock of $100,000 to build an electric railway in Logan, Utah, has just finished about 2½ miles of line in that city. The company does not expect to do any more work this year. David Eccles, Ogden, Utah, is president.

VERMONT.

The Rutland Railway, Light & Power Co. has completed surveys and has secured the capital for the construction of a 7 mile extension from Fairhaven, Vt., to Poultney, Vt. Construction contracts will be let about April 1. G. T. Rogers, Binghamton, N. Y., is president and Geo. S. Haley, Rutland, Vt., is chief engineer and general manager.

WEST VIRGINIA.

Carpenter & Boxley, Glen Alum, W. Va., railroad contractors, have 3½ miles of heavy work at Glen Alum, W. Va., and 2 miles of heavy work, including three tunnels at Big Four, W. Va., and would like to hear from some of their old men.

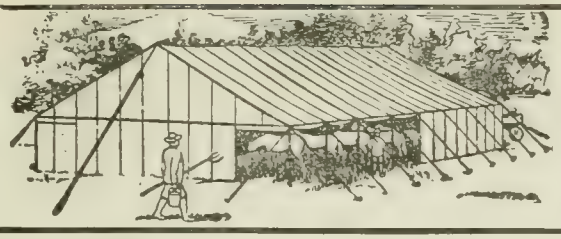
WASHINGTON.

Stone & Webster, Boston, Mass., are planning to double track a short distance on the Tacoma end of their interurban line between Seattle and Tacoma. They will also purchase two interurban cars. R. T. Laffin, 219 Pioneer Bldg., Seattle, Wash., is district manager for Stone & Webster.

CANADA.

Tenders are asked by A. W. Campbell, Chairman Government Railways Managing Board, Ottawa, Ont., up to and including March 15, for the construction of a line of railway for the Intercolonial Ry., between George's River and Sydney Mines, N. S., a distance of 9.09 miles. Plans anl specification may be seen at the Stationmaster's Office at Sydney Mines, N. S., and at the office of W. B. McKenzie, Chief Engineer, Moncton, N. B., where forms of tender may be obtained.

Tenders are asked by C. N. Coburn, Chief Engineer, Algona Central & Hudson Bay Ry., Sault Ste. Marie, Ont., until noon, April 15, for the clearing, grading and bridge work on the 31 mile (more or less) section of the Algoma Central & Hudson Bay Ry. between Hawk Lake Junction, Algoma Central & Hudson Bay Ry., and Hobon, Canadian Pacific Ry.



Over 40 years building Contractors' Tents, Tarpaulins and Canvas Goods of Every Kind

Stable Tent **30 x 49** 10 oz. army duck, roped on ridge, eaves, across bottom of gables and every seven feet over top with 6 foot detachable 10 oz. S. F. walls and poles for **$160,00** net. First-class in every respect. Other sizes and weights in same proportion. *Write for Catalogue.*

MORRISON TENT & AWNING CO., 115-117 OLIVE STREET ST. LOUIS, MO.

Power Developments, Levees, Drainage and Irragition Works.

ARKANSAS.

The letting of contracts for work in the Plum Bayo drainage district has been indefinitely postponed. Parkes & White, Seuyard Bldg., Pine Bluff, Ark., are the Engineers.

Roach & Stansell, Memphis, Tenn., have 61,000 cu. yds. of U. S. levee work at Wilson, Ark., which they are ready to sub-let. The time for completion is Dec. 1, 1910. Maj. M. L. Walker is U. S. engineer in charge.

The contract for constructing nine miles of levee, containing 165,700 cu. yds. of material, for the Woodson Levee District has been let to Peters & Adams, Fort Worth, Tex., at 16.1 cts. per cubic yard. The contract for constructing eight concrete culverts, eight gates and a reinforced concrete flood gate was let to the Nick Peay Construction Co., Little Rock, Ark., at $13,000.

CALIFORNIA.

The Modesto Irrigation District has awarded the contract for constructing outlet gates to the Dallas and Warner Lake Reservoir to T. K. Beard, Modesto, Cal. The work will be done by force account. The estimated cost is $20,000.

COLORADO.

Bids will be received at the office of the Kiowa Valley Municipal Irrigation District at the residence of Charles T. Walker, Section 13, Township 6 South, Range 63 West, Kiowa, Elbert County, Colorado, until 2 p. m., March 19, for furnishing materials and constructing the several dams, canals and ditches to be built for the district. Plans, etc., are at the office of the District Engineer, F. H. Whiting, Room 239 Century Bldg., Denver, Colo., or at the office of the Kiowa Valley Reservoir & Irrigation Co., 210 McPhee Bldg., Denver, Colo., and at the office of the district after March 12.

J. H. Nations, grading contractor, Swink, Colo., and El Paso, Tex., has been awarded all the concrete work on the Nepesta Ditch & Irrigation Co.'s intake ditches. The work consists of one headgate, one dam and wing walls and various other improvements. J. H. Nations also has the work of enlarging the Timpas Creek Ditch & Land Co.'s headgate and will put in a number of drops and spillways. All of this work is reinforced with ½-in. steel. P. J. Clark, Swink, Colo., is Manager for J. H. Nations.

GEORGIA

As stated in our last issue, bids are being asked by Col. Dan C. Kingman, U. S. Engineers, Savannah, Ga., until noon, March 21, for dredging refractory material in Brunswick Harbor, Ga. The work includes the removal of material as follows: In East River, where there are two lumps with a total area of about 2,300 yds., and where the cutting to be made is from 2 to 8 ft. in depth. In Turtle River, opposite the northwest end of Buzzards Island, there are several lumps, whose aggregate area is approximately 9,000 sq. yds., and where the cutting to be done varies from ½ to 2½ ft. There is quite an extensive lump in the lower shoal in Turtle River, below the mouth of Jointer's Creek, and several shallow shoals which have a total area of approximately 14,000 sq. yds. The depth of cutting at this shoal varies from 1 to 5 ft. The material to be removed is thought to be of a marly formation consisting of shell and sand cemented together.

ILLINOIS

Roach & Stansell, Memphis, Tenn., have 350,000 cu. yds. of levee work at Gale, Ill., which they will sub-let. The work is all open fields for an average 9 ft. levee. The work was let by the East Cape Guardeau and Clear Creek Drainage District, of Cairo, C. E. Farbush being an engineer in charge.

MISSISSIPPI.

Roach & Stansell, Memphis, Tenn., have two or three pieces of levee work in the Mississippi Levee District near Greenville to sub-let.

MISSOURI.

Roach & Stansell, Memphis, Tenn., have 45,000 cu. yds. of U. S. levee work at Crosno, Mo., which they are ready to sub-let. The work is to be completed by Dec. 31, 1910. Maj. M. L. Walker is the U. S. Engineer in charge.

NEW YORK.

The United Engineering & Contracting Co., 17 W. 42d St., New York City, has 150,000 cu. yds. of rock work on the New York State Barge Canal at Lockport, N. Y., which it will let.

Ziba L. Squier, Jamestown, N. Y., has 100,000 cu. yds. of dredging in Chautauqua Lake to let.

Contracts for work on the New York State Barge Canal were let Feb. 16, as follows: Contract No. 75, for guard gates at Spencerport and 1.5 miles of work in Monroe County, J. B. & J. M. Cornell Co., 26th St. and 11th Ave., New York City, at $42,917; Contract No. 49, for 6.18 miles of canal in Monroe County, Bellew & Merritt Co., Tuckahoe, N. Y., at $750,270.

TEXAS.

Roach & Stansell, North Memphis Savings Bank Bldg., Memphis, Tenn., are the contractors for 1,000,000 cu. yds. of levee work in Burleson County, Texas. This levee extends about 25 miles along the Brazos River. Roach & Stansell have their headquarters at Bryan, Tex., and Walter Stansell is in charge and ready to sub-let as many as 500,000 cu. yds. The Chief Engineer of the work is J. E. Nagle at College Station, Tex. The time of completion is Sept. 1st, 1910. Roach & Stansell on Feb. 24 sent a special train over the I. C. from Memphis containing 20 carloads of their own equipment and The Cotton Belt ran a special from Memphis bearing 150 men for this job.

The commissioners of Bernalillo County, New Mexico, have awarded the contract for raising the dike at Alameda, N. M., 2 ft. to J. B. Sanchez, Albuquerque, N. M., at 17¾ cts. per cubic yard. The contract for constructing a wing dam north of the Barelas Bridge was let to the Missouri Valley Bridge & Iron Co., Leavenworth, Kas., at $1,834

A local company has been organized at Valley City, N. D., to build an electric line from down town to the Northern Pacific's new station on the hill.

The Morris County Traction Co., with offices at Park place, Morristown, N. J., is planning to begin the extending of its lines as soon as the weather will permit. It is probable that the company will soon apply to the board of aldermen of Morristown for a franchise to the Lackawanna station in Morris St. Although the company has not as yet adopted any route from the park to the station it has made surveys down South St. to Pine St. and thence to the depot, and from its present line in front of police headquarters down Morris St.

Committees have been appointed at Clinton, S. C., and Greenville, S. C., to secure right of way for building a branch of the Greenville, Spartansburg & Anderson Ry. from Greenville to Clinton.

Local capitalists at Carlsbad, Eddy county, New Mexico, are organizing a company to build to Knowles, Monument and Lovington in the plains country to the Texas line.

The Cheat Valley & Monongahela Valley Ry. Co., has ben chartered and proposes to construct a railroad from Albright, Preston county, West Virginia, along Cheat River to the West Virginia-Pennsylvania line, near Cheat Haven. James W. Flynn and others of Kingwood, W. Va., are incorporators.

As the result of the acquirement of the Pittsfield Street Ry. Co. of Pittsfield, Mass., by the New York, New Haven & Hartford R. R., it is believed that the line of the Berkshire Street Ry. Co., now running from Bennington, Vt., to Great Barrington, Mass., will be extended south into Connecticut, making it a part of the trolley system controlled by the New England holding company of the N. Y., N. H. & H. R. R. Co.

Contractors have work well under way on the double tracking of the Northern Pacific between Billings and Huntley, Mont. The new track will be constructed on the north side of the present track to within a short distance of Huntley, where, it is understood, it will cross over to the south side. The bridge over the Yellowstone river will not be altered, the tracks interlacing on the structure.

Officials of the Union Pacific R. R., according to reports, have announced that engineers have prepared plans for the construction of the improved yards and shops at North Platte, Neb., estimated to cost $1,500,000. Other improvements, such as planting timber around the city for the purpose of raising tie wood for the company, are estimated to raise the expenditure several million dollars. R. L. Huntley, Omaha, Neb., is chief engineer of the company.

The Pennsylvania R. R. is shortly to take up the matter of completing the belt line which runs from Gloucester City, N. J., through Audubon, N. J., to Haddonfield connecting there with the New York division. It is probable that the Pennsylvania R. R. will complete part of the work with its own forces. The La Cato Construction Co., of Audubon, N. J., is reported to have one of the sub-contracts and is said to have received orders to have a large force of men ready. Geo. P. Miller, Jersey City, N. J., is principal assistant engineer.

The New York, Philadelphia & Norfolk R. R., Elisha Lee, superintendent, Cape Charles City, Va., is planning a number of improvements for its lines in Delaware. The double track is to be extended to Princess Anne and there connected with the long siding already existing to King's Creek, making 21 miles of double track south from Delmar, Del. The wooden culvert trestles between Princess Anne and King's Creek are to be replaced by concrete culverts and a concrete sheet pile bulkhead will be built beside the wharf and freight house at Cape Charles, Va.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

C. O. Lynn, J. C. Carrigan and E. F. Emerson have organized the Carrigan & Lynn Construction Co., of Birmingham, Ala., and will engage in a general construction business. The company is incorporated with a capital stock of $20,000, fully paid in.

Definite plans are to be announced shortly for the Columbus, Mississippi & Western Alabama R. R., which projects a line from Winfield to Columbus, Miss., via Vernon, Ala. Charles F. Sherrod, Columbus, Miss., is president.

The Alabama City, Gadsden & Atalia Ry. has secured the material for the new line that is to be constructed to the plants of the Alabama Consolidated Coal & Iron Co. in North Gadsden and work on this extension will begin some time this month. The company is pushing its extensions with all possible speed and will soon have all parts of Gadsden accessible over its lines.

The town of Roanoke has closed an option on a place known as High Shoals, seven miles north of town, containing a considerable fall of water on Wehadkee Creek. The town proposes to utilize the water power for the generation of electricity.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys have been made, right of way secured and some of the material bought for a new railroad to be built by the Doniphan Lumber Co. from Letona, in White County, on the Missouri & North Arkansas, west into Cleburne County, for a distance of about 15 miles. The road, as planned, will touch within a few miles of Quitman and later will be extended to that place.

Arch L. Russell of Farmington, Mo., has purchased the interests of John Ellis in the firm of John Ellis & Co., contractors. A reorganization has been effected and the firm name changed to the Kiamichi Tie & Timber Co. R. A. Clarkson, who was associated with Mr. Ellis, continues with Mr. Russell and will have charge of the office in the American National Bank Bldg., Fort Smith, Ark. Mr. Russell will have active management of the field operations. The Kiamichi Tie & Timber Co. will assume the contract to furnish the Rock Island railroad company with 1,000,000 ties, of which 300,000 are yet to be delivered. The cutting of stumpage for ties is confined to land between Fort Smith and Hugo, the company controlling about 25,000 acres.

The Arkansas State Board of Railroad Incorporators has granted the Central Arkansas & Eastern R. R. Co. authority to construct an extension of its line from McGregor, Lonoke County, to Stuttgart, and thence to a point on the Chicago, Rock Island & Pacific Ry. in Prairie County, a distance of 35 miles. The line is estimated to cost $780,000. Robert M. Foster, Lewis Sachs, W. J. Locke and T. B. Goldsby applied for the permit.

According to reports the Missouri & North Arkansas R. R. contemplates the construction of a branch line from Letona, Ark., on the main line in White County to Bald Knob, a distance of 15 miles. The proposed line will give the Missouri & North Arkansas direct connection with Memphis over that division of the St. Louis, Iron Mountain & Southern Ry. S. W. Lee, Eureka Springs, Ark., is consulting engineer of the company.

Surveys are under way for the new railroad projected between Cotton Plant and the Cache River. The road will leave the Missouri & North Arkansas at the Cotton Plant depot and will extend due west to the Cache River.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Oakland Traction Co., Oakland, is to construct an extension of the present Euclid Ave. car line from Hilgard Ave. to the Berryman reservoir in the Cragmont District.

Test pits are being sunk at Oakland to determine the nature of the strata along that portion of the estuary where the 2,700 ft. of seawall and quay are to be constructed with the money voted at the bond election of Nov. 15th. City Engineer F. C. Turner, assisted by members of his office, is superintending the work of determining the nature of the ground upon which the seawall is to be built. The borings which have already been made in the test pits are said to have revealed the fact that the hard strata is from 12 to 15 feet below the top of the soft mud. The borings are being made to a depth of 45 feet. Plans and specifications for the work are to be drawn up as soon as the money is obtained from the sale of the bonds.

The project for building a steel pier at the foot of American Ave. at Long Beach, has been revived and Col. W. J. Horne, retired, living in that street, has agreed to subscribe the first $1,000 and also promised he will make a canvass for contributions.

Grading work for the extension of the Holton Interurban R. R.—the eastern connection of the San Diego & Arizona R. R.—has begun at El Centro and it is expected the track will be completed to New River, a distance of about ten miles, before summer.

As is well known the Harriman system is planning the construction of many miles of branch lines in northern and northeastern California, Southern Oregon and Western Nevado with primary object of strengthening its hold aginst the prospective aggressions of the Hill combination and of Gould's new Western Pacific road. Five different and separte branch lines have been mapped out as follows: California Northeastern Co., 90 miles; Oregon Eastern Railway Co., 150 miles; Modoc Northern Railway Co., 80 miles; Goose Lake & Southern Co., 160 miles; Fernley & Larsen Railway Co., 120 miles.

The county supervisors at Oakland have advertised for bids for a franchise asked by the Southern Pacific Co., for a line to run through Northrae and connect the present lines in Berkeley and Ocean View.

The Northwestern Pacific R. R. is planning to expend $600,000 on the extension of the Fort Bragg & Southeastern, 14 miles to Willetts. W. C. Edes, San Francisco, is chief engineer.

The Tibbitts Construction Co. of San Francisco has begun work on the Twin Peaks reservoir for the city of San Francisco, in which will be stored the water for the auxiliary fire system. The first work will be the building of two tunnels, which will contain the pipes carrying the water from the reservoir to the outlet 150 ft. lower down the hillside. Each tunnel will be 10 ft. in width and 8 ft. in height. The contractors are allowed 320 days in which to complete the work. The contract price is $158,143.

It is reported that Theodore A. Bell of Sacramento will shortly apply to the city trustees of Vallejo for a franchise to construct an electric railway to Sulphur White Springs.

The Fullerton-Richfield R. R. Co., a subsidiary of the Atchison, Topeka & Santa Fe, has been incorporated and proposes to build a road from Fullerton to Richfield, a distance of five miles, for the hauling of freight. The road when built will cut seven miles from the present distance from Los Angeles to San Bernardino. It is stated that the construction of the road will begin as soon as the contracts can be awarded and the material obtained. The directors of the company are: A. G. Wells, Los Angeles, general manager, A., T. & S. Fe. Ry.; G. Holterhof, W. H. Brenner, J. I. Hibbard and C. W. Jones.

The Rubio Canyon Land & Water Association of Altadena is planning to construct a 3,000,000 gallon storage reservoir at the mouth of Rubio Canyon. The reservoir will cost about $14,000.

The Vallejo & Northern R. R. has an application before the city trustees of Woodland for a franchise on 2d St. in that city.

Preliminary plans have been completed for the proposed tunnel in Stockton St., from Bush St. through the hill to Clay St., at San Francisco. M. Manson is city engineer.

Two miles and one-half of rebuilt Santa Fe Ry. track between San Diego, Cal., and Santa Ana have been thrown open to traffic from Del Mar to Encinitas. There still remains a large amount of work on the Del Mar stretch, including a big fill across Sorrento flats, and laying track to a point where the tunnels are to be bored through the hills between Sorrento and Rose Canyon. The expenditure planned by the Atchison, Topeka & Santa Fe division will amount to about $1,000,000. H. C. Phillips, Los Angeles, Cal., is chief engineer of the company.

The Petaluma & Santa Rosa R. R. is to be shortly extended to Guerneville. The electric road now has its terminus at Forestville, only a few miles distant from the Guerneville section. It is understood that this is only the beginning of the expansion of the road and that eventually it will be extended to the ocean.

Alva Udell, an attorney of San Francisco, has filed notice appropriating 200,000 ins. of the waters of Eagle Lake and the streams flowing into the lake and 200,000 ins. of the waters of Willow Creek. The waters of Eagle Lake are claimed by a prior location made by the Lassen-Willow Creek Water Co., a company formed about four years ago for the purpose of tapping the lake by a tunnel over a mile in length.

The Hallwood Irrigation Co. of Marysville, recently incorporated with a capital stock of $25,000, is planning to have work started shortly on the ditch which is to convey water from the Yuba River at DaGuerre Point onto the lands of the company. The directors of the company are Marshall Diggs, Thomas F. Matthews, Fred D. Groh, E. E. Long and Byron Jakes.

The Southern Pacific Ry. Co. is to issue bonds amounting to $50,000,000, which amount will probably be used for the construction of new terminals at San Francisco on the property purchased several years ago for $2,000,000 and new track work. William Hood, San Francisco, Cal., is chief engineer of the company.

Work is to be started shortly at Colton by the Southern Pacific. The changes include lowering of the racks through the city, keeping up the grade of the double tracks to Bloomington.

E. P. Dewey, city engineer, Long Beach, has prepared plans for a steel and concrete pier to be erected at Devils Gate, Long Beach. The plans provide for a pier proper 700 ft. long and 18 ft. wide, with an outer wharf 40 ft. wide and 106 ft. long. It is a single-deck structure, the deck being 2 ft. higher than the pleasure pier at Pine Avenue. The pier as proposed will be supported by concrete cylinders connected with arches of solid concrete. Over these will be laid a floor of Concrete, flanked on either side by a concrete parapet 3 ft. high. The pier would extend into water 12 ft. deep at low tide.

The Board of Trade of Pomona is now securing right of way between Pomona and Claremont for the Pomona-Claremont-Upland electric line and it is hoped to have the line in operation by July 1. Bonds for the road have been sold and the material has been ordered.

The Vallejo & Northern R. R. is stated to have secured the necessary capital for the con-

CONTRACTORS' TENTS
PLAIN DUCK WATERPROOFED DUCK

Our waterproofing and mildewproofing process is the best known. We do this work ourselves and consequently are in a position to name bottom prices. Our workmanship and materials are not excelled. We offer you QUICK SERVICE. BEST TENTS MADE.

THE COLUMBUS TENT & AWNING COMPANY, Columbus, Ohio

struction of its line and work will be started this year. The company was incorporated to build a double track system from Vallejo to Sacramento. T. T. C. Gregory, Fairfield, is president.

The California Midland R. R. has been securing options on land in Auburn for its depot and yards, and is reported to have let the contract for constructing the road from Grass Valley to Auburn, the work to begin this spring. The road has been surveyed from Marysville through Wolf to Auburn and from Wolf to Grass Valley. Wolf, the junction point on the line, is located about ten miles north of this city, on the Bear River, just over the boundary between Placer and Nevada counties. The grade to Hammonton from Marysville is practically ready for the rails.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Advices from Trinidad state that the Yankee Fuel Co., the Santa Fe, Raton & Eastern, the Santa Fe, Raton & Des Moines and associated railroad companies, which some time ago went into the hands of a receiver, are to be reorganized at once. The properties in Colorado and New Mexico are to be improved and developed, over $1,000,000 being spent for that purpose. H. W. Kruse, Raton, N. M., is general manager.

The Denver & Gulf R. R. Co. has closed an agreement with the city of Lamar, Colo., agreeing to have in operation 150 miles of standard gage railroad between Lamar and Texhoma, Tex., on or before July 1, 1911. This with other agreements now in force in Texas, it is said, will insure the completion of 350 miles of the system by the date given. The agreements provide that the road shall be built with a maximum grade of not exceeding 1 per cent per mile, and the curvature will not exceed 3½ degrees per 100 ft. at any point. The distance between Denver and Lamar will be 70 miles less by this road than the present distance by rail. The road is bonded for $40,000 a mile. The agreement required engineers to be in the field at Lamar on or before Feb. 26, 1910, and requires actual physical construction to be begun at Lamar on or before May 1, 1910, and to continue uninterrupted until the entire system is completed.

A meeting of the farmers in the Otero Irrigation District has been held at La Junta to hear the report of George Anderson, Denver, engineer for the district. He reported that it would take $250,000 to put the canal in first class shape. This will include cement headgates, syphons and the straightening and widening of the ditch. The farmers had already voted bonds of $100,000 toward the work and promised to vote an additional $150,000 to have it completed.

Timber men along the right of way of the Missouri Pacific state that they have been requested to submit bids for furnishing ties for the proposed extension of that road westward from Steamboat Springs, Colo., and that engineers are already busy making surveys across the western part of Routt.

The Colorado Fuel & Iron Co. has been awarded contracts by the San Diego & Avijano R. R. of Mexico for 6,000 tons of steel rails, to cost about $300,000. They will be used for an extension of that road. It will require 200 freight cars to carry the shipment to the Pacific coast, from which place the rails will be distributed along the proposed road.

The city council of Greeley has granted Albert Howard and others permission to change the course of the Cache La Poudre River on condition that they bear all expense, and assume all responsibility for damages. Those interested claim the river is washing away their crops. They will undertake the project immediately.

Durango, Colo., Aztec, N. M., and Farmington are taking steps toward raising the required bonus to insure the construction of the Arizona & Colorado Ry. through those places. This company was recently incorporated as mentioned in ENGINEERING-CONTRACTING.

J. M. Gingrich, of Denver, has purchased 4,600 acres of land northeast of Greeley and is planning to spend $50,000 in reservoir improvements on the land.

The citizens of Durango have subscribed $50,000 to secure the entrance of the Southern Pacific Ry. to that city, and will raise an additional $50,000.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city council of La Grange, Ga., has granted a franchise for an electric street railway to Messrs. Aikin and Preston and others of Macon, C. M. Awtrey, G. E. Dallis and others of LaGrange. The company will begin construction of a number of miles of trackage at an early date after the organization is perfected and it is expected the railway will be in operation by the end of 15 months from date of franchise.

The Georgia, Southern & Florida Ry., W. C. Shaw, Jr., chief engineer, Macon, Ga., is to build a $50,000 repair shop at Valdosta. The road is also filling in a large tract of land and this tract is to be converted into freight terminals. In addition to the tracks now in use the road will put in ten new switches.

The Rome & Northern R. R., H. M. Smith chief engineer, Rome, Ga., has surveys under way for an extension from Gore to Tunnel, a distance of about 30 miles. It is said that the extension will be built at once if the people along the route will donate the right of way.

The South Georgia & West Coast Ry., Chas. T. Tillman, purchasing agent, Quitman, Ga., has placed an order for 15 miles of 60 lb. steel rail which will be used to replace some 40 lb. rail now in use.

The construction of a railroad from Elberton to Washington, Ga., is under consideration. The Chamber of Commerce of Elberton, W. O. Jones, president, is advocating the road.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

According to a reported statement of H. E. Dunn, Payette, Idaho, vice president and general manager of the Payette Valley R. R., construction work will be started as soon as weather permits on building the line from New Plymouth to Emmett, Idaho.

The Nez Perce & Idaho R. R., now under construction between Vollmer, Idaho, and Nez Perce City, 14 miles is to be in operation by April 1. Rails for the line are already on the ground.

Judge J. H. Hawthorne, St. Paul, Minn., has filed at the U. S. Land Office in Boise applications for a site for a reservoir and for right of way for canals to be constructed on an irrigation project in Owyhee county for reclaiming 15,000 acres of land.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The construction of an electric railway from Rochelle by way of Earlville to Ottawa is under consideration. H. J. Burdick, Elgin, Ill., is interested.

The Illinois Traction System, H. E. Chubbuck, general manager, Peoria, is planning to expend $150,000 for improvements in Bloomington. These improvements include several extensions, laying of heavy rail on several of the city lines, new pavements, improvements at the power plant and the transformation of the Normal street cars to the pay as you enter variety.

Receivers for the Illinois Tunnel Co. of Chicago probably will ask the court to authorize an issue of $3,000,000 two year 6 per cent receivers' certificates with which to begin the work of installing its projected telephone system.

Plans have been outlined before the city council of Elgin for the projected electric belt line of the Elgin-Evanston R. R. According to the franchise application the company wishes to enter Elgin along a private right of way and the proposed line is to be a direct road from Elgin to Evanston. T. M. Sayer is president.

The Chicago & Alton R. R. has resumed work on its double tracking north and south of Springfield after the halt made necessary by the cold weather. Nearly 1,000 men have been put to work. The double tracking includes 20 miles out of Bloomington and south of the city from Chatham to Carlinville.

The Chicago & Alton R. R., E. L. Crugar, resident engineer, Springfield, is to expend $300,000 for the enlargement of the Ridgely freight yard and for the building of a roundhouse at Springfield.

The Florida Everglades Reclaimed Land Co., of Chicago, has been incorporated with a capital stock of $25,000, and proposes to engage in a general drainage and contracting business. The incorporators are C. D. Forhner, Charles S. Holland and William Butterworth.

Investigations are under way for a route out of Freeport for the proposed Freeport-Dixon interurban line. Chicago capitalists were recently in Freeport looking over the project, which is being promoted by O. T. Smith of Freeport.

Practically all right of way has been secured for the Galesburg-Rock Island interurban line, and it is believed that construction work will be started by May 1. A bonding firm of New York city has made a proposition to finance the road. W. C. McWhinney, Galesburg, is the promoter.

Roach & Stansell, Memphis, Tenn., have been awarded the contract for constructing 350,000 cu. yds. of levee work from Gale to McClure for the East Cape Girardeau and Clear Creek Drainage District. Roach & Stansell have moved outfits of graders, men and teams from Cleveland, Miss., and from Benoit, Miss., onto the work, which is to be completed by July 1. R. H. and G. A. McWilliams, Mattoon, Ill., were awarded the contract for the ditch work at 9 cts. per cubic yard.

Surveys have been under way all winter for the improvement of the Chicago, Burlington & Quincy R. R. Co.'s line between St. Paul and Savanna. It is expected that work will be commenced this spring on the work, which includes considerable double track work and eliminating curves.

According to reports in the vicinity of Carmi, Ill., the Louisville & Nashville R. R. Co. will start surveys in the spring for the construction of a branch line from Maunie, Ill., to Carmi. J. E. Willoughby, Louisville, Ky., is engineer of construction.

Permanent surveys are to be started at once on the Evansville, Mt. Carmel & Northern Ry. Co.'s proposed line from Mt. Carmel, Ill., to Evansville, Ind., a distance of 32 miles. A preliminary line was run by the Big Four engineers in 1906 and that company in conjunction with the New York Central lines will now take up the matter of construction and operation. As projected the line will pass through

an undeveloped farm region of Indiana and at Mt. Carmel, Ill., will make connections with the Cairo division of the Cleveland, Cincinnati, Chicago & Louisville R. R. G. P. Smith, Cincinnati, O., is chief engineer of the C., C., C. & L.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Terre Haute, Indianapolis & Eastern Traction Co. is planning to expend $500,000 this year for a new terminal and traction station on Cherry St. at Terre Haute. Rough plans only have been worked out and no definite details are available at present.

The Fort Wayne & Springfield Traction Co., Wm. H. Fledderjohann, president, Decatur, Ind., is planning to begin work in the spring on its extension from the present terminus at Decatur to Portland. The company has asked the city council of Portland to renew the franchise for the road, giving the company the privilege to use certain streets in that city. The line will in all probability parallel the G. R. & I. railroad tracks and pass through Monroe, to which point the roadbed is already graded, Berne, Geneva and Bryant.

Business men and farmers living in and near Monroe are forming an organization to secure the building of a direct east and west interurban line from Bluffton to Wilshire.

The Wabash R. R., J. C. Sullivan, division superintendent, Peru, Ind., is planning to begin work on its track elevation project at Fort Wayne by April 1. The work will cost about $125,000, and the city is already calling for bids for its share of the work, as noted elsewhere in this issue. The Pennsylvania R. R. will also commence its track elevation work about April 1.

The Lake Shore & Michigan Southern Ry. is to break ground shortly at Elkhart for locomotive and car shops to cost $3,000,000. O. M. Foster, Elkhart, is division master mechanic.

The city council of Portland has granted the new franchise asked by the Fort Wayne & Springfield Ry. Co. for an extension of its traction line from Decatur to Portland.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Preliminary details are being worked out for an interurban line south from Dubuque. Chicago parties are reported to have offered to put $2,000,000 into the project if bonuses of $150,000 and right of way are given. J. B. Wellsford, Dubuque, Ia., is interested.

Final surveys for the proposed extension of the Muscatine North & South Ry. to Burlington have been started from Elrich Junction, and it looks as though the extension would be built this year. Charles Howard, Muscatine, Ia., is general manager.

Arrangements are reported to have been completed for beginning construction work in the spring on the projected line of the Sioux City & Des Moines Interurban Ry. Permanent surveys have been completed and terminal facilities have been secured at Des Moines. Franchises have been secured at Ida Grove, Valley Junction, Perry and at practically all other towns along the route. The American Engineering Co., Indianapolis, Ind., has the contract for the engineering and construction work.

The Charles City & Western R. R. Co., recently incorporated, as mentioned in our last issue, has had preliminary surveys made for its line and it is believed that bids for construction work will be asked in the near future. The Hart-Parr Co. of Charles City is interested in the enterprise and has subscribed for $100,000 of the capital stock.

The Chicago, Burlington & Quincy Ry. is to start work as soon as weather permits in improving the division from Sioux City to O'Neill. New 80 lb. rails will be laid, cuts will be lowered and the track ballasted. The improvements will cost about $100,000.

The Southern Iowa Traction Co. has been incorporated under the laws of New Jersey for the purpose of taking over the property of the Albia & Centerville R. R. A number of improvements are to be made and other projects developed. The Russell Sage interests in the Albia & Centerville R. R. were recently acquired by William A. Boland, of New York City, who is president of the new company. Dr. J. L. Sawyers, Centerville, Ia., is secretary.

The Great Western Ry., according to a statement reported to have been made by the company's officials at Des Moines, Ia., recently, is planning the improvement of its system in Iowa, making necessary an expenditure of several million dollars.

Plans have been made for the new yards of the Chicago & Northwestern R. R. at Clinton, Ia. The work, which includes round houses and machine shops, is estimated to cost $1,000,000.

Hershal Clovis, Red Oak, Ia., is busy securing right of way for the proposed line of the Red Oak & Northeastern R. R.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Steps are being taken to organize a construction company to build the Kinsley-Denver Air Line R. R. It is hoped to raise $75,000 for the construction company in Kinsley and Edwards county and the balance along the line. W. F. Brown, Naron, Kas., is president.

The Kansas City, Lawrence & Topeka Electric Ry. Co. has obtained an order from the commissioners of Johnson County for the condemnation of a right of way from its present terminus at Shawnee to Zarah, six miles west, on the Atchison, Topeka & Santa Fe R. R. Work will be started on the extension as soon as the weather will permit. It is also said that steps will soon be taken to build the line on to Lawrence.

The Atchison, Topeka & Santa Fe Ry. has been making preliminary surveys for a new line of track from the station at Lake View to Lawrence, with a view to securing a roadbed which will be above the flood line of the Kaw River. Three possible routes have been surveyed. The first two lines would require a new track of about ½ mile in length; the latter route would require the laying of about five miles of new track, but would give a better line into Lawrence, and avoid a sharp curve around the river side of the bluff.

Citizens of Wichita, Kas., are to vote soon on a proposition to authorize the city commissioners to issue bonds amounting to $20,000 for the construction of a concrete dam across the Little River at that place.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Saginaw Valley Traction Co. has been granted a franchise at Saginaw for the operation of a loop line.

The Detroit, Lansing & Grand Rapids Ry., a new cross state electric line, has asked a franchise over the streets of Portland. Dr. Oliver H. Lau, Detroit, Mich., is president.

The city council of Flint has asked the Detroit United Ry. to put in a crosstown line east to west in that city.

The Murdock interurban interests of South Bend, Ind., which have taken over the Southern Michigan line, operating between St. Joseph and South Bend, plan building a line from Niles through to Dowagiac and Kalamazoo, connecting with the Michigan United Rys.

The State Railway Commission has approved the proposed merger of the Saginaw and Bay City Electric Railways. The name of the Bay City Traction Co. is to be changed to the Saginaw-Bay City Traction Co., and the capital stock increased from $1,500,000 to $2,000,000.

Hanady Bros., Bay City, will soon open two new mines two miles west of Unionville and connect them with the Akron mine and main line of road by a spur track. Shafts will be sunk for mines as soon as possible so the bed of coal may be reached by the time their railroad now under construction reaches them, when 650 men will be employed.

The Michigan Central R. R., G. H. Webb, chief engineer, Detroit, Mich., is stated to be planning to build an extension from its Bay City line to some point on the St. Clair river. It is expected an extension will be built from Lenox to Rochester and Utica via Mt. Clemens.

The State Railroad Commission has approved the maps of the Grand Rapids Electric Ry. Co. for the line between Mt. Pleasant and Gladwin, and recently granted the company permission to cross the Pere Marquette R. R. at Clare. The road is to extend from Grand Rapids to Gladwin. It is expected that construction work will be taken up soon. Col. J. W. Boynton, Grand Rapids, is president.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Duluth, Missabe & Northern Ry., H. L. Dresser, chief engineer, Duluth, Minn., is soon to construct an extension of its line into Chisholm.

The Zumbro River Power Co., recently incorporated, prosposes the erection of a 50 ft. dam across the Zumbro River 15 miles from Rochester and the development of electric power there. Judge Henry O. Cristensen is interested.

M. D. Stoner of Bedmidji has gone to International Falls to resume personal supervision of his contract for the construction of the line of railway which is being built from the Nakota Junction, seven miles south of International Falls, to the mouth of the Black river. Mr. Stoner has some 250 men at work and before long the number will be increased to 400. He has purchased a pile driver, which will be at once put into use driving piles for the many bridges which it will be necessary to construct along the new line of railway. He will have the line ready for the rolling stock not later than May 1.

Duluth and the Ranges.

BY PETER E. MEAGHER.

J. K. Hartridge, representing the American Hydraulic Stone Company, Chicago, was a caller here recently.

Horace Clark, salesman for Macomber & Whyte Rope Company, was a caller here a few days ago. He reported wire rope business very good.

Frank Donald has been appointed General Superintendent for MacArthur Brothers Company, in charge of their mine stripping work in Minnesota. He arrived here last week, and has already assumed his new duties.

H. Hanson, of the Winston-Dear Company, was a caller in Duluth recently. He was on his way to Minneapolis.

C. J. A. Morris, of the contracting firm of Morris & Shepard, was a caller on the writer recently, and said he had some new work, which they would be ready to start on in the very near future.

The writer has just returned from a four days' visit to the Concrete Show at Chicago, and while there met a great many old friends, and made some new ones, I believe. The show was very interesting as well as instructive, and those interested in contracting and in contracting equipment that did not attend missed something.

Captain Roberts of the Roberts-Kingston Company, contractors, has returned from a trip to Milwaukee where he purchased a new Bucyrus Steam Shovel for his work on the Range.

The labor situation and business in general here at the present time is quiet. There are a few men here, and just about enough work to take care of them. There are some new contracts being contemplated, but there will not be very much doing here until about April first, when I expect that business will open up with a rush.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys are to be started in the spring, it is said, for an electric railway from Kirksville southeast to Gibbs. The project is being promoted by C. M. Coe, a contractor of Denver, Colo.

The city council of Kansas City has been working on an ordinance for a special election

to vote on issuing bonds for public improvements. Among other things it is proposed to issue $500,000 of bonds for park purposes and $75,000 for rebuilding the levee.

The city council of Webster Groves has passed an ordinance ordering the abolishment of two grade crossings. The road will be lowered at the crossing of the Rock Hill road over the Missouri Pacific tracks and at the crossing at Percival Ave. over the Frisco tracks.

The Blackwater Drainage District of Warrensburg, Mo., has sold $190,000 of bonds. These bonds were issued for the purpose of draining Blackwater River valley for a distance of 47 miles with a ditch 37 ft. wide and 17 ft. deep.

The Kansas City Belt Line Ry. has been formally transferred to the Kansas City Terminal Ry. Co., the organization that is to build the union passenger station and railway freight terminals at Kansas City. The consideration is said to have been $3,000,000. H. L. Harmon is president of the Terminal Co.

The Inland Construction & Realty Co. has been organized with Dr. P. A. Herrington, Houston, Mo., as president and E. E. Young, Licking, Mo., as secretary. The company will purchase lands and lay out town sites, additions to towns already started and develop the country along the line of the proposed new Missouri Inland Ry., to be built from Rolla to Houston, Mo. The company will also have charge of all surveys, the grading and all the construction work of the new railroad. The present intention is to start work on the new road about the first of April, 1910.

The Hannibal & Northern Missouri R. R. Co. has made a proposition to the citizens of Hannibal asking for a stock subscription of $75,000, in return for which the company agrees to construct an interurban line between Palmyra and Hannibal. The company was organized last June and has had its preliminary surveys made, and final grade stakes set from Palmyra to Bethel. Capt. F. W. Latimer, president.

The Chicago, Rock Island & Pacific Ry. has set aside an appropriation of approximately $4,000,000 for the reconstruction and shortening of its line between St. Louis and Kansas City. Plans are also said to have been completed for an independent terminal system at St. Louis covering 36 acres.

St. Louis Items.

BY A. B. KOENIG.

Morey, Faulhaber & Co., 1212 Chemical Bldg., St. Louis, Mo., secured 30 miles of grading and trestle work on the Santa Fe R. R. west of Lameta, Texas. They will sublet part of this work in quantities to suit outfits and they expect to open an office at Lameta, Texas, the forepart of next week.

The Missouri, Kansas & Texas Terminal Co. bill passed the House of Delegates with only one vote against it, after it had been amended so as to place the maximum switching charge of $2.00 until such time as a court or commission, or other body having jurisdiction, should decide that the rate was unfair. The bill must go back to the Council to have the amendments approved. A two-hour debate followed the favorable report by a majority of the Committee on Railroads Tuesday night, because Delegate Hamilton opposed fixing a maximum rate in the bill. He offered a minority report in which he suggested that a "reasonable rate" be allowed for switching between points along the line of the Katy Terminal system. When Hamilton was voted down he offered another amendment, which was practically the same as that accepted last week by the House of Delegates, which gives the company the franchise and leaves it up to the courts or legally authorized body to determine the validity of justice of the rate. An additional feature of the amendment adopted last week was that the M. K. & T. Terminal Company is not permitted to contest the rate in court, but an individual, corporation or officer of the company may ask the courts to pass upon the question, and any rate fixed by court in lieu of the $2.00 rate must be accepted by the company. This gives the company the right to establish terminals here and enjoy the franchise for a term of eighty-three years, the length of the lease of the M. K. & T. Railway for the use of the Burlington tracks north of the city limits. It is expected the Council will accept the bill in its present form. Under the terms of the franchise the company is permitted to establish yards in the extreme northern end of the city, between Doddridge and Aurora Avenues; to build a freight depot and install spur tracks east of Broadway, between Mellanphy and Brooklyn Streets and to connect up its system with the tracks of the Terminal Railroad Association. According to Jos. L. Bryson, attorney for the M. K. & T. Terminal Company, property has been purchased to carry out the scheme at an aggregate cost of $3,000,000. He says the company expects to expend about $7,000,000 additional in improvements and establishment of yards in this city. The company agrees to pay the city $140,000 cash; to build a viaduct at the north end of the property, and to abolish any grade crossings that they may be called upon by the city to remove and puts a maximum switching charge of $2.00 per car on all freight moved from one point of the system to another point on the same system. The company further agrees to make no charge for handling freight from points along the line of the M. K. & T. R. R. to points along the system of the Katy Terminal Company. When the bill came up for final passage last night, Delegate Mischel of the Seventh Ward was the only member to vote against it.

With the first sign of fair weather the first caisson for the Municipal free bridge will be sunk on the east side of the river. The contractors have been ready for the thaw for several days, but could not begin work until the thermometer was well above freezing point. President Reber of the Board of Public Improvements says the caisson will be sunk just as soon as the weather will permit the mixing of the concrete. He says it would be unsafe to undertake the work unless the danger of the concrete freezing had passed. The Missouri Valley Bridge & Iron Co., which is constructing the piers, has experienced much difficulty in progressing with the work, both on account of high water and the unusually cold weather which has lasted almost continuously throughout the winter. Had there been a few bright and balmy days the pier builders could have made some progress, but they have had to stop repeatedly.

The Board of Local Improvements of East St. Louis let to the three East St. Louis construction companies contracts for street improvements that will cost $203,666.55. Mayer & Thomas were given a contract to improve Belmont Avenue from Columbia place to the Venice and Carondelet Railroad tracks for $25,112.70. J. and P. Keeley got the contract to improve Illinois Avenue, Twenty-ninth Street, Louisiana Boulevard and Thirty-third Street for $127,175.50, and Meyer & Thomas will improve Twenty-fifth Street, Waverly Avenue and Fortieth Street at a cost of $51,378.35. The cost of the three contracts, $203,666.55, is about $16,000 lower than the probable cost estimated by the Board of Local Improvements several weeks ago. It is understood work on all three of these improvements will be started immediately.

Assistant City Engineer Wiliford A. Thompson of East St. Louis, who also is County Surveyor of St. Clair County, has returned from Springfield, Ill., where he helped to organize the Association of County Surveyors of Illinois. Mr. Thompson was elected first vice-president of the organization.

The Board of Public Improvements last Friday caused ordinances to be introduced in the Council authorizing the letting of contracts for sewers in the Glaise Creek and North Harlem Creek joint sewer districts, for two sections of the River des Peres foul water sewer, aggregating $1,408,000. The River des Peres sewer runs from the Mississippi River at Catalan Street to Tennessee, estimated to cost $324,000, and from Tennessee to Greenwood, near Forest Park, estimated to cost $615,000, making a total cost for the foul water sewer of $939,000. This does not include any provision for storm water. The two sections of North Harlem Creek sewer are to cost $141,000 and $148,000, respectively, of which the city pays $10,955. It drains 1,096 acres, of which 41 is in St. Louis county. The Glaise Creek sewer is to cost $180,000. The estimated drainage area of the River des Peres sewer is 110 square miles, or nearly double the total area of the city. Of this amount, 84 square miles, or just one and one-third times the area of the city, is in St. Louis County. The area is large because of small streams emptying into the river in its course through St. Louis County, and even after it comes into the city,

Nebraska Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

T. P. Kennard, Lincoln, Neb., is promoting a project for the construction of an interurban line from Lincoln to Auburn, Neb., passing through Cheney, Bennet, Dunbar, Talmage and Brock.

The Nebraska Transportation Co. has an ordinance before the city council of Fremont, Neb., giving it a franchise to construct an interurban road through the city.

The Missouri Pacific Ry. is reported to be considering extending its line from Virginia to Beatrice, Neb., 15 miles.

Nevada Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Preliminary surveys for the proposed extension of the Tonopah & Goldfield R. R., F. T. Armistead, engineer, maintenance of way, Tonopah, Nev., from Tonopah Junction to the Morio County line have been somewhat retarded by heavy snows, and have only reached a point about 35 miles west of Tonopah Junction.

The Eureka & Palisade Ry., G. D. Abbott, superintendent, Palisade, Nev., is said to be planning to build a branch line into the new camp of Buckhorn. The branch will leave the main line at Blackburn and will be 17 miles long. It is stated that steel has already been ordered to complete the job, work upon which will be started within the next two months.

City Engineer Mann of Reno has been running a preliminary line for the proposed canal to divert the waters of Peavine creek, which now flows through the city.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The contract for the construction of the Elizabethtown Terminal R. R., an 8 mile steam railroad between Westport and Elizabethtown, Essex County, New York, has been let to Marco Lavorgna, railroad contractor of Canton, Me. Construction is to be begun by April 1 and the road is to be in operation by Aug. 1, 1910. V. R. Coon, Elizabethtown, N. Y., is general manager of the railroad.

The Grade Crossing Commission of the city of Buffalo and the Erie R. R. are completing final arrangements for grade crossing improvements within the city limits, which will cost about $1,000,000. The work involves the elimination of all grade crossings along what is known as the Erie Belt Line, or Niagara Falls branch. There are nine crossings along that part of the line lying within the limits of the city. At each of the crossings the street will be depressed and the tracks run overhead. Edward B. Guthrie, Buffalo, is engineer for the commission.

The New York Connecting R. R. Co., mentioned in our last issue, has filed with the State Public Service Commission the necessary property consents required under the franchise. The railroad is to be about nine miles long and when constructed will extend from a connection with the Long Island R. R. near the boundary line between the boroughs of Brooklyn and Queens, through the latter borough to Astoria, thence crossing the East River at a clear elevation of 135 ft. to Randall and Ward's Islands, and thence over Little Hell Gate and Bronx Kills into The Bronx, to a connection with the New Haven railroad near its Oak Point yards, Port Morris. It

will also be connected with the New York tunnel extension of the Pennsylvania R. R. by a branch in Sunnyside yard.

The Schenectady Ry. Co. of Schenectady has certified to the state department that it proposes to extend its road in that city from the intersection of Lyon St. and River Road and Washington Ave., thence along Lyon St. to Edison Ave. to its tracks at South Center St.

The Pennsylvania R. R. is said to be planning the expenditure of $500,000 for improvements on its Buffalo division. Improvements are to be made between Hinsdale and Cadiz, a distance of five miles, and include eliminating curves, lowering the grades and putting in additional tracks. Between Buffalo and Olean $400,000 is to be spent and $50,000 will be used on similar work between Cadiz and Lime Lake. From Olean to Emporium additional main tracks and interlocking devices will cost $225,000; additional main track sidings and interlocking improvements between Relay and Keating Summit will cost $125,000.

Contracts are to be let this spring by New York city for a large amount of new subway construction in that city. Detail section drawings of the subway plan are about completed and it is planned to advertise the work soon. The estimated cost and mileage of each line, as computed by the Public Service Commission, is as follows: Broadway-Lexington Ave. Line—Battery to Harlem River, with branches to Woodlawn Cemetery and Pelham Bay Park; 22 64-100 miles; estimated cost, $75,000,000. Canal Street Crosstown Subway—Hudson River to Manhattan end of Manhattan Bridge, near Centre St.; one mile; estimated cost, $7,000,000. Broadway-Lafayette System—From Brooklyn end of Williamsburg Bridge under Broadway to its intersection with Lafayette Ave., there turning and following a return course under Lafayette Ave. to Flatbush Ave., and there meeting with the Fourth Ave. Subway; length, 4 96-100 miles; estimated cost, $13,000,000. Branches of the Fourth Ave. Subway—From Fourth Ave. at about Fortieth St. to New Utrecht Ave., to Eighty-sixth St. and thence probably as an elevated line to Coney Island. Fort Hamilton branch from the Fourth Ave. subway at Forty-third St. out Fourth Ave. to Fort Hamilton. Length of these branch lines, 9 17-100 miles; estimated cost, $18,000,000.

It is probable that a proposition for a new dam in the creek in the rear of the Municipal Building will be submitted again to the tax payers of Batavia at the coming election.

The Erie R. R., according to reports, during the coming summer will continue the work of double tracking the line between Hornell and Jamestown. The double track will be extended from Olean to Carrollton. The distance from Hornell to Olean is already double tracked, as is also the line between Carrollton and Salamanca.

The State Canal Board has approved plans for Barge Canal Contract No. 63, providing for the improvement of the Erie Canal from the west line of Wayne County to King's Bend, at an estimated cost of $2,186,383. The work is in Monroe County. The board also approved plans for Contract No. 90 for furnishing and establishing the equipment for the operation and lighting of several locks on the Erie, Oswego and Champlain canals at a cost of $180,630. The locks are No. 24, Erie Canal; Nos. 1, 2, 7 and 8, Oswego Canal, and Nos. 9, 11 and 12 of the Champlain Canal.

The Road of Contract and Supply of Albany has awarded the contract for the improvement of the State St. Pier to John Dyer, Jr., Albany, at $96,166.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Sandusky, Norwalk & Mansfield Ry. Co. has asked the city council of Shelby for a franchise to construct a street railway line in that city from Smiley Ave. through the city to the west corporation line. The line is a part of the proposed new line which the company is planning to build from Shelby to Mansfield and from Shelby to Bucyrus.

The Ohio & Southern Ry. Co. is to extend the electric railroad running from South Columbus to the Hartman stock farm in the early spring south to Shadeville, a distance from Columbus of 7½ miles. The line is now 4½ miles long and the extension will be thus 3 miles. The right of way has practically all been secured.

Engineers have been in the field running preliminary lines between Crooksville and New Lexington for an extension of the Southeastern Ohio Traction Co. of Zanesville.

Surveys are being made for a manufacturers' independent belt line railroad which will extend from Youngstown to Lawrence Junction and will tap a number of large plants in the Shenango and Mahoning valleys. Robert Bentley, president of the Ohio Iron & Steel Co. of Lowellville, has already acquired much right of way.

The Kanawha & Michigan Ry., N. Monsarrat, president, Columbus, O., is to spend $100,000 to eliminate heavy grades and sharp curves. The new work will consist of elevation of track and straightening of track.

The Ohio Electric Rys. Co. has filed a mortgage for $15,000,000 and it is believed a considerable part of this sum will be spent for improvements, which will include a large amount of double tracking.

The Pennsylvania R. R. is to commence work this spring on elevation of its tracks through Piqua from Summit west to Jordan east, a distance of six miles. The work will involve the expenditure of a large amount of money.

Both the Northwestern Ohio Electric Ry. Co. and the Cincinnati, Dayton & Fort Wayne Electric Ry. Co. are reported to have secured the necessary capital for beginning construction work in the spring. As projected, the Cincinnati, Dayton & Fort Wayne is to connect Cincinnati and Fort Wayne and the Northwestern Ohio Electric is planned to connect Defiance and Montpelier, passing through Bryan. The two lines are to be connected, according to the project, by a line from Defiance to Fort Wayne. Dr. S. F. George, Dayton, O., is reported to be interested.

An ordinance has been before the city council of Cleveland authorizing the director of public service to expend $100,000 for dredging in the Cuyahoga River.

The Chesapeake & Ohio R. R. is reported to have closed negotiations for taking over the Chicago, Cincinnati & Louisville R. R. and the directors of the former road are said to have made an appropriation of $4,000,000 for putting the C., C. & L. in good condition.

The Cleveland & Chagrin Falls Ry. Co. of Cleveland has been incorporated with a capital stock of $10,000, the incorporators being A. M. Snyder, R. R. Moffets, Nora L. Young, W. J. Budd and E. G. Deer.

The Pittsburg, Chicago, Cincinnati & St. Louis R. R. is to at once make plans for the construction of additional trackage in Chester, O. The company already has a right of way 100 ft. in width and several hundred yards in length.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Kansas, Lawton & Gulf Ry. Co. of Walter, Okla., has filed amended articles of incorporation in Guthrie, with $5,000,000 capital stock, to build a line 250 miles in length, commencing near Randlett, in Comanche county, extending northwest through Comanche, Kiowa, Caddo, Washita, Custer, Dewey, Woodward and Harper counties, terminating on the northern border of Harper county; also branch lines beginning in the southern part of Comanche county, running northeast through Comanche, Stephens, Grady, McClain, Cleveland, Oklahoma, Logan, Payne, Pawnee and Osage counties to the state line. The directors are Dr. A. W. Green, F. F. Grossman Dr. C. M. Beckman and E. F. Sawyer of Walter and J. M. Bellamy of Lawton.

The Red River Valley & Texas Railroad Co. has been chartered with a capital stock of $50,000, proposes to build a line of 120 miles in length from Ardmore through Carter, Jefferson, Comanche and Tillman counties to Chillicothe, Tex., at an estimated cost of $16,000 per mile. The headquarters are at Erick and the directors are Frank L. Meyer and Lee DeBaum, of Davidson; Eugene Blazier, of Lawton, and T. B. Trueblood, of Grand Forks, N. D.

The Altus, Wichita Falls & Hollis Ry. Co., of Altus, has been chartered and proposes to build west from that point to the state line, 112 miles, connecting with the Wichita Falls & Northwestern at Altus. The capital is $45,000 and the estimated cost of construction $672,600. The directors are J. A. Henry, C. C. Hightower, J. H. McMahan, Cage Beach, of Altus; J. A. Kemp, Frank Kell and C. C. Huff, of Wichita Falls, Tex. Construction work on this road is reported to be already under way under the direction of Kemp & Kell, of Wichita Falls, Tex.

The J. W. Maxey Co., engineers, Houston, Tex., has engineers in the field northwest of Ardmore making preliminary surveys for a railroad from Ardmore to Lawton.

The Patton-Gibson Construction Co., Atlanta, Ill., is stated to have a $500,000 contract for practically reconstructing the Katy track from Atoka to Limestone Gap, Okla.

The Oklahoma City & Panhandle Ry. Co., with $250,000 capital and headquarters at Oklahoma City, has been chartered and proposes to build a line from Oklahoma City southwest through Oklahoma, Canadian, Grady, Caddo, Kiowa, Jackson, Greer and Harmon counties to the west line of the state. The length of the proposed road is 160 miles and the estimated cost $2,000,000. The directors are: A. Key, J. B. Johnson, T. R. Anderson, S. P. Bennett, Joseph Fain and E. J. Dupree of Oklahoma City and H. E. Chapman of Altus.

According to a statement reported to have been made by General Superintendent Wanamaker of the Mountain, Valley and Plains R. R. permanent location of the right of way for the proposed line has been determined from Guthrie to Kingfisher, Okla., and engineers are now at work on the line on to Hitchcock.

Devol, Okla., is engaged in raising the necessary bonus for the construction of the Wichita Falls & Northwestern R. R. branch from Devol to Lawton, giving that city a direct connection with Wichita Falls. In case Lawton, which is also requested to subscribe for the project, fails to meet the demands of the company, the line will probably be built through Walters and Chickasha to Oklahoma City, Okla. R. A. Thompson, Wichita Falls, Tex., is chief engineer of the company.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Work upon the Pacific & Eastern Ry. extension is progressing rapidly and nearly 1,000 men are at work. It is expected that the road will be completed to Butte Falls by June and then work will be rushed on the extension over the Cascades to an eastern connection. J. R. Allen, 49 Wall St., New York, is president.

The American Development Co., recently incorporated at Portland, and in which British Columbia capital is said to be interested, has applied to the Jackson county commissioners for a franchise over the roads of the county for a proposed electric line to extend through Jackson and Josephine counties to a point southeast of Ashland. John R. Allen, 49 Wall street, New York, owner of the Medford-Eagle Point or Crater Lake R. R., has also announced his intention of building a system and has been seeking franchises in several cities of the valley which he hopes to connect by electric roads to be built, it is announced, at the earliest possible date.

The American Development Co., recently incorporated, has about a blanket franchise for a trolley line over the roads in Jackson and Josephine counties. The company is said to have also acquired about 15,000 acres of land as well as water rights on the Rogue river. It is believed that this land is to be irrigated and that the object in securing the railway franchise is to open up the land. E. M. Runyan, Marquam Bldg., Portland, Ore., is one of the incorporators.

The Washington & Oregon Traction Co. has placed orders for 52 miles of rails and will at once start construction work on the city line at Pendleton. The company has given bonds in the sum of $50,000 to complete at least six miles of the road within Pendleton and vicinity, to have cars in operation and to establish a

city park within one year's time, and to have the line electrified within two years. The road will first be extended westward to Echo, Stanfield, Hermiston, Umatilla and other west end towns, while another branch will be constructed southward through Pilot Rock and Camas Prairie into the John Day country.

Grading has been started on the Oregon Railway & Navigation Co. between The Dalles and Celilo. A big force of men is at work and hundreds more will be on the ground soon. When it is completed the entire road bed will be changed. G. W. Boschke, Portland, Ore., is chief engineer of the company.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Eastern Pennsylvania Rys. Co. to double track Centre St. at Pottsville.

A special meeting of the stockholders of the Lehigh Valley Transit Co. is to be held April 21 at Allentown, to approve a proposed increase of indebtedness from $9,000,000 to $15,000,000. The money will be used to refund the improvement bonds, defray consolidated mortgage bonds and provide for improvements and extensions. The company now has 200 miles of tracks from Philadelphia north to Slatington and from Nazareth on the east to Macungie on the west. The money for improvements will go largely into new construction in the way of eliminating curves, stronger bridges, new rolling stock and general development. The system is owned chiefly by E. B. Smith & Co. and Brown Brothers & Co. of Philadelphia.

The Pennsylvania R. R. is stated to have completed arrangements for double tracking the Allegheny division between Kittanning and Templeton and between East Brady and Oil City, and the work is to commence soon.

The Pittsburg, Shawmut & Northern R. R. now being built from Brookville, Pa., to Freeport, Pa., has filed a $12,000,000 mortgage, thus confirming in a measure the report that the line will connect with the Bessemer & Lake Erie R. R. and thus gain an outlet for the Pittsburgh district. The new line in Butler county will be 10 miles long, from Freeport to Houseville. It is said the road will be extended from Houseville to Mars, where connection will be made with the Baltimore & Ohio railroad. In this way, it is claimed, the line will effect an entrance into Pittsburgh, as the old Pittsburgh & Western franchise provides that other lines shall be given the privilege of the use of its tracks in Allegheny county.

The Midland Pennsylvania R. R. has been chartered with a capital stock of $430,000 and proposes the construction of a line from Millersburg, Dauphin county, to Ashland, Schuylkill county, through the towns of Killinger, Berrysburg and Gratz, Dauphin county, and the towns of Sacramento, Valley View, Hegins, Weisample, Maple and Gordon in Schuylkill county, 43 miles. The incorporators are Walter E. Harrington, Pottsville; John F. B. Atkins, Franklin C. Dively, William M. Sheahan, William A. Radford, Philadelphia; Edward A. Price, Chester; Robert J. Ritchie, Frank A. Apple, Joseph B. Lanning, Philadelphia, and Harry B. Reeves, Woodbury, N. J.

The Gloucester Ferry Co. of Philadelphia has had plans made for a 1 story steel ferry house to be erected at the foot of South St., Philadelphia, at a cost of about $50,000. The new house will have two slips and a freight pier will be constructed at the south side of it.

Tennessee Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Right of way from Memphis, Tenn., to the corporate limits of Jackson, Tenn., has been secured for the projected interurban line between those two cities. It is hoped to have the line in operation within 18 months. Dr. J. D. Hopper, Jackson, Tenn., is interested.

The Nashville & Adairville Ry. Co. with main offices at Nashville, Tenn., recently chartered to construct a railroad between Nashville and Adairsville, has had its charter amended giving it power to extend its proposed lines into Kentucky and connect with the Illinois Central at Owensboro. The extension provides for the line to run through Morgantown, Butler County, thence to or near Beaver Dam, thence to or near Hartford, Ohio County, thence through Daviess County to Owensboro.

Owners of bottom lands along the Forked Deer River are to form a drainage district. Surveys for the proposed canal have been made by W. P. Farrar, Jackson, Tenn. According to these the canal would be about 26 miles in length and would drain 18,000 acres of land. The canal will be from 32 to 35 ft. at the top and 25 ft. at the bottom and the estimated cost is $90,000.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Stone & Webster Engineering Corporation, Boston, Mass., has secured practically all right of way for its interurban line between Houston and Galveston, and will probably start construction work next month. An ordinance is now before the city council of Houston for an entrance to that city. The cost of construction is estimated at about $2,000,000. This will include terminals at both ends and three subpower stations, besides the main station at Texas City, but will not include the cost of passenger depot at Houston. Mark Lowd, First National Bank Bldg., Houston, is engineer in charge of the work.

Roach & Stansell, Memphis, Tenn., have been making good progress with their grading contract for the Orient and it is expected that the grade between San Angelo and Mertzon will be ready for the steel by the middle of March.

W. O. Cox and W. S. Banks, of Temple, are organizing the Temple & Northwestern R. R. Co. for the purpose of constructing a line of railroad from Temple through Gatesville to Hamilton in Hamilton county, a distance of approximately 65 miles. The promoters have already obtained the necessary bonuses from Temple, Hamilton, Gatesville and other points through which the new road will traverse.

It is reported in Austin that the Santa Fe line being extended west of San Angelo to Sterling City is to go to Pecos on the Texas & Pacific and there connect with the Pecos River line, a Santa Fe road. The Pecos River line is the Santa Fe system road from Western New Mexico, connecting Pecos with Carlsbad and Roswell, N. M., and from there to Amarillo, via Canyon City. By building across from San Angelo the New Mexican lines in question would have a direct Gulf line, and it would open a new section of country.

The Commercial Club of Aransas Pass has started to raise a bonus of $50,000 to be given to the first railroad making connections with that port.

E. G. Hammock, Little Rock, Ark., has accepted a proposition of the Commercial Club of Colorado, Tex., to build a railroad from that city to Robert Lee.

Work is now under way completing the Estacado & Gulf R. R. into Roby. Grading work and track laying reached a point about four miles from Roby some time ago. With the road completed to Roby, W. A. Butts, president, Stamford, will be in a position to consider extensions to the east and west.

Surveys have been completed for the projected railroad between Waco and Georgetown.

The Mission Canal Co. of Mission has been incorporated with a capital stock of $331,422, the incorporators being John J. Conway, James W. Holt and W. E. Pope.

A petition is being circulated among land owners along the Trinity River in the vicinity of Arlington, which will be forwarded to Congressman Gillespie, asking that the Department of Agriculture prepare estimates of the cost of levees to protect the bottom lands from overflow during periods of high water.

The Commercial Club of Pyote, Tex., has received a proposition from eastern railroad promoters offering to construct a railroad from Pyote north, connecting with the Chicago, Rock Island & Pacific Ry. at Tucumcari, N. M. A large bonus has already been subscribed for the project and work will first be started between Pyote and Duval, a new town in Winkler County.

Roach & Stansell, Memphis, Tenn., have been awarded a contract by the Kansas City, Mexico & Orient Ry. to construct 50 miles of line connecting up a gap between Edwards and San Angelo, Tex. This is the second contract Roach & Stansell have secured from the Kansas City, Mexico & Orient R. R. Their first was a similar one calling for constructing a gap of 50 miles.

The Kansas City, Mexico & Orient R. R. has filed an amendment to its charter providing for the construction of a branch line from San Angelo to Del Rio instead of Uvalde, as recited in the original articles of incorporation. The line will be extended ultimately into Mexico to a connection with the Mexican National, traversing the great Trevino estate in northern Mexico to get there. C. H. Webster, Sweetwater, Tex., is chief engineer.

An amendment of the charter of the Pecos & Northern Texas R. R., a subsidiary company of the Atchison, Topeka & Santa Fe Ry., has been filed with the secretary of state, providing for the construction of a branch line from Lubbock, Tex., on the Texico-Coleman cutoff to a point in Dawson County, a distance of 55 miles. This extension with the line from Canyon to Lubbock, 105 miles; branch from Plainview through Hale, Floyd and Crosby to Dickens, 70 miles; branch from Lubbock west through Hockley County to the Texas state line, 75 miles, and the Lamesa extension, set out the Texico-Coleman cutoff at 300 miles.

C. E. Ensminger, Quanah, Tex., chief engineer, Quanah, Acme & Pacific Ry., who has been making surveys for the southwestern extension of that road from Paducah and Roswell, has forwarded his report to officials at St. Louis, Mo. Construction work will be started as soon as possible in order that the road will be completed into New Mexico by Jan. 1, 1911.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

An agreement has been reached between the Knight interests and the Evans-Chipman interests for an interurban franchise through Utah County and into Salt Lake County, and Jesse Knight, Provo, has been elected president of the company which will build and operate the line.

E. O. Howard, assistant cashier of the Walker Brothers Bank, Salt Lake City, has filed a petition for a franchise for an interurban road to run from Salt Lake City to Provo and take in all of the rural settlements in the southern and eastern parts of the county. According to the terms of the franchise it is proposed to run branches of the line to Garfield, Holliday, Mill Creek, Cottonwood, Riverton, Taylorsville, Murray, Sandy and Draper.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Southern Ry., W. H. Wells, engineer of construction, Washington, D. C., is said to be planning to immediately begin double tracking its line from Orange to Munroe in Amherst County. The Chesapeake & Ohio Ry., H. Pierce, engineer of construction, Richmond, Va., is also said to be contemplating double tracking its road from Orange to Charlottesville.

The Lynn Haven Terminal Corporation, of which Alvah H. Martin is president, has applied to the city council of Norfolk, Va., for a right of way for a tunnel under the Elizabeth River from Norfolk to Pinners' Point. It is the object of the company to permit trains of the Southern Ry. and the Atlantic Coast Line to run directly into the city instead of having to transfer passengers and freight by ferry, as at present. The corporation also proposes to divert traffic toward Cape Henry, and plans for building breakwater and harbor facilities are being considered.

J. R. Sarpell & Son, Louisville, Ky., who were recently awarded the contract by the Norfolk & Western R. R. for three miles of double track and several tunnels east of Huger, W. Va., are stated to have declined the

contract, and it has been awarded to Carpenter & Boxley, Roanoke, Va.

Joseph H. Sands, Roanoke, Va., has been awarded the contract by the Norfolk & Western R. R. for the construction of the Petersburg cutoff or low grade line, 9 miles in length. The work will require several months and will cost in the neighborhood of $750,000.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

According to a report of the Northwest Corporation at Portland, Ore., the Walla Walla interurban railroad is to be extended over the Blue mountains, through the Grande Ronde valley and Wallowa country and perhaps through the Powder valley into Baker City. Surveys have already been run over the Blue mountains to a point above Summerville.

The Northern Pacific Ry., B. L. Crosby, division engineer, Tacoma, is to spend about $50,000 for the improvement of its yard service at the head of the bay in Tacoma. The improvements include 30,000 ft. of sidetracks to cost about $40,000 and an improved water system, including a 100,000 gallon tank, for the upper yards.

All of the property and rights of way of the Priest Rapids R. R. Co. has been transferred to the Chicago, Milwaukee & Puget Sound R. R., thus placing under control of the new transcontinental road the branch line extending from West Beverly, where the Milwaukee crosses the Columbia, to the Hanford district. This transfer confirms previous reports that the Milwaukee road intended to build a line from West Beverly to the Columbia via Hanford, North Yakima and the Ahtanum Valley outlet to the south. A section of the new line has already been completed and contractors for the Milwaukee have secured rights of way into the city of North Yakima. A good grade into the Yakima Valley has been secured over the Saddle mountains, and the line south and west from North Yakima has been surveyed. It is believed that this line will eventually extend into Portland, with possibly a branch tapping central Oregon.

The Wenatchee Valley Railway & Power Co. of Wenatchee has been incorporated with a capital stock of $2,500, the incorporators being H. A. Chapin, Ralph Vermilya, A. J. Linville, John Godfrey and L. J. Nelson.

The Spokane Railway & Power Co. of Spokane has been incorporated with a capital stock of $2,000,000, the incorporators being H. L. Moody, D. M. Drumheller and Alfred Coolidge.

Practically all of the necessary $400,000 subscription to assume the construction of the Bellingham-Skagit interurban line has been secured and it now seems practically certain that the road will be built. The line is to be built by the Stone & Webster Engineering Corporation of Boston, Mass., of which R. T. Laffin, Seattle, Wash., is district manager.

The Commercial Club of Monroe has decided to ask the co-operation of Snohomish in draining 13,000 acres of fertile marsh land between Monroe and Snohomish in this district. The tract begins about a mile west of Monroe and extends as far down Snohomish as the mouth of Pilchuck.

Peter Sims, Spokane, is stated to have been awarded the contract for constructing the Northern Pacific Ry.'s new water grade line out of Tacoma via Point Defiance and the Narrows through the eastern portion of Thurston County. As stated in our last issue, the work will include the construction of a 2,000 ft. tunnel.

The Stone & Webster Engineering Corporation, Boston, Mass., is said to be planning to begin active construction work on its Lake Tappa power projects in April, when 2,000 men will be put at work. Preliminary work has been under way all winter. Lake Tapps is located five miles northeast of Sumner and is about one mile wide and 3½ miles long. It is the intention of the power plant people to raise the fall of the lake 30 ft. by forcing the waters of the White River into the lake and then allowing it to flow back into the channel of the river at some point below the lake. The plant proposed will develop 25,000 hp. to being with and can later be increased 60,000 hp. The plant is to be completed in

The Wenatchee Valley Railway & Power Co., recently incorporated, is planning the construction of an electric street railway in Wenatchee. It is also proposed to extend the line to Leavenworth, Wenatchee, Lake Blemett and other points in the Wenatchee Valley.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

John Marsh, 181 La Salle St., Chicago, Ill., who has the general contract for the construction of the belt line of the Chicago & Northwestern railway around Milwaukee and of the main line as far as Clyman, as noted previously in this paper, has opened an office in a suite of rooms on the third floor of the Public Service Building at Milwaukee. P. Strang will be the superintendent in charge of the work, and the office will be in charge of A. L. Braskey.

The Milwaukee Western Electric Ry. Co., which was given a franchise some months ago to enter Waukesha, has filed with the register of deeds there maps and blue prints of its proposed route from Beaver Dam to Milwaukee and Waukesha to Sussex. The route by which the company proposes to enter Waukesha follows the north shore of the Fox River to Barstow street, thence west on Barstow to Broadway, where it will terminate at the intersection of Broadway and South street.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Penticton Ry. Co., the chief promoters of which are A. H. MacNeill of Vancouver, solicitor for the Great Northern, and J. H. Kennedy, chief engineer in charge of the railway's works in British Columbia, have applied to the legislature of British Columbia for permission to build from Penticton, a terminal point of the Kettle River Valley road, to the lower end of Okanagan lake and south from that lake to the boundary, with a spur north from Oroville, Wash., to provide another connection. Construction of the proposed new line will give the V. V. & E. alternative routes through to the coast and also with the American system with which the V. V. & E. interests are affiliated.

The Canadian Pacific Ry. has announced an extensive construction program for this season in western Canada. The program includes some 346 miles in Saskatchewan, 45 miles in Alberta, 174 miles in British Columbia and 56 miles in Manitoba, the latter being double tracking. Some of the details of the work as given out by Wm. Whyte, second vice president, Winnipeg, Man., are as follows: Complete the line from Regina by a 15-mile cut-off from Craven to Bulyea. A line from Craven on the west side of Last Mountain lake, northwesterly to Colinsay, on the line between Winnipeg and Saskatchewan, 110 miles. A line westerly 93 miles from Outlook and from that point north to Macklin on the Saskatoon-Wetaskiwin line. A line from a point 26 miles west of Weyburn, where the present line ends, 25 miles farther. On the Lauder colonization line the road will be continued from Tilston, 24 miles west. From Regina a line will be built southeast to Craven on the cutoff between Weyburn and Stoughton, 79 miles. In Alberta the program includes a line running north from Langdon, which already extends 30 miles to Rirricana in the irrigation country. This will be extended 15 miles easterly and will eventually be carried north to connect at Red Deer with the Calgary and Edmonton line. Another line will be built on the Kipp extension west of the Belly river viaduct, which now stops at Carmangay on the Little Bow River. This will be extended northerly 30 miles to take care of the Alberta fall wheat district. In British Columbia in the Columbia and Kootenay valleys a line will start from near Elcho on the Crow's Nest pass line up to Fort Steele, to meet the line already started southward from Golden, making a connection between the two main lines, a total distance of 174 miles.

Work will be started as soon as summer breaks on the 179 miles of line which will bring the Grand Trunk Pacific Ry. to Yellowhead Pass. Tenders for the remaining 135 miles of the branch line from Tofield to Calgary are in and it is expected that contracts for this work will soon be awarded, the line to Calgary to be completed by the end of this year. B. B. Kelliher, Winnipeg, Man., is chief engineer.

The colonial assembly of Newfoundland has passed a resolution authorizing the construction of 250 miles of branch railways as an extension of the present system in Newfoundland.

A company has been formed at Niagara-on-the-Lake to build an electric railway from that city to Queenston and it is expected that work will shortly begin on the construction of the extension. Edward Garrett, former superintendent of the Canadian division of the International Ry. Co., has been elected president of the new company.

Eastern capitalists have applied to the city council of Moose Jaw, Sack., for a franchise for a street railway.

The Niagara, St. Catharines & Toronto Ry., E. F. Seixas, general manager, is to build an extension of its electric railway from Niagara Falls, Ont., to Crystal Beach, and expects to have the line in operation by July 4.

A number of bills affecting street railways are now before the Massachusetts legislature, among them being the following: A bill to authorize the Worcester & Southbridge Street Ry. Co. or one of its leased lines to purchase a trolley line running from the Massachusetts-Connecticut line to Thompson, Conn. A bill to permit the Springfield Street Ry. Co. to purchase the Suffield Street Ry. Co. in Connecticut. A third bill authorizes any street railway company to purchase from a foreign street railway company so much of its line as is operated in this state, and a fourth bill prohibits the granting of street railway locations at the side of any highway within one mile of the center of any city or town of more than 5,000 inhabitants or within half a mile of the center of smaller towns.

A resolution is to be brought before the city council of Providence, R. I., by Councilman William F. Sears of Ward 6 to determine the cost of providing a subway system from near Market square to Cathedra square for express service on the electric lines running in the suburbs and to outlying towns. This is but a tentative proposition, to be considered as to engineering possibilities, costs and the future needs of Providence.

Le Roy Ferry, a banker of 49 Broadway, New York city, has placed a loan of $5,000,000 in London, the proceeds of which will be used toward the construction of a contemplated railroad in Honduras. The railroad is to be built between the towns of Tinjillo and Juticalps, a distance of 350 miles, running from the gulf towards the Pacific. It will take two years for the completion of the road, which will then connect with the old Port Cortez Railroad, which reaches the Pacific, so that in three years' time there will be a trans-Honduras railroad. The controlling interest in the railroad is stated to be held by ex-Vice President Fairbanks and his associates. In addition to this control, Mr. Fairbanks and his associates own and control a $20,000,000 development corporation which plans to devote a large part of its capital to development of the country.

A bill is before the Maryland legislature to incorporate the Northern Maryland Railway & Power Co. The company proposes the establishment of an electric road from Baltimore, Md., to Havre de Grace and that section. The incorporators are Thomas H. Robinson, Michael H. Fahey, Omar D. Crothers, Richard Dallam, Samuel C. Rowland, Murray Vandiver and Clarence C. Pusey.

Engineers of the Louisville & Nashville Ry. have been instructed to start surveys at once for the construction of the proposed line to Owensboro, Ky., from Nashville, Tenn. As projected, the line will pass through Adairville, Morgantown, Beaver Dam and Hartford. R. Montford, Louisville, Ky., is consulting engineer.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Phoenix, Ariz.—Until 11 a. m., March 16, by Board of County Supervisors, for the construction of a reinforced concrete bridge across the Salt River at Center St. This structure will be 2,150 ft. long with a causeway approach of 1,000 ft. Mayberry & Parker, 764 Pacific Electric Bldg., Los Angeles, Cal., are the Engineers for the work.

Streator, Ill.—Until 5 p. m., April 4, by John B. Patterson, City Clerk, for building a bridge across the Vermillion River at Bridge St. and for grading and paving the approaches. Bond for $15,000 required of successful bidder. Official advertisement will be found elsewhere in this issue.

Topeka, Kan.—Until March 7, by City Council, for the construction of the Melan Bridge extension.

Towson, Md.—Until noon, March 10, by E. Stanton Bosley, Secretary, Board of Highway Commissioners, for improving the public highway between Broadway and Beaver Dam bridge, known as the Falls Road.

Albuquerque, N. M.—Until March 11, by County Commissioners for the construction of two steel spans as approaches to the new Alameda bridge. The spans will be 75 ft. in length.

Grand Forks, N. D.—Until 10 a. m., March 22, by Hans Anderson, County Auditor, for the construction of steel bridges for which all bids rereceived Feb. 16 were rejected.

Everett, Wash.—Until 10 a. m., March 14, readvertisement of bids asked Feb. 28, by John F. Birney, County Engineer, for the construction of the Snohomish River swing span.

St. Thomas, Ont., Can.—Until noon, March 5, by James A. Bell, County Engineer, for the construction of reinforced concrete abutments for a 133-ft. span of a roadway bridge with sidewalk, to be built over Otter Creek, in Pt. Burwell; also for a 60-ft. arch bridge to be built over Kettle Creek in Lynhurst, adjoining St. Thomas.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Eugene, Ore:—Light Fixtures.—Thomas Day Co., San Francisco, Cal., at $982, for the installation of light fixtures in the U. S. public building at this city.

Frankford Arsenal, Philadelphia, Pa.—Chain Drives and Bearings.—Standard Roller Bearing Co., 50th St. and Lancaster Ave., Philadelphia, Pa., at $1.70 each, for furnishing four chain drives and six grooved ball thrust bearings. Bids were opened Feb. 17.

Dallas, Tex.—Pipe.—United States Cast Iron & Foundry Co., for furnishing the city with 5,534 tons of water pipe.

Kaysville, Utah.—Pipe and Fittings.—Portland Wood Pipe Co., Portland, Ore., for furnishing pipe and fittings to this city. The amount of pipe is 24,085 ft. of 4-in., 11,070 ft. of 6-in., 9,745 ft. of 8-in., with valves, specials, etc.

Sheboygan, Wis.—Power Plant.—The Optemberg Iron Works, for the remodeling of the entire power plant of the Oostburg Canning Co., of Oostburg. The work will include the installation of a new 150 horsepower Corliss engine and an additional new boiler. When completed the plant will be increased from 30 to 150 horsepower.

Sheridan, Wyo.—Light Fixtures.—Cascade Gas and Electric Fixture Co., Seattle, Wash., at $1,857, for the installation of light fixtures in the U. S. public building at this city.

Wetaskiwin, Alta.—Well.—J. A. Grant, Walsh, Alta., at $7.50 per ft., for drilling a well for natural gas to a depth of 2,000 ft. Bids were opened Feb. 15.

PROJECTED WORK.

Bridges.

Items Arranged Alphabetically by States.

Phoenix, Ariz.—Board of Supervisors and J. A. Jaeger, Prescott, Ariz., Chief Engineer, Santa Fe, Prescott & Phoenix Ry. have made an agreement regarding the proposed plans for the Center street bridge at this place.

Hartford, Conn.—City Council is planning the construction of a bridge over Farmington Ave., which is estimated to cost $18,000.

Columbus, Ga.—The proposition to issue $100,000 worth of bridge bonds was carried.

struction of new bridges at Washington, La Salle and Wells Sts. is also under consideration by the City Council.

Hartford, Ind.—County Commissioners have taken up the matter of constructing two bridges over the Salamonie River, a concrete structure over the old channel and a steel bridge over the new channel, the latter having two 80 ft. spans. Plans for the work will be prepared by W. H. Bladders, Portland, Ind.

New Albany, Ind.—Officials of the railroads controlling the Kentucky and Indiana Bridge over the Ohio River between New Albany and Louisville recently held a meeting at Louisville, and although no definite action was taken, it was decided that the structure be rebuilt in the near future.

Des Moines, Ia.—According to plans and estimates prepared by City Engineer J. W. Budd, a steel trussed span across the Des Moines River at College Tve. can be constructed for $65,000 and the same style bridge at University Ave. will necessitate an expenditure of $115,000.

Hutchinson, Kan.—City Commission has approved plans of City Engineer G. L. McLane for the construction of the proposed concrete bridge at Main St. Bids for the work will probably be advertised soon.

Salina, Kan.—Local Commercial Club has petitioned the County Commissioners to construct a bridge over the Salina Creek in Salina Canyon. Road Commissioner will take up the matter.

Wichita, Kan.—A proposition is to be submitted to the citizens of this city to vote on issuing bonds amounting to $40,000 for the construction of a concrete bridge over the Little River.

Elizabethtown, Ky.—County Commissioner William C. Montgomery is arranging for letting contracts in the spring for the construction of a bridge over Salt River at West Point, connecting Hardin and Jefferson Counties.

Lansing, Mich.—City Council is discussing the matter of constructing a bridge over the Grand River either at South or Robert Sts. Plans have already been prepared for a $1,130 foot bridge, and a general traffic bridge is also under consideration.

Duluth, Minn.—The Canadian Northern Ry., recently granted a franchise for the entrance of its road into Duluth, will take immediate steps toward the reconstruction of the Oneida St. bridge.

Minneapolis, Minn.—The Chicago, Milwaukee & St. Paul Ry. will construct a concrete girder bridge over the canal between Lake of the Isles and Lake Calhoun and also a similar structure for the St. Louis road near Cedar Lake.

Maryville, Mo.—County Commissioners are considering the construction of two bridges on the Graham road east of the Maitland Bridge.

Sibley, Mo.—In connection with the double track work between Kansas City and Chicago, Ill., the Atchison, Topeka & Santa Fe Ry. is planning the construction of a double track bridge across the Mississippi River at this place. A. F. Robinson, Chicago, Ill., is Engineer of Bridges of the A. T. & S. F. Ry.

West Point, Miss.—H. J. Kornegay, County Treasurer, will sell bonds amounting to $40,000 for the construction of bridges.

Grand Forks, N. Dak.—Grand Forks County Commissioners have rejected all bids received for the construction of bridges and bids will be soon readvertised.

Troy, O.—At the Troy Business Men's request, the County Commissioners have instructed the County Engineer to inspect the site for the proposed bridge across the canal at West Main St.

Youngstown, O.—Engineer Wilson is preparing plans and maps for the proposed high level bridge on S. Main St.

Muskogee, Okla.—County Commissioners are to construct three small bridges over creeks on the Spaulding Bridge road five miles north of this city.

Altoona, Pa.—The Pennsylvania R. R. has submitted a proposition to the City Council offering to pay $25,000, one-third the cost, toward the construction of the proposed Seventh St. bridge.

Mckees Rocks, Pa.—City Council has passed an ordinance permitting the Pittsburg, Chartier & Youghiogheny R. R. to construct a bridge over the tracks of the Pittsburg Railways Co. in Chartiers Ave. and another at Andrew St. The work will require a total expenditure of about $125,000.

Pittsburg, Pa.—A rehearing is to be held March 8 by Col. W. H. Bixby, U. S. Engineers, Federal Bldg., on the proposed changes by the secretary of war in the bridges over the Allegheny River from Sixth St. to 43d St.

Pittsburg, Pa.—Plans have been completed by the City Bridge Department for the new Point bridge, which will span the Allegheny River about 50 ft. above the site of the old Union bridge. The government has approved the plans and contracts for the substructure and masonry work will be let early this spring. It is planned to have the piers completed before next fall. The cost of the new bridge will be $1,000,000. The bridge will be about one-half mile long with two spans resting on a pier in the center of the channel, and piers at each water edge. Each span will be 531 ft. long. The structure will be 60 ft. wide, providing a 36-ft. roadway and two 12-ft. sidewalks. It will have a clearance of 70 ft. above pool level. Each approach to the new bridge will be about 900 ft. long.

Wilkesbarre, Pa.—County Commissioners have decided to construct a bridge over the Susquehanna River at Plymouth, Pa. Scofield Engineering Co., Philadelphia, Pa., is Engineer.

Cleburne, Tex.—Commissioners of Johnston County have been petitioned for the construction of a substantial steel or concrete bridge over the Nolan River at Granbury Road Crossing.

Sherman, Tex.—The Municipality and the Texas Traction Co. have made arrangements in the matter of constructing a bridge over the Postoak Creek on West Lamar St. The structure will be of concrete and is estimated to cost $3,500, of which amount the traction company will pay $1,500.

New Westminster, B. C.—Residents of Annacis Island will petition the provincial government for assistance in constructing the proposed $40,000 bridge to connect the island with New Westminster, via Lulu Island.

Vancouver, B. C.—Municipality is considering the construction of a bridge over the Narrows to connect Vancouver and North Vancouver. The structure is estimated to cost $1,250,000 and the Dominion Government has promised to pay $250,000.

Reinforced Concrete Columns.

The question of cost is paramount in deciding between the use of concrete columns and steel fireproofed columns for buildings having floors and frame of reinforced concrete. This is a question to be settled for each structure. Concrete being selected, the battle of the reinforcing systems begins, for the number is great.

Theory indicates that a concrete column reinforced with longitudinal rods or bars will be strengthened by the steel in proportion as the areas are influenced by the ratio of deformation of the steel and concrete. This ratio is preferably named by Professor Talbot "the ratio between steel stress and concrete stress"; if a concrete is selected, such that 500 lbs. per sq. in. is considered a safe working stress, then with a stress ratio of 15 the steel stress will be 15×500=7,500 lbs. per sq. in. The uneconomical use of the steel is manifest and theories of column reinforcement have not been confined to an endeavor to make the ratio smaller. Strangely enough the idea has been to use more steel so placed that it will confine the concrete to permit of the use of higher stresses. To increase the amount of cement and improve the quality of concrete did not appeal with enough force to investigators and the number of patented columns on the market and the energy with which they are pushed blinded the eyes of many designers to obvious facts.

The theory of the hooped column is that the bands or wire hooping will confine the concrete and prevent or retard bursting. A cylinder filled with sand compressed by a close fitting plunger is taken as an analogous example. In a spiral wrapping of course the sand would not hold and the tight outside cylinder confining the sand is replaced by a coil inclosing the concrete, the cohesiveness of this material destroying the completeness of the analogy. The use of concrete possessing high value in cohesion was not deemed of great importance and when used its value was not appreciated. The hooped or wound column is very expensive and its widespread use is another example of the value of good advertising. All tests made on hooped columns showed, at ordinary working loads, such reinforcement to be expensive. It really served no useful purpose until the deformation was so great that equal deformation in a structure would lead to condemnation as unsafe Hooping merely "toughens" the column and renders possible the use of higher stresses, amounting in effect to a lower factor of safety under ordinary loading.

Here and there experimenters have announced that by using a better concrete higher stresses might be used in this material, with a lessening of steel. This opinion has been gaining in force until at the Chicago convention of the National Association of Cement Users two weeks ago Professor Gillespie presented a paper which will go far towards settling the matter. His paper is printed in this issue and is worthy of careful consideration. He advocates a rich, dense concrete for columns and the longitudinal reinforcement is used merely to guard against possible flexure and to provide toughness to resist shocks. In the discussion some question was raised as to difficulties that might be encountered in securing in actual work as good a concrete as was obtained in the laboratory.

The objectors lost sight of the speaker's point that cement is the cheapest and most efficient reinforcement for columns. Professor Withey of the University of Wisconsin showed this very plainly. Professor Berry of the University of Pennsylvania within the past few weeks demonstrated the fact that reinforcement adds very little to the actual strength of concrete, the function of reinforcement being principally to guard against sudden failure. Manufacturers of reinforcing for columns publish results of tests to prove that spiral reinforcement wonderfully strengthens columns, but always the fact appears that the best results occur with the best concrete.

Flexure does not enter. Building ordinances limit the ratio of l/d and the case is one of compression pure and simple. Professor Gillespie proportioned his concrete by weight, 70 lbs. of cement and 70 lbs. of trap rock from ⅛ in. to ¾ in., making 1 cu. ft. of concrete, with the necessary water. The comparative costs given in his paper show how much can be spent on cement and how materially the cost is reduced by comparison with a highly reinforced column of leaner concrete. There should be little difficulty in securing in actual building operations a concrete having an ultimate strength of 4,000 lbs. per sq. in. and over by paying some attention to grading of aggregates. Such concrete it would be sinful to wrap in wire bands.

A Notable Article on Tunnel Excavation and the Opportunities That It Suggests.

Engineering literature contains few articles on rock tunneling more replete with useful and well analysed data than the article published in our earth and rock section this week. We mention this not only to commend the character and quality of the drilling and blasting data here presented to tunnel men, but to point out the opportunities that lie open in every piece of work for observing methods and results and recording them in useful form.

This tunnel had nothing unique about it. True it was a work of magnitude, but it was plain, straightforward rock tunneling. No intricate and stubborn problems of timbering were introduced by unstable material or sliding rock strata. There were no difficulties due to subterranean heat or water and the problem of ventilation was ordinary. The work was located on the threshold of supply for machinery, power and labor. All the "features" that make "copy" for the space writer were lacking. Yet the article which we publish is not only valuable, but it is interesting. Why?

In seeking the answer we are not without selfish interest. The editors of this journal have no more difficult task than that of securing really good articles on earth and rock excavation. This is not because such work is rare, rather, perhaps, it is because rock and earth excavation are so common. Almost no engineering construction is without a certain amount. The aggregate expenditure involved is enormous. The influence of good management, the getting of the highest efficiency from men and machines, is paramount. A knowledge of details is vital. Yet when we are searching for articles on earth and rock excavation we have over and over again the claim presented that this or that work was plain, straightforward rock work or earth work—that there is nothing to write about. And, considering the opportunities, how little is written that is at all superior.

The engineer rarely writes an article on excavation, yet the publications devoted to engineering are filled with engineer's articles on bridges and on concrete work which are scarcely more than commonplace. The contractor seldom writes, more is the pity, about excavating work or anything else. The editors of this journal are candid in saying that they wish articles on earth and rock excavation from both engineers and contractors. They do not wish general discriptions, but articles that con-

Copyright 1910, by the Myron C. Clark Publishing Co. All Rights of Republication Reserved.

tain data on methods, output, efficiency and particularly costs which are the only true measure of efficiency. Such articles can be written. The article which we mentioned in our opening paragraph as published in this issue is evidence, and we can name many others from the columns of our earth and rock section. Yet altogether these are few to what the number might be.

There is an explanation for this and we believe that it may be inferred from the very article to which we have referred above. We have read dozens of articles on efficiency in drilling, blasting, mucking, work and not found a single item of data on efficiency in drilling, blasting, mucking, etc., that was of general value. Many of our readers can confirm this experience. We have read articles on this same tunnel work which gave none of these data. They are contained in Mr. Lavis' article. This is not because he had opportunities and privileges not enjoyed by other engineers on similar work, but because he had a different conception of the work. He saw it not as an assemblage of tasks but as a single effort of many interdependent processes acting together to form a mechinasm designed to produce a certain thing and he analyzed the efficiency of the mechanism. Holding this veiwpoint the work ceased to be commonplace. So does every work of earth or rock excavation. There is a rock cut to excavate. Consider the assemblage of drills, compressors, derricks, cars and what not as a factory and the workmen as its operatives and study the whole from the point of view of its efficiency in turning out finished excavation. Or take any one element of the mechanism, say the drill plant and its operation, and analyze its efficiency and how this efficiency is influenced by conditions. Does not the work take on a dignity quite as great as the two or three spans of Pratt truss bridge in the valley beyond? Does it not present as much to write about? Indeed it does. And the subject matter is not less worthy from any point of view.

The engineer need not wait for the "100,000-yard cut" for his opportunity. The "1,000-yard scraper job" will give it to him, and an enlightening article on the 1,000-yard job will find ten appreciative readers where an account of the greater work will find one. In one of the early issues of this journal we published an article on methods and cost of cellar digging with a steam shovel. We should say off-hand that we have had more requests for copies of that article than for any but a few others on earthwork, and these others were mostly small jobs. There is no littleness in writing of the small thing that is unusual, littleness comes in writing of the commonplace thing because it is big.

The subject of this talk is one easy to wander in and we have explored only a few of its paths—we have gone far enough, however we think, to show that the opportunity exists for engineers to write instructively and without lack of dignity on earth and rock excavation. To be personal again, they can find a place in this journal for every bit of good matter they can turn out, and they will be paid for all that we publish.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

A Comparison of the Efficiency and Economy of Different Designs of Reinforced Concrete Columns.*

In the study of the elastic properties of any material, the stress-strain curve is a very importand aid. Straightness on such a curve is evidence that Hooke's law of proportionality of stress to deformation obtains. The steepness of the curve with respect to the axis of strain is the measure of the rigidity of the material— perpendicularity to this axis denoting infinite stiffness and parallelism to the same axis, complete plasticity. The "elastic limit" is indicated by the departure of the curve from the straight line. The true elastic limit is in most instances not definitely marked; but, in the case of soft steel and wrought iron, the position of the so-called "apparent elastic limit" or "yield point" need never be mistaken. The "return path" is plotted by observing simultaneous values of stress and strain under decreasing loads. The intercept, if any, of this path on the axis of strain is the measure of the "permanent set." A repetition of the stresses and a replotting will show to what extent, if at all, the properties of the material have altered because of the process of restressing.

Since, in the discussion of efficiency and economy in concrete column design, the elastic and other properties of the material to be employed are of vital importance, there is shown by way of illustration, in Fig. 1, the the data for which were obtained from *Tests* the date for which were obtained from *Tests of Metals* for 1904. The upper curve is for a 1:1 cement and sand mortar of ultimate crushing strength, 6,940 lbs. per sq. in. The lower is for a 1:2:4 cement, sand and gravel mixture, which failed at 1,700 lbs. per sq. in. It will be observed that while the former continues straight up to a stress of 2,500 lbs. per sq. in., the latter deflects almost from the start. That the former is at the outset, almost twice as steep as the latter, will be interpreted as meaning that the modulus of elasticity of the richer concrete is nearly twice as great as that of the poorer. That there would be a permanent "set" for relatively small stresses in the case of the latter would be anticipated. As might also be ex-

1617	1 : 3 : 6	600	4,860	516	9.4	2,290
Average			6,000	530	11.6	

pected, a much closer approach to complete recovery was realized in the other instances after even moderately large stresses.

For the reinforcement of concrete columns, two methods have been adopted, viz.: by longitudinal rods and by hoops or spirals. Frequently, indeed, the two methods are employed in combination. The former depends for its effectiveness on the fact that when two dissimilar materials deform together, they take stresses in proportion to their relative rigidities. That is to say, if the steel in the longitudinal reinforcing of a concrete column be ten times as rigid as the surrounding concrete, its stress for a given deformation will be ten times that of the concrete. Experiments conducted on columns of concrete of the grade ordinarily manufactured and reinforced with longitudinal rods show that the stresses in the steel, accompanying stress in concrete of such intensity as is commonly specified, are very much lower than good practice will endorse or economy recommend. In Table I are given some data taken from *Tests of Metals* for 1904. In parallel columns are shown simultaneous values of stress in concrete and in steel longitudinals in compression members having from 0.97 to 2.09 per cent of reinforcing.

From this table, it is seen that the average stress existing in steel longitudinals in columns carrying 600 lbs. per sq. in. over the gross area was only 6,000 lbs. per sq. in. In structural and bridge work, working stresses at least twice this would not be considered excessive. It is undoubtedly true that metal is sometimes employed in structures for emergency purposes, and ordinarily may sustain stresses which are very small indeed or absent altogether. In the case of concrete columns, this is partly true. To take care of bending stresses due to eccentric loading or to possible inequalities in the concrete, longitudinal rods are necessary; still, if the working stresses in them could be increased somewhat past the limit given in the accompanying table, it could be felt that more of the advantages of the use of the metal were being realized, particularly since, even when stressed to the maximum which good practice favors, it carries a load in compression at about twice the cost of concrete.

By employing a better grade of concrete, thus permitting the utilization of higher working stresses, a partial remedy is secured. An improvement in quality is, however, accompanied by a marked increase in the elastic modulus as well as in the ultimate strength, as is indicated in Figures 1 and 2, the latter being a typical stress graph for a plain 1:1 concrete of age three months, plotted from a test made by the writer. The aggregate was a hard trap rock, with the fine crusher dust screened out, the size of aggregate varying from ¼ to ¾ in. The member was first stressed up to 2,200 lbs. per sq. in. when the load was released. The magnitude of the "set" is almost insignificant, it being observed that the second curve, is plotted from a new origin. The prolonged straightness of the curve is one of its most noticeable features. The increase in stiffness which occurs whenever the quality of the concrete is improved, will mean a reduction in the stiffness ratio for the two materials so that the increase in the steel stress due to the employment of a richer mixture, is not as great as might at first be supposed.

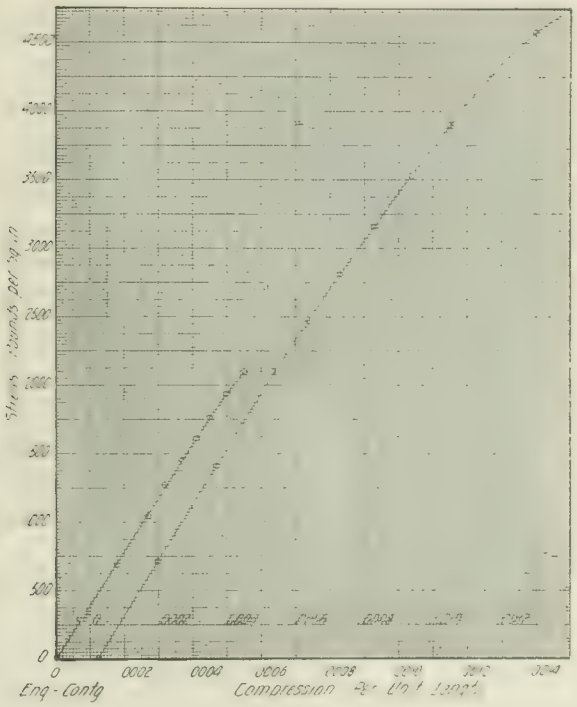

Fig. 2—The Stress-Strain Curve of a 1 : 1 Mixture.

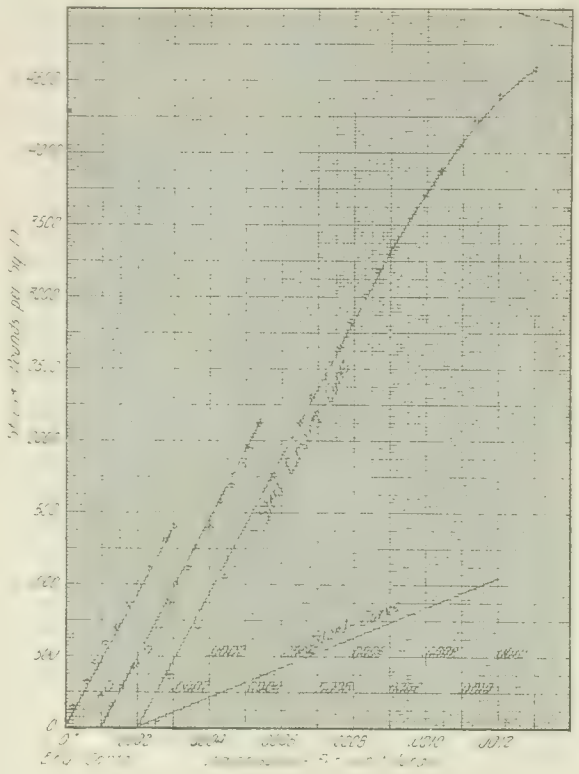

Fig. 3—Curve Showing the Behavior of a 1 : 1 Concrete Column with Longitudinal Reinforcement.

In Table II are given the results of a few compression tests made by the writer on columns of this grade of concrete. The specimens were 6 ins. in diameter and 21 ins. long.

As the average strength is well over 5,000 lbs. per sq. in., it would seem that a working stress of 1,250 lbs. per sq. in. is not excessive.

To determine the manner in which such material will behave in combination with steel, longitudinally placed, a number of columns were constructed and tested. Nine determinations of the modulus of elasticity for this concrete plain, gave an average value of 3,900,000 lbs. per sq. in. with the smallest value 4 per cent lower and the largest 4½ per cent higher than the mean of all. Eight determinations of the elastic modulus in columns reinforced with from 0.88 per cent to 4.42 per cent of steel, gave an average value of 3,600,000 lbs. per sq. in., showing that apparently the concrete is less rigid in the reinforced column than it is in the plain. In the latter case, the smallest value was 13 per cent less and the greatest, 11 per cent more

TABLE II—COMPRESSION TESTS ON SHORT COLUMNS.

(Mixture 1 : 1, Age, 6 mos.)

Specimen No.	Crushing Strength lbs. per sq. in.
A	4,900
B	5,075
C	5,150
D	6,160
E	4,120
F	5,180
Average	5,300

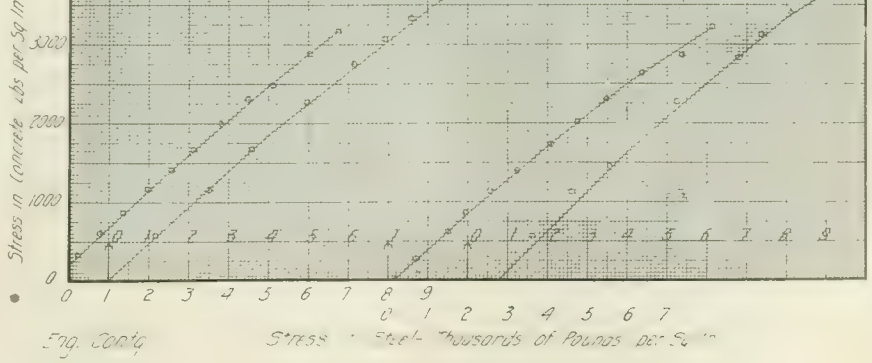

Fig. 4—Curve Showing Ratio of Steel Stress to Axial Compressive Stress in Concrete in a 1 : 1 Hooped Column.

than the mean of all. Typical stress-strain curves for these columns are shown in Fig. 3. It will be noticed that the "set" following the stresses indicated in the first two applications of load, is practically zero. The "steel curve" is drawn in such a way that that portion of the average or gross stress between it and the curve proper, is the measure of the stress in the concrete. In this way, it is possible to determine the simultaneous stresses in the two materials since the steel stress may be found by multiplying the unit deformation by the elastic modulus of that material. This method of graphical segregation is always possible and it will be evident that the steel curve will be steepest where the quantity of metal is greatest. Table III shows in a few other representative cases, the magnitude of the stress in the longitudinal reinforcement accompanying a stress of 1,250 lbs. per sq. in. in the concrete.

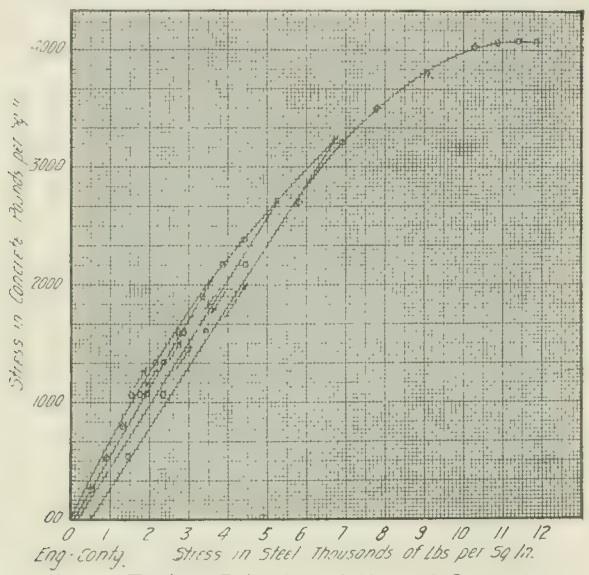

Fig. 5—Typical Behavior of Hooped Concrete Under High Compressive Stress.

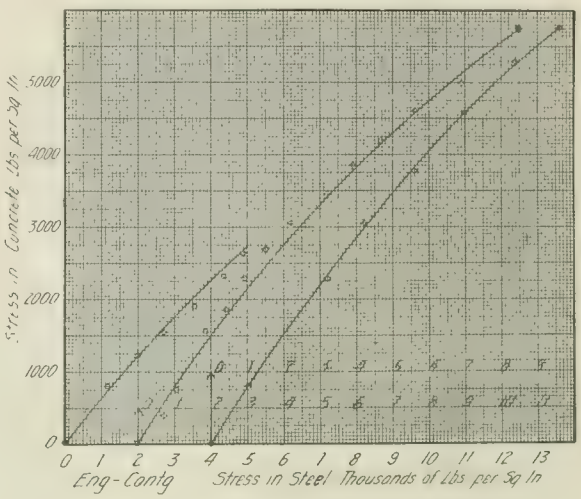

Fig. 6—Curve Showing Ratio of Steel Stress to Axial Compressive Stress in a 1 : 1 Hooped Column.

On account of the increased working stress in the concrete, the average stress in the steel is substantially greater. The attainment of such stresses, rendered possible through the employment of a better grade of concrete, must be considered a step toward the economical use of steel in concrete columns.

TABLE III.—SIMULTANEOUS STRESSES IN CONCRETE AND STEEL LONGITUDINALS. (Mixture 1 : 2. Percentage of metal, 0.88 to 4.42.)

Design-ation.	Stress in Concrete lbs. per sq. in.	Stress in Steel lbs. per sq. in.	Steel Stress Concrete Stress.
M	1,250	9,200	7.4
J	1,250	9,600	7.7
H	1,250	10,500	8.4
N	1,250	10,500	8.4
Q	1,250	12,000	9.6
R	1,250	10,800	8.6
O	1,250	10,500	8.4
P	1,250	10,500	8.4
Average	1,250	10,100	8.4

Another matter of some consequence is the amount of "set" taken by the concrete after the stress is relieved. The most satisfactory materials for the purpose of the engineer are those which have for moderate stresses, the power of perfect recovery. Of concrete, as ordinarily manufactured, this can scarcely be said. It will be observed in Table IV, that the average "set" for the rich concrete after a stress of 2,000 lbs. per sq. in., is approximately half as great as that of the poorer grade after a stress of half the magnitude. The data were taken somewhat at random from the Report of the Watertown Arsenal for 1904, but are believed to be fairly representative of the two grades of material.

The function of hoops in compression members is to resist the lateral expansion which accompanies longitudinal compression due to load. For most materials, there is a more or less constant ratio between the lateral and the longitudinal strain. This is known ordinarily as Poisson's ratio and for most materials of construction is about 1-3 or ¼. Let us assume a concrete column reinforced with hoops and with longitudinal rods. When it is stressed by loading a longitudinal shortening takes place which sets up stresses in both steel and concrete, the ratio between them being the ratio of their relative rigidities. If the hoops were absent, a lateral expansion would have taken place, which, per unit of diameter would be only a fraction of the aforementioned shortening per unit of length. The hoops reduce this to some extent (otherwise they would not serve their purpose), and, consequently, the unit deformation in them must be of even smaller extent. From this it is manifest that hoop stress will be very much less than the compressive stress carried at the same time by the longitudinal rods, and if some misgivings are had as to the wisdom of employing longitudinal steel in columns, certainly greater doubt might be entertained regarding the use of hoops. For while the fabrication of hooped reinforcement is usually more expensive than where longitudinal rods are used, the safeguard against bending due to eccentric loads and defective materials locally, is very inadequately afforded.

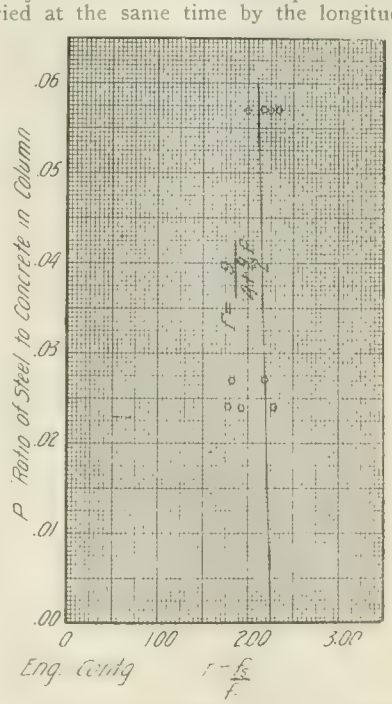

Fig. 7—Curve Showing Theoretic Effect of Change in Percentage of Metal on the Ratio of Steel Stress to Concrete Stress in 1 : 1 Hooped Concrete.

In the hooped columns, the tests on which are referred to below, a 1 :1 mixture of small size trap rock and cement was used. The hoops were welded from steel flats and were of two thicknesses, 0.05 and 0.12 ins. The quantity of metal relative to the core within the hoops varied from 0.024 to 0.057. No longitudinal metal was employed save three strips of thin hoop iron which were employed as spacers for the hoops. In order to measure the stresses in the hoops, certain of the rings were left exposed, partly or completely, and to these mirror extensometers were attached. Longitudinal deformations were measured by means of compressometers fixed to a gage length of about 50 ins. In the curves of Figs. 4, 5 and 6, an opportunity to see the manner in which the steel stress varies with the compressive stress in the concrete is afforded. In every case as the concrete was subjected to higher compressive stresses, a tendency on the part of the curve to deflect downward, manifested itself. In some cases, the curve became parallel with the axis of steel stress. This would indicate that the concrete, under high compressive stresses, had reached a state of partial plasticity within the hoops. The fact that, on release of load after heavy stressing, the extensometers did not usually completely recover, would indicate that this apparent tendency to flow had left the steel in a state of residual tension, since usually the steel stress had not even approached the elastic limit. In Fig 5 the continued increase in steel stress under a constant load is shown.

TABLE IV.—SHOWING THE AMOUNT OF "SET" AFTER THE RELEASE OF STRESSES IN TWO GRADES OF CONCRETE.
(Specimens all 12 ins. long.)

After 2,000 lbs. per sq. in.			After 1,000 lbs. per sq. in.

1 : 1	.0004	6,400	1 : 2 : 3	.0012	1,680
Average	.0009			.0017	

From purely theoretical considerations, if the elastic properties of the materials and the quantity of hooping present are known, it is possible to establish a simple relation between the compressive stress in the concrete and the accompanying stress in the encircling bands. In the evolution of the equation which follows, the stiffness ratio for this material was assumed to be 9. A number of determinations of Poisson's ration gave ¼ for an average value. For these materials, it can be shown that

$$\frac{f_s}{f_c} = \frac{9}{9 \over 4 + \frac{p}{2}}$$

where f_s is stress in steel bands, f_c is axial compressive stress in the concrete and p is the ratio of metal to concrete within the bands. Since p is usually small with respect to the other numbers involved, it follows that the usual changes which p might undergo, do not affect the ratio $f_s \div f_c$ in a very conspicuous way. In Fig. 7, the manner in which this ratio changes, consequent on variation of p, is shown. The points plotted adjacent to the curve show to what extent the theoretic investigation agrees with the results of experiment. In Table V are given a few simultaneous values of hoop stress and compressive stress in concrete. The figures are representative of a somewhat large number of determinations and broadly speaking, show, as is indicated on figures 6, 7, 8 and 9, that for the materials employed, the hoop stress is approximately twice that in the concrete.

TABLE V.—SIMULTANEOUS STRESSES IN CONCRETE AND STEEL HOOPS.
(Mixture, 1 : 1; Percentage of Metal in Hoops, 2.4 to 5.7.)

Concrete Stress lbs. per sq. in.	Hoop Stress lbs. per sq. in.	p	Steel Stress Concrete Stress.	State of Hoop.

2,750	5,000	.027	1.82	Com. Expd.
Average			2.02	

Tests made by Professor Talbot in 1907 on hooped concrete colums, using a 1:2:4 mixture, showed that the ultimate strength was increased about 570 lbs. per sq. in. for each per cent of hooping employed. Similarly, tests made at the Watertown Arsenal in 1906, show that one per cent of metal in the form of hoops increased the strength of the member to the extent of 1,020 lbs. per sq. in. Professor Withey, in 1909, reported that for each per cent of metal employed in the form of spiral reinforcing, the increase in ultimate strength on an average was 1,320 lbs. per sq. in. for 1:2:4 concrete. From these and other tests which might be cited, a generous allowance for hooping would be 1,000 lbs. per sq. in. gross strength for each per cent of metal employed. Tests conducted on hooped columns reinforced also with longitudinal rods indicate that greater efficiency is obtained from the rods than when employed without the hoops.

A comparison of costs between the rich mixture concrete column, carrying light longitudinal reinforcement and a hooped structure of estimated equivalent ultimate strength is interesting. The materials laid down have been assumed to cost as follows:

Cement, $1.50 per bbl.
Aggregate, $2 per cu. yd.
Sand, $1 per cu. yd.
Plain reinforcing, 3 cts. per lb.
Hooping, fabricated, 5½ cts. per lb.

For a 1:1 cement and rock mixture, the cost per cubic yard will be:

Cement	$8.10
Rock	1.58
Labor	2.00
Plain steel, ½%	2.03
Total	$13.71

Since the metal is added chiefly as emergency material, it will not be figured in the ultimate strength, which will be taken at 5,000 lbs. per sq. in. A 1:2:4 concrete (the ultimate strength of which plain may be assumed at 2,000 lbs. per sq. in.) will be rendered equivalent in strength to the 1:1 mixture by the use of 3 per cent of hooping metal. The cost per cubic yard will then be:

Cement	$2.52
Rock	2.00
Sand	.50
Steel hoops	22.28
Labor	2.00
Total	$29.31

In addition to the greater cost, this column will not possess the stiffness and probably, not the margin of safety against bending stresses which are found in the cheaper column.

In order to compare the areas of three different types of column, and their cost per foot of height, it will be assumed that a 10-story building with dead and live floor loads at 200 lbs. per sq. ft. and a roof load of 100 lbs. per sq. ft. is to be constructed. Assume also square floor bays of 15 ft. to a side. It will be seen that the load sustained by a column on the ground floor will be 427,500 lbs. This may be carried (a) by a structural steel column; (b) by a column of the poorer grade of concrete; (c) by a column of the richer mixture.

A reference to the Carnegie Handbook, p. 141, shows that a steel column consisting of two 10-in. channels and two ⅞-in. plates will be adequate. This column weighs 121 lbs. per running foot. The cost per foot of height will be:

Steel at 5 cts. per lb.	$6.05
Fireproofing 2 ins. thick.	.58
Total	$6.63

A 1:2:4 concrete column with 1 per cent of longitudinal metal will be figured at 450 lbs. per sq. in. for the concrete and $450 \times 15 = 6{,}750$ lbs. per sq. in. for the steel. The average stress will therefore be $450\ (1 + .14) = 513$ lbs. per sq. in. The gross area required will be $427{,}500 \div 513 = 833$ sq. ins. Hence, a column 29 ins. square will be adequate. Allowing 1 in. additional for fireproofing, we have a clumn 30 ins. square, the cost of which per foot of height would be:

Concrete, including 1% steel and labor...	$2.55
Forms	.46
Total	$3.01

The third method employs a 1:1 mixture, the working stress on which will be taken as 1,250 lbs. per sq. in. The area required will be $427{,}500 \div 1{,}250 = 342$ sq. ins. This is the area of a square of 18.5 ins. to the side. Allowing 1½ ins. for fireproofing, we obtain a column 20 ins. square, the cost of which per foot of height, with ½ per cent of longitudinal steel, would be:

Concrete, including ½% steel and labor..	$1.30
Forms	.32
Total	$1.62

The areas of the cross-sections in the three cases are:—(a) 1.8 sq. ft.; (b) 6.3 sq ft.; (c) 2.8 sq. ft.

It is thus seen that the difference between the smallest cross-section and the largest is 4.5 sq. ft., an item of considerable importance in districts where the rental of floor space is high. On the other hand, the difference in cross-sectional area between the most expensive method of carrying the load, and the cheapest, is 1.0 sq. ft. Having regard then to the fact that the rich mixture column costs only one-fourth as much as the steel structure, there would seem to be a good deal to be said in favor of the stronger mixture.

The writer desires to state that of the experimental work referred to above, part was conducted in the Testing Laboratory of McGill University in Montreal, and part in the Laboratory of Applied Mechanics in the University of Toronto, the former being done under the general supervision of Professor E. Brown of the Department of Civil Engineering.

Consideration is invited to the following inferences to which an examination of the data at hand seems to lead. Since the experimental evidence supporting these conclusions is, in the opinion of the writer, scarcely extensive enough upon which to base broad generalizations, they are not advanced as being final and conclusive.

(1.) The rich mixture is more uniform in its elastic properties than the lean mixture and for proportionate stresses, the permanent set is likely to be very much less. The parabolic feature of the stress-strain curve is also less noticeable.

(2.) The employment of a rich mixture in columns permits of the more economic stressing of the steel longitudinals. It is very probable that a strength equal to that obtained by the use of a 1:1 mixture can be secured by the careful grading of the aggregate and the use of less cement.

(3.) The experiments cited indicate that, for the materials employed, the stress in the steel hoops was approximately twice the axial compressive stress in the concrete core. The steel is, consequently, not economically employed.

(4.) Theoretically, and experimentally, the variation in the relation of steel stress to axial compressive stress, did not vary greatly with variation in the percentage of metal.

(5.) A given ultimate strength can be more cheaply secured by a rich mixture lightly reinforced by longitudinals than by the utilization of hooping. The former also secures greater rigidity and safety against bending.

(6.) For equal safe loads on columns, the lean mixture is probably intermediate in cost between the steel column and the rich mixture lightly reinforced by longitudinals, the latter being the cheapest.

(7.) The cross-sectional area of the steel column is least for a given loading and the lean mixture greatest. The difference between the cross-sectional areas of a steel, fireproofed column and a rich mixture concrete column is the least of all.

Relay Pumps for Hydraulic Fill.—The progress of work on the hydraulic fill of the Gatun dam of the Panama Canal has made it necessary to add three auxiliary or relay pumps to the ones in use in order to operate against the increasing head. The three 20-in. dredges originally installed were designed to overcome a head including friction of 75 ft. When the total reached 100 ft. the output of the dredges was materially reduced and it became necessary to add more pumps. Accordingly three 20-in. centrifugal pumps, each direct connected to a 550-HP. induction motor, were installed at such elevations and distances as to take an average of about half the load. Additional relays will be installed as the higher parts of the dam are reached. The dam is to be built up to 115 ft. above sea level. This makes the actual maximum lift about 160 ft., but the total head to be overcome will be far in excess of that. The friction in the pipes has been equivalent to a 2 or 2½-ft. lift per 100 ft. The length of pipe lines used for the first 100 ft. of head varied between 2,000 ft. and 4,500 ft., so that the friction to be overcome amounted to nearly half the dredge lifting power.

Steam Shovel Records On the Panama Canal.—The total amount of material excavated by steam shovels in the central division of the Panama Canal during the month of January was 1,461,389 cu. yds. The best record for one shovel during the month was in the Culebra district where 50,933 cu. yds. of rock were removed in 25 days by shovel No. 223. Shovel No. 219 had the second best record with 50,270 cu. yds. of rock excavated in 25 days. In the 70-ton class the best work was done by shovel No. 111 working in the Bas Obispo district which excavated 27,688 cu. yds. of earth in 23 working days. The high record for one day was 3,009 cu. yds. of rock excavated on Jan. 8 by shovel No. 218 in the Empire district.

A Municipal Reference Library for Milwaukee:—A municipal reference library, a new department for the investigation of municipal problems, has been created in the city of Milwaukee. The object of the department is to collect all possible data bearing on municipal reform and civic betterment. The department aims to cooperate with the heads of departments in other cities in the effort to obtain useful information along these lines. A classification of charters, laws, ordinances, etc., together with reports and statistics obtainable from other cities will be made. The information thus obtained will be used as an aid in securing better laws and municipal government for the improvement of the city.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Methods and Cost of Excavating Twin Tunnels Through Trap Rock for the Pennsylvania R. R. Tunnel Entrance to New York City.*

There are two parallel single-track tunnels. The center line is a tangent, and nearly on the line of 32d St., New York city, produced, its course being N. 50° 30′ W. The elevation of the top of the rail at the Weehawken Shaft, on the west bank of the Hudson River, is about 64 ft. below mean high water; and at the Western Portal, or Hackensack end, the rail is about 17 ft. above; the grade throughout is 1.3 per cent, ascending from east to west. The length of each tunnel between the portals is 5,920 ft.

The contract for this work was let on March 6, 1905, to the John Shields Construction Co.; it was abandoned by the receiver for that company on Jan. 20, 1906, and on March 20, of that year, was relet to William Bradley, who completed the work by Dec. 31, 1908.

Geology.—Starting west from the Weehawken shaft, the tunnels pass through a wide fault for a distance of nearly 400 ft. The broken ground of the fault, which consists of decomposed sandstone, shale, feldspar, calcite, etc., interspersed with masses of harder sandstone and baked shale, gradually merges into a compact granular sandstone, which, at a distance of 460 ft. from the shaft, was self-supporting, and did not require timbering, which, of course, had been necessary up to this point.

A full face of sandstone continued to Station 274 + 60, 940 ft. from the shaft, where the main overlying body of trap appeared in the heading. The full face of the tunnel was wholly in trap at about Station 275 + 30, and continued in this through to the Western Portal, where the top of the trap was slightly below the roof of the tunnel, with hardpan above. The contact between the sandstone and the overlying trap was very clearly defined, the angle of dip being approximately 17° 40′ toward the northwest.

The character of the trap rock varied considerably. At the contact, at Station 275, and for a distance of approximately 200 ft. west, corresponding to a thickness of about 60 ft. measured at right angles to the line of the contact, a very hard, fine-grained trap, almost black in color, was found, having a specific gravity of 2.98, and weighing 186 lbs. per cu. ft. The hardness of this rock is attested by the fact that the average time required to drill a 10-ft. hole in the heading, with a No. 34 slugger drill, with air at 90 lbs. pressure, was almost 10 hrs. The specific gravity of this rock is not as high as that of some other specimens of trap tested, which were much more easily drilled. This rock was very blocky, causing the drills to bind and stick badly, and, when being shoveled back from the heading, as it fell, it sounded very much as though it were broken glass.

The remainder of the trap varied from this, through several changes of texture and color, due to different amounts of quartz and feldspar, to a very coarse-grained rock, closely resembling granite of a light color, though quite hard. The speed of drilling the normal trap in the heading was approximately 20 to 25 mins. per ft., as compared with the 60 mins. per ft. noted above, the larger amounts of quartz and feldspar accounting for the greater brittleness and consequently the easier drilling qualities of the rock. The normal trap in these tunnels has a specific gravity varying from 2.85 to 3.04, and weighs from 179 to 190 lbs. per cu. ft.

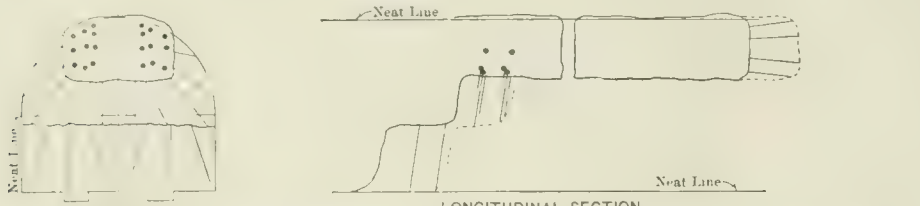
Timbering.—These tunnels have been excavated entirely by the center top heading method, almost invariably used in the United States. Timbering, where required, was of the usual segmental form with outside lagging. In a few places it was necessary to hold the ground as the work progressed, and, in such cases, crown bars were used in the headings. There was some little trouble at the Western Portal, where the top of the rock was very near the roof of the tunnel. A side heading was driven at the level of the springing line until a point was reached where the roof was self-supporting, and the timbering was brought out to the face of the portal from that point.

Drilling.—Where no timbering was required, several different methods were used in drilling and excavating the solid rock though in all cases a center top heading was driven. The four diagrams, Figs. 1, 2, 3, and 4, gave typical examples of these methods and show, in the order of their numbers, the general tendency of the development from a small heading kept some distance ahead of the bench to a large heading with the bench kept close to it. The notes on each diagram give the general details of the quantity of drilling and power used, methods of blasting, etc.

All the drills used throughout the work by Mr. Bradley were Rand No. 34 sluggers, with 3⅝-in. cylinders, and the steel was that known as the "Black Diamond Brand," 1⅜-in., octagon. It was used in 2, 4, 6, 8, 10 and 12-ft. lengths; toward the end of the work it was proposed to use 14-ft. lengths, but owing to some delay in delivery this length was never obtained. The starters, 18 to 24 ins. long, were sharpened to 2¾ to 3-in. gage, which was generally held up to depths of 6 ft.; then the gage gradually decreased until it was 1¾ to 2¼ ins. at the bottom of a 12-ft. hole. Frequently, as many as three or four starters were used in starting a hole, and generally two sharpenings were required for each 2 ft. drilled, after the first 6 ft. It is estimated that about ¼ in. of steel was used for each sharpening, and that there was an average of one sharpening for every foot drilled.

The total quantity of steel used up, lost, or scraped on the whole work was almost exactly 1 ft. for each 10 cu. yds. excavated, equal to 1¼ in. of steel per yard, distributed approximately as follows:

Sharpening	¾ to ⅞ in.
Other losses	½ to ⅜ in.
Total	1¼ in. per cu. yd.



Drilling Method No.1: Small heading, 60 to 80 ft. long. Two columns used in heading, with two drills on each. Drills on sub-bench and main bench mounted on tripods.

	Per Round				Per Cubic Yard		Per Linear Foot of Tunnel		
	Total Depth Drilled	No. of Cubic Yards	Pounds of Dynamite	Advance	Linear Feet Drilled	Pounds of Dynamite	Cubic Yards	No. of Feet Drilled	Pounds of Dynamite
Heading	110-135	18-21.6	93-131	5-6	8-9	5-6	3.6	29.-32	18-22
Bench	110-120	53-60	76-97	3½-4	2	1.4-1.6	15.4	30.-31	21.5-24.6
						Total	19	59.-63	39.5-46.6
						Per cubic yard, whole tunnel section		3 to 33	2.1-2.5

Blasting Notes:	Number of Sticks
Heading: First Round: 6 sticks, 60% in each cut hole, cut generally fired twice	36 to 72
Second Round: 3 side holes each side, 5 sticks, 40% each	30
Third Round: Rest of side holes and dry holes, 5 sticks, 40% each	40
Stub holes, say	5 to 15
Total Sticks	111 to 157
Total Pounds	93 to 131
Sub-bench: 4 widening holes, 2 to 3 sticks each, 40%	10 to 12
6 down holes 5 to 7 sticks, each, 40%	30 to 42
Bench: 6 holes 6 to 8 sticks each, 40%	36 to 48
Taking up bottom, average, say	15
Total Sticks	91 to 117
Total Pound	76 to 97

*Condensed and rearranged from a paper by F. Lavis, Proceedings, American Society of Civil Engineers, Vol. xxxvi, p. 262.

An "Ajax" drill sharpener was used, and proved very satisfactory. Rubber and cotton hose, covered with woven marlin, was used for the bench (3 ins. inside diameter, in 50-ft. lengths), for drills (1 in. in diameter, in 25-ft. lengths), and for steam shovels (2½ ins. in diameter, in 50-ft. lengths). Hose coverings of wound marlin, and of woven marlin with spiral steel wire covering were tried, but were not satisfactory, owing to the unwinding of the marlin and the bending of the steel covering.

The average quantity of powder used on the whole work was about 2.9 lbs. per cu. yd. The tables on the diagrams, Figs. 1, 2, 3, and 4, show that the quantity actually used in making the advance at the main working faces was about 2.5 lbs. The difference is accounted for by the larger percentage of powder used for trimming the sides, breaking out the cross-passages between the tunnels, and the excavation of the ditches, the latter operation not being done until the concrete lining was about to be put in.

There was some time, too, during the earlier stages of the work, when it is believed that an excessive quantity of powder was used; for one or two months it ran up to 4 lbs. per cu. yd.

The dynamite used was "Forcite." At first, both 40 per cent and 60 per cent were used, the 60 per cent generally only for blasting the cut in the headings; during the latter part of the work, however, the 60 per cent was used exclusively.

The rock as a rule broke very well, and only a comparatively small quantity could not be handled by the shovels without being broken up further by block-holing. In the sandstone the quantity of powder per cubic yard was much more than for any of the trap.

In drilling the Central shaft, a 6-hole cut was made approximately on the center line, east and west, the enlargement requiring about 18 more holes, which were generally about 6 ft. deep, the average advance being about 4 ft. per day of 24 hours.

The drills were run by steam until a depth of about 150 ft. had been reached, air from the plant at Hackensack being available after that time. Four drills were used most of the time, and six later when air was available. This work was done entirely by the John Shields Construction Co., and a depth of 205 ft. was sunk in 6 months (from July 15, 1905, to Jan. 15, 1906). A derrick was used for hoisting and lowering men and tools during the sinking, elevators being put in later.

Drilling Data.—During the progress of the work, both general and detailed observations were made of the drilling, the results of which are shown in the tables. Table I has been compiled from the records as platted daily on the chart from the inspectors' reports. Table II contains some data relating to the drilling in the headings.

The general results of these observations show that the average time the drills were "actually working" was 5.2 hrs. per shift, and that they were actually "hitting the rock" about half of this time, or about 2.5 hrs. per shift. The average depth drilled per hour, during the time the drills were "actually working," was 2.66 ft.

The "actual working time," as noted above covers the period from the time the drills were first set up in the heading after blasting until they were taken down for the next blast; it does not include the time occupied in setting up or taking down, which would probably average 30 mins. more per shift. It is believed that this figure will also apply very closely to drills working on the bench, though no actual observations were taken to determine this, on account of the irregularity with which they were worked.

The actual working time of the drills in the 736 shifts (7,360 hrs.) covered by Table I, was 3,826 hrs., or 5.2 hrs. per shift. The average depth drilled per yard, as shown in the last column of Table I, agrees fairly well with the figures on the diagrams, Figs. 1, 2, 3 and 4.

Table II has been compiled from detailed timed observations of individual drilling of down holes in the bench, for periods of 7 or 8 hrs. each, in January, 1907. The work at that time was in fairly normal condition at all points.

The figures in the third column of Table II include the time required for moving from one hole to another, when this occurred during the observation, the time required for changing bits, oiling drills, etc., and all delays of all kinds. A close record of the delays was kept, and it was considered that, of the 93 hrs., 48 mins. in Table II the unnecessary delays amounted to 5 hrs., 7 mins., or about 5½ per cent.

As a check on the average figures obtained from various sources, the following estimate of the cost of drilling per cubic yard was made up from these average figures, for comparison with the actual average cost on the whole work. The cost records show this to be about $2.25 per yd., exclusive of power for running the drills, almost exactly what the following estimates give for theoretical average conditions, although no effort was made to have this latter compare so closely.

ESTIMATED COST PER DRILL PER DAY

Drill runner, 1 at $3.50 per day	$3.50
Helper, 1 at $2.00 per day	2.00
Nipper, 1-5 at $1.75 per day	0.35
Heading foreman, 1-1[illegible] at $5.00 per day	0.42
Walking boss, 1-50 at $7.50 per day	0.15

Fig. 4—Drilling Method No. 4.

The specifications required that the excavation should be taken entirely outside of the neat line, but not necessarily beyond this line, but that the contractor would be paid for rock out to the standard section line, which is 1 ft. larger on the sides and top and 6 ins. deeper in the bottom than the neat line.

A great deal of the extra quantity was due to rock falling from the core-wall side whenever one working face was behind the other. Blasting at the face behind generally loosened more or less rock on the core-wall side of the tunnel which was ahead, in one or two instances breaking entirely through, the hole in the core-wall in this case being utilized by building a storage chamber in it.

Table III gives some of the statistics of drilling in the Simplon Tunnel, as compared with the drilling on this work, the figures for the Simplon being taken from papers read before the Institution of Civil Engineers of Great Britain.

TABLE III.

	Bergen Hill.	Simplon.
Drills set up in heading, per cent of total elapsed time	50%	60%
Actually drilling the rock, per cent of total elapsed time	25%	50%
Average advance per round (attack)	8.5 ft.	3.8 ft.
Average time for each attack	36 hrs.	5 hrs.
Average advance per day of 24 hours	5 ft.	18.4 ft.
Depth of holes	10 ft.	16 ft.
Diameter of holes	3 ins.	2¾ ins.
Linear feet drilled per hour, per drill	2.7	7.0

The figures in Table III are for "heading only" in both cases, except for the last item (number of men), the heading in the Simplon Tunnels being about 60 sq. ft., as compared with the heading of Method No. 4 (which has been used for comparison), of 210 sq. ft.

Mucking and Disposal.—The conditions affecting the disposal of the muck, after blasting, were quite different at the two ends, the grade descending in the direction of the loads at Weehawken and ascending at the Hackensack end. At the Weehawken end the mouth of the tunnels was at the bottom of a shaft some 80 ft. deep, the muck in the tunnel cars being hoisted by elevators to a platform at the top from which it was dumped into standard gage cars supplied by the Erie Railroad, as shown by Fig. 5; or later hauled to the crusher or storage pile, some 500 ft. distant. At the western end, the cars were hauled directly to the surface through the approach cut, and the material, except that required for concrete and rock packing, was deposited in the embankment across the Hackensack Meadows, a haul of from 1,000 to 3,000 ft. beyond the portal.

All disposal tracks were of 3-ft. gage, the main running tracks being generally laid with 60-lb. second-hand rails, although some of lighter weight were used.

Except for about 1,000 ft. in each tunnel at the Weehawken end, where the muck was loaded by hand, four steam shovels, operated by compressed air, were used, one at each working face. One of these was a "Marion, Model No. 20," weighing 38 tons, the others were "Vulcan Little Giant," of about 30 tons each. All these shovels were on standard-gage track, and were moved back from 300 to 500 ft. from the working face during blasting.

At Weehawken, previous to the time the shovels were installed, the muck was shoveled by hand into the cars from the bottom of the bench, and the heading muck was dumped into them from a movable platform. There were three loading tracks at the face. The cars used at that time were similar to that shown by Fig. 6, but were about two-thirds the size and had no end door; stop-planks were supposed to be placed in the ends but seldom were. The loads averaged about ½ cu. yd. (measured in place). After the shovel was installed the cars shown by Fig. 6 were used, and the loads averaged nearly 1 cu. yd.

Th empty cars were pushed up to the shovel by hand from the storage track. When loaded, they were given a start with the bucket of the shovel, and were then allowed to coast by gravity out to the storage track near the shaft, where they were stopped by placing rolls of cement bags or burlap on the rails. After the lining was started, the loaded cars were stopped on the inside of the lining and only sent out over the single track through this latter at stated intervals, when several cars followed in close succession, with a long interval, which permitted the concrete to be brought in. The empty cars were hauled back to the storage track near the working face by mules, one mule usually hauling two cars at a time.

Up to the time the trap rock was reached, about 1,100 ft. from the shaft, the excavated material was disposed of by loading it on flat cars. All the trap, however, was stored to be used later for concrete and ballast.

When the tunnels were in full working order, 60 muck cars of the type shown by Fig. 6 were in use, about evenly divided between the two tunnels. For some time the work was greatly hampered by lack of cars, and even with the 60 finally obtained, there were many times when extra cars could have been used to advantage to keep the shovel working.

When mucking by hand, the mucking gangs consisted of from 15 to 20 men. The maximum output was 50 cu. yds. and averaged about 35 cu. yds. per shift; there was a great deal of trouble in keeping the gangs full, as labor at that time was very scarce, and the tunnels were quite wet. The maximum output of either of the shovels was 159 cu. yds. in one shift, and the best average in any month—which was between July and December, 1907, during which time only the enlargement and bench of the Central Shaft headings was being taken out from the western end—was 60 cu. yds. per shift. As the shovels were generally idle for one shift out of three, the quantity actually handled averaged 90 cu. yds. per shift during the shifts the shovel worked. All these quantities were "measured in place," and as previously noted, would be about equal to twice as much measured loose in the cars.

The shovels at both ends were usually worked with three crews for the two tunnels; two day crews, one at each shovel, and a night crew which was used in either tunnel as occasion required. The day crews generally averaged from 45 to 60 hrs. overtime during the month, one of them working during the early part of the evenings in the opposite tunnel to the night crew. For a short time, when the ventilation at the western end was very bad, four crews were worked, day and night crews in each tunnel; but, as a general rule, the method of working three crews was preferred by the men, and was less expensive for the contractor.

At the Hackensack end, 4-yd., Allison, one-

*On Bergen Hill Tunnels, for two full working faces at the Hackensack end, about 3,000 ft. in from portal (March, 1908). At Simplon, two full faces and two headings, at distance of about 5,000 ft. in from the portal (January, 1909). These both include lining as well as excavation. The lining of the Bergen Hill Tunnels progressed about twice as fast as the excavation; it is inferred that on the Simplon it progressed at about the same rate as the excavation.

†At the Italian end, in Antigoric gneiss, which is stated to be very hard rock.

Average, 36.6 min. per ft. drilled, or 1.64 ft. drilled per hour.

way, dump cars were used, being handled by dinky locomotives, of which there were three in use up to October, 1907, and four after that. One 15-ton Porter engine, with 10x16-in. cylinders, was used outside the tunnels for handling the trains (from 6 to 8 cars) on the dumps and to the crusher; the other three, 12-ton Vulcans, 9 x 14-in., were used in the tunnels. About 30 dump cars were in use, and of these there were generally from 3 to 6 under repair.

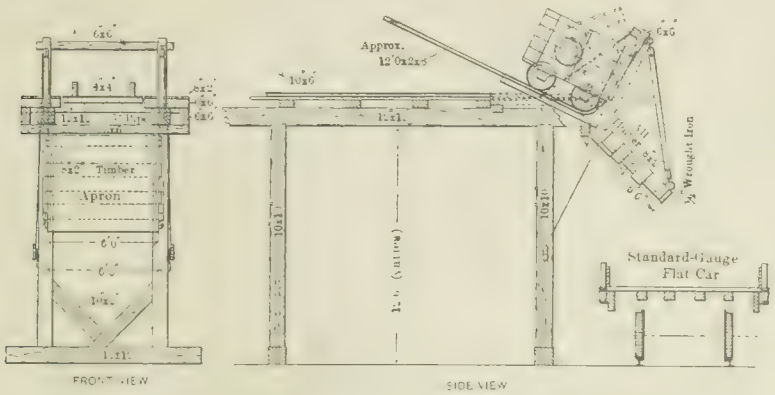

Fig. 5—Method of Emptying Dump Cars at Weehawken Shaft.

Generally, 4 cars were hauled out together, although 5 and occasionally 6 were handled. The work was generally arranged so that the heavy mucking shift alternated in the two tunnels, the two engines being worked there and a single engine in the other tunnel.

The tunnel engines left the cars on a track just outside the portal, from which they were made up into trains of from 6 to 8 cars and taken to the dump or crusher by the large dinky.

The muck from the Central Shaft headings was loaded by hand into cars similar to that shown by Fig. 6, but smaller and having no door at the forward end. A double elevator took the cars to a platform about 20 ft. above the surface, where they were dumped by revolving platforms, similar to those at Weehawken, into storage bins or directly into wagons. The muck was all hauled away in wagons; part of it was used to fill some vacant lots, and part was hauled to the crusher at the Western Portal.

The method under which the best results were obtained was that in which a full round was blasted every 36 hrs., securing an advance of practically 9 ft. of full section. During the first shift of three, as soon as the blasting had been completed and lights strung, the shovel was moved forward, and cleaned up the floor to the main pile of muck, the material from the blast being scattered from 150 to 300 ft. back from the face; during this shift, also, the drillers mucked the heading and set up their drills, the muckers helping to carry in the columns and drills. During the second shift the main pile of muck was disposed of, leaving not more than 2 or 3 hrs. work for the shovel on the third shift. This left nearly the whole of the third shift for drilling the lift holes.

Ventilation.—At Weehawken considerable difficulty was caused by fog and smoke accumulating in the tunnels after blasting. This was generally worse on days when the barometric pressure was low outside, and worse in the North than in the South Tunnel. A 6-ft. fan, driven by an electric motor, was installed in the cross-passage at Station 274, 900 ft. from the shaft, the headings at that time being about 300 ft. in advance of this point, to force the air from the South into the North Tunnel, drawing it in at the mouth of the South tunnel and discharging it at the mouth of the North Tunnel, thus insuring a circulation in both tunnels, as shown in plan by Fig. 7.

This necessitated, of course, that the cross-passages between that in which the fan was placed and the mouths of the tunnels should be blocked tight. There was some difficulty in keeping this blocking tight, owing to the force of the blasting blowing out the bulkheads. The fan, however, did good service when it and the bulkheads were in good order. The compressed air discharged from the drills kept the headings fairly clear, as well as that part of the tunnel between the headings and the fan. The fan was moved ahead to the next cross-passage at Station 277 when the work had progressed far enough, and was used there for some time; it was found, however, that by the time the excavation had reached Station 280, about 1,500 ft. from the shaft, there was practically no further difficulty from fog and smoke. No satisfactory explanation was found for this, as it would rather be expected that the ventilation and trouble with smoke and fumes from blasting would be worse as the distance increased between the mouth of the tunnel and the working face. One explanation was offered: That the blasting of the softer sandstone tended to create more and lighter dust than the heavier trap rock; whether or not this was so, it is a fact that there was far less trouble with fog and smoke after the sandstone was passed.

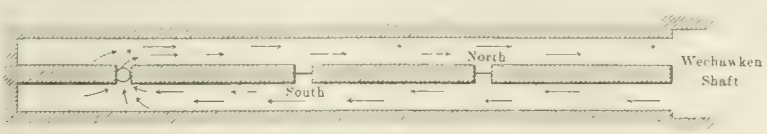

Fig. 7—Plan of Ventilation.

At Hackensack, the principal cause of trouble was the smoke from the "dinky" locomotives. As the tunnels progressed, this gradually became worse, until a connection was made with the Central Shaft headings. A fan was installed in the cross-passage at Station 316 (700 ft. in from the portal), but was never worked properly. Apparently, the men, at least the walking bosses and foremen, had little faith in the fan as a means of ventilation; no real attempt was made to keep it in order or operate it properly, and a great deal of time and money was lost groping around in the smoke and fog, the density of which increased, not only with the state of the atmosphere, but also with the direction of the wind. On some days the tunnels easily cleared themselves, and on others the smoke was so thick that a candle held at arm's length could not be seen. At this end the South Tunnel was generally worse than the North. After the headings were holed through between the portal and the Central Shaft there was very little trouble, there being usually a strong up-draft through the shaft. This was so pronounced when the wind was blowing toward the portal, that the moisture-laden air, as it ascended from the mouth of the shaft, presented the appearance of a heavy rainstorm with the rain ascending instead of descending. When the wind was blowing away from the portal, that is, from the southeast, the effect of the shaft as a chimney was neutralized, and consequently, the smoke accumulated in the tunnels. To overcome this, a large blower, with a fan 9 ft. in diameter, and with blades 4 ft. wide and 2 ft. 3 ins. long, operated by a vertical 12-HP. engine, was installed at the top of the shaft, and this kept the tunnels reasonably clear of smoke at all times. After the bench and enlargement had passed the bottom of the shaft the use of the fan was abandoned, as it was found that the tunnels cleared themselves fairly well, probably owing to the larger cross-section reaching all the way to the shaft. What little fog and smoke there might be did not cause enough trouble to warrant the cost of running the fan, which, owing to its location, required the whole time of a mechanic in attendance day and night.

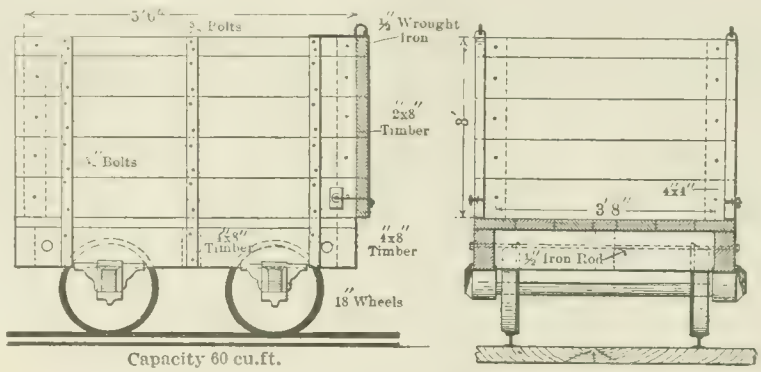

Fig. 6—Muck Car Used at Weehaken Shaft.

Lighting.—During the earlier stages of the work, gasoline lamps and Kitson lights were used. The former, of the familiar banjo type, and a modification of this, with a section of wrought-iron pipe for the reservoir, were very unsatisfactory, and were out of repair and leaking a large proportion of the time. The Kitson lights were given only a short trial, but were found unsatisfactory, owing to the necessity of moving them frequently and having to set them up in insecure positions. Electric lights were installed by Mr. Bradley, on his assumption of the contract.

The number of lamps maintained in each of the tunnels for the excavation was approximately as follows:

At the main working face	From 8 to 10
On and around the shovel	From 9 to 12
Between the portal and the working face	From 60 to 80

The cost of lighting for the whole work averaged about 15 cts. per cu. yd., which is quite large. This was mainly due to the fact that current was brought from outside sources during a large part of the time (one-third of the yardage). Part of this current cost 5 cts. per kw.-hr., and there were fairly heavy charges for connecting the tunnel wiring system with the source of supply. Current bought from the Public Service Corporation

cost from 10 to 12 cts. per kw.-hr. delivered at the mouth of the tunnel.

Pumping.—The quantity of water encountered during the excavation of the tunnels, measured somewhat roughly, was approximately as follows:

At Weehawken . . . . . 74 gal. per min.
At Central Shaft . . . . . 1 gal. per min
At Hackensack . . . . . 18 gal. per min.

The water at the Weehawken end had to be pumped from the bottom of the shaft, a lift of about 90 ft., while at the Hackensack end it had to be pumped back from the face up grade to the portal.

The cost of pumping was about $100 to $125 per month for labor for the whole work, besides the cost of the plant (about $1,200) and the power for running it.

PROGRESS.

The total time elapsed from the time of starting work at the Weehawken end, in May, 1905, to the completion of the excavation, in May, 1908, was almost exactly three years. Of this time about 40 days were lost in February and March, 1906, when work was stopped by the Receiver of the Shields Company, the total number of days actually worked being about 940, giving an average progress of 6.26 ft. per working day in each of the two tunnels, which, omitting the Central Shaft headings, gives an average rate of progress for each working face, of 3.13 ft. per day.

These 940 days include practically all the time elapsed, except Sundays and such few holidays as were observed. For some of this time, work was being carried on at only one or two points; the time, therefore, represents practically the total possible working time during the period covered.

Progress at Weehawken.—At Weehawken the total number of days worked was 763, divided as follows:

186 days in timbered section, about 426 ft., an average rate of 2.3 ft. per day in each tunnel;
176 days in hard sandstone, about 563 ft., an average rate of 3.2 ft. per day in each tunnel;
112 days in hard trap, about 267 ft., an average rate of 2.4 ft. per day in each tunnel;
289 days in ordinary trap, about 1,316 ft., an average rate of 4.55 ft. per day in each tunnel.

Progress at Central Shaft.—At Central Shaft the average length driven per day in each of the four headings is shown by Table IV.

Progress at Hackensack.—At Hackensack the total number of days worked on the tunnels proper, all in trap rock (omitting the cut and cover) was about 792, divided as shown in Table V.

The best months' work in each location was as follows, the actual yardage excavated and paid for being reduced to equivalent linear feet of full section. The tunnels were generally taken out to full section, except for a small amount left in the bottom, which latter reduced the equivalent linear feet of full section to about 95 per cent of the actual advance at the face.

Weehawken:—

	Lin. feet.	Ft. per day.
Full timbered section, North Tunnel, Nov., 1906	87	= 3.0
Sandstone, North Tunnel, Nov., 1906	109	= 3.9
Trap (normal), South Tunnel, July, 1907	144	= 5.3

Hackensack (All trap):—

	Lin. feet.	Ft. per day.
Portal to Central Shaft headings, South Tunnel May, 1907	139	= 5.0
*Enlargement of headings, South Tunnel, Nov., 1907	175	= 6.0
Central Shaft headings to Weehawken headings, North Tunnel, April, 1908	145	= 5.2

Central Shaft Headings.—During April, 1907, 122 lin. ft. of heading, averaging 3.8 cu. yds. per lin. ft., were taken out in the South Tunnel, west of the shaft. This was equal to 5 ft. per day for the 24 days worked.

TABLE IV.

Location.	Number of days worked.	Total length of heading, in feet.	Av. length of heading driven per day worked in feet.
N. E.	227	438	1.96
S. E.	168	356	2.06
N. W.	272	768	2.82
S. W.	234	698	2.98

TABLE V.

Location.	Number of days worked.	Advance.	Av. advance per day.
Station 323 to Central Shaft headings	492	1 450	2.9
Bench and enlargement of Central Shaft headings	159	1 150* 906†	7.2* 5.7†
Central Shaft headings to Weehawken headings	145	640	4.4

*Actual advance. †Equivalent linear feet of full section tunnel.

The Best Week's Work.—The best week's work at either of the main working faces, when the full section was being excavated in trap rock, was 803 cu. yds., equal to 41.8 lin. ft. of full-section tunnel, or an average of 6 lin. ft. of full section per day; this was from the South Tunnel at Hackensack for the week ending Jan. 11, 1908.

The Best Yardage.—The largest number of yards taken out in any one week from one working face was 1,087, equivalent to 56.6 lin. ft. of full section per day. This was bench and enlargement only (Central Shaft headings) in the North Tunnel, Hackensack, for the week ending Oct. 19, 1907.

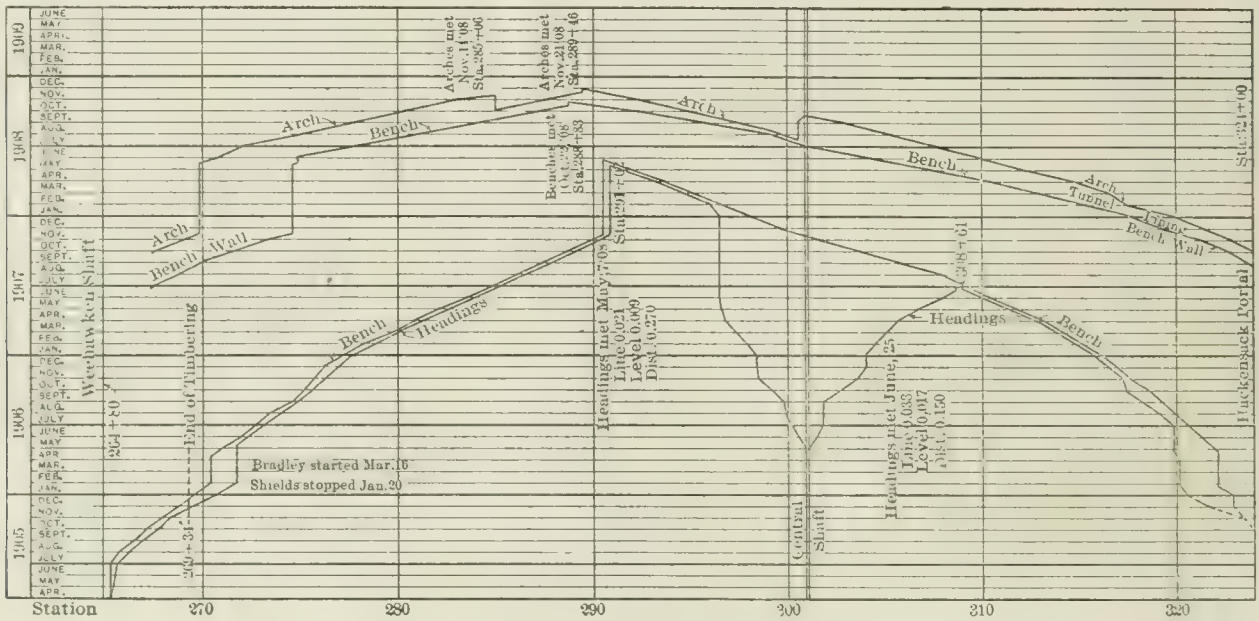

Fig. 8—Progress Profile of North Tunnel.

The largest yardage for the whole work in any one week was 3,238 cu. yds., from four working faces—two at Weehawken in full section and two at the Hackensack bench and enlargement (Central Shaft headings). This was equivalent to 168.4 lin. ft. of full-section tunnel, or an average of 6 ft. per day from each working face.

The Best Month's Work.—The best month's work with each of the four methods of drilling the headings, as shown in Figs. 1, 2, 3 and 4, where the work was straight forward and the full section was being taken out, was as follows:

Method No. 1, about 90 ft. in sandstone.
Method No. 2, about 140 ft. in trap.
Method No. 3, about 137 ft. in trap.
Method No. 4, about 145 ft. in trap.

In regard to these figures it should be noted, as stated previously, that the organization of the men and plant was not properly completed until near the time Method No. 4 was put in operation.

In Fig. 8 is shown graphically the relation of the progress to the time elapsed in the North Tunnel, the diagram for the South Tunnel being almost exactly the same.

PLANT.

The plant installed by the John Shields Construction Company, and taken over by Mr. Bradley, was composed very largely of second-hand material, and eventually most of it had to be replaced. Insufficient and inefficient plant and delay in installation were largely responsible for the small progress made by the Shields Company, and Mr. Bradley's endeavor to utilize this plant not only caused much delay during the first 8 or 10 months after he started work, but also involved large expense.

Power Plant.—At Weehawken the plant installed by the Shields Company consisted of three old locomotive boilers, each having a nominal capacity of about 125 h. p., and one Rand and one Ingersoll-Sergeant compressor, each of a rated capacity of about 1,250 cu. ft. of free air per min. compressed to 100 lbs. To this Mr. Bradley added two more second-hand locomotive boilers, and another Rand compressor of the same type and capacity as the first. The theoretical steam capacity of each of the five old locomotive boilers was about 4,250 lbs. per hour, or a total capacity of 21,250 lbs. per hour.

Theoretically, the demand on this steam was:

	Pounds per hour.
Three compressors, about 5,600 lb. per hour each	16,800
One dynamo, about	1,000
One 500-g.d. pump, about	1,000
One hoisting engine for elevators, about	2,000
Total	20,800

Actually, there was considerable deficiency of steam when an endeavor was made to work the three compressors at their full capacity. A separate boiler was afterward installed to run the hoisting engine for the elevators and the pumps thus leaving a requirement of only approximately 18,000 lbs. of steam per hour, but even this was beyond the capacity of the boilers, especially as one was almost always out of commission.

The two Rand compressors were 24 x 24 by 30-in., straight-line, one-stage, steam-driven, with a nominal capacity of 1,250 cu. ft. of free air per min. at 80 rev. per min. The Ingersoll-Sergeant was of similar type and capacity. Therefore, the theoretical quantity available was 3,750 cu. ft. of free air per min. The theoretical air requirements (as taken from manufacturers' catalogues) were:

	Cubic feet of free air per minute.
20 Rand slugger drills (22 by 174)	2,088
2 Little Giant shovels (taking air two-thirds of the time)	1,100
Total	3,188

This estimate, based on the assumption (given in the catalogues) that the drills would be working about three-fifths of the time, and the shovels about two-thirds of the time, left apparently an ample margin between the full capacity of the compressors and the requirements for the drills; as a matter of fact, however, it was seldom that more than 80 lbs. of air was available, and the pressure often dropped to 60 or 50 lbs. at the compressors. During the time this plant was in use the greatest distance to the drills was about 1,500 ft.

As this plant proved to be entirely inadequate to the demands, an arrangement was made with the O'Rourke Construction Co. on Aug. 17, 1906, whereby they agreed to supplement the air supply by 1,000 cu. ft. of free air per min. at 100 lbs. pressure. This arrangement was not altogether satisfactory, and finally (on Dec. 5, 1906) an arrangement was made with the same company to supply air up to 4,000 cu. ft. of free air per min. at 100 lbs. and the old plant was shut down.

The new plant had been in use previously in the construction of the River Tunnels. The air from it was compressed to 40 lbs. by lower pressure machines, one being used all the time and two when necessary. These machines were built by the Ingersoll-Sergeant Co., the engines being of the Corliss duplex type, cross-compound steam, with simple duplex air cylinders, each compressor having a capacity of nearly 4,000 cu. ft. of free air per min. This air, at 40 lbs. was delivered to an Ingersoll-Sergeant high-pressure machine, having Corliss cross-compound engines, 14 x 26 x 36-in., with air cylinders of the piston inlet type, 13¼ x 36-in., which compressed it to 100 lbs. The capacity of this latter machine, taking air at normal pressure, is 920 cu. ft. of free air per min. working at 85 rev. per min.; by taking the air at 40 lbs. and working at a somewhat higher speed, this machine alone supplied all the air used at the Weehawken end (approximately 4,000 ft.) from December, 1906, to November, 1907, and, with very few exceptions, the pressure was steadily maintained at from 90 to 100 lbs. there being no breakdown of any kind.

At Hackensack the plant taken over by Mr. Bradley consisted of six old locomotive boilers and four Rand compressors, all of the same type as those at Weehawken. To this he added two second-hand marine boilers, each of a state capacity of about 350 h. p., and two more Rand compressors of the same type and capacity as the others, making the total theoretical steam power available approximately 1,450 h. p., with a compressor capacity of approximately 7,500 cu. ft. of free air per min., equal to about 1,500 h. p., allowing for 15 per cent of loss.

Nowhere near the theoretical steam power was ever developed from the boilers. The tubes of the old locomotive boilers were filled with mud in many cases, and were always leaking. The marine boilers were not properly installed to give the best results, and it was seldom possible to work more than four compressors at once, or to keep the air pressure at the power house much greater than from 70 to 80 lbs. at any time.

This plant had been built by the Shields Company on the meadows alongside the Erie and New York, Susquehanna and Western Railroads, and the foundations were not made sufficiently strong to resist the effect of the vibration caused by the passing trains. It was impossible to keep the steam connection tight, and there was not only the loss of steam due to leaky joints, but positive danger of one of the main steam lines breaking entirely. After attempting to operate this plant for nearly 5 months, Mr. Bradley determined to abandon the site and the boilers, and build a new plant, farther back from the railroad, on solid ground, in such a position that a spur track could be built to a coal trestle in front of the boilers.

Two pairs of Stirling boilers, with a capacity of 2,000 h. p., were installed. As a rule, at times of maximum demand, three of the boilers were in use; after the Central Shaft was stopped, two were generally sufficient, until, toward the latter part of the excavation, the losses in the transmission of the air made it necessary to keep three going.

Eight compressors (the six old ones with two brought from Weehawken), were installed in the new power house. All were of the same type, namely, Rand, straight-line, steam-driven, 24 x 24 x 30-in., each of with a nominal capacity of 1,250 cu. ft. of free air per min. Seven of these were generally worked to their full capacity in order to keep up the necessary supply of air.

The maximum requirements of air at this end were primarily estimated as follows:

Central Shaft, four headings	24 drills.
Hackensack, two working faces	20 drills.
Total	44 drills.

	Cubic feet of free air per minute.
44 Slugger drills (22 by 174)	4,356
2 Steam shovels	1,600
Pumps and machine-shop, say	1,000
4 Hoisting engines, placing concrete	2,000
4 Derricks	2,000
Total	10,956

The theoretical capacity of the whole eight compressors was:

1,250x8=10,000 cu. ft. of free air per min.

It was considered that not more than two-thirds of the above equipment would be working at the same time; the actual requirement, therefore, was taken at about 8,000 cu. ft. of free air per min., thus leaving a margin of one spare compressor.

As actually worked out, there were probably never more than eight drills working at any one time at the Central Shaft, and this work was entirely suspended in June, 1907, before there was any demand for power in connection with the tunnel lining. The heaviest actual requirement, therefore, was approximately as follows:

	Cu. ft. of free air per minute.
40 Drills (22 by 174)	3,520
2 Shovels	1,600
Pumps and machine-shop, say	1,000
2 Derricks	1,000
Total	7,428

(B) After November, 1907 (after completion of enlargement of Central Shaft headings):

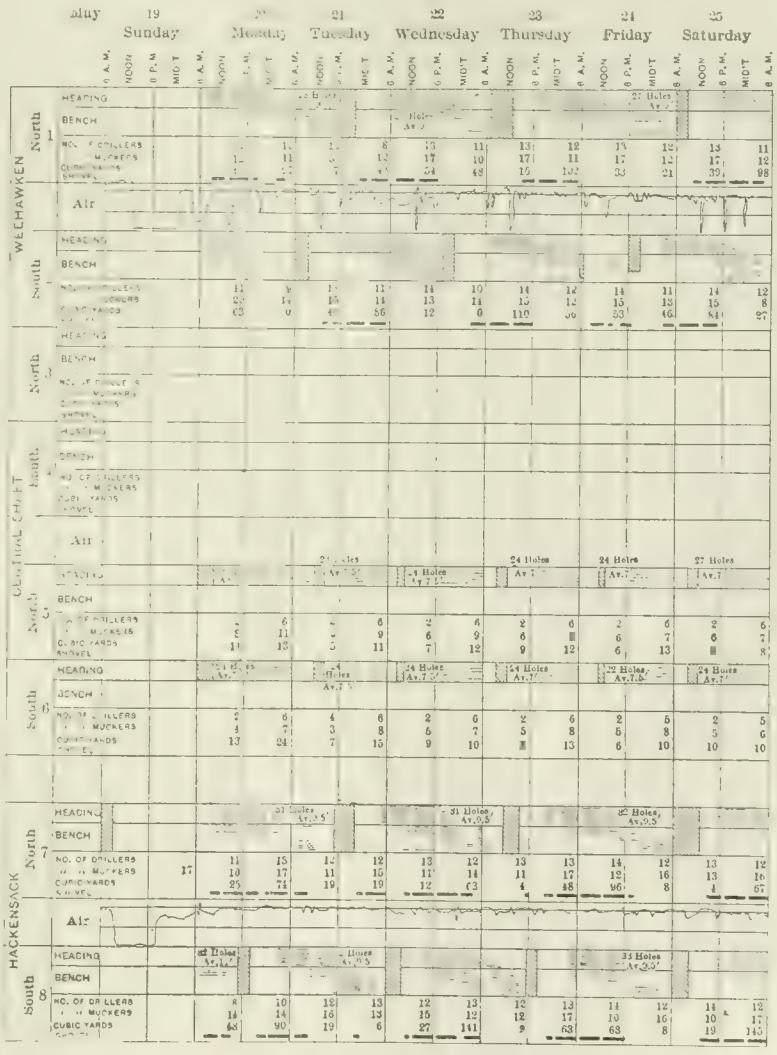

Fig. 9—Blank for Recording Drilling, Air Pressure, Mucking, Etc.

	Cu. ft. of free air per minute.
32 Drills, 6½ by 8½	2,958
2 Shovels	1,800
Pumps, etc.	1,004
3 Hoisting engines on concrete, each working one-third time	500
2 Derricks	1,000
Total	7,078

The average number of drillers per shift was about 25 at the two main working faces. There were also from 5 to 10 drills trimming and cleaning up for concrete, say an average of 7, making 32 in all.

After Nov. 1, it actually required three boilers under steam all the time, and not less than seven compressors running at full capacity, to keep the air at proper pressure, the theoretical capacity of the compressors being 8,750 cu. ft. of free air per min., as against 7,000 to 7,400 cu. ft., the theoretical maximum requirement.

Some of this deficiency was due to losses in transmission, part also was due to the fact that the actual was probably considerably below the theoretical capacity of the compressors.

Contractor's Organization.—The work was in general charge of a superintendent, and, during the time it was being carried on at both ends, an assistant superintendent had charge at night. At each end there was a day and a night walking boss, who had general supervision of the men in the tunnels, the day walking boss being the superior, and responsible for the general conduct of the work at his end, both day and night. Two 10-hour shifts were worked, thirteen shifts every two weeks, no work being done on alternate Sundays and Sunday nights. With the exception of the walking bosses and the master mechanic, all the men changed from the day to the night shift every two weeks. The organization was approximately as follows, for each shift:

General—Both Tunnels.

1 Master mechanic (days only).
1 Machinist,
1 Engine runner,
2 Firemen,
2 Oilers,
1 Electrician and helper,
1 Drill machinist and helper,
3 Blacksmiths and helpers,
1 Powderman,
4 Locomotive engine runners.
1 Walking boss,
4 Brakemen,
1 Switchman,
1 Foreman on dump,
6 Men on dump,
1 Foreman on track,
6 Men on track.

In Each Tunnel.
Drilling and Blasting.

1 Foreman,
12 Drillers,
12 Helpers,
1 Nipper,
1 Pipe-fitter.

Mucking.

1 Shovel engineer,
1 Cranesman,
1 Muck boss,
12 Muckers.

RECORDS.

The records of the work have been based largely on the reports of the day and night inspectors, which were made out in regular forms.

A daily report card was made out each morning and forwarded to the office of the chief engineer. It covered the work done for the previous 24 hours, up to 6 o'clock each morning.

A telephone report was made to the resident engineer by the inspectors each day at 8:30 a. m., giving the conditions, number of men, etc., at the opening of the day's work.

A daily progress profile, on 10 by 10 to the inch cross-section paper, covering the whole length of the tunnels, was kept in the office of the resident engineer. This was mounted in sections, on a piece of composition board, and hung on the wall for convenient reference. The information, showing the progress up to 6 o'clock each morning, was shown on the report of the night inspector, and was plotted on this profile at 7 o'clock each morning. The plotting was left in pencil, and each month's work was colored in. A progress profile was taken by the men of the alinement corps each Saturday morning and plotted by them, alternate weeks being in red and blue ink on the same profile.

A chart showing the number of drills working, time worked, blasting periods, etc. (Fig. 9), was plotted each morning and was extremely useful, not only in keeping in touch with the work, but in compiling many of the statistics used in the preparation of this paper. These cross-section sheets were ruled 12 by 12 to the inch, thus giving one space per hour horizontally. In the top vertical space are shown the heading drills, their time of stopping and starting, and their number, each heavy line representing one drill. In the next space below are shown the drills on the bench, lift holes, etc.

The blasting time is shown by the portion hatched (shown in red on the original), which covers the whole vertical space when a complete round of both heading and bench is blasted, and only part, top or bottom, as the case might be, if only one or the other. The number of drillers and muckers at the main working face is shown, and below that (in red ink on the original) the number of cubic yards handled each shift. The time the shovel is working is shown by the heavy line filling a whole space; and the air pressure, platted from the recording, gauge charts, is shown in the space below.

A combination daily and weekly report, showing the total number of men working on each section, and the number of cubic yards excavated, was entered every day and kept on a filing board in the office of the resident engineer, and a copy was sent to the main office at the end of the week, with such notes on the back as might be necessary, or of interest.

A report was made out weekly and sent to the contractor's superintendent, showing any deviations from grade, any tight places, and the station of bench and headings.

A monthly report was made to the chief engineer, giving detailed statistics of the amount of work done, etc., plant installed, and short notes of any matter of interest affecting the work in any way.

Some Data on Water Purification from Poughkeepsie, N. Y.

From the 1909 report of the Board of Public Works of Poughkeepsie, N. Y., the following data have been obtained on the operation of the water purification plant. The highest recorded amounts of chlorine were 19 parts per million on Dec 12, 1908. The general average has been 12 parts per million. The raw water is subject to considerable variations in turbidity and bacteria; the periods of low turbidity being in general coincident with periods of low bacteria. The maximum turbidity recorded was 400 on Feb. 25, 1909, the maximum bacterial count being 120,000 two days previous. The minimum turbidity was 12 on May 19, 1909, and the minimum bacterial count was 600 on July 6, 1909. The sedimentation basin provides storage for about twenty-four hours' flow on the average. The results of the study of silt in the basin was as follows:

Total number of gallons of water	914,552,299
Total volume of sludge, cu. yds.	551
Total weight of sludge, tons	524
Total weight of dry material, tons	140
Per cent. of total deposit in 1/6	58.4
Per cent. of total deposit in ⅓	74.4
Per cent of total deposit in ½	82.9
Cubic yards sludge per million gals.	0.6
Tons dry material per million gals.	153
Average turbidity raw water	37.2
Average turbidity settled water	18.7
Per cent. removed	49.7

The low per cent removal probably on account of clear water during a great portion of the year.

Based on experience of 1908 the following coagulant table was prepared:

Turbidity.	Grs. per gal.
40	1.00
50	1.15
60	1.30
75	1.55
100	1.75
125	1.85
150	2.00
200	2.20

The turbidity was determined by the standard turbidity rod. The color by comparison with permanent "platinum cobalt" standards. The alkalinity according to standard methods, using lacmoid as an indicator. The chlorine was also determined by standard methods. Bacterial counts on gelatine at 20° C. and again at 37° have been made daily throughout the year; the 20° gelatine in duplicate.

The general averages of temperature, turbidity, color and alkalinity of the raw and settled waters for year ending Dec. 1, 1909, were as follows:

	Raw Water.	Settled Water.
Temperature	53.6	53.6
Turbidity P. P. M.	35.4	16.3
Color P. P. M.	49.4	38.6
Alkalinity P. P. M.	51.5	47.3

The general averages of turbidity and bacterial counts from Sept. 1, 1908, to Dec. 1, 1909, were as follows:

	Raw Water.	Settled Water.
20°	9853	1569.
Per cent. rem.		84.2
37°	551	2.15
Per cent. rem.		60.8
Turbidity	37.9	19.9
Per cent. rem.		47.5
Coag. grs. per gal.	1.224	
Number days coag. used	12.7	
Free P. P. M.		0.46

Experiments with chlorine as a disinfectant were begun Feb. 1, 1908, and continued until the 12th, using the coagulating tanks for the applying of the chlorine. Later a crude tank was used to permit the use of the coagulent until a disinfectant house could be built. The removal from the first to the twelfth was an average of 96.4 per cent in the settled water, and in the same number of days previous the per cent removal was 53.3. At the present time two large vats are used alternately with a capacity of 990 gals. each, with proper pipe connections and apparatus to carry the solution directly over the flow of water into the basin. The use of chlorine was continued during the summer months while the basin was out of service by laying a line of 1-in. pipe across the road into the small intake basin. Not the slightest trace of chlorine can be found after an 8-hour flow.

From Dec. 1, 1907, to May 1, 1909, thirty-two counts were made in which the counts before cleaning were less than counts after cleaning and six counts were greater before than after cleaning, the total number of counts being 38, a per cent of 84.2, in which an increase was shown after cleaning. During the year filter No. 1 was scraped seven times; No. 2 six times, No. 3 six times, and No. 4 seven times. The following table gives data regarding average length of runs and millions of gallons of water filtered between scapings.

	Filters 1	2	3	4
Days elapsed	54.7	57.0	66.4	59.2
Days actual operation	51.9	54.1	58.5	56.3
Mill. of gals. per acre filt.	89.8	91.1	126.3	79.4
General average of days elapsed	57.8			
General average days operation	55.2			
General avg. mill. gals. per acre filt.	96.6			

The general average removal of dirty sand at each scraping has been, approximately:

	Filters 1	2	3	4
Thickness removed (feet)	0.10	0.14	0.08	0.09
Cubic yards removed	54.5	77.0	41.0	42.0

No. 1 and No. 2 filters were resanded to make a depth of sand of 5.33 ft. above the bottom of the pillars, 497.8 cu. yds. being placed on No. 1, and 511 cu. yds. on No. 2. No. 3 and No. 4 were resanded the year before. Four-inch cast iron water pipe was laid on top of filters used as a supply for the new sand-washing apparatus, which consists of an ejector, a distributing box and 200 ft. of fire hose, with 8-in. pipe for waste. This apparatus is said to have greatly reduced the cost of resanding and is expected, with a few improvements, to effect a total saving of 40 per cent. The heaviest deposits of silt are at the effluent ends of all the filters. The policy has been followed of letting the filters with the lowest "co-efficient of conditions" deliver the most water.

The foregoing data on the operation of a slow sand filter plant are of value, but the cost items are omitted. In the portion of the report devoted to bookkeeping and financial statements the items are not given in sufficient detail to give satisfactory ideas of unit costs.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Data On Street Cleaning in St. Louis, Mo.

The work being done in the city of St. Louis in keeping the streets clean is attracting attention. The following details have been furnished by Mr. Jas. C. Travilla, street commissioner.

The appropriation for 1909-10 was $535,000, apportioned as follows:

General cleaning	$290,000
Patrol system, "White Wings"	170,000
Municipal stables (44 per cent of appropriation for garbage removal)	75,000
Total	$535,000

The amount of work done with this money is shown in the following tabulation:

	Miles.	Sq. yds.
Streets Cleaned.		
Asphalt	9.46	125,332
Bitulithic	38.69	807,249
Granite blocks	70.02	1,334,318
Wood blocks	3.26	61,901
Vitrified brick	142.02	2,742,450
Total	313.45	6,191,250
Alleys Cleaned.		
Granite blocks	8.89	85,325
Vitrified brick	113.58	1,085,555
Granitoid	1.31	11,528
Limestone	60.92	537,022
Total	184.70	1,719,430

The cleaning includes snow removal.

Methods and Organization.—Weather permitting, pavements in the business districts are cleaned twice a week, the work being done at night; and in the residential district, pavements are cleaned once a week. All important traffic streets are included in the Patrol System. Alleys are cleaned about once a month.

Street and alley cleaning is done by day labor with flushers, squeegees, machine sweepers, hand sweepers and patrol system.

The city is divided into four cleaning districts in charge of district superintendents, who report to a general superintendent in charge of all the work. The district superintendents have supervision over inspectors in charge of men and machines. In the general superintendent's office is stationed a man familiar with the work, the city and the most convenient places for disposing of sweepings. The district superintendents and inspectors report by phone to him twice a day, and in addition, there are written reports received daily from the inspectors of the work done showing the number of laborers, teams and machines employed. The unit cost of the work is ascertained monthy.

The street flushing is done by eight crews, the organization and wages being as follows:

4 Flushers at $7 per day	$28.00
12 Laborers at $1.50 per day	18.00
4 Mud wagons at $4 per day	16.00
2 Inspectors at $3 per day	6.00
Total	$68.00

Two inspectors are required with such a gang; one in charge of the flushers and four laborers. Two of the laborers keep the sewer inlets screened and free from rubbish and two of them follow the flushers, brooming the water down the gutters and off of the street crossings. The other inspector has charge of eight laborers and four mud wagons.

Two crews are engaged in squeegee work. The organization of the squeegee crew and wages paid are as follows:

1 Sprinkler at $5 per day	$ 5
2 Squeegees at $7 per day	14
2 Pickup wagons at $4 per day	8
4 Laborers at $1.50 per day	6
1 Inspector at $3 per day	3
Total	$36

In the machine sweeping four crews are engaged, the organization and wages being as follows:

1 Sprinkler at $5 per day	$ 5
2 Machine brooms at $5 per day	10
12 Laborers at $1.50 per day	18
6 Pickup wagons at $4 per day	24
2 Inspectors at $3 per day	6
Total	$63

Two inspectors are required: one in charge of sprinklers and machine brooms, the other looking after the laborers and pick-up wagons.

Eight crews are engaged in the hand sweeping and scraping, the wages being paid and makeup of the force being as follows:

12 Laborers at $1.50 per day	$18
2 Pickup wagons at $4 per day	8
1 Inspector at $3 per day	3
Total	$29

The alley flushing is done by six crews, organized as shown below, and paid as there shown:

2 Flushers at $7 per day	$14
6 Laborers at $1.50 per day	9
2 Mud wagons at $4 per day	8
1 Inspector at $3 per day	3
Total	$34

The average number of men employed daily on the patrol system—"white wings"—is 309, these being 19 patrolmen under (1) inspector and one pick-up wagon for every six patrolmen. Patrolmen are paid $1.50 per day; inspectors, $3.50 per day, and pick-up wagons, $4.00 per day. The patrolmen are in uniform. The minimum area given one patrolmen is 2,000 sq. yds.; the maximum area given one patrolman is 11,000 sq. yds., and the average area given one patrolman is 6,000 sq. yds.

The general superintendent receives $150 per month and district superintendents receive $85 per month. Eight hours constitutes a working day.

Average Unit Costs.—The average unit costs of the street cleaning work are as follows:

	Per 1,000 sq. yds.
Streets.	
Flushing	$1.00
Squeegee	0.45
Machine sweeping	0.81
Hand sweeping	1.58
Patrol system	0.25
Alleys.	
Flushing	$1.94
Hand sweeping	1.70

Flushers are used on the granite block, vitrified brick and sheet pavements. The squeegees are used exclusively on sheet pavements. The cost of flushing, if restricted to sheet pavements, would not be much in excess of the cost of the work done with the squeegees. No charge is made for water.

Mr. Travilla states that the whole success of street cleaning depends upon a proper organization and constant work to realize the highest possible efficiency. He believes that the entire plant necessary for maintaining the streets and alleys in a sanitary and cleanly condition should be owned by the city, and with that end in view, there has been established a municipal stable with 400 horses and mules, 200 wagons, 10 machine brooms and 4 squeegees, for the above purpose and for the collection of garbage, which comes under the direction of the street commissioner.

Modelling Structural Work in Paper.—Messrs. Linforth & Milburn, Butte Mont., have perfected a method for making heavy paper models of head frames, cars, cages, ships, bridges and roofs. The structures are made of heavy drawing paper and connected by gluing, all rivets being marked in ink. Many engineering schools are purchasing samples of the work.

Data On Steam Road Roller Practice of English County Councils.

In England the steam road roller plays an important part in the maintenance of rural highways. Nearly all of the county councils, which have charge of the rural main roads, maintain several steam rollers and keep them constantly employed practically the year round. In a recent issue of the *Surveyor* Mr. Walter J. Fletcher, county surveyor of Dorset, gives some data on the general practice of these councils as to steam road roller work, and from that paper we have taken the matter that follows:

The county council of Anglesey county owns one steam road roller. The initial cost of the roller with van was $2,430. The roller is worked the year round; when not engaged on highway work, it is used for driving the stone-breaker, or is hired out.

Berkshire county owns three steam rollers, the initial cost of each roller with motor cart and sleeping van being $2,785. The average cost of rolling is 12 cts. per ton, this including driver's wages, repairs, repaying capital and interest, water, insurance, oil, etc. Coal cost $5.04 per ton. The average number of days worked per year per roller was 242. In addition, the council hires some road rollers for its work.

Buckinghamshire county owns six rollers, the initial cost being $2,430 each for 10-ton single cylinder Averling & Porter roller, van and water cart. The average cost of rolling is 22 cts. per cu. yd., this including attendants, fuel, repairs and water carting. The average numbers of days work per year per roller is 200. This county also lines rollers to assist in its work.

Bedfordshire county owns four steam rollers, the initial cost being $2,469 for a set consisting of roller sleeping van, water cart and scarifier. The rollers are worked from the beginning of November to the end of June. In addition the county council hired rollers the past year for a total of 429 days at $4.80 per day.

Carnarvonshire county owns three steam rollers. The initial cost was $2,644 for rollers, sleeping, two water carts and road wagon. The set of three rollers and plant cost $7,932. The total yearly cost of the upkeep was $3,645, including driver's wages, repairs to rollers, fuel and oil. This is $1,215 per roller per year. Coal cost $4.32 to $6.24 per ton. The rollers were worked all the year round except when undergoing repairs and during frosty weather. Cheshire county owns four road rollers, the initial cost being $2,673 for rollers, sleeping vans, water cart and hose. The total yearly cost of upkeep is $1,458 per roller, this including wages, fuel, interest and depreciation, etc. The rollers are worked all the year. During the past year the county council also hired rollers at a cost of $1,458.

Cardiganshire county owns four steam rollers, the initial cost being $17,496 for four engines—2 roller tractions and two tractions convertible into rollers—six traction wagons and three sleeping vans. The total cost of upkeep for the year was $14,668 for the four engines, including wagons, materials and steel plating roller wheels. This would be about $1,167 per roller per year. The rollers are worked all the year, breaking and hauling stone in the summer and rolling during the winter months.

Durham county owns two sand rollers, the initial cost of the plant being as follows:

Two 15-ton compound steam rollers	$4,001
One Morrison scarifier	428
One traction wagon	170
Two water carts	257
One sleeping van	267

The total cost of upkeep per year is about $1,215 for each roller, this including depreciation, repayment of capital and interest, driver's and assistant's wages, repairs, fuel and water for rolling. The coal costs $2.88 to $3.48 per ton. The council also hires rollers at $5.40 per day, this including driver's wages, fuel, oil, stone, water and use of water cart.

Denbigshire county owns one steam roller and one convertible traction. The initial cost was $2,235 for roller sleeping van and two water carts. The total cost of upkeep is about

$1,701 per year for both engines; this including wages of driver and flagman, repairs, coal, etc. The average cost of coal is $4.80 per ton. The rollers are worked all the year, being only stopped by frost and snow. The county also hires some of its rolling done at a cost of about $194 per mile.

Derbyshire county owns seven rollers, a plant consisting of roller, scarifier, water cart and sleeping van. The average cost of upkeep in 1909 was $1,157 per roller, this cost including wages, fuel, repairs, etc. The driver was paid $1.20 per day and the flagman 84 cts. per day. Coal cost $3.84 to $4.32 per ton. The rollers are worked all the year, being stopped only in the case of frost and snow. The council also hires additional rollers, paying $4.32 per day and furnishing fuel.

Dorset county hires all the rollers for its road work, paying on an average 24 cts. per cu. yd., for stone rolled in place, this including water cart and horse and sweepers. The average number of rollers hired is 14 and these are worked during autumn, winter and spring.

Essex county owns ten steam rollers. The average initial cost of a roller with scarifier attached is $2,040. Sleeping vans cost $243 each and coal wagons cost $97 each. The working expenses for the year ended March 31, 1909, were $9,370, or $937 per roller. The rollers are worked practically all the year, being idle only for cleaning purposes. The county also spent for the year over $17,000 for hired roller.

Flint county owns two steam rollers. An average of 18 tons of granite is rolled per day by each roller. The rollers are worked all the year round.

Glamorgan county owns nine steam rollers. The initial cost of the plant was $26,288 for nine rollers, eight sleeping vans, eight coal bunkers, and nine watering carts. The total yearly cost of upkeep of the plant is about as follows:

Wages of drivers and other men with rollers	$12,296
Haulage of water and fuel	4,582
Cost of fuel, oils, etc.	2,445
Repairs	2,338
Total	$21,991

This would be about $2,445 per roller per year. The coal cost on an average $4.38 per ton. The rollers are worked all the year unless stopped by frost or repairs.

Gloucester county owns 18 steam rollers, the initial cost of the plant including rollers, water carts, Dobbin carts and pumps being $45,684. The cost last year of working 17 rollers was $19,027 or $1,119 per roller. This cost includes, wages, fuel, etc. The cost of coal varied from $2.88 to $6.00 per ton. The rollers are worked all the year, except when idle for repairs. Practically all of the rolling is done by the rollers owned by the county; but rollers are occasionally hired at $5.88 per day.

Kent county owns ten 12-ton compound steam rollers, the initial cost of the rollers being $23,814 or $2,381 each. The vans cost $2,965. The average daily cost of working the rollers, including repairs, coal, waste, scarifying, driver and attendant is $4.80. The average cost of coal is $5.28 per ton. The rollers are worked the year round. About 9/10 of the rolling in this county is done by county rollers. Rollers are hired at about $5.40 per day for the rest of the rolling.

Monmouthshire county owns three steam rollers, the initial cost of the plant including rollers, water carts and sleeping vans, being $7,515. The rollers are worked all the year if water is obtainable. All the rolling done by this county last year cost about $12,986. A total of 51,486 tons of granite and limestone was consolidated, the cost thus being 23.2 cts. per ton. Middlesex county owns three steam rollers, the initial cost of the plant being as follows:

Rollers, each	$1,871
Scarifiers, each	161
Sleeping vans, each	274
Water carts, each	137

The average cost per day for the past five years for steam rolling has been $4.50, this sum including scarifying, but not depreciation. The rollers are worked throughout the year. Practically all of the rolling is done by the county, but in some cases rollers are hired at $5.40 per day and 1½ cts. yer yard for scarifying.

Middlesex county owns three steam rollers. The initial cost of a single cylinder roller with Morrison's scarifier was $2,430. The total cost of rolling, including sweeper, in this county, has been 30 cts. per ton. Coal costs $3.12 to $4.20 per ton. The cost of operating the rollers has been about $3.84 per day. The county also hires several rollers, paying $5.76 per day.

Notts county owns four steam rollers, the initial cost of the plant being as follows:

Rollers, each	$1,700
Sleeping van	237
Watering cart	143

The total number of tons consolidated by the rollers was 36,858, the cost per ton being 17 cts. The four rollers worked 1,211¾ roller days during the year, the average cost per day being $5.19. Coal cost from $2.64 to $3.84 per ton.

Northamptonshire county owns two rollers and has one other on order. The initial cost of the roller plant was as follows:

12½-ton compound roller	$2,050
Scarifier	340
Traveling van	364
Two water carts	267

The average cost of upkeep per year, including wages, fuel, repairs, etc., has been $875. Coal has averaged $3.60 per ton. In this county one roller serves for 90 miles of road. The average number of tons rolled per year is 9,000 for each roller. This would make the cost of rolling about 9 cts. per ton.

Norfolk county owns 12 rollers, the initial cost of the roller being $20,200. The average cost of the upkeep per year for the 12 rollers for the past six years has been $2,410. The average cost per year of each roller has been $212.

Pembrokeshire county owns two steam rollers, the initial cost of the plant being $6,405, this including the cost of two 10-ton compound rollers, two living vans, two water carts and two coal carts. The average cost of upkeep for this plant for the past six years has been $2,075, this including driver's wages, water, fuel, oil, waste repairs, and removal of plant. This figures out about $1,037 per year per roller and coal costs from $5.28 to $6.00 per ton. Owing to the scarcity of water rolling is stopped early in June and not commenced again until in August. The rollers are worked steadily for the remainder of the year.

Shropshire county owns six steam rollers. The average cost of upkeep for the past three years has been $1,414 per year per roller, this including driver's wages, fuel, oil, waste, haulage of water, coal and repairs. Coal costs from $3.60 to $4.32 per ton. The rollers are worked all the year round. This county does all of its own rolling, only occasionally hiring a roller.

Staffordshire county owns seven steam rollers. The initial cost of the plant, which includes seven rollers, six coal wagons, six sleeping vans, 12 water carts and six roller sheds, was $19,000. The average cost of upkeep per year of the plant, including wages, repairs, fuel, etc., has been $6,850, or about $978 per roller. Coal costs from $3.84 to $4.08 per ton. The rollers are worked all the year, except when stopped by frost or repairs. The Table I. shows the number of steam road rollers owned by each county, and the yearly cost of operating the rollers. The latter figures include interest, wages, fuel, repairs, depreciation, etc., and is the actual cost of rolling per year. It should be borne in mind that wages in England are about one-half what they are in this country, roller engineers receiving about $1.25 per day and laborers about 87 cts.

TABLE I.

County.	Number steam rollers owned by county.	Mileage of rural main roads.	Miles per county roller	Cost of working per roller per year.

*Also hires rollers. †Hires all rollers.

Suggested Standard Specifications for Macadam, Brick, and Granite Block Pavement, Creosoted Wooden Block Pavement and Concrete Pavement.

An important step toward the standardizing of street paving specifications was taken at a convention of city officials held at Chicago on Feb. 21 to 26. This convention was called at the suggestion of Mr. Frank T. Fowler, Superintendent of Streets, of Chicago, for the sole purpose of taking action looking to the standardization of street paving. Invitations were sent to all cities having a population of 50,000 or more and 94 delegates representing 44 cities represented. The majority of the delegates were city engineers, or men directly connected with municipal street improvement work. The convention was formally organized under the name of the "Organization of City Officials for Standardizing Paving Specifications," and standing committees were appointed to draft standard specifications for various types of pavements. Each committee gave careful consideration to all phases of the type of pavement assigned to it, and reported recommended specifications to the convention. In drawing up the specifications the committee endeavored to meet as many conditions as possible by a sufficient number of standard arrangements which would permit the selection of one standard closely meeting the requirements of any particular locality. With this end in view several of the committee recommended only the principles upon which the specifications should be drafted, thus enabling the local engineers to adapt them to conditions in his particular city.

MACADAM PAVEMENTS.

The committee on macadam specifications consisted of J. L. Darnell, chairman, Kansas City, Mo.; Wm. H. Brooks, vice chairman, Philadelphia, Pa.; H. R. Peterman, St. Joseph, Mo.; H. S. Richards, Chicago, Ill.; Walter J. Leininger, Chicago, Ill.; Ellis R. Dutton, Minneapolis, Minn.; H. W. Klausman, Indianapolis, Ind.; Wm. Mungle, Newark, N. J.; Thos. P. Wriggins, Trenton, N. J.

In submitting its report this committee stated: Your committee unanimously concurs in the belief that a modern macadam pavement can hardly be considered finished until it has been given some binding treatment, and the specification has been prepared with an ultimate treatment with some bituminous compound in view. We have considered treatment by penetration only, however, as other methods would more properly come before your Committee on Asphalt and Bituminous Macadam. In the limited time at the disposal of your committee it has been impossible to go fully into the merits of the various tar and bitumens offered by the manufacturers for macadam road treatment. In this specification, we have endeavored to indicate a method of application which would generally be attended with successful results. However, in the use of these materials it is

recommended that the engineers consult with the manufacturers and so amend this specification that it will comply with their requirements. It is further recommended that careful consideration be given the physical and chemical requirements of the bituminous treatment and that they be specified by such requirements rather than by trade name.

The specifications recommended by the Committee were as follows:

Sub-Grade.—The portion of the roadway indicated shall be excavated from the present surface thereof to a sub-grade which, when properly prepared, in the case of Telford foundation, shall be 14 ins., and in Macadam foundation, shall be 12 ins., below and parallel with the surface of the completed pavement. Said completed surface shall conform to the general cross-section of the street as indicated, and shall be thoroughly cleaned, all stumps, roots and sod or other vegetable matter removed and the sub-grade shall be rolled with a steam road roller weighing 10 tons, so the surface shall be exactly parallel with the proposed finished surface. All soft or spongy places shall be excavated and refilled solidly with gravel, broken stone or approved earth before the completion of the rolling. If, by reason of steep grades, or other circumstances, it is deemed impracticable to use the steam road roller, the contractor will be permitted to use an approved horse-roller upon application to and with the consent of the proper authority.

Telford Foundation.—Upon the sub-grade thus prepared, rolled and accepted, there shall be placed a foundation of clean, hard, sound stone, broken into sizes which shall come within the following dimensions: 4 to 8 ins. in width, 8 to 14 ins. in length, and not less than 8 ins. in depth. The stone shall be placed by hand vertically upon the broad edge and lengthwise across the roadway, so as to form a close, firm foundation from gutter to gutter. The projection of the stones above and below surface 8 ins. above the sub-grade shall be broken off with napping hammers and the pieces so broken off, together with other stones of suitable size and shape, shall be used as wedges to firmly fix the stone of the foundation in proper position, so that its top surface will be parallel to the sub-grade of the roadway and 8 ins. above it.

Upon the roadway thus prepared there shall be spread a layer of good, clean earth, preferably clayey loam, not to exceed 1 in. in thickness. The foundation shall then be thoroughly rolled with a steam road roller weighing not less than ten tons. In places where rolling is impracticable, the foundation shall be rammed with suitable rammers with the approval of the proper authorities.

Macadam Foundation.—Upon the sub-grade prepared in the manner above described shall be spread a layer of broken stone, which when thoroughly compacted as herein provided shall be not less than 6 ins. in depth. The stone in this layer shall be practically uniform in quality and as near an approach to a cube as possible, and broken so that its greatest dimension shall not exceed 4 ins. and the smallest dimension not less than 2 ins.; all to be free from dust, dirt and screenings. All stones which do not approach uniformity of measurement shall be rejected and removed from the roadbed. No stones shall be allowed to remain which are not sound, strong and equable in size and quality. This layer of stone shall be thoroughly rolled with a steam road roller weighing not less than ten tons without the application of water.

Second Course.—On the above described foundation shall be placed a layer of broken stone whose greatest dimension shall not exceed 2 ins. and the least dimension shall not be less than ¾ in. to a depth which when compacted as herein specified shall be 4 ins. This stone shall be thoroughly rolled with a 10-ton steam road roller and sufficient clean stone screenings and water shall be spread over its surface to afford, when the rolling is completed, a practically smooth, dense and hard surface. When the second course as herein specified is completed, there shall be spread upon it a layer of stone ranging in size from 1 in. to ½ in. in the greatest dimension, which when compacted shall be 2 ins. in depth. This latter shall be thoroughly rolled and compacted with the 10-ton roller without the application of water until the stone ceases to creep before the rolls of the machine.

Bituminous Filler.—After the macadam as above specified shall have been thoroughly rolled and when it is in a bone-dry condition, it is to receive a bituminous treatment applied as follows: The surface must be clean, free from dust, dirt or foreign matter, the bitumen applied in an approved manner and at a temperature of not less than 00 degrees Fahrenheit, and in sufficient quantity to cover all parts of the surface and in quantity not less than 1½ gals. and not more than 2 gals. to a square yard of surface. After the application of the bitumen and after it has had time to set, there shall be applied a coating of clean stone chips whose greatest dimension shall not exceed ½ in. and whose smallest dimension shall be no less than ¼ in., sufficient to absorb all of the excess of bitumen, and the whole shall be rolled and rerolled until it presents a smooth, hard, dense and granular surface.

The rolling herein specified must be generally begun at the curb or gutter line and rolled from curb to crown, the shoulders first being rolled so as to prevent the spreading of the stone.

VITRIFIED BRICK PAVEMENT.

The committee on vitrified brick and stone block paving applications was composed of the following: B. T. Fendell, chairman, city engineer, Baltimore, Md.; M. F. McKenna, city engineer, Bridgeport, Conn.; D. M. Roberts, city engineer, Terre Haute, Ind.; John Minwegen, Board of Local Improvements, Chicago; M. R. Sherrerd, chief engineer, Department Public Works, Newark, N. J.; Edward H. Christ, member Board Public Works, Grand Rapids, Mich.; A. N. Aldrich, mayor, Aberdeen, S. D.; W. K. Seitz, assistant city engineer, St. Joseph, Mo.; John B. Hittell, chief engineer of streets, Chicago; J. A. Hooke, assistant sewer commissioner, St. Louis.

The report of the committee recommended brick paving specifications as follows:

Brick.—All brick must be strictly No. 1 pavers of the size commercially known as block, the widths of which must not vary more than ⅛ in. They must be thoroughly annealed, tough and durable, regular in size and shape and evenly burned. When broken the block shall show a dense, stone-like body, uniform in color inside, free from lumps of uncrushed clay, lime, air pockets, cracks or marked laminations; kiln marks or surface cracks must not exceed 3/16 in. in depth. All blocks so distorted in burning as to lay unevenly in the pavement shall be rejected.

All blocks shall be tested for abrasion and absorption, the limits of loss by abrasion test and amount of absorption to be determined by the engineer in charge of the work.

The abrasion test shall be made with the rattler recommended by the National Paving Brick Manufacturers' Association* and of the following shape and dimensions: A regular 14-sided polygon, circumscribed around a circle 28 ins. in diameter and the barrel to be 20 ins. long with ¼-in. spaces between each side, and where cast iron staves are used the engineer in charge of the work shall require greater loss from abrasion than when steel is used.

All blocks shall be laid on a 6-in. concrete base with sand cushion. The sand cushion shall be clean, sharp sand, spread to a uniform surface to conform to the cross section of the finished pavement, the sand cushion to be slightly moistened and rolled with a hand roller weighing not less than 10 lbs. per inch of width, the depth of sand to be not less than 1½ ins. nor more than 2 ins. after rolling.

Cement Filler for Brick Pavements.—The filler shall be composed of one part each of clean, sharp sand and Portland cement. The sand should be dry. The mixture, not exceeding ⅓ bu. of the sand, together with a like amount of cement, shall be placed in the box and mixed dry, until the mass assumes an even and unbroken shade. Then water shall be added, forming a liquid mixture of a consistency of thin cream. The sides and edges of the brick should be thoroughly wet before the filler is applied by being gently sprinkled. From the time the water is applied until the last drop is removed and floated into the joints of the pavement, the mixture must be kept in constant motion.

The mixture must be removed from the box to the street surface with a scoop shovel, all the while being stirred in the box as the same is being thus emptied. The box for this purpose shall be 4 ft. 8 ins. long, 30 ins. wide and 14 ins. deep, resting on legs of different lengths, so that the mixtures will readily flow to the corner of the box, the bottom of which should be 6 ins. above the pavement. This mixture, from the moment it touches the brick, should be thoroughly swept into the joints. Two such boxes shall be provided in case the street is 20 ft. or less in width; exceeding 20 ft. in width, three boxes should be used.

The work of filling should thus be carried forward in line until an advance of 15 to 20 yds. has been laid, when the same force and appliances shall be turned back and cover the same space in like manner, except to make the proportions two-thirds Portland cement and one-third sand.

To avoid the possibility of thickening at any point, there should be a man with a sprinkling can, the head perforated with small holes, sprinkling gently the surface ahead of the sweepers.

Within one-half to three-quarters of an hour after this last coat is applied and the grout between the joints has fully subsided and the initial set is taking place, the whole surface must be slightly sprinkled and all surplus mixture left on the tops of the brick swept into the joints, bringing them up flush and full.

After the joints are thus filled flush with the top of the brick and sufficient time for hardening has elapsed, so that the coating of sand will not absorb any moisture from the cement mixture, ½ in. of sand shall be spread over the whole surface, and in case the work is subjected to a hot summer sun, an occasional sprinkling, sufficient to dampen the sand, should be followed for two or three days.

Note.—Or if a stronger filler is desired pure cement may be used where streets can not be kept closed long enough to permit cement grout to properly set, or on account of any other local conditions, a bituminous filler may be used.

After brick in pavements are inspected and the surface is swept clean, the pavement shall then be rolled with roller weighing not less than three nor more than five tons in the following manner: The brick next the curb should be tamped with a hard wood tamper to the proper grade. The rolling will then commence near the curb at a very slow pace and continue back and forth towards the center, until the center of the street is reached, then passing to opposite curb and repeat in the same manner to the center of the street. After this first passing of the roller the pace may be quickened and the rolling continued until each brick is firmly imbedded in the sand cushion. The pavement shall be rolled transversely at an angle of 45 degrees from curb to curb, repeating the rolling in opposite 45 degree direction. Before and after this transverse rolling has taken place, all broken or injured blocks must be taken up and replaced with perfect ones. The substituted blocks must be brought to the true surface by tamping.

Expansion joints shall be placed parallel with and at each of the curb lines and shall be not less than 1 in. in width. Said joints shall be filled completely with bituminous cement.

(To be continued.)

*In view of the fact that the National Paving Brick Makers' Association is now considering a modification as to dimensions and materials of the "Rattler" now and for some time in use, the committee advised that questions touching the "Rattler" be not considered until after the association had reached a conclusion and made a recommendation as to this appliance.

The steel for the Nez Perce & Idaho R. R. has been delivered in Vollmer, Idaho, and the tracklaying will be inaugurated as soon as weather conditions will permit. The company now plans to have the line in operation for regular traffic on April 1.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Method and Cost of Constructing a Concrete Water Tower at Victoria, B. C.*

The tower, as built, consists of a hollow cylinder of plain concrete, 109 ft. high, and having an inside diameter of 22 ft. The walls are 10 ins. thick for the first 70 ft. and 6 ins. thick for the remaining 39 ft., and are ornamented with six pilasters (70 ft. high, 3 ft. wide, and 7 ins. thick), a 4-ft. belt, then twelve pilasters (12 ft. high, 18 ins. wide, and 7 ins. thick), a cornice, and a parapet wall. A steel tank of the ordinary type is embedded in the upper 40 ft. of this cylinder. To form the bottom of this tank, a plain concrete dome is thrown across the cylinder at a point about 70 ft. from the base, the thrust of this dome being taken up by two steel rings, ½ in. by 14 ins. and ⅜ in. by 18 ins., bedded into the walls of the tower, the latter ring being riveted to the lower course of the tank. The tank is covered with a roof of reinforced concrete, 4 ins. thick, conical in shape, and reinforced with ½-in. twisted steel bars.

The tower is built on out-cropping, solid rock. This rock was roughly stepped, and a concrete sub-base built. This sub-base consists of a hollow ring, with an inside diameter of 20 ft., the walls being 5 ft. thick. It is about 2 ft. high on one side and 7 ft. high on the other, and forms a level base on which the tower is built. The forms for this sub-base consisted of vertical lagging and circumferential ribs. The lagging is of double-dressed, 2x3-in. segments, and the ribs are of 2x 12-in. segments, 6 ft. long, lapping past one another and securely spiked together to form complete or partial circles. These ribs are spaced 2 ft. center to center.

Similar construction was used to form the taper base of the tower proper, except, of course, that the radii of the segments forming the successive ribs decreased with the height of the rib. Tapered lagging was used, being made by double dressing 2x6-in. pieces to 1¾ x 5 13/16 ins. and ripping on a diagonal, thus making two staves, 3 ins. wide at one end and 2¾ ins. wide at the other. This tapered lagging was used again on the 4-ft. belt and cornice forms, the taper being turned alternately up and down.

The interior diameter being uniform up to the bottom of the dome, collapsible forms were used from the beginning. These forms were constructed in six large sections, 6 ft. high, with one small key section with wedge piece to facilitate stripping, as shown in Fig. 1. There were three tiers of these, bolted end to end horizontally and to each other vertically.

Above the taper base and except in the 4-ft. belt and cornice, collapsible forms were used on the outside also. There were six sections extending from column to column and six column sections, all bolted together circumferentially and constructed as shown in Fig. 1. Three tiers of these were also bolted together both vertically and horizontally.

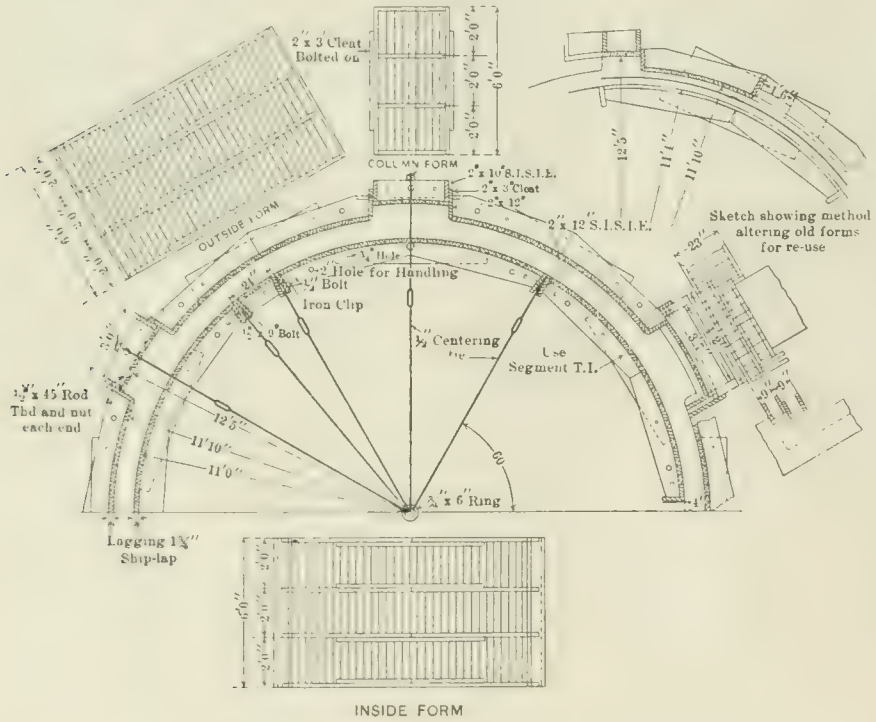

Fig. 1—Movable Forms for Shaft of Concrete Water Tower.

Having filled the top tier, the mode of operation was as follows: All horizontal bolts in the lower inside and outside forms were removed, as was also the small key section on the inside; this left each section suspended to the corresponding one immediately above it by the vertical bolts before mentioned. It is thus seen that in each case the center tier performed the double duty of holding the upper tier, which was full of green concrete, and the sections of the lower tier, until they were hoisted up and again placed in position to be filled.

These lower forms were then hoisted by hand—four-part tackles being used—and placed in position on the top forms, their bottom edges being carefully set flush with the top edge of the form already in position, and then bolted to it. On the outside, the column forms, and on the inside, the wedge and key sections were set last. A 3-lb. plumb-bob and a fine line were suspended from the inner scaffold and carefully centered over a point set in the rock at the base. This line was in the exact center of the tower, and the tops of all the forms, after each shift, were carefully set from it by measurement, thus keeping the structure plumb.

The first 23 ins. of the barrel of the tower was molded with special outside forms, constructed so as to form the bases of the large pilasters. After eleven applications of the 6-ft. forms, these 23-in sections were reversed to form the capitals, thus making these pilasters, 69 ft. 10 ins. over all.

The forms of the 4-ft. belt and beading were made in twelve sections of simple segments and vertical lagging, as shown in Fig. 1.

Two sets of the outside forms were split longitudinally, as shown in Fig. 1, and used to form the small pilasters. The first set was put in place, filled, and the concrete allowed to harden. The bolts were loosened and the forms raised 5½ ins. vertically, again bolted up, and the second set was placed in position, bringing the top of the second set up to the bottom of the cornice. The bases and capitals of the small pilasters were molded on afterward.

The cornice forms are clearly shown in Fig. 1. The small boxes separating the dentils are made of light stuff, and tacked into the cornice forms so that, in stripping, they would remain in place and could be taken out separately, in order to prevent the breaking off of the corners of the dentils. A number of outside and inside sections were sawed in half horizontally in order to provide forms for the parapet wall.

The inside diameter of the tank is 8 ins. greater than the inside diameter of the base. Two sets of inside forms were split longitudinally and opened out as shown in Fig. 1, and another small section was added to complete the circle. The remaining set was left in place to support the dome forms.

The dome forms were made in twelve sections, bolted together to facilitate stripping. All ribs and segments were cut to size on the ground, put together in place, and then covered with lagging and two-ply tar paper. The lagging on the lower sharp curve was formed of a double thickness of ⅝-in. spruce, the remainder being 1x4-in. pine, sized to a uniform thickness of ⅞ in. Figure 2 shows the construction of these forms and the method of putting on the lagging.

The roof forms were made in eight sections and bolted together to facilitate stripping. All ribs and segments were cut to size on the ground, put together in place, and covered with 1x4-in. lagging, dressed to a uniform thickness of ⅞ in., and two-ply tar paper. Figure 2 shows the construction of these forms. The segments being put in horizontally instead of square with the lagging, gave circles instead of parabolas, making them much easier to lay out, and giving a form which was amply stiff.

The question of using an inside scaffold only was carefully considered, but owing to the considerable amount of ornamentation on the outside, necessitating a large number of individual forms, it was not thought that any economy would result. Fig. 3 shows clearly the construction of the scaffolding.

All concrete was mixed wet, in a motor-driven, Smith mixer, and handled off the outside scaffold, being sent up in wheel-barrows on the ordinary contractor's hoist and placed in the forms through an iron chute having a hopper mouth. This chute was built in three sections bolted together, either one, two, or three sections being used, depending on the distance of the forms below the deck. When the top of the forms reached the elevation of any deck, the concrete was put in through the chute from the deck above. The chute was light and easily shifted by the wheel-barrow men, assisted by the man placing the concrete, during the interval between successive wheel-barrows.

The concrete, except that for the roof and parapet, was composed of sand and broken

*Abstracted and rearranged from a paper by A. Kempkey, Proceedings, American Society of Civil Engineers, Vol. XXXVI, p. 176.

rock, the run of the crusher being used. That for the roof and parapet was composed of sand and gravel. The only reason for using gravel for the concrete of the roof was the ease with which it could be obtained in small quantities, the supply of broken rock having been used up, and this being the last concrete work to be done.

The concrete used was as follows: 1: 3: 6 for the sub-base and taper base; 1: 3: 5 for the barrel of the tower and tank casing; and 1: 2: 4 for the dome and roof. The dome was put in at one time, there being no joint, the same being true of the roof. Vancouver Portland cement, manufactured on the island about 15 miles from the city, was used throughout the work.

Before filling, the inside of the tank was given a plaster coat, consisting of 1 part cement to 1¾ parts of fine sand. This proved to be insufficient to prevent leakage, the water seeping through the dome and appearing on the outside of the structure along the line of the bottom of the rings. Three more coats were then applied over the entire tank, and two additional ones over the dome and about 8 ft. up on the sides, and except for one or two small spots which show just a sign of moisture, the tank is perfectly tight.

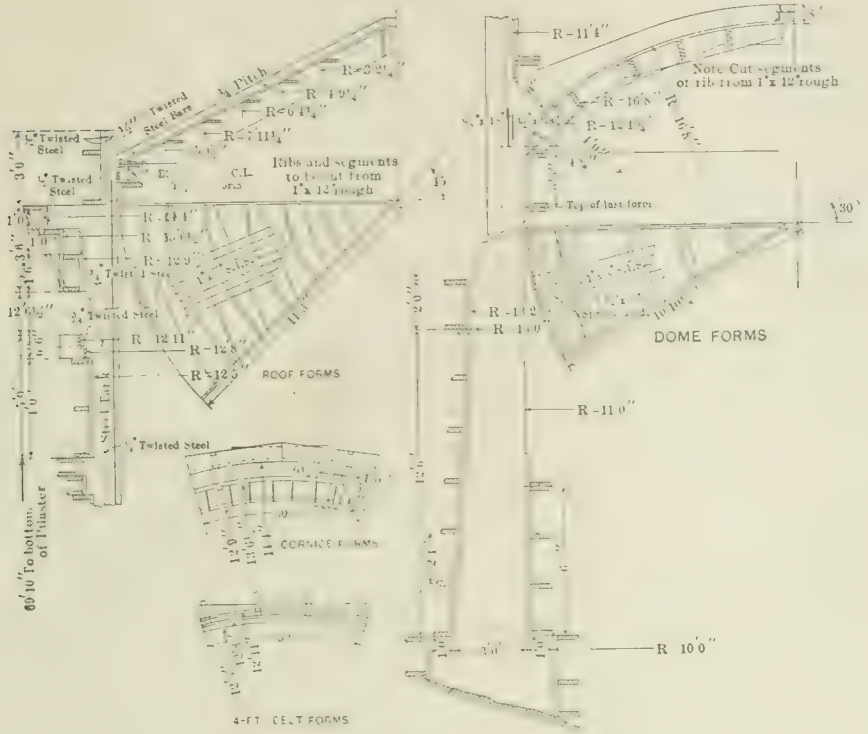

Fig. 2—Details of Base, Dome and Roof Forms for Concrete Water Tower.

The barrel of the tower was carried up to a height of 66 ft. A special set of inside forms, about 2 ft. high, extending to the springing line of the dome, was then put in, and the dome forms were set up on it. The idea was that this 2-ft. form could be knocked out piece by piece and the weight of the dome form taken on wedges to the last 6-ft. form, these wedges being gradually slackened down in order to allow the dome form to settle clear of the dome. As a matter of fact, this was done, but the dome forms, being very tight, did not settle, and had to be pried off a section at a time. A similar method was used for slacking down the roof forms, with similar results.

After the dome forms had been put in, the concrete was carried up approximately to the elevation of the bottom of the rings. Small neat cement pads were than put in and accurately leveled, and on these the steel rings were placed, and the steel tank was erected.

In order to insure a perfectly round tank, each course was erected against wooden templates accuratedly centered and fastened to the inside scaffold. The tank is the ordinary type of light steel, the lower course being 3/16-in., the next, No. 8 B. W. gage, the next, No. 10 B. W. gage, and the remaining four, No. 12 B. W. gage.

Work on the foundation was started on Aug. 15, 1908, and the tower was not completed until April 1, 1909. Much time was lost waiting for the delivery of the steel, and also owing to a period of very cold weather which caused entire cessation of work for about one month.

The tower as completed presents a striking appearance. In order to obliterate rings due to the successive application of the forms and to cover the efflorescence so common to concrete structures, the outside was given two coats of neat cement wash applied with ordinary kalsomining brushes, and, up to the present time, this seems to have been very effective in accomplishing the desired result. Irregularities due to forms are unnoticeable at a distance of 200 or 300 ft., and the grouting gave a very uniform color. The application of two coats of cement wash cost, for labor, $97.68, and for material, $15.18, or $1.32 per 100 sq. ft., labor being at the rate of $2.25 per 8 hours and cement costing $2.53 per bbl. delivered on the work.

The tower was designed by Arthur L. Adams, M. Am. Soc. C. E., under whose direction the plans for all the work of remodeling the water-works system were prepared and executed. The forms, scaffolding, etc., were designed by the writer, who was also in immediate charge of the erection.

Tenders received for the construction of

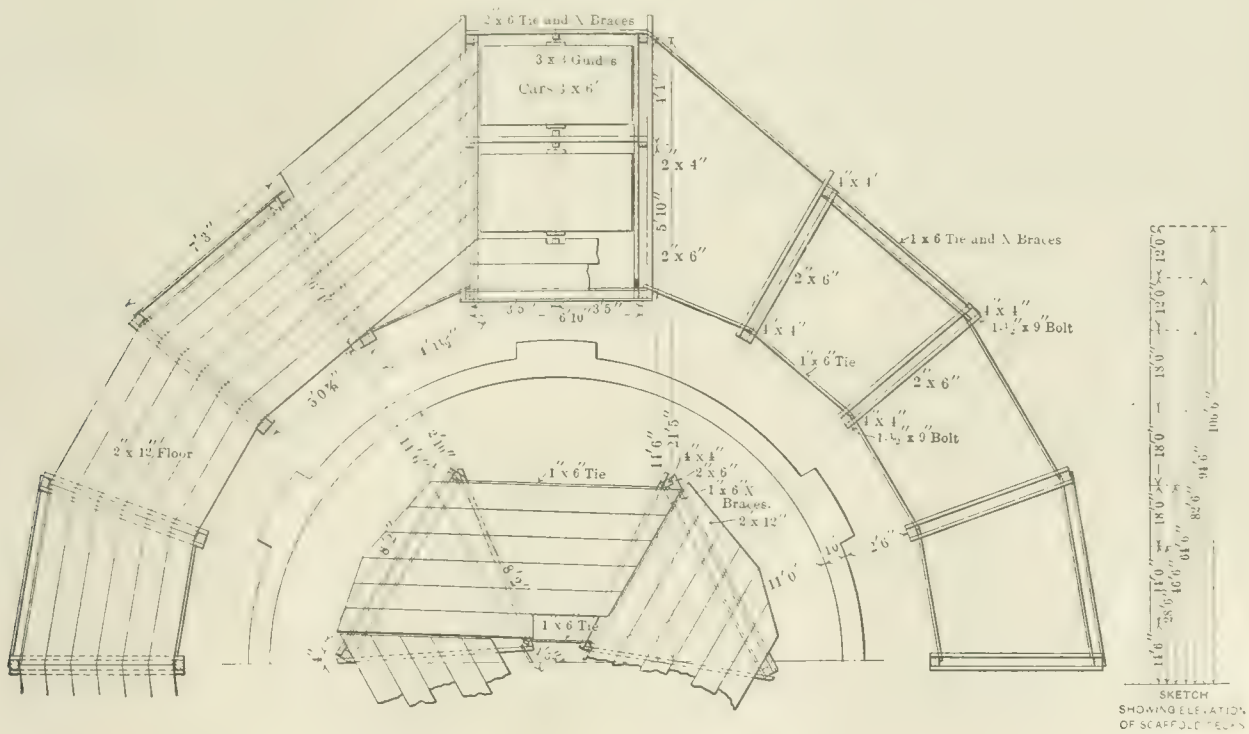

Fig. 3.—Details of Scaffold for Constructing Concrete Water Tower.

the tower covered an extremely wide range, and indicated at once the utter lack of knowledge on the part of the bidders of the cost of a structure of this kind. Inasmuch as none of them had had previous experience in this class of construction, the engineer deemed it the part of wisdom and economy to retain the construction under his immediate supervision, and, therefore, the work was done by day's labor.

The following tables give the cost of the structure. The total herein given will not coincide with the total cost as shown by the city's books, for the reason that various items not properly chargeable to the structure itself have been omitted, the principal ones of which are the cost of the site, the laying of about 600 ft. of sewer pipe to connect with the overflow, and considerable expense incident to the construction of a wagon road to the tower.

The rates of wages paid, all being on a basis of an 8-hour day, were as follows:

Common labor	$2.25 and $2.50
Carpenter	4.00
Carpenter's helper	2.75
Boilermaker	3.50
Holders on	2.50
Boilermaker foreman	5.00
Plasterers	6.00
Plasterers' helpers	3.00

The cost of material was as follows:

Cement, per barrel	$ 2.53
Sand, per yard	1.47
Rock, per yard	0.80
Lumber, per 1,000 ft. B. M.	$14.00 and 16.00

All these prices are for material delivered on the work.

An examination of the cost data, as given, will show that for the most part the unit costs are very high. This is due chiefly to the continued interruption of the work, during its later stages, owing to bad weather, particularly in the case of the erection of the steel tank. The material cost in this case was also exceedingly high. In the case of the concreting, inability to purchase a hoist and motor and the high cost of renting the same, together with the delays mentioned, added greatly to the unit cost. When it is considered that the cost of plastering covers that of four coats over the entire inside of the tank and three more over about one-third of it, it does not appear so high, especially in view of the high rate of wages paid. The cost per yard for concrete alone was $25.126, and this is probably about 25 per cent in excess of the cost of the same class of work executed under more favorable conditions as to location, weather conditions, etc.

The following costs have been rearranged and further analyzed by the editors of ENGINEERING-CONTRACTING from the tables given by the author:

Preliminary work	Total	Per cu. yd.
Labor, carpenter at 50 cts. per hour	$ 11.00	
Labor, common at 24.4 cts. per hour	64.94	
Labor, common at 28.1 cts. per hour	249.67	
Total labor	$ 325.61	$ 0.720
Materials	133.62	0.324
Total labor and materials	$ 459.23	$ 1.114
Forms Building, Shifting, Stripping:		
Labor, carpenter, at 50 cts. per hour	$1,832.99	
Labor, common, at 34.4 cts. per hour	80.85	
Labor, common, at 28.1 cts. per hour	563.84	
Total labor	$2,477.68	$ 6.014
Materials		
Lumber	$ 583.49	
Hardware	325.51	
Miscellaneous	13.90	
Total material	$ 922.90	$ 2.240
Grand total	$3,400.58	$ 8.254
Scaffold Erecting and Tearing Down:		
Labor, carpenter at 50 cts. per hour	$ 698.00	
Labor, common, at 34.4 cts. per hour	350.59	
Labor, common, at 28.1 cts. per hour	117.27	
Total labor	$1,160.86	$ 2.818
Materials.		
Lumber	$ 487.77	
Hardware	202.79	
Total materials	$ 690.56	$ 1.676
Grand total	$1,851.42	$ 4.494
Concreting:		
Labor at 50 cts. per hour	$ 142.00	
Labor at 34.4 cts. per hour	11.00	
Labor at 28.1 cts. per hour	947.81	
Total labor	$1,100.81	$2.672
Material:		
Rock	$ 317.30	
Sand	335.72	
Cement	1,591.97	
Total material	$2,244.99	$ 5.449
Hoisting:		
Rental motor and hoist	$ 406.56	
Power	83.53	
Total power	$ 490.09	$ 1.189
Grand total	$3,737.89	$ 9.316
Grand total concrete	$9,449.12	$23.178

These figures do not include apparently any charge for superintendence which with perhaps some other items may account for the difference between the final total and the cost of $25.126 for concrete given by the author of the paper.

The cost of plastering 3,000 sq. ft. was as follows:

Labor:	Total.	Per sq. ft.
Plasterers, at 75 cts. per hour	$116.50	
Labor at 46⅔ cts. per hour	15.00	
Labor at 37½ cts. per hour	198.52	
Labor at 28.1 cts. per hour	105.66	
Total labor	$435.68	$0.1452
Materials:		
Sand	$ 8.64	
Cement	66.10	
Alum and potash	16.00	
Total material	$ 90.74	$0.0302
Grand total	$526.42	$0.1754

The cost of washing 8,560 sq. ft. with cement wash was as follows:

Labor:	Total	Per sq. ft
Common at 43¾ cts. per hour	$ 50.00	
Common, at 28.1 cts. per hour	47.68	
Total labor	$ 97.68	$0.0114
Material:		
Cement	$ 15.18	$0.0018
Grand total	$112.86	$0.0132

The itemized cost of the steel tank, 20,000 lbs., was as follows:

Labor:	Total.	Per lb
Carpenter at 50 cts. per hour	$ 124.24	
Helper at 34.4 cts. per hour	2.75	
Boilermakers	382.57	
Holders on	117.33	
Labor	10.61	
Foreman at 62.5 cts. per hour	186.25	
Total labor	$ 883.75	$0.0441
Materials:		
Tank, rivets, etc	$1,740.69	$0.0870
Grand total	$2,624.44	$0.1316

The various miscellaneous items of cost were as follows:

Windows, Doors, Etc.:	Total.
Labor	$ 49.00
Material	47.26
Total	$ 96.26
Equipment, 10% of $161.46	$ 184.58
Ironwork: (Spiral stairway, inlet and overflow pipes, radiator, reinforcing steel, etc.):	
Labor:	
Machinists at 50 cts. per hour	$ 89.50
Helper, at 34.4 cts. per hour	240.16
Labor, at 28.1 cts. per hour	100.79
Total labor	$ 430.45
Material	$ 1,814.71
Grand total	$ 2,245.16
Grand total (tower and tank complete)	$16,578.29

The Lowering of Well Water Supplies and the Use of Air Lift Pumps.

At the recent (1910) meeting of the Indiana Sanitary and Water Supply Association, Mr. Charles Brossman, consulting engineer, Indianapolis, Ind., gave it as his opinion that one large factor in the lowering of deep well supplies in the drainage of farm lands. He stated that he has seen farms drained, underlying which was a splendid stratum of gravel ordinarily taking care of the greater portion of the water. At present nearly all the water is taken rapidly to the nearest water course and none goes down to the gravel; the small amount retained in the soil being absorbed by vegetation. The following instances were given of lowering of water:

Kentland	15 ft. drop in 5 years
Elwood	10 ft. drop in 12 years
Greensburg	10 ft. drop in 10 years
Marion	28 ft. drop (time not given)
Remington	8 ft. drop in 10 years
Marion	6 ft. drop in 20 years
Butler	4 ft. drop in 10 years
Bourbon	3 ft. drop in 8½ years
Linton	some wells show 30 ft. drop in 6 years
Kokomo	some wells show 15 ft. drop in 14 years

The cause of the drop at Marion is given as due to waste from other wells. A number of plants have installed air lifts or other deep well pumps. Mr. Brossman concluded his remarks by saying:

> Is it necessary that wells should be uncapped and allowed to flow, or is it necessary that all the water falling on rural lands be run off at once into the nearest waterway, without some attempt at having it serve some useful purpose? The lesson of natural gas has been learned in Indiana. Do the facts that we have learned in regard to water supplies merit a further investigation to determine if conditions can be improved? Do they warrant the placing of the situation before the state authorities?

As bearing upon the subject Mr. J. B. Marvin, C. E., of Frankfort, Ind., gave the following data, based on his personal experience at Frankfort since 1886:

At certain low levels in and around Frankfort the water flowed as late as 1890. It was observed, however, prior to that date the head of the ground water was gradually receding. My concern was rendered acute on the water supply question, made so by having in charge the management of the water-works at Frankfort during these years.

The water supply is obtained from a coarse gravel and sand stratum reached at a depth of fifty feet; at the point where the works are located near the center of Frankfort, and continues to a depth of eighty ft., thus giving 30 ft. of most excellent water producing gravel and sand. Immediately above this stratum lies 20 ft. of blue impervious clay; below is found a greater thickness of the same kind of clay. These conditions prevail throughout a large area of our section, the water bearing stratum varying somewhat in thickness. From this it would appear that the supply of water in this locality was reasonably well assured. However, I have no theory to exploit, either scientific or theoretical, as to the ultimate permanency of the supply, nevertheless I have a decided opinion. I know that by 1892 the head of the water had fallen to a depth where it was necessary to use artificial means to aid the flow.

At this period of the declining ground water level, compressed air was employed to accelerate the flow of the water and the same was used with varying degrees of success until 1907, and abandoned at that time on account of the ineffectiveness of the method and in consequence of the excessive cost, but most of all the never ending trouble caused by an offensive odor and disagreeable taste in the water. Be it here understood that at no time prior to the using of air was there even a suggestion of trouble from algae, and it entirely disappeared with the discontinuance of the use of air. During the period air was used our storage consisted of two reservoirs of brick construction, puddled on the outside with blue impervious clay and water proofed within; bottoms made secure, both reservoirs covered and never neglected in the point of being regularly cleaned. Mention is made of the reservoirs and their construction and condition so that it would be self-evident that the presence of algae in the water could not be charged to sunlight. Often in the autumn months the offensiveness, both to taste and smell, was almost past endurance, and even in the winter months the odor and taste in the water could be readily detected at the hot water faucet. At the time of the greatest distress, a suggestion was offered to very high authority, that the trouble might be traced to the compressed air, that is that the fungi might be carried in from the open atmosphere with the compressed air and its growth encouraged and propagated by the warmth imparted by the frictional heat. At that time the suggestion met with a strong negative opinion.

Since then this theory has been under the expert's scrutinizing investigation and experiments and it has been conclusively demonstrated that certain forms of algae live and thrive best without light, and when once im-

parted to the water finds congenial elements for growth in the dark recesses of the water mains. It is a demonstrated fact that our trouble came from the compressed air source, for, as stated before, there was no trace of algae prior to its use, and it entirely disappeared with its discontinuance.

A somewhat extensive experience in other fields, not only in this, but other States, has convinced me that compressed air is a breeder of trouble, that in almost all cases, if not every case, where compressed air is employed for raising water, the presence of algae in some form and to some extent can be found, and this whether the storage is covered or open.

The ground level of the water has lowered about one foot per year during the last twenty years; at first more rapidly, of late very slowly, until at the present time the static head is 26 ft. It seems certain that the next 24 ft. to the point of the beginning of the water-bearing stratum will offer stubborn resistance to further decline, on account of the large area that supports this subterranean supply. The statement of "large area" is made for the reason that this stratum is drawn upon for water all over Clinton county, and the uniform lowering of the head is well observed.

Deep well augur or impeller pumps, driven by vertical electric motors, direct connected, have been in use since February, 1907, one 6-in. and one 8-in. being sufficient to furnish the present requirements. Before installing these pumps 19 walls were used. A sufficient supply can be obtained now by running the 8-in. pump from 6 A. M. to 6 P. M., which delivers 700 gals. per minute, and the 6-in. pump from 6 P. M. to 6 A. M. delivering 408 gals. per minute. The 6-in. pump has 60 ft. of shafting and requires 9.9 HP. for operating, using $3 per ton run of mine coal. The fuel cost per 1,000 gals. for raising water into storage reservoirs, based upon a daily average pumpage for 1909, of 755,756 gals., was 2 9/10 mills, or 22 HP. for 12 hours, and 10 HP. for 12 hours, an average of 16 HP. The last year compressed air was in use, with the static head of the ground water very much higher, the fuel cost per 1,000 gals. for raising the water into the same reservoirs was 4½ mills. A Band Duplex Air Compressor with Keyer gear was used. The size of the steam cylinders being 12x16 ins. air end 14x16 ins., having a capacity of 570 ft. of free air per minute, at 100 revolutions, with 60 lbs. of air and 80 lbs. of steam pressure.

Notes from the Springfield, Ill., Water Works Report.

Springfield, Ill.—In the 1909 annual report Mr. J. W. Southwick, superintendent of water works, recommended that when rehabilitation of the electric light plant becomes necessary it should be installed at the pumping station. This will result in a saving of fuel, will require but one or two additional firemen and no increase in the number of engineers, although some increase will be needed in steam power for three months in the year. In his opinion the overflow of water at the new dam can be utilized to produce all the electricity required during nine months of the year. To protect the water supply septic tanks are recommended for the outlet of the new large sewer in the south part of the city. The cost for 400 tons of cast iron water mains averaged $23.95 per ton f. o. b. Springfield. The total expenses for the year were $123,420, of which improvements cost $62,976. Total collections for the year amounted to $117,535, leaving a deficit of $5,885. New mains cost $31,274 and the new dam, the improvement of Spring Creek and new work on the power plant cost $31,701, so the deficit was only apparent, for it was a year of extraordinary expenditure on work of a permanent nature. In 1905 Springfield, Ill., was credited with a population of 38,234. The number of meters in use in 1908-9 was 869, of which 534 were in business houses and only 155 in residences and flats. In 1908-9 there were laid 7,021 ft. of 10-in. mains, 26,499 ft. of 6-in. and 667 ft. of 4-in., the total in the city of all mains, public and private, being 92 miles.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Plans and Specifications for Early Timber, Earth and Masonry Dams Built in Connecticut.

Three of the dams described in the following text and illustrations were built between 1860 and 1870, and nine were built between 1881 and 1891. All of these dams were designed by Harry T. Potter, nine of them while he was a member of the Connecticut State Board of Engineers, having supervision of dams and reservoirs. As examples of the work of an older generation of engineers, these dams are worthy of record, and we describe them here from a paper read at the recent annual convention of the Connecticut Society of Civil Engineers, by Mr. C. E. Chandler of Norwich, Conn.—Editors).

Between 1860 and 1870, Mr. Potter designed and superintended the construction of three dams on the Shetucket River, two of them about 25 ft. high and one of them about 15 ft. high, and the Ousatonic dam on the Ousatonic River, about 24 ft. high. These dams are still among the very largest in the state; the drainage area at the first three dams being 459, 477 and 526 square miles, respectively, and at the latter dam 1,560 square miles. All these dams were built on a rather poor gravel foundation.

Stream flow data in this country were scarce in the 60's, and only the smaller streams had, as a rule, been developed.

Accidents occurred in the building of these larger dams that made Mr. Potter's experience more valuable than it would otherwise have been. As the law does not require that members of the State Board of Engineers should report their doings to any one, there is no convenient way to find out how many, or what dams have been brought to their attention officially. From such plans as Mr. Potter left among his papers, kindly loaned me by his family, from my own personal knowledge and from certificates on the Land Records of the various towns in the district, it appears that Mr. Potter had some official connection with nine dams.

The first dam was built in 1881 and 1882 on the Shetucket River in Norwich at a point where the drainage area is about 1,250 square miles. The rollway is 400 ft. long by 12 ft. high. The height of abutments has since been increased 4 ft. The material for the foundation was loose gravel more than 60 ft. deep. The dam was built of rubble masonry laid in cement mortar coped with granite. The specifications did not call for full mortar joints, as the writer remembers them, but simply required that the stones be well bedded in mortar. There was a concrete facing on the upstream side of the dam, and earth filling as shown by the original plan, Fig. 1. This

Fig. 1.

plan calls for the base of the dam to be 1 ft. below the bed of the stream, and to be 15 ft. wide including 1 ft. of concrete facing and 15 ft. high. The crest is of granite blocks 7½ ft. wide across the dam, inclining upstream on a slope of 5 to 1.

The apron is 22 ft. wide and is a crib of three layers of 12-in. timbers at right angles to each other 6 ft. apart; the lower layer cut into the bed of the stream and the others filled with stone and covered solid with 12-in. timbers, laid parallel with the stream. The 7 ft. of timbers furtherest downstream had an upstream slope of 6 ins. to keep standing water on the apron. The form of the timber apron

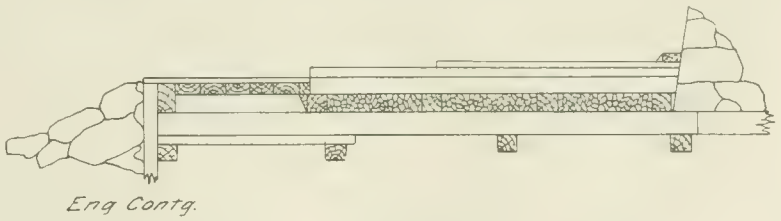

Fig. 2.

was changed in 1885 to that shown in Fig. 2. The new apron had no back slope.

About 200 ft. of this rollway went out in the great freshet of 1886, and it was replaced by a timber dam, built in accordance with Fig. 3. The new work is an immense timber crib 200 ft. long, 68 ft. wide, and 24 ft. high, entirely filled with stones and gravel. The whole crib was built in place, stick by stick, and it floated on the water in the excavation made by the washout until it grounded. This timber crib was extended along the remaining 200 ft. of the dam so that the external appearance is uniform, and the relative position and magnitude of the new and old sections is

shown in Fig. 4. As about one-half of this dam went out and the balance remained undamaged, it is fair to assume either that the material under the balance was poorer than that under the balance, or that something

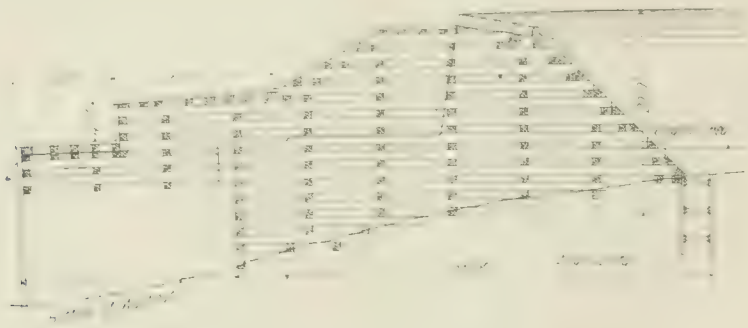

Fig. 3.

happened to one part that did not happen to the other. As during the freshet large quantities of drift passed by, including whole trees, parts of bridges and buildings, the latter may be the case. It is claimed by some that an oil tank floated over the dam and broke the apron.

The second dam was on the Quinebaug River in the town of Thompson, where the drainage area is in the neighborhood of 175 square miles. No plans of it exist so far as the writer knows. My recollection of it is that there was no core wall, except a low one to break the joint between the natural ground and the embankment. A highway occupies the top of the embankment. There was considerable seepage at the foot of the slope and a drain was laid to carry the water into the river.

The following account of this dam is from Professor Dwight Potter's description of the water power on streams tributary to Long Island Sound.

At the site of the new dam the river-bed is gravel, with some quicksand. The dam was carried down 3 or 4 ft. below the surface of the apron into the river-bed and protected by sheet-piling, in the usual manner. The rollway is 200 ft. long, rises 15 ft. above the apron, is 4 ft. wide on top, 30 ft. wide at the base, and has front and back slopes of 20 ft. each. The back slope is covered with 2½-in., the top with 4-in., and the face with 3-in. chestnut planking. In interior construction the dam is a log crib-work filled with stone. An apron projects 16 ft. beyond the foot of the dam, and has a permanent covering of 4-in. chestnut plank, over which is a temporary layer of 2-in. white oak plank, easily renewed when worn out. From the rollway there extends a gravel embankment 900 ft. long, about 20 ft. high, 60 ft. wide at the base and 24 ft. at the top, the inner slope of which will be riprapped.

The third dam Mr. Potter was called to act on was in Woodstock, on a stream of about 7 square miles drainage area. It does

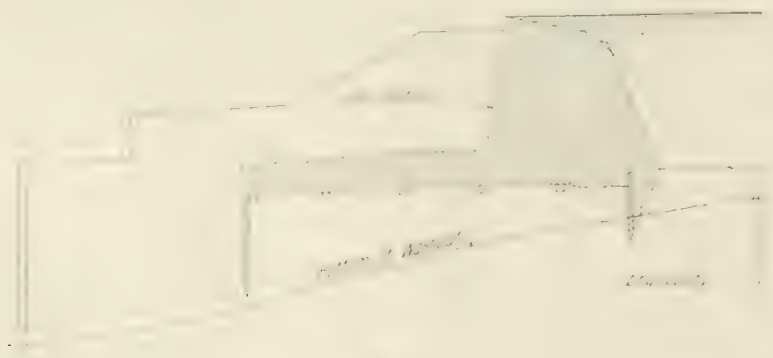

Fig. 4.

not appear that state approval was asked on the original plans. The plan from which the dam appears to have been originally built is shown in Fig. 5. The specifications read as follows:

The masonry to be good rubble work laid in a good workmanlike manner to be 20 ft. thick at the base for a height of 32 ft. and in that proportion; top to be 40 ins. thick. Batter on water side 5⅝ ins. per foot. The lower side to be perpendicular for 12 ft.; above that batter of 1½ ins. per foot. On upper side of dam logs of 12 ins. in diameter laid horizontally 5 ft. apart and planked perpendicularly with good chestnut plank 2 ins. thick. The whole to be graveled to within 2 ft. of top and puddled for 3 ft. in width from planking. Top of graveling to slope on an angle of 30°. For further details reference is made to a plan enclosed herewith.

The foundation appears to be ledge. The rubble was evidently intended to be dry as no mortar is mentioned. The proposed length of wasteway is not given, either in plan or specifications, but it now measures 113 ft. with abutments 2½ ft. high. Among Mr. Potter's papers is a pencil sketch made, probably, by Mr. Potter which is shown in Fig. 6. They built the dam like the original drawing, and after it had bulged from *A* to *B*, they consulted Mr. Potter and braced it up by adding 10 ft. on downstream side at bottom, taking down the old part to *C*.

The privilege has not been in use for many years. The mill owner below was afraid of the dam and its owner dug a channel through it about 37 ft. wide at the top and 25 ft. deep. The experience on this dam plainly teaches, however unnecessary the lesson appears to be, that a dry wall 32 ft. high with a 20 ft. base, and a vertical downstream face for a third of the way up is wholly inadequate.

Dam number four was built on the Pachaug River in the town of Griswold, at a point where the drainage area is 62 square miles. The legal length of the rollway is 82½ ft. The plans call for a rollway 110 ft. by 5 ft The 82½ ft. were placed at the legal height and the balance about 1 ft. higher. The foundation is ledge rock. The cross section is shown in Fig. 7. For a height of 23 ft. it calls for a base of 19 ft. and a 9 ft. coping

Fig. 5.

sloping 2 ft. The specifications were as follows:

The masonry of the face of the dam to be of granite and shall have an average thickness of 3½ ft. It shall be cut and laid with joints not exceeding ¾ of an inch in thickness for a distance of 12 ins. back from the face. The courses shall be laid breaking joint and shall have headers not less than 2 ft. 6 ins. long on face and extend back into the body of the dam not less than 4½ ft. Headers to average not more than 10 ft. apart in each or the same course and alternate in succeeding courses.

The back of the dam and abutments shall be of good rubble work thoroughly laid in cement mortar and properly bonded to interior. All spaces in the interior to be well filled with medium size and smaller stone and thoroughly grouted with cement grout, to make when complete a solid mass of masonry.

The stone piling walls as shown on the plans to be laid with suitable size stone, thoroughly laid in cement mortar and all spaces completely filled.

The coping will be of granite of thickness and length as shown on plans, cut on front edge and top bevel, and thoroughly bedded and secured to other stone work of the dam. The vertical and top joints not to exceed ½ in. in thickness.

After the masonry is in place a filling of earth

and stone is to be put in at back of dam as shown on plans.

The rock under dam and abutments to be excavated to such depth as to give a good footing for the base and toe of the dam. The bottom of the river will be stepped or channeled as shown by plans as decided advisable by the superintendent in charge, in order to guard against

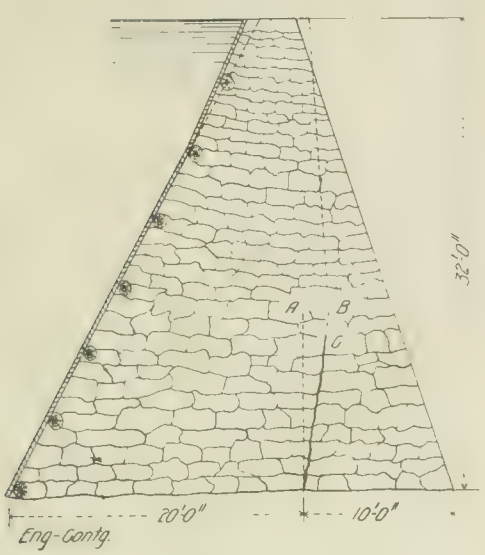

Fig. 6.

leakage between the dam and rock and all hollows and channels thoroughly filled with grouted work.

The top surface of the filling of dam will be protected by riprap of stone suitably laid and extending back a distance of about 6 ft. from back line of coping.

All mortar to be composed of hydraulic cement of some approved manufacture and good clean sharp sand mixed in the proportion of two of sand to one of cement. The mortar to be prepared only as fast as wanted and none having once set to be mixed and used in any part of the work.

This is a first-class dam on a first-class foundation.

The fifth dam was on the Pachaug River where the drainage area is 61 square miles.

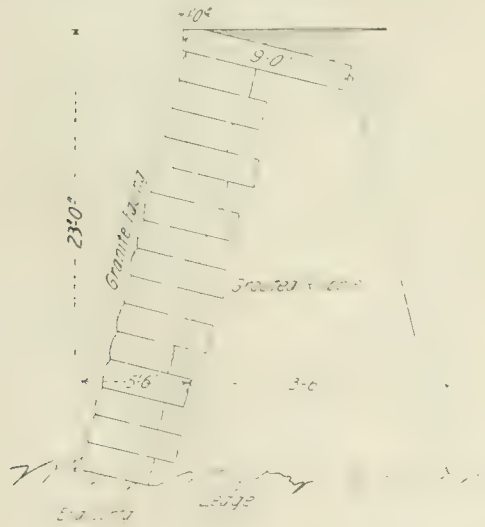

Fig. 7.

The spillway is 111 ft. long by 7 ft. high. The cross section of the spillway is shown in Fig. 8. The foundation is excellent blue gravel. The specifications were as follows:

The whole ground to be occupied by rollway, abutments, and apron is to be excavated to the depth of bottom of mudsill under old apron, which is to be known as the grade line.

The priming or sheet piling under dam and abutments is to be set 4 ft. from upper face of dam in the middle of a trench excavated 3 ft. wide at a level 3 ft. below grade line or as much lower as may be necessary to get to good material.

Except that if boulders too large to be readily removed without blasting are met, the piling may be scribed to them, and the joints well cemented.

Piling to be sound chestnut plank 3 ins. thick, free from unsound knots and wormholes and accurately jointed, or of 3-in. spruce plank tongued or carefully hand spliced and grooved, and free from loose knots.

The piling is to be pointed and cornered and driven as far below bottom of trench as is practicable with an 8 or 10-lb. hammer in such a manner that it may and shall be watertight.

The top of piling is to be spiked to a 3 x 4-in. scantling.

The trench is to be backfilled with blue gravel and carefully puddled. The piling shall extend through the abutment and connect with a 12-in. priming beginning at a depth of bottom of plank and stepping up into embankment as shown on plans.

The top of brick priming to come within 1 ft. of top of abutments and is to be built into a groove 1 ft. deep in back of abutments.

The brick shall be hard and well burned and laid solid in good cement mortar.

The stone used in rollway and abutments are to be good, sound, durable large rock, carefully laid in cement mortar or grouted. The first course of stone in rollway and abutments to be laid in cement mortar. The stone in both faces of rollway and abutments to be laid in mortar for a distance of 12 to 18 ins. and the remainder grouted. All voids in the stone work to be entirely filled with mortar or grout. All stones to be laid with their largest surfaces horizontal and in such a manner as to have good, firm bearings and bond well.

Coping is to be good, sound granite, not less than 7 ft. long, 3 ft. wide and 1 ft. thick, with side joints not more than ⅜ in. thick.

The rollway masonry is to be 20 ft. thick at base and 8 ft. thick at top.

The abutments are to be 12 ft. thick at base and 4 ft. at top.

All mortar or grout used shall be composed of not less than 1 part good fresh burned hydraulic cement to 2 parts clean, sharp sand.

The apron is to consist of 13 or 14 sticks of chestnut or oak timbers called mudsills 28 ft. long and 10 ins. thick, hewn on two sides their whole length. They shall be bedded in the ground parallel with the stream with their tops at grade line and level both ways. The backfilling must be carefully puddled under and around them. They shall extend 8 ft. under the dam and all have their largest ends upstream. They shall have a face on both sides of at least 10 ins. for at least 18 ft. and at small end at least 9 ins. on upper side and 3 ins. on under side.

The stones laid on them shall have good beds to give a good bearing on the timber and earth and there shall be no joints in the first course over the timber.

The cross-sills shall be of good, sound oak or white chestnut 10 ins. thick, and shall be spaced substantially as shown on plans. They shall have a face of at least 10 ins. on upper side and have a face or be spotted at each intersection a width of at least 10 ins. on lower side. The cross timbers at lower edge of apron shall be hewn on three sides.

At least two of the cross-sills beginning at lower edge of apron must be fastened to mudsills with 1⅜-in. bolts with threads and nuts at both ends; the remainder may be fastened with ⅞-in. iron tree nails 20 ins. long.

The cross-sills are to extend at least 1 ft. into the abutments. Where necessary to splice them it shall be done by halving them together as shown on plans over the mud-sills. These splices must be so arranged as to break joints.

The top timbers are to be of oak 10 ins. thick laid to a close joint parallel with the stream. They may be of any width at widest end but not less than 9 ins. at narrowest end.

The wane must in no case exceed 1 in.; yellow pine 12 ins. square may be substituted for the oak.

The upper timbers are to be fastened to the cross timbers at each intersection with ⅞-in. iron tree nails 20 ins. long. Wherever tree nails are used the holes in upper timbers are to be bored small enough so that some force will be necessary to drive irons into them and the holes in cross timbers to be 1/16-in. smaller.

Tree nails are to be slightly pointed cold and the heads heated and sufficiently broomed to take a firm hold on the timber.

The piling at lower edge of apron shall be of 3-in. unjointed chestnut or spruce set in same manner as that under rollway and fastened to cross-sill with 7-in. spikes.

This piling must go 4 ft. below under side of mud-sill, except in case of large boulders as mentioned for piling under rollway.

This trench may be backfilled with concrete, grouted stone work or puddled blue gravel.

All backfilling not otherwise specified must be well puddled blue gravel.

Should the foundation at the grade line be anything softer than blue gravel said softer material shall be removed and replaced with puddled blue gravel or masonry.

The whole of said work both as regards quality of material and mode of operation is to be performed in the most thorough, substantial and workmanlike manner and shall be watertight.

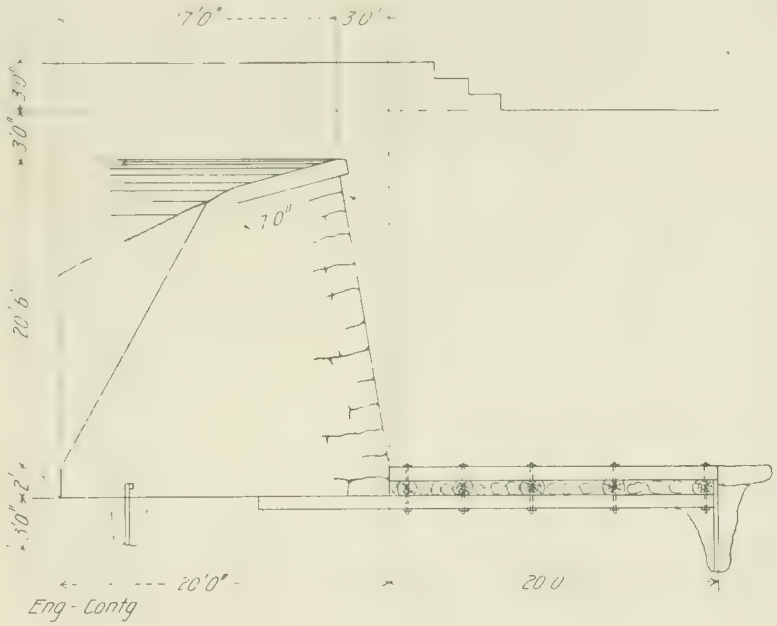

Fig. 8.

This is an excellent dam and is Mr. Potter's ideal dam on a good blue gravel foundation.

The sixth dam was on the Pachaug River at a point where the drainage area is 51 square

miles. No plans of this dam are in existence so far as the writer knows.

The dam was built under Mr. Potter's direction, probably as near as possible like No. 5.

Dam number seven was to be built on the Moosup River at a point where the drainage area is about eighty-six square miles. The cross section for dam drawn under the direc-

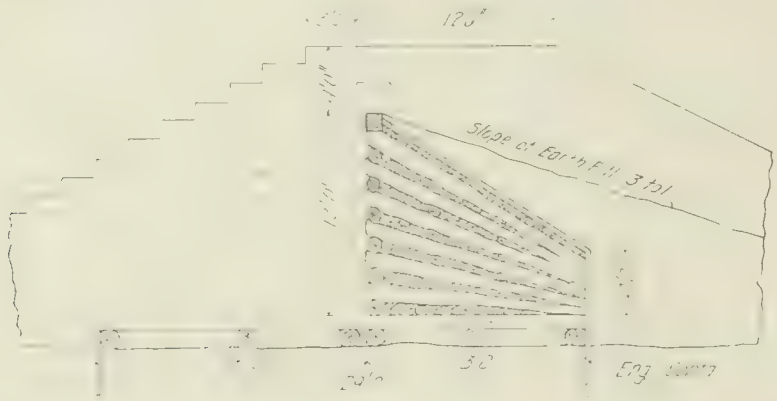

Fig. 9.

tion of the owner, is shown in Fig. 9. The cross section suggested by the engineer employed by the owner is shown in Fig. 10. Both plans call for a crib dam of logs filled with stone. In Fig. 9 the base is 13 ft. for a height of 12 ft. at the crest and 4 ft. at the upstream end, and in Fig. 10 the base is 20 ft. for the same heights. They call for aprons 16 ft. wide of 12-in. timber fastened to logs trenched into the bed of the stream. The writer does not know which plan was followed. The plans called for a rollway 180 ft. long and 4 ft. high. The specifications were as follows:

Foundation for Rollway and Abutments.—The whole ground to be occupied by the rollway and abutments is to be cleared of all loose material and excavated to the level of lowest point in bed of stream, after removal of loose material.

This level, provided the ground proves suitable will be known as the grade line, and will be the level of the top of the mudsills.

Mudsills.—The mudsills are to be of good, sound chestnut or oak timber not less than 10 ins. in diameter at small end hewn on top so as to have a face of at least 6 ins.

They must be properly spliced together, and the splices must break joints with splices in adjoining sills.

The mudsills at toe of dam will extend to connect with the priming under abutments, and it will face on the upper side at least 10 ins.

The mudsills at lower edge of apron will be faced on the lower side at least 6 ins.

All mudsills will extend about 1 ft. into abutments except that at toe of dam.

The mudsills are to be firmly bedded in

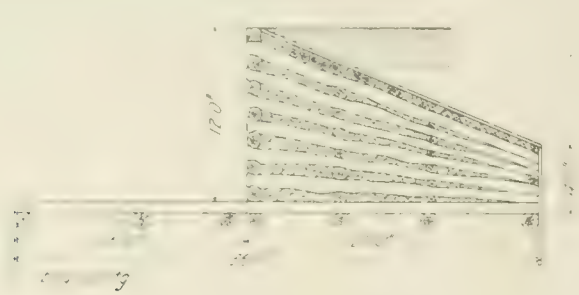

Fig. 10.

trenches excavated for the purpose with their tops at grade line.

Sheet Piling.—All sheet piling is to be of sound chestnut plank free from unsound knots and wormholes. Except at lower edge of apron it is to be accurately jointed or grooved and tongued or spliced. The piling is to be pointed and cornered and driven as far below the bottom of trench as is practicable with an 8 or 10-lb. hammer in such a manner that it may and shall be watertight.

The trench is to be excavated 3 ft. wide at a level 3 ft. below grade, or as much lower as may be necessary to find proper material.

The priming must be set in the center of the trench and the backfilling must be carefully puddled with best available material on both sides of the piling.

The piling at toe of dam will be spiked to upper mudsill as shown on plan and will be 3 ins. thick.

The piling at lower edge of apron will be 2 ins. thick and be spiked to lower mudsill.

The piling under abutment will be 3 ins. thick and be spiked to a 3 x 4-in. scantling, which scantling will be spiked to upper mud-sill.

Apron.—The apron is to be laid solid with good, sound chestnut or oak timber 10 ins. thick.

At each bay of 7 ft. the timber will extend back to mudsill under center of rollway and then be spliced to the corresponding timber of the rollway. The largest ends of these timbers to be laid upstream.

All other apron timbers are to extend 1 ft. under caplog. The apron timbers may be wider at one end than the other, but in no case less than 6 ins. wide. They must be laid with close joints and not have more than 1 in. wane. They will be fastened to the mudsills at each intersection with ⅞-in. iron tree nails 18 ins. long. The tree nails will be slightly pointed cold and the heads heated and sufficiently broomed to take a firm hold on the timber. The holes in apron timbers are to be bored 1/32 in. smaller than the tree nails, and the holes in mudsills ⅛ in. smaller than the tree nails.

Rollway.—The timber used in the rollway will be good, sound chestnut or oak of the dimensions shown on plans, and hewn or spotted at all intersections and tree nailed as specified for apron at all intersections. It will be planked on top and upstream side with good, sound 3-in. plank. All spaces between timbers are to be entirely filled with stone well packed to height 5 ft. above top of apron and with stone or gravel above that height.

Timbers running across the stream must break joints, and those at upper and lower sides of dam must be continuous.

Masonry.—The abutments below face of retaining walls and above toe of dam, and the retaining walls are to be good, dry rubble on a good foundation. The abutments are to go at least 1 ft. below the grade line.

The abutments above face of retaining wall and below toe of dam and the priming, are to be good rubble, thoroughly grouted in the following manner.

The bottom and both faces are to be laid in mortar composed of 1 part first-class hydraulic cement and 2 parts clean, sharp sand, thoroughly mixed before wetting.

The interior is to be filled with a grout made by adding just sufficient quantity of water to the above described mortar to make it flow freely.

It shall be grouted in sections not more than 10 ft. long and not more than 18 ins. thick.

All of the grouted walls must be laid in trenches at least 1 ft. below the grade-line or level at which the embankment begins.

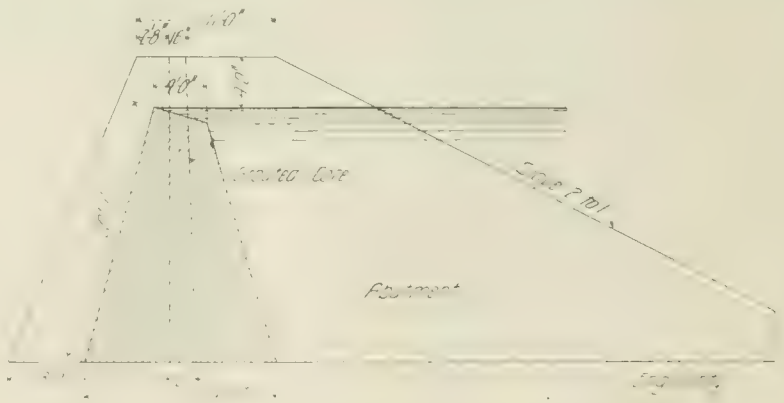

Fig. 11.

In priming and abutments above face of retaining walls no stone is to go entirely through the wall.

Embankment.—The whole surface to be covered by embankment, including the space above the rollway must be entirely clear of turf, brush, roots, and loose material of every kind.

The best available material must be used in the embankment which must be carried up level in every part.

It must be put on in layers not exceeding 6 ins. in thickness by dumping a single load of material in a place and leveling it off.

The embankment is to be 12 ft. wide at the top exclusive of the retaining wall and have a slope of 2 horizontal to 1 vertical.

The loose material removed must not be used above the rollway nor in any part of the embankment proper.

The whole of the work both as regards quality of material and mode of operation is to be performed in the most thorough, substantial and workmanlike manner.

Mr. Potter's eighth dam was for a storage reservoir on a stream with only 3½ square miles of watershed, at a location distant from any village or railroad in the town of Lebanon. The cross section is shown in Fig. 11. It calls for a dam consisting of a dry rubble retaining wall 24 ft. high, 13 ft. wide and base 40 ins. at top. A mortared rubble cut off wall or priming about 20 ins. thick and an earthern embankment on the water side 7 ft. wide at top with a slope of 2 to 1.

The rollway was of mortared rubble 20

ft. high, 15 ft. thick at base and 4 ft. at top. There are some discrepancies between plans and specifications, and the writer does not know which controlled. The essential parts of the specifications were as follows:

The whole ground to be occupied by masonry and embankments is to be cleaned of brush, turf, roots and all loose material.

The ground to be occupied by the masonry is to be excavated to solid rock or to material suitable for a foundation. If the material on which the foundation for mortar work is begun, should be a seamy rock, the seams must be thoroughly filled with cement mortar.

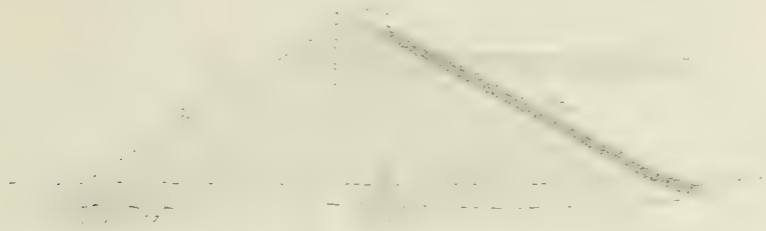

Fig. 12.

The priming wall will be 16 ins. thick at top and have a batter of 3/16 in. per foot on each side, and its foundation will go at least 3 ft. below the bottom of embankment, unless the material is rock. The priming must be smoothly faced on both sides and plastered with cement mortar. No stones shall go entirely through the priming. The backfilling on both sides of priming wall is to be carefully puddled with the best available material.

The rollway will be 4 ft. thick at top and 12 ft. thick at bottom, and 30 ft. long at top.

The rollway must start on a level or stepped foundation on lines parallel with the stream. The mortar work of rollway will extend at least 1 ft. into the face of abutments where it will connect with the priming wall; that is, a part of the abutments of section equal to the section of rollway will be built as directed for rollway to a vertical line 1 ft. back of face of abutment at top and a section equal to that of the priming will be built in same manner to the same point, making a perfect watertight connection between rollway and priming.

All masonry is to be good rubble work. All stones are to be laid on their largest surfaces, and are to be of good, sound stone with angular surfaces, and are to be well boned and so built as to make good, strong work. No unbroken boulders are to be used.

The rollway and priming is to be built as follows: The bottom course and faces are to be laid in cement mortar composed of one part good hydraulic cement and two parts clean sharp sand thoroughly mixed before wetting.

The interior of these walls is to be entirely filled with a grout made by adding sufficient water to the above mortar to make it run freely. The work shall be grouted in sections not more than 2 ft. thick in the rollway and 18 ins. thick in the priming, and not more than 10 ft. long in either.

The abutments are to be 4 ft. thick at the top and the east one 11 ft. thick at the base and the west one 12 ft. thick at the base.

The top of priming is to be 1 ft. below top of embankment and top of rollway 3½ ft. below top of embankment. The embankment will be 15 ft. wide at the top, with a slope of 1½ to 1 on the downstream side and 2 to 1 on the upstream side.

The coping of the rollway is to be of good stones not less than 4 ft. long across the wall and be laid with ½-in. side joints.

The embankment shall be built of the best available materials in level layers of not more than 6 ins. deep, thoroughly rammed by carting over it to deposit the material and by thorough hand ramming at points not driven over.

The embankment must not be carried up on one side more than 1 ft. in advance of the other side.

If the material is not carted with teams it must be kept carefully leveled and thoroughly and evenly wet.

The whole of the work, both as regards manner of work and quality of materials, shall be performed in the most thorough, substantial and workmanlike manner, and must be watertight.

In case it should be decided to substitute a dry wall for the embankment on lower side of the dam the priming will occupy the same position and be of the same dimensions, except that all of the batter will be on the upstream side and the priming will extend to the top of the embankment.

The top of the wall including priming will be 4 ft. thick and have a batter on the downstream side of 5 ins. per foot.

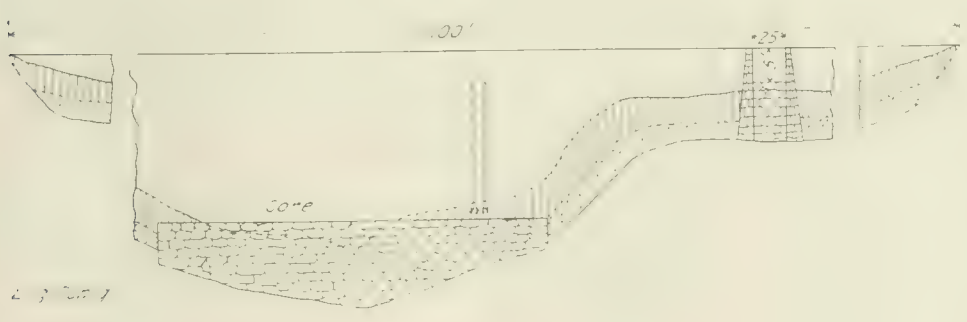

Fig. 13.

The rollway will be of the same dimensions as the retaining wall including priming.

The dry wall and the priming may be built together, well bonded, or they may be built separately. If they are built separately the joint between them must be perfectly vertical, well faced, and smoothly plastered.

In this case there will be no wings below the face of retaining wall, but the pipe and buttresses will be put in the same as heretofore described.

The retaining walls must be finished off with stones not less than 4 ft. long across the walls.

The face of the dry masonry is to be well pointed.

The owner did not think an engineer or inspector necessary. The first time the reservoir filled the whole rollway went out, and the reservoir was emptied as promptly as any automatic flush tank. There was a rumor that, owing to a delay in arrival of cement, several feet of the dam was built up dry and an attempt was made to grout it later. The rollway was rebuilt according to the same plans and specifications under continuous inspection and is still on duty.

The ninth dam was a water supply reservoir on a watershed of one-quarter of a square mile, in the town of Norwich. The specifications were as follows:

The entire surface to be occupied by the dam shall be well cleaned of top soil, etc., to hard pan, or to a surface satisfactory to the engineer. It is thought that a depth of about 4 ft. will be sufficient, and it is so indicated on the plans, but it must go down to a satisfactory material whether more or less than the said 4 ft.

Trench for Core Wall in Hard Pan.—This trench is shown on the plans. It is to be about in the middle of the dam, dug into the hard pan to a depth of 3 ft. and about 8 ft. wide, the entire length of the dam. The width of about 8 ft. will be exactly determined by the engineer. The filling is to be thoroughly rolled for puddling, lengthwise throughout the entire length of the dam. Selected material is to be put into this trench in 6-in. layers and wet and rolled.

After the core wall has been laid the whole surface of the puddling can be rolled close up to the wall and when the puddling has been brought above the top of the core wall there will be no barrier to the entire rolling of the puddle which must be done in a uniform and thorough manner.

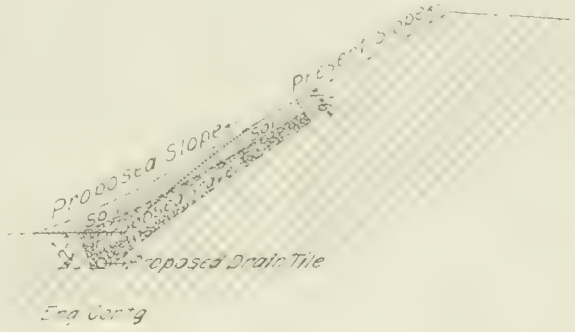

Fig. 14.

Core Wall.—The location for the core wall is shown on the plans. It is to be 3 ft. wide and about 360 ft. long and a general average of 8 ft. high, except at the center of the dam at the deepest place, where it will be higher, as shown by the plan. The trench for the core wall is to be 3 ft. wide and 1 ft. into the hard pan below the bottom of the puddle trench, making 4 ft. into the hard pan. The core wall is to be laid well, using field boulders, etc., on the ground, but well placed to make a good, solid, well-bonded wall, laid in cement mortar of 3 parts of suitable sand to 1 of cement. The outside of the wall to bond in well with the puddling filling the trench solid.

Selected Material.—The upstream side of the dam is to be selected material from the downstream edge of the level top, vertically down to the bottom, shown on the plan of the section by a heavy dotted line. All the material above this place is to be carefully selected and to be suitable material for a dam, no top soil or fine sand to be used. This material is to be placed wet and rolled as described for trench. The material below this division may be what is left, and the stones and boulders not used in the core wall, the stones and heavy material at the bottom nearest the core wall and the filling well rammed in between them, and as soon as possible the filling to be put on in layers and rolled as above division.

Upper Slope of Dam.—This is to have a true and even slope of 2 to 1 to be covered with a layer of small stones and above that with suit-

able filed stone paving as sufficiently shown on the plans.

Lower Slope.—This slope is to be graded to a true and even slope of 1½ to 1 and top soiled, well raked and graded and sown to grass. The level space on top of the dam will be treated in the same way.

Overflow.—This is to have a waterway 25 ft. wide with side walls with dimensions as shown on the plans. These side walls are to be extended down until they reach the ledge on which they are to rest. The ledge is to be cut away to secure an even plane on which to rest the walls. There is to be a wall built lengthwise of the overflow, as shown by the dotted lines on the plans. This wall is to extend down to the ledge for a foundation. The slopes shall be paved as indicated on the plans.

Figure 12 is the section shown on the original drawings. It calls for an earth embankment 10 ft. wide on top with the lower slope 1½ to 1 and the upper 2 to 1 with core wall ending 24 ft. below top of embankment. Fig. 13 shows a small amount of core wall and a spillway 25 ft. by 5 ft.

The dam was built without any spillway and Mr. Potter is said to have refused a certificate on that account. Probably the owner's theory was that a blow-off pipe was sufficient for so small a watershed. After the superintendent had spent one rainy night with the blow-off open and the water apparently just ready to go over the embankment, they put in a spillway 11 ft. long and 3 ft. high.

There was some percolation through the embankment. It was sufficient to make meadow grass grow and the ground at foot of slope was quite wet. One day a patch of soil about 10 ft. by 30 ft. slid off the embankment so rapidly that it went on to level ground some distance from the foot of the slope, and piled itself up in a heap.

Figure 14 shows how this section of embankment was treated. The slope was flattened by the addition of 6 ins. to 2 ft. of very coarse gravel and the soil replaced. This was successful so far as making the embankment dry and permanent is concerned. The leaks were led away in a drain pipe. Experience with this dam indicates injurious percolation is liable to exist in an earthen dam without a core wall.

It is interesting to note that the eminent civil engineer who made the original plans thought it desirable to provide a spillway 25 ft. by 5 ft. The experineced mill owner thought none necessary, while the engineer later consulted thought a spillway 11 ft. by 3 ft. was ample. In some cases differences in length of spillway adds very little to the cost of the dam. In this case it would add considerable. The most important difference in the ideas of the first and last engineer is in the level of the spillway in relation to the top of the embankment.

The difference of 2 ft. makes a difference of 15,000,000 gals. in the capacity of the reservoir which is quite important when one-quarter of a square mile of watershed supplies 3,000 people with water.

Personals.

Mr. Gerhard M. Dahl has been appointed city street railroad commissioner of the city of Cleveland.

Mr. David Sloan has been appointed consulting engineer and Mr. W. G. Sloan has been appointed chief engineer of Mac Arthur Brothers Co., Chicago, Ill.

Frank Dever, head of the engineering corps of the Lehigh Valley Coal Co. in the Hazleton, Pa., district, was killed Feb. 26 by a dynamite explosion in the Buch Mountain colliery.

Messrs. G. H. Fehr, M. W. Cluxton and V. R. Lynch have formed the Fehr Construction Co., and have opened offices at 567 Washington St., Chicago, Ill. The company will engage in a general [illegible] of sewers, tunnels, foundations, retaining walls and concrete work, pile driving, steam shovel and railroad work.

Mr. S. H. Knight, Mem. Am. Soc. Engr. Conts., and Mr. E. J. Riner, C. E., formerly Contracting Engineer and Superintendent, respectively, of the Northwest Bridge Works' Spokane office, have severed their connection with that company and will engage in business for themselves under the firm name of the Engineering Construction Co., with headquarters at Spokane, Wash. They will make a specialty of electric railways, irrigation works, bridges, foundations and reinforced concrete work.

Mr. F. D. Brown of Minneapolis, Minn., has been employed by the Aberdeen Street Ry. Co. as chief engineer and superintendent of construction. Mr. Brown has been connected with the Twin City Transit Co. during the last four years.

The U. S. Civil Service Commission, Washington, D. C., will hold an examination on March 29, 30, 31, 1910, at various cities throughout the country, to secure eligibles from which to make certification to fill eight vacancies in the position of skilled draftsman, at salaries ranging from $900 to $1,200 per annum, in the Office of the Chief of Ordnance, War Department, and vacancies requiring similar qualifications as they may occur in that office.

Mr. M. R. Ramsay, Mr. W. S. Grant and Mr. A. L. Freret have entered into partnership for the practice of mining engineering in the city of Birmingham. Mr. Ramsay, who is one of the best known mining engineers in the Birmingham district, has been in practice at Birmingham for a number of years. Mr. Grant, who is an electrical engineer, has been superintendent of power stations of the Textile Mills Corporation of New Orleans and later in charge of the power plant of the Birmingham Railway, Light and Power Company.

Mr. Chas. A. Alexander, Mr. A. R. Shumway and Mr. C. P. Utz have formed a company incorporated under the name The Alexander, Shumway & Utz Co., for the purpose of engaging in reinforced concrete engineering and contracting. Mr. Alexander has formerly been privately engaged in this work. Both Mr. Shumway and Mr. Utz are engineers experienced in reinforced concrete construction, having been employed by the Ransome & Smith Co. and The Turner Construction Co. The offices are at 16 State St., Rochester, N. Y.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Spiral Conveyors.—Paper, 3½x6 ins., 20 pp. Jeffrey Mfg. Co., Columbus, Ohio.

A pamphlet containing order and price lists of spiral conveyors and conveyor parts made by this company. A cut of each part listed is shown.

Aggregate.—Paper, 6x9 ins., 6 pp. Edison Portland Cement Co., New Village, N. J.

This little booklet contains a set of twenty-four beautiful illustrations showing the use of cement in the building of country and of town residences.

Motor Driven Air Compressors.—Paper, 6x9 ins., 36 pp. National Brake & Electric Co., Milwaukee, Wis.

Contains complete description of motor driven air compressors manufactured by this company. Details of all working parts are explained by the aid of cuts and sectional drawings. Also explains minutely the operation of the different classes of machines. Some useful tables on capacities and cylinder dimensions at various pressures are included.

Specifications for Reinforced Concrete.—Paper, 5½x7¼ ins., 32 pp. Trussed Concrete Steel Co., Detroit, Mich.

Gives standard specifications for reinforced concrete as well as specifications for Hy-Rib floors and roofs, ceilings and walls of all kinds, cement stucco and waterproofing work in which products of this company are used. Some of the more important of the Kahn System Products are mentioned along with a few remarks as to their use in concrete construction.

Technical Paints for Metal.—Paper, 6x9 ins., 50 pp. National Paint Works, Williamsport, Pa.

An exhaustive discussion on metal paint requirements, causes of paint decay and paint ingredients. A large number of extracts from engineering society papers and quotations from other good authorities are given in support of conclusions reached. Following this is given information concerning the use of different metal paints made by this company. The list number, ingredients, quality, class of work best suited for, demand for, instances where used, with results, etc., are some of the points dealt with.

Crushing Machinery.—Paper, 6x9 ins., 71 pp. C. G. Buchanan, 90 West St., New York, N. Y.

This book gives an elaborate description of rock and ore crushers, magnetic separators, screens, conveyors, hoists, etc., made by the Geo. V. Cresson Co., Philadelphia, Pa. The construction and action of each type of machine is explained in detail by the aid of cuts and sectional drawings, lists of the sizes, weights, capacities, speeds, etc., being attached in handy table form. Diagrams with explanatory notes are provided to show the installment of machinery in crushing plants and separating mills for any desired daily capacity.

Clam Shell Buckets.—Paper, 7¼x9¾ ins., 23 pp. The Owen Bucket Co., Cleveland, O.

This pamphlet describes and illustrates the Owen grab bucket. Particular attention is paid to explanation of the construction of the bucket, along with well presented arguments on its digging power. A number of views are given showing the bucket in operation on different classes of work. A table of dimensions and capacities of different sizes of buckets made is included.

Contractors' Machinery, Tools and Supplies.—Paper, 7x9¾ ins., 288 pp. Harold L. Bond Co., Boston, Mass.

A complete and extensive catalog of machinery and tools for all kinds of construction work, also of railroad, mill and contractors' supplies. Contains full information with cuts of all articles listed, also price and order lists. The order lists show such dimensions, weights, capacities and other properties of aid in ordering from catalog lists.

Collapsible Steel Centering.—Paper, 6x9 ins., 30 pp. Blaw Collapsible Steel Centering Co.

This pamphlet contains an article on cut and cover construction on the Catskill aqueduct in Ulster County, N. Y. An explanation of the general nature of the work is given, followed by a detailed description of the methods of construction used during the progress of the work. Illustrations are used profusely to show the methods of handling and placing the materials and of setting and removing the forms. Along with this is given a full description of the collapsible steel forms and form moving machinery in use. Sectional drawings and views show the design of the different parts of the forms.

Gas Manufacture. — Paper, 6x9 ins., 20 pp. Hawkeye Manufacturing Co., Waterloo, Iowa.

Contains a description of machinery for making gas from gasoline in private plants. Explains the working parts of the different machines, showing by the aid of cuts how the plant is set up and how safety from explosion is assured by placing the plant underground. Also describes the process of making gas, compares the cost of gas with other illuminating means and gives costs on installation of machines of different capacities. Some gas using appliances are also shown.

Crushing and Road Building Machinery.—The Good Roads Machinery Co., Kennet Square, Pa.

This company sends a two-page circular describing and illustrating a new reversible, three-wheel, two-horse road grading machine. Aside from meeting the demands for a light road machine, other advantages are claimed by the manufacturers.

Industrial Railways.—Paper, 3¼x6¼ ins., 17 pp. Ernst Wiener Company, 50 Church St., New York, N. Y.

Describes and illustrates tracks, turntables, cars of different type and industrial track supplies made and sold by this company, a large stock of which is kept on hand for prompt shipment.

Hydraulic Valves and Fittings. — Paper, 6x9 ins., 130 pp. Watson Stillman Co., 50 Church St., New York, N. Y.

An extensive catalog of hydraulic valves and fittings, complete in description, price lists and illustrations. Gives extensive hints as to the best piping arrangements, what types or combinations of valves are best suited to certain work and how to arrange valves so as to operate a number of cylinders or machines automatically.

Drawing Materials.—Paper, 6 x 9 ins., 240 pp. Keystone Blue Paper Co., Philadelphia, Pa.

A complete illustrated catalogue of drawing instruments, drawing paper and drawing supplies, engineer's field books, engineer's and surveyor's instruments and blue print machines. Also contains a list of scientific books in stock, sold by this company.

Concrete Highway Bridges.—Paper 3½ x 6 ins. 16 pp. Northwestern Expanded Metal Co., Old Colony Building, Chicago, Ill.

This booklet contains a great many valuable data on concrete bridges from spans of 10 to 150 ft. Tables are given, showing complete dimensions of girder bridges and arch bridges with all necessary reinforcement.

Leveling Instruments.—Paper, 5¼x7½ ins. 16 pp. Gurr & Bluhm, Troy, N. Y.

This is an accurate explanation, illustrated with half sectional view and half tone engravings, of the construction of wye levels made by this firm. A price list is included.

Amiesite.—Paper 7x8 ins. 12 pp. Amies Road Co., 576-582 Bourse Bldg., Philadelphia, Pa.

A description of a material for making dustless and auto-proof roads, neatly illustrated with photographic views of streets and roads where the product of this company has been used.

Permanent Docks and Bulkheads.—Paper, Raymond Concrete Pile Co., Chicago, Ill.

A two page pamphlet devoted to argument on the permanency and other good qualities of concrete docks and bulkheads. Contains illustrations showing some reinforced concrete dock construction work done by this company.

Engineering-Contracting Monthly Review Index of Civil Engineering Literature.

A classified index and review of the civil engineering papers, articles, reports, pamphlets and books published during the month just passed is given in the succeeding pages. The literature indexed and reviewed—with the exception of books—relates solely to civil engineering. In the section devoted to Book Reviews all books in all branches of engineering are listed as received and such of them as seem worthy are reviewed as fully as due regard for conciseness will permit. In choosing books for review rigid selection is exercised. Next to careful choice of books for review timeliness of review is sought. All books are reviewed within a month of their receipt. The same statement is true of the articles and papers that are indexed. Also, as in choosing books for review, the choice of articles and papers for indexing is based on merit. Numerical strength in "titles indexed" is not sought; excellence of selection is sought.

The purposes of the Monthly Review Index are: First, to inform civil engineers and contractors of the articles and papers of merit that are published each month, in such a way as will give a clear idea of their character and scope; second, to supply the user with the date and place of publication, the length of each article and the cost at which it can be secured. The name, adopted abbreviations, place of publication and price per number of each periodical examined for civil engineering articles are given in the list immediately following. The other information is given in the index proper for each article separately.

Books reviewed will be sent post paid on receipt of price by the Book Department of ENGINEERING CONTRACTING; periodicals, etc., containing articles indexed should be ordered direct from the publishers.

LIST OF PERIODICALS INDEXED.

American Architect (Am. Arch.), New York, N. Y.; w; 7x10 in.; 15 cts.
American Builders' Review (Am. Bldrs. Rev.), San Francisco, Cal.; m; 7x10 in.; 50 cts.
American Carpenter and Builder (Am. Car. & Bldr.), Chicago, Ill.; New York, N. Y.; m; 7x10 in., 20 cts.
American Engineer and R. R. Journal (Am. Engr. & R. R. Jl.), York, N. Y.; m; 7x10 in.; 20 cts.
American Gas Light Journal (Am. G. L. Jl.), New York; N. Y.; w; 10x13 in.; 10 cts.
American Institute of Electrical Engineers Proceedings (Am. I. of E. E. Proc.), New York, N. Y.; m; 4x7 in.; 50 cts.
American Machinist (Am. Mchst.), New York; w; 7x10 in.; 15 cts.
American Society of Civil Engineers Proceedings (Am. Soc. C. E. Proc.), New York, N. Y.; m; 4x7 in.; 75 cts.
American Society of Mechanical Engineers Journal (Am. Soc. M. E. Jl.), New York, N. Y.; m; 4x7 in.; $1.
Annales des Ponts et Chaussees (An. P. & C.), Paris, France; m.
Applied Science, Toronto, Ont.; m; 6x9 in.; 20 cts.
Architects and Builders Journal (Arch. & Bldrs. Jl.), Baltimore, Md.; m; 9x12 in.; 20 cts.
Architects and Builders Magazine (Arch. & Bldrs. Mag.), New York, N. Y.; m; 5x8 in.; 20 cts.
Architect and Engineer of California (Arch. & Engr.), San Francisco, Cal.; m; 5x7 in.; 15 cts.
International Railway Congress Bulletin (Int. Ry. Cong. Bul.), Brussels; m; 50 cts.
California Journal of Technology (Cal. Jl. of Tech.), Berkeley, Cal.; m; 4x7 in.; 25 cts.
Canadian Architect (Can. Arch.), Toronto, Ont.; m; 7x19 in.; 20 cts.
Canadian Cement and Concrete Review (Can. Cem. & Conc. Rev.), Toronto, Ont.
Canadian Engineer (Can. Engr.), Toronto, Ont.; w; 7x11 in.; 20 cts.
Canadian Machinery and Manufacturing News (Can. Mach. & Mfg. News), Toronto, Ont.; m; 7x10 in.; 15 cts.
Canadian Mining Journal (Can. Min. Jl.), Toronto, Ont.; bi-w; 7x10 in., 20 cts.
Canadian Municipal Journal (Can. Mun. Jl.), Montreal, Que.; m; 6¾x10 in.; 10 cts.
Canadian Society of Civil Engineers Proceedings (Can. Soc. C. E. Proc.), Montreal; m; 4x7 in.; 50 cts.
Carpentry and Building (Carp. & Bldg.), New York, N. Y.; m; 11x8 in.; 10 cts.
Cassier's Magazine (Cas. Mag.), New York; m; 5x8 in.; 25 cts.
Cement, New York, N. Y.; bi-m; 5x8 in.; 25 cts.
Cement Age (Cem. Age), New York, N. Y.; m; 4¾x8 in.; 15 cts.
Cement and Engineering News (Cem. & Eng. News), Chicago, Ill.; 7x10 in ; 25 cts.
Cement Era (Cem. Era), Chicago, Ill.; m; 7x10 in.; 10 cts.
Cement-Record (Cem. Rec.), m; 4¾x8 ins.; 15 cts.
Cement World (Cem. Wld.), Chicago, Ill.; m; 9x11 in.; 10 cts.
Chemical Engineer (Chem. Engr.), Chicago, Ill.; m; 4x7 in.; 15 cts.
Clay Worker (Cl. Wkr.), Indianapolis, Ind.; m; 7x10 in.; 20 cts.
Compressed Air (Comp. Air), New York, N. Y., m; 5x7 in.; 10 cts.
Concrete, Detroit, Mich.; m; 6x9 in.; 15 cts.
Concrete Age (Conc. Age), Atlanta, Ga.; m; 9x11 in.; 10 cts.
Concrete and Constructional Engineering (Conc. & Cons. Eng.), London, England; m; 5x7 in.; 25 cts.
Concrete Engineering (Conc. Eng.), Cleveland, O.; m; 7x10 in.; 10 cts.
Contract News, Chicago, Ill.; bi-w; 7x10 in.; 10 cts.
Contractor (Contr.), Chicago, Ill.; bi-w; 7x10 in.; 20 cts.
Cornell Civil Engineer (Cor. Civ. Engr.), Ithaca, N. Y.; m; 4x7 in.; 25 cts.
Domestic Engineering (Dom. Engr.), Chicago, Ill.; w; 6x9 in.; 10 cts.
Electrical Age (Elec. Age), New York, N. Y.; m; 7x10 in.; 10 cts.
Electrical Review (Elec. Rev.), New York, N. Y.; 8x10 in.; 10 cts.
Electric Railway Journal (Elec. Ry. Jl.), New York, N. Y.; w; 7x10 in.; 10 cts.
Electrical World (Elec. Wld.), New York, N. Y.; w; 7x10 in.; 10 cts.
Electric Traction Weekly (Elec. Trac. Wkly.), Chicago, Ill.; w; 7x10 in.; 10 cts.
Engineer (Engr. Lon.), London, England; w; 4x11 in.
Engineer (Engr.), Chicago, Ill.; bi-w; 7x10 in.; 20 cts.
Engineering (Eng.), London, England; w; 8x11 in.
Engineering-Contracting (Eng.-Contg.), Chicago, w; 7x10 in.; 10 cts.
Engineering Digest (Eng. Dig.), New York; m; 5x8 in.; 20 cts.
Engineering and Mining Journal (Eng. & Min. Jl.), New York; w; 7x10 in.; 15 cts
Engineering Magazine (Eng. Mag.), New York; m; 5x7 in.; 25 cts.
Engineering News (Eng. News), New York; w; 8x11 in.; 15 cts.
Engineering Record (Eng. Rec.), New York; w; 8x11 in.; 10 cts.
Engineers' Club of Philadelphia Proceedings (Engr.'s Club, Phila. Proc.), Philadelphia; qr; 4x7 in.; 25 cts.
Fire and Water Engineering (F. & W. Eng.), New York, N. Y.; 8x11 in.; 10 cts.
Le Genie Civil Paris, France; w.
Good Roads Magazine (Gd. Rds. Mag.), New York, N. Y.; m; 7x10 in.; 10 cts.
Industrial Magazine (Ind. Mag.), Cleveland, O.; m; 4x7 in.; 10 cts.
Industrial World (Ind. Wld.), Pittsburg, Pa.; w; 7x10 in.; 10 cts.
Insurance Engineering (Ins. Eng.), New York; m; 4x6 in.; 25 cts.
Iron Age, New York, N. Y.; w; 7x11 in.; 15 cts.
Iron Trade Review (Iron T. Rev.), Cleveland, O.; w; 7x10 in.; 15 cts.
Irrigation Age (Irr. Age), Chicago, Ill.; m; 7x9 in.; 10 cts.
Journal Association of Engineering Societies (Jl. Assoc. Engr. Soc.), Boston, Mass.; m; 4x7 in.; 30 cts.
Journal Franklin Institute (Jl. Frank. Inst.), Philadelphia, Pa.; m; 4x7 in.; 50 cts.
Journal New England Waterworks Association (Jl. N. E. W. W. Assoc.), Boston, Mass.; q; 4x7 in.
Journal Western Society of Engineers (Jl. W. Soc. Engrs.), Chicago, Ill.; bi-m; 4x7 in.; 50 cts.
Journal of Electricity, Power and Gas (Jl. Elec., P. & G.), San Francisco, Cal.; w; 7x10 in.; 10 cts.
Journal of Worcester Polytechnic Institute (Jl. W. P. I.), m; 4x7 in.; 20 cts.
Machinery, New York, N. Y.; m; 7x11 in.; 20 cts.
Marine Review (Marine Rev.), Cleveland, O.; w; 7x10 in.; 15 cts.
Mines and Minerals (Mi. & Mis.), Scranton, Pa.; w; 7x9 in.; 20 cts.
Mining and Scientific Press (Min. & Sci. P.), San Francisco, Cal.; w; 7x11 in.; 15 cts.
Mining Reporter (Min. Rep.), Denver, Colo.; w; 7x10 in.; 15 cts.
Mining World (Min. Wld.), Chicago, Ill.; w; 7x10 in.; 10 cts.
Modern Machinery (Mod. Mchy.), Chicago, Ill.; m; 7x10 in.; 10 cts.
Municipal Journal and Engineer (Mun. Jl. & Eng.), New York, N. Y.; w; 7x10 in.; 10 cts.
Municipal Engineering Magazine (Mun. Eng. Mag.), Indianapolis, Ind.; m; 4x7 in.; 25 cts.
Ores and Metals (O. & M.), Denver, Colo.; bi-w; 6x10 in.; 10 cts.
Pacific Building Engineer (Pac. Bldg. Engr.), Seattle, Wash.; w; 9x11 in.; 15 cts.
Popular Mechanics (Pop. Mech.), Chicago, Ill.; m; 5x7 in.; 10 cts.
The Polytechnic (Poly.), Troy, N. Y.; m; 5x8 in.; 15 cts.
Power and Engineer (Pwr. & Engr.), New York; m; 7x10 in.; 20 cts.
Railway Age Gazette (R. R. Age Gaz.), New York; w; 8x11 in.; 15 cts.
Railway Master Mechanic (Ry. M. M.), Chicago; m; 7x10 in.; 10 cts.
Railway and Engineering Review (Ry. & Eng. Rev.), Chicago, Ill.; w; 9x11 in.; 10 cts.
Railway and Locomotive Engineering (Ry. & Loco. Eng.), New York, N. Y.; m; 7x10 in.; 20 cts.
Railway and Marine World (Ry. & M. Wld.), Toronto, Ont.; m; 7x10 in.; 15 cts.
Railway Engineering and Maintenance of Way (Ry. Eng. & M. W.), Chicago, Ill.; m; 7x10 in.; 10 cts.
Roadmaster and Foreman (Rd. & For.), Chicago; 7x10 in.; 10 cts.
Rock Products (Rk. Prod.), Chicago, Ill.; bi-w; 9x11 in.; 10 cts.
Rose Technic, Terre Haute, Ind.; m; 4x7 in.; 15 cts.
School of Mines Quarterly (Sch. Min. Quart.), New York, N. Y.; qr; 4x7 in.; 50 cts.
Schweizerische Bauzeitung, Zurich; w.
Scientific American (Sci. Am.), New York; w; 9x14 in.; 10 cts.
Scientific American Supplement (Sci. Am. Sup.), New York, N. Y.; w; 9x14 in.; 10 cts.
Sibley Journal of Engineering (Sib. Jl. Eng.), Ithaca, N. Y.; m; 4x7 in.; 20 cts.
Stevens Institute Indicator (Stev. Inst. Ind.), Hoboken, N. J.; m; 4x7 in.; 20 cts.
Street Railway Bulletin (St. Ry. Bul.), Boston; m; 6x10 in.; 10 cts.
Surveyor (Surveyor), London, England; w; 8x11 in.; 10 cts.
Technology Quarterly (Tech Qr.), Boston; qr; 4x6 in.; 35 cts.
U. S. Department of Agriculture Bulletin (Dept. Agr. Bul.), Washington, D. C.; 4x7 in.
U. S. Geological Survey Bulletin (Geo. Surv. Bul.), Washington, D. C.; 4x7 in.
Waterproofing and Fireproofing (W. P. & F. P.), Detroit, Mich.; m; 7x10 in.; 10 cts.
Zeitschrift d. Oest. Ing. u. Arch. Ver. Vienna; w
Zeitschrift d. Ver Deutscher Ing.; Berlin; w.

ROADS AND STREETS.

Method of Constructing Macadam With Asphaltic Oil Binder at Pasadena, Cal. — Eng.-Contg., Feb. 23, 1910. ½ p.

Describes in detail method of constructing base and wearing surface with statement of quantities of oil used, etc.

Summary of Tests Made at New York City of Machines for Cleaning Streets by the Use of Water.- Eng.-Contg., Feb. 23, 1910. ⅓ p.

Gives in tabular form results of tests of five different flushing machines.

Proposed Standard Specifications for Portland Cement Curb and Gutter.—Eng.-Contg., Feb. 23, 1910. 1 p.

Reprint of specifications presented by a committee of the National Association of Cement Users at the last convention.

English Methods of Using Tar as a Binder in Macadam Road Construction.—Eng.-Contg., Feb. 16, 1910. ¾ p.

Gives results of experience in Northumberland, England, of using tar by the three methods of tar painting, tar macadam and tar grouting.

Work of the Municipal Asphalt Plant of San Francisco in 1909.—Eng.-Contg., Feb. 16, 1910. ½ p.

Statistics, with comment, showing output and unit costs of operation for the municipal asphalt plant of San Francisco, Cal., for seven months of 1909.

Directions for Working Steam Road Rollers and Steam Traction Engines.—Eng.-Contg., Feb. 16, 1910. 2⅓ pp.

Gives a series of rules and directions for working steam road rollers, covering, making ready of boiler, injector and engine for starting work, management on the road, priming, firing, oiling, adjustment of bearings, washing out boiler and shutting down after work and precautions for safety.

Notes on the Construction of Macadam Pavement and a Table Showing the Amount of Stone Required.—By Geo. B. Pike. Eng.-Contg., Feb. 9, 1910. ⅓ p.

Gives some general discussion on requirements for excavation and on allowance to be made for volume of stone required for macadam. The table shows thicknesses and quantities of loose stone required—coarse stone and screenings separately—for thicknesses of compacted macadam varying from 3 ins. to 12 ins.

Paving Along Street Railway Tracks.—Eng.-Contg., Feb. 9, 1910. ⅔ p.

Discusses conditions to be met in paving along street railway track and describes a construction used with success in recent work in Indianapolis, Ind.

Methods and Costs of Sidewalk Construction in Chicago. Eng.-Contg., Feb. 2, 1910. 1⅓ pp.

Describes in detail structure of and method of constructing cinder walks and cement walks in Chicago, Ill., and gives itemized average costs of both kinds of walks.

Notes on State Highway Work in 1909.—Eng.-Contg., Feb. 2 and 9, 1910. 2⅔ pp.

Gives statistics of and general description of road work done by highway commissioners in Delaware, Kentucky, Maryland, Massachusetts, New York, Utah, Wisconsin, Illinois, Maine and Pennsylvania.

Method of Repairing Openings in Pavements.—Eng.-Contg., Feb. 2, 1910. ⅓ p.

Describes in detail the work of procedure in the work of the Chicago street department in repairing openings in asphalt pavements.

Detailed Cost of Constructing 2,070 Sq. Yds. of Brick Pavement at Carlisle, Pa.—By C. A. Bingham. Eng.-Contg., Feb. 2, 1910. ½ p.

Describes character of construction and methods of preparing the work and gives itemized unit costs for each part of the work.

How Chicago Builds Sidewalks and Their Cost.—Contractor, Feb. 5, 1910. 4 pp.

Abstract of paper before the 1910 convention of the Illinois Society of Engineers and Surveyors, by Mr. N. E. Murray, superintendent of sidewalks, Chicago. Replete with valuable data.

Notes on Street Paving.—By Thos. B. McMath. St. Ry. Jl., Feb. 5, 1910. 1 p.

Abstract of a paper read Jan. 27, 1910, at the annual meeting of the Central Electric Railway Association, Columbus, O. The author is chief civil engineer, Indianapolis Traction & Terminal Co., and the paper deals with paving between street car rails. A good paper for city engineers.

Sidewalk Practice in Chicago.—By N. E. Murray. Eng. News, Feb. 17, 1910. 1¼ pp.

Abstract of a paper read at the January, 1910, annual meeting of the Illinois Society of Engineers and Surveyors. The author is superintendent of sidewalks, Chicago, Ill., and explains fully the practice in his department.

Effect of Motor and Horse Drawn Vehicles on Roads.—By Logan Waller Page. Eng. Rec., Feb. 26, 1910. 1 p.

A paper summarizing present knowledge and conclusions on this important subject.

SEWERS.

The Efficiency of Day Labor Maintenance of Chicago Sewers With Particular Reference to Cleaning Catch Basins and Sewers. — Eng.-Contg., Feb. 23, 1910. 1 p.

Abstract of report of engineer of the Chicago Commission on City Expenditures showing waste of time and money due to insufficient work of city laborers.

Design and Construction of the Improved Sewage Works at Columbus, Ohio, With Unit Costs.—Eng.-Contg., Feb. 9, 1910. 7½ pp.

Gives a full description of the design and construction of this important new sewage disposal plant, with 20 illustrations of structural features. Total and unit costs for the main features of the work are tabulated.

Baltimore Sewage Plant.—Contractor, Feb. 1, 1910. 5½ pp.

A general description of the construction features involved in constructing a part of the Baltimore sewage disposal works covering 25 acres. The work described is concrete handling and mixing.

Brooklyn's Bureau of Sewers.—Mun. Jl. & Eng., Feb. 2, 1910. 6½ pp.

This article gives information about the sewer pipe testing laboratory, the percentage system of bidding, cost data on sewer and catch basin cleaning.

Sewer Construction in Baltimore.—Mun. Jl. & Eng., Feb. 2, 1910. 12 pp.

An exceedingly good description of construction methods used on a modern sewer system.

Sewer Work by Day Labor and by Contract.—By Harrison B. Eddy. Mun. Jl. & Eng., Feb. 2, 1910. 4½ pp.

Gives a very interesting analysis of day labor and contract sewer work in Boston and other New England cities and towns and favors contract work.

Sewerage Statistics.—Mun. Jl. & Eng., Feb. 2, 1910. 3½ pp.

This article contains data from the 1907 report of the United States Census Bureau on sewers and sewage treatment in the 158 largest cities in the United States.

Concrete Sewers at Richmond, Ind.—By Frederic R. Charles. Eng. News, Feb. 3, 1910. 1 p.

This is an abstract of a paper read at the January, 1910, meeting of the Indiana Engineering Society and gives methods and costs of constructing concrete sewers from 36 ins. to 54 ins. in diameter.

Disposal of Manufactural Wastes and Sewerage at Gloversville. III.—Eng. Rec., Feb. 5, 1910. 3 pp.

This third installment concludes an interesting and valuable contribution to sanitary science.

The Sewerage Problem of Greater Pittsburg.—Eng. Rec., Feb. 12, 1910. 2 pp.

This is interesting as showing the degree of supervision now exercised by boards of health in settling details of plans for sewage collection and disposal.

Standards for Sewage Effluents.—Eng. Rec., Feb. 12, 1910. 1 p.

An abstract of a paper read by Dr. John C. Thresh at the 1909 annual meeting of the Association of Managers of Sewage Disposal Works, England. He presents and discusses three methods for testing effluents, his own method being remarkably simple.

Purification of Sewage for Power Plant Purposes. Eng. Rec., Feb. 19, 1910. 1 p.

The plant described is at the Allis-Chalmers plant in West Allis, Wis. It purifies 450,000 gallons per day, handling all drainage sewerage and rain water from the plant and delivering the purified effluent to the condensing water reservoir.

The Design of Small Intermittent Sewage Filters.—Eng. Rec., Feb. 19, 1910. 1½ pp.

Abstract of paper read by Mr. Paul Hansen at the February, 1910, meeting of the Ohio Engineering Society. An instructive paper for engineers in small places.

WATER-WORKS AND HYDRAULICS.

Depth of Water Pipe.—Eng.-Contg., Feb. 16, 1910. 2 pp.

An account of practice, with statistics, in the matter of depth of water pipe in relation to temperature.

Some Costs of the New Water Purification Works at Columbus, O.—Eng.-Contg., Feb. 9, 1910. 2 pp.

Gives general description of the works with general plans and some structural details including an interesting form of expansion joint for concrete work. Unit costs of the main features of the work are given, also tables of sizes of filter gravel and filter sand and operating averages for 1906 by months.

Some Construction Details and Costs of the Scioto River Storage Dam and Reservoir, Columbus Water Works.—Eng.-Contg., Feb. 2, 1910. ¾ p.

Describes structural features and general method of construction of concrete dam 1,006 feet long, and gives total costs by items and unit costs per million gallons of water impounded.

Sterilization of Water by Chloride of Lime.—By James Caird. Mun. Jl. & Eng., Feb. 23, 1910. 1⅓ pp.

A good review of the present state of knowledge of the value of chloride of lime to sterilize water. It is good for polluted waters, but cannot take the place of filtration systems; in fact can be used only as an adjunct to filtration. As an algicide it is not so cheap and efficient as copper sulphate.

Electrolysis by Earth Currents.—By Wm. A. Del Mar. El. Wld., Feb. 17, 1910. 3 pp.

In the Journal of the Institution of Electrical Engineers, London, September, 1909, there appeared an article by Messrs. J. G. and M. G. Cunliffe describing an electrolytic survey of Manchester. This article by Mr. Del Mar is written with the idea of introducing the conceptions of these investigators and discusses the cure for electrolysis.

Disinfection of Water and Sewage.—Mun. Jl. & Eng., Feb. 2, 1910. 1 p.

Abstract of paper read by Mr. Clyde Potts before the New Jersey Sanitary Association, December, 1909, summarizing present data on disinfection of water and sewage.

The Story of the Folsom Power Plant.—By Archie Rice. Jl. El. P. & G., Feb. 26, 1910. 7 pp.

An interesting and detailed description of a California hydro-electric plant that commenced operation in 1895.

Relation of Typhoid Fever and Water Supplies in Illinois.—By Edward Bartow. Eng. News, Feb. 10, 1910. ⅔ p.

Abstract of a paper read at the January, 1910, convention of the Illinois Society of Engineers and Surveyors. A connection is drawn between the low death rate in certain counties and the fact that water in these counties is obtained from deep wells in glacial drift.

Steel Penstocks.—By R. A. Wright. Eng. News, Feb. 10, 1910. 2⅔ pp.

This is a good article for designers and contains useful tables.

The Type Characteristic of Impulse Wheels and Its Use in Design.—By S. J. Zowski. Eng. News, Feb. 10, 1910. 3pp.

A mathematical article on design of impulse wheels.

The Design of Pressure Tunnels of the Catskill Aqueduct. Part II.—Eng. Rec., Feb. 5, 1910. 2⅔ pp.

Completes an article dealing with concrete lined tunnels and shafts to work under pressure on the New York City water supply.

The New Coagulating Works of the St. Louis Water Department.—Eng. Rec., Feb. 12, 1910. 6 pp.

The Mississippi River at St. Louis furnishes a water good for all uses, but containing large amounts of matter in suspension. This article is abstracted from a paper by Mr. Arthur I. Jacobs

before the Engineers' Club of St. Louis describing in detail the plant installed for adding lime and iron sulphate to the water to clarify it, no filtration being necessary.

Pumping With Gasoline Engines.—Eng.-Rec., Feb. 26, 1910. ⅔ p.

Abstract of a report on cost of pumping with gasoline engines, in Bulletin 181 of the Office of Experiment Stations, Department of Agriculture, Washington, D. C.

Water Sterilizing Plant at Montreal.—Eng. Rec., Feb. 26, 1910. 1 p.

Description of a plant for sterilization of 19,200,000 U. S. gallons of water in 24 hours, with a solution of hypochlorite of lime.

The Discharge of a 12-ft. Wood Stave Pipe.—By H. H. Cochrane. Eng. Rec., Feb. 26, 1910. ⅔ p.

In 1906 the Madison River Power Co. in Montana put in a 10-ft. wood stave pipe and recently measured the flow to find the value of the coefficient for roughness to use in the Kutter formula. This was found to be 0.0116, so the new pipe for additional capacity was made 12-ft. in diameter.

Steel Pipe Lines and River Crossing, Little River Water Supply, Springfield, Mass. — Eng. Rec., Feb. 19, 1910. 2½ pp.

The pipe is 42 ins. and 30 ins. in diameter. Interest attaches to this work because of the use of sections of wood stave pipe to prevent a flow of electric current, as an insulator against danger from electrolysis. Methods of laying pipe at river crossings are shown.

DRAINAGE AND IRRIGATION.

Proposed Standard Specifications for Reinforced Concrete Drain Tile.—Eng.-Contg., Feb. 23, 1910. ⅔ p.

Reprint of the specifications presented by a special committee of the National Association of Cement Users at the last convention.

The Protection and Drainage of Lands Subject to Overflow.—Eng. Rec., Feb. 26, 1910. 1⅔ pp.

Abstract of paper by C. W. Brown read before the February, 1910, meeting of the Illinois Society of Engineers and Surveyors. Experience gained in the Mississippi valley has been drawn upon in the preparation of this paper.

RIVERS, HARBORS AND CANALS.

Some Types of Sea Wall and Their Structural Characteristics and Cost.—Eng.-Contg., Feb. 16, 1910. 1½ pp.

Illustrates and describes five constructions of sea walls, discusses their respective utility and gives some general costs of construction.

Methods and Cost of Constructing a Concrete Lock and Timber-Crib Dam With Appurtenant Structures Employing Day Labor.—Eng.-Contg., Jan. 26 and Feb. 2, 1910. 6 pp.

This article describes the construction of a crib dam and concrete lock constructed in the Federal improvement of the White River in Arkansas. The work involved concrete construction, excavation, riprap, crib work, protection mats, etc., and the article gives itemized total and unit costs for each kind of work.

Interlocking Steel and Concrete Pile Construction for Sea Walls and Foundation Work.—Eng. News, Feb. 3, 1910. 2 pp.

This article describes a bulkhead wall in Chicago constructed of interlocking piling that forms a solid and continuous wall. A steel shell with a groove on one side and a tongue on the other is used. It is partly filled with concrete during the sinking, being completely filled when down the proper depth.

Preliminary Report of the United States National Waterways Commission. — Eng. News, Feb. 3, 1910. 6⅓ pp.

This is a digest of the report made to Congress of the 12 congressmen and senators appointed under the act of Congress, March 3, 1909, to investigate waterways in this country and abroad.

Some Practical Views as to Transportation on Western Rivers.—By Thomas P. Roberts. Eng. News, Feb. 17, 1910. 3½ pp.

Traffic on the Ohio River.—By John Howe Peyton. Eng. News, Feb. 17, 1910. 2½ pp.

The above two papers make very interesting reading, the author of the first being a U. S. assistant engineer, the author of the second paper being assistant to the president, Louisville & Nashville R. R. The writers hold opposite views on the expediency of river improvement.

Paxton Creek Flood Controlling Works, Harrisburg, Pa.—By R. M. Riegel. Eng. News, Feb. 17, 1910. 4 pp.

Reprinted from the "Cornell Civil Engineer," October, 1909. Paxton Creek flows through Harrisburg and is subject to sudden and rather severe floods, the controlling works to regulate same being well described.

Inland Waterways Transportation in the United States.—Eng. Rec., Feb. 5, 1910. 3 pp.

Synopsis of the reports of the National Waterways Commission dealing with the decline in inland waterways transportation and on canal transportation.

The Improvement of American Waterways and Harbors.—Eng. Rec., Feb. 12, 1910. 5 pp.

Contains the recommendations of the United States National Waterways Commission, with data from abroad.

The Sea Wall in Connection with Buildings.—By George A. Orrok. Eng. Rec., Feb. 26, 1910. 2 pp.

A paper read at the February, 1910, meeting of the Connecticut Society of Civil Engineers, describing six standard forms of bulkheads, principally pile.

Fighting the Paris Flood.—By Warren H. Miller. Eng. Rec., Feb. 26, 1910. 2 pp.

A graphic description of work performed to minimize the danger caused by the recent severe floods in Paris.

The Evaluation of Water Rights.—By Arthur Halsted. Eng. Rec., Feb. 26, 1910. 1⅔ pp.

The author discusses water rights and the cost of steam, steady and intermittent, and the cost of combined steam and water power. A diagram is presented showing cost of combined steam and water power.

The Locks and Gates of the Panama Canal.—Eng. Rec., Feb. 26, 1910. 8⅓ pp.

A description of the structures and explanation of the principles governing their design. The article is well illustrated and there are two inset sheets, one of details and the other a colored general map of the Canal Zone.

A Telpherage System for Handling River Traffic.—Eng. Rec., Feb. 26, 1910. 1 p.

One big argument against the improvement of inland streams is the cost of handling freight from boat to shore, for all buildings must be above high-water mark. The system described here is a cantilever frame extending over the river with trolley rails, being essentially an extension of the overhead tracks now such a common feature in shops. Hand labor is practically eliminated. This telpher system has been installed by the Illinois Central R. R. three miles below Memphis.

RAILWAYS.

Reinforced Concrete Bridge Construction, Track Elevation Work, C., B. & Q. R. R., Chicago, Ill.—Eng.-Contg., Feb. 23, 1910. 4⅔ pp.

Gives economic comparison of three proposed styles of bridge construction and of three designs of concrete retaining wall. Illustrates type of construction and describes method of construction in some details.

The North River Tunnels of the Pennsylvania R. R. Tunnel Entrance to New York City.—Eng Contg., Feb. 2, 1910. 4⅔ pp.

Gives profiles and sections and a general description of the series of tunnels from the Jersey side across the North River into Manhattan by which the Pennsylvania R. R. enters New York City. The general structural features of the work are described and the reasons for them are explained.

Seasoning and Preservative Treatment of Ties.—By F. J. Angier. Ry. & Eng. Rev., Feb. 26, 1910. 3½ pp.

This is a reprint of a paper read Feb. 18, 1910, before the New York Railway Club by Mr. Angier, who is superintendent of Tie Preservation, Burlington system. A summary with tables is given of all preservative processes now used; the article being a good statement of practice and costs. A 3½ page digest of same paper appears in the Railway Age-Gazette, Feb. 25, 1910.

Books For
Architect, Builder and Contractor

By H. G. RICHEY,
Superintendent of Construction,
U. S. Public Buildings.

A Handbook for Superintendents of Construction, Architects, Builders, and Building Inspectors

16mo, v+742 pages, 357 figures.

Morocco, $4.00.

The Building Foreman's Pocketbook and Ready Reference Edition

16mo, ix+1118 pages, 656 figures.

Morocco, $5.00.

The Building Mechanics' Ready Reference Series

Carpenters' and Woodworkers' Edition

16mo, vi+226 pages, 118 figures.

JOHN WILEY & SONS
43 and 45 E. 19th Street
NEW YORK

The Experimental Catenary Line of the Connecticut Company.—El. Ry. Jl., Feb. 26, 1910. 8½ pp.

This is a very complete illustrated description of an elaborate service test of a catenary suspended system for electric trolley lines in Connecticut. The total trial section is about 11,000 ft. long, of which 10,050 ft. are over the Valley Branch (steam) of the N. Y., N. H. & H. R. R. and 950 ft. over public highways. Six prominent manufacturing companies each erected about 1,700 ft. of test line.

Trackless Trolleys in Austria.—El. Wld., Feb. 17, 1910. 1 p.

A very good description, with costs, of a system of traffic in Austria in which large cars are propelled by overhead trolley without tracks in the streets.

Specifications for Steel Rails.—Ry. & Eng. Rev., Feb. 5, 1910. 2 pp.

This is a revision proposed in Bulletin 118 by a committee on Rail of the American Railway Engineering and Maintenance of Way Association.

Colfax Grade Revision; Southern Pacific.—By Bradford Boardman. Ry. Age-Gaz., Feb. 18, 1910. 7¾ pp.

A good description of a piece of heavy railroad work 30.8 miles long. A table is presented showing the equipment used and number of men employed.

The Electrification of Trunk Lines.—By L. R. Pomeroy. Ry. Age.-Gaz., Feb. 18, 1910. 4 pp.

Abstract of an address before the Engineering Society of Columbia University, containing many valuable data and costs. The same paper is given in the February, 1910, issue of the American Engineer and Railroad Journal, occupying 5½ pp.

Area of Contact Between Car Wheels and Rails.—By E. L. Hancock. Eng. News., Feb. 10, 1910. ½ pp.

Describes experiments made with car wheels so arranged that the bending of the axles might be taken into account.

Track Elevation at Evanston, Ill.; Chicago, Milwaukee and St. Paul Ry.—By E. O. Griefenhagen. Eng. News, Feb. 10, 1910. 9½ pp.

A detailed and valuable description of an important work. An analysis is given of different types of subway bridges and reasons given for selecting reinforced concrete.

Strengthening Track for Higher Train Speeds.—By M. L. Byers. Eng. News, Feb. 3, 1910. 5 pp.

An abstract of a paper published in "Bulletin of the International Railway Congress Asociation" for September, 1909; being a complete and valuable presentation of the subject.

The Design of the Stations on the Evanston Track Elevation Work; C., M. & St. P. Ry.—By E. O. Griefenhagen. Eng. News, Feb. 17, 1910. 2 pp.

These stations are of a type made necessary by peculiar conditions incident to track elevation work. They are of reinforced concrete and partly under the tracks.

Railway Ties.—Eng. News, Feb. 17, 1910. 1 p.

Two articles. One describes concrete ties made in vibrating molds and compound ties of wood and steel. The other describes a combination steel and concrete tie on the Pittsburg, Fort Wayne & Chicago Ry.

The Sewells Point Coal Pier, Virginian Railway.—Eng. Rec., Feb. 5, 1910. 4 pp.; ill.

This is a description of a terminal for handling annually 4,500,000 tons of coal. All the principal details are given.

The Construction of the Evanston Subway Bridges, Chicago, Milwaukee & St. Paul Railway.—By E. O. Griefenhagen. Eng. Rec., Feb. 5, 1910. 3 pp.

Previous articles described the design and other general features. This article takes up the working methods in building the reinforced concrete subway bridges.

The Economy of Treated Cross Ties.—Eng. Rec., Feb. 26, 1910. 1 p.

Abstract of paper by Mr. F. J. Angier, superintendent of timber preservation for the Chicago, Burlington & Quincy R. R., presented before the New York Railroad Club, Feb. 18, 1910. Gives valuable cost data.

Diagrams for Designing Reinforced Concrete Structures

Including

Diagrams for Reactions and Strengths of Steel Beams

By G. F. DODGE, M. West. Soc. Engrs.

This book is the outgrowth of diagrams prepared by the author for his own use while serving as a designing engineer for a reinforcing company. A man need not be experienced in mathematics to use these diagrams successfully.

The author says in his preface:

"Many methods have been and are in use at present, but all of these, whether in tabular or diagrammatic form, are based on more or less inflexible approximate formulae which introduce quite considerable errors if the proportions of the composite structure vary materially from those assumed in deriving the formulae on which the method is based.

"A method to be universally acceptable must be based on theoretically correct formulae and embody all of the requirements that occur in the building ordinances that govern construction in the various localities. It must be rapid and accurate in its applications, and if possible give at a glance the final result of changing any one or more of the assumed variables of design.

"In the following diagrammatical treatment of the subject is offered a solution that is believed to fulfill all of the above requirements."

TABLE OF CONTENTS

FORMULAE AND DISCUSSION.

STRAIGHT LINE VARIATION OF STRESS.

Slabs, Stone Concrete 1
Slabs, Cinder Concrete 1
Rectangular Beams 2
T-Beams 3
Compressive Reinforcement 4
Shear Stresses 6
Short Columns, Longitudinal Reinforcement 8
Hooped Columns, Ultimate Loads 8
Hooped Columns, Working Loads 9

PARABOLIC VARIATION OF STRESS, ULTIMATE LOADS.

Slabs 10
Rectangular Beams 11

MISCELLANEOUS.

Deflection 11
Impact 12
Reactions and Strengths of Steel Beams 13
Moments of Resistance of Steel Beams and Channels in Ft.-Lbs. 14
Bending Moment and Shear Formulae 15

DIAGRAMS.

Slabs, Straight Line Law, Working Loads, $n = 12$ 24
Slabs, Straight Line Law, Working Loads, $n = 15$ 38
Slabs, Straight Line Law, Working Loads, $n = 18$ 52
Slabs, Straight Line Law, Cinder Concrete, $n = 30$ 62
Rectangular Beams, Straight Line Law, Working Loads, $n = 12$ 27
Rectangular Beams, Straight Line Law, Working Loads, $n = 15$ 41
Rectangular Beams, Straight Line Law, Working Loads, $n = 18$ 55
T-Beams, Straight Line Law, Working Loads, $n = 12$ 30
T-Beams, Straight Line Law, Working Loads, $n = 15$ 44
T-Beams, Straight Line Law, Working Loads, $n = 18$ 58
Compressive Reinforcement, Straight Line Law, $n = 12$ ... 35
Compressive Reinforcement, Straight Line Law, $n = 15$ ... 49
Shear Stresses 64
Short Columns, Longitudinal Reinforcement 68
Hooped Columns, Ultimate Loads 70
Hooped Columns, Working Loads 72
Slabs, Parabolic Law, Ultimate Loads, $n = 12$ 74
Slabs, Parabolic Law, Ultimate Loads, $n = 15$ 80
Slabs, Parabolic Law, Cinder Concrete, $n = 30$ 86
Rectangular Beams, Parabolic Law, Ultimate Loads, $n = 12$. 76
Rectangular Beams, Parabolic Law, Ultimate Loads, $n = 15$. 82
Deflection 88
Impact 90
Weights and Volumes of Slabs, Beams and Columns 93
Metric Conversion 96
Reactions and Strengths of Steel Beams 99
Appendix 102

Cloth; 15½x12½ inches; 112 pages; 43 diagrams.

Price $4.00 net, postpaid.

The Myron C. Clark Publishing Co.

355 Dearborn Street, CHICAGO

13-21 Park Row, NEW YORK

Terryville Tunnel, New York, New Haven & Hartford Railroad.—Eng. Rec., Feb. 26, 1910. 1¾ pp.

Description of the driving of a double track concrete lined tunnel through rock.

The Re-Located Panama Railroad.—Eng. Rec., Feb. 19, 1910. 2 pp.

Abstract of paper presented by Mr. Ralph Budd at a meeting of the Western Society of Engineers, Feb. 2, 1910.

A Water Tank with a Dome Supported Bottom.—Eng. Rec., Feb. 26, 1910. 1 p.

Describes reinforced concrete water tanks 27 ft. in diameter and 14½ ft. deep used on the Southern Pacific R. R. of Mexico. The tanks are carried on circular rubble walls and the bottom is supported by a dome instead of the usual beams and girder construction. The cost for a single tank is higher than for steel plate tanks, but when several are built so forms are used more than once the cost is less than for steel.

Demolition of the Old Union Station, Worcester, Mass.—By C. H. Gilman. Eng. Rec., Feb. 26, 1910. 1 p.

This beautiful building erected in 1877 is being removed because the grade elevation work renders a new station necessary. The contractor's methods are described for removing old steel roof trusses and a large cut stone arch.

BRIDGES, BUILDINGS AND FOUNDATIONS.

Diagrams for Estimating the Approximate Cost of Mill Buildings.—Eng.-Contg., Feb. 23, 1910. 1¾ pp.

Gives a series of tables and diagrams for estimating the approximate cost of mill buildings.

Emergency Repairs to a Bascule Drawbridge Over the Chicago River; Chicago Terminal Transfer Ry.—By F. H. Avery. Eng. News, Feb. 3, 1910. 3 pp.

This bridge with a span of 275 ft. was struck by a steamer. In 24 hours it was opened for boats, and this article describes the methods used by the men doing the work.

Erection Appliances for the Belly River Viaduct at Lethbridge, Alberta.—Eng. News, Feb. 24, 1910. 2 pp.

This description of an erection traveller and assembling cage on an important piece of work should interest contractors.

Some Deductions From Professor Marburg's I-Beam Tests.—Eng. News, Feb. 24, 1910. 1⅔ pp.

Professor Tildren shows mathematically that the highest stresses in a steel beam are not on the edges, but are near the junction of web and flange. Professor Marburg discusses this letter.

Proportioning Latticed Columns by Weight per Foot.—By Benton Lattin. Eng. News, Feb. 24, 1910. 1 p.

The author presents data to prove his belief that the strength of a good latticed column is proportional to the mean weight per foot.

A Pier Type of Abutment for Highway Bridges.—Eng. Rec., Feb. 5, 1910. 1 p.

Describes an abutment used for steel highway bridges over the New York State Barge Canal. The abutment consists essentially of a short reinforced-concrete span carried on piers at the four corners. A minimum restriction of water way is thus created.

A Table of Moments of Inertia of Flat Rectangles.—By H. Loewenherz. Eng. News, Feb. 24, 1910. 1 p.

This is a table of moments of inertia of rectangles about an axis parallel to the long side, with widths from 6 ins. to 40 ins. and depths from ¼ in. to 3 ins.

Moving a Railroad Bridge Transversely.—Eng. Rec., Feb. 12, 1910. ½ p.

Describes the moving of a double track, 1.36 ft. 6 in. span railroad bridge 39½ feet transversely on steel rollers.

Concrete Pile Foundation for the Evansville Filters.—By F. H. Stephenson. Eng. Rec., Feb. 19, 1910. 1 p.

Describes, with details, the construction and driving of piles of reinforced concrete to carry the Evansville, Ind., water filtration plant.

CONCRETE AND REINFORCED CONCRETE.

Use of Reinforced Concrete in the Subways Recently constructed on the Track Elevation Work of the Illinois Central R. R. in the City of Chicago, Ill.—Eng.-Contg., Feb. 23, 1910. 1⅔ pp.

Describes the general method of bridge construction across streets of separately molded reinforced concrete slabs on concrete piers.

Method of Putting a Reinforced Concrete Jacket on a Cracked Chimney.—Eng.-Contg., Feb. 16, 1910. ⅔ p.

Describes character of damage to original construction and outlines methods of work and forms employed in placing the new jacket. The work is chiefly interesting for the form construction and for the method of handling the forms.

Reinforced Concrete Bridges for Track Elevation, in Evanston, Ill., for the Chicago, Milwaukee & St. Paul Ry.—Eng.-Contg., Feb. 16, 1910.

Gives economic analysis of several possible plans of construction and describes adopted plan. Shows various essential structural details and describes methods of construction with illustrations of forms, machines and plant employed. A valuable article on track elevation work.

Formula for Determining the Crown Thickness of Reinforced Concrete Arches. — Eng.-Contg., Feb. 9, 1910. 1-6 p.

Gives formula for crown thickness suitable for all ratios of rise to span and explains conditions assumed.

Method of Making Watertight by Grouting the Yonkers Pressure Tunnel of the Catskill Aqueduct.—Eng.-Contg., Feb. 9, 1910. 2 pp.

Illustrates and describes the grouting machines, grouting pads and system of embedded pipes to be used in grouting rock crevices and voids in packing behind the concrete lining of the high pressure tunnel named. The grouting pad is a particularly interesting device.

Method of Constructing and Driving Combination Timber and Concrete Piles with Some Results of Tests.—Eng.-Contg., Feb. 9, 1910. ⅔ p.

The combination pile is formed by rolling a timber pile in a blanket of concrete on wire mesh. The article describes in detail the method of construction and gives results of tests to show column strength of the pile and the strength of adhesion between the wooden core and the reinforced concrete covering.

A Novel Method of Striking Steel Centers for 150-ft. Concrete Arch Spans.—Eng.-Contg., Feb. 9, 1910. 1⅓ pp.

Gives strain sheets and make-up of steel arch centers used on a concrete arch railway bridge of seven 150-ft. skew spans. These centers are notable chiefly for the means devised for lowering them away from the finished concrete arch. This means consists of a peculiar toggle construction of the crown panel members and this construction is described in detail.

Design of and Method of Constructing a Reinforced Concrete Aqueduct Lining, with Some Data in Costs.—Eng.-Contg., Feb. 2, 1910. 1⅔ pp.

Describes the general design and the structural features of the reinforced trunk or trough used in the aqueduct bridges for the Illinois & Mississippi Canal. A number of data are given on construction methods and on general costs.

Method and Cost of Reinforced Concrete Highway Bridge Construction Under the Direction of the Illinois Highway Commission.—Eng.-Contg., Feb. 2, 1910. 3⅓ pp.

Describes the design, construction and structural characteristics of the standard through girder reinforced concrete bridges adopted by the Illinois Highway Commission, and gives itemized cost of some 37 of these bridges already built. A valuable and suggestive article to road officials.

Hume Lake Multiple Arch Dam.—By John S. Eastwood. Feb. 12, 1910. Jl. El. P. & G. 4½ pp.

A Book of Instructions For Reinforced Concrete Inspectors

INSPECTORS' HANDBOOK OF REINFORCED CONCRETE

BY

W. E. BALLINGER and EMILE G. PERROT

This book was written for the purpose of assisting inspectors in carrying out plans and specifications under which they are working. It points out the essentials governing the construction of reinforced concrete buildings and is divided into three general divisions, each division embracing a study of one of the main elements that enter into the construction of this class of buildings. These are, first, the "Forms or Falsework," second, the "Reinforcement" and third, the "Concrete."

Flexible cloth; 4½x6½ in.; 64 pp.; 6 Folding Plates, and an Appendix of Formulas and Tables. Price, $1.00 net.

CONCRETE-STEEL CONSTRUCTION

(Der Eisenbetonbau)

BY

PROF. EMIL MÖRSCH

of the Zurich Polytechnic

Authorized Translation of the Third (1908) Edition

By E. P. GOODRICH, C. E.

Mörsch's "Eisenbetonbau" is the clearest exposition of European methods of Reinforced Concrete Construction that has yet been published and is a recognized standard in Europe. It also has had an extensive sale in this country, but the comparatively limited usefulness of the German edition has prompted its translation and publication in English. It contains much information not given in any other book in the English language, and we highly recommend it as a necessary work for every engineer dealing with reinforced concrete design and construction.

Cloth; 6½ x 9½ inches; 364 pages and 350 illustrations. Price, $5.00 net.

ORDER NOW.

ENGINEERING NEWS
BOOK DEPARTMENT
220 Broadway New York

Last year in the above paper there was an article on a concrete dam at Hume Lake, Calif., consisting of a series of arches, not reinforced. In the issue of Oct. 30, 1909, several engineers discussed the dam, and this present article is a reply to these discussions.

Effect of Twisting on Iron and Steel Bars.—[illegible] Feb. 3, 1910. 2 pp.

Gives results of tests made in San Francisco, Cal., in which some remarkable increases were noted in tensile strength and elastic limit. The bars were twisted and untwisted, bent and straightened and each operation produced an increase in strength and elastic limit.

Cost of Concrete Highway Bridges.—A. N. Johnson. Contracting, Feb. 1, 1910. 2 pp.

This is an abstract of paper read at the January, 1910, meeting of the Illinois Society of Engineers and Surveyors at Cairo, Ill. Gives costs of concrete girder highway bridges in the state of Illinois.

Design and Cost of Reinforced-Concrete Highway Bridges.—By A. N. Johnson. Eng. News, Feb. 10, 1910. 1⅓ pp.

Abstract of a paper presented at the January, 1910, convention of the Illinois Society of Enginers and Surveyors. Cost data are given for 38 bridges built in Illinois in 1909.

Reinforced Concrete Girder Bridge at Stakeford, England.—Eng. News, Feb. 17, 1910. 1 p.

Describes with details a girder bridge of six skew spans, four of 44.4 ft. and two of 42.4 ft. with slab floor carrying a macadam roadway 18 ft. wide and a sidewalk 4 ft. wide.

The Albelda Reinforced-Concrete Siphon for a 97-ft. Head, Tuena, Spain.—By B. A. Etcheverry. Eng. News, Feb. 17, 1910. 2½ p.

This inverted siphon is 2,363 ft. long, 13.12 ft. in diameter and subject to a maximum pressure head of 97 ft. Details are shown.

A Covered Bridge of Reinforced Concrete, Southbridge, Mass.—Eng. News, Feb. 17, 1910. 1 p.

This bridge is unique in that it is pipe gallery for a manufacturing company carried across a river on piers. The inside dimensions are 10 ft. wide by 8 ft. high, with two 40-ft. and two 57-ft. spans.

Reinforced Concrete Aqueduct Lining.—By H. D. Rockey. Eng. News, Feb. 3, 1910. 1½ pp.

Abstract of a paper presented at the January, 1910, meeting of the Illinois Society of Engineers and Surveyors. It describes aqueduct construction with steel framing and reinforced concrete lining; Illinois & Mississippi Canal.

Some Cost Data for Reinforced Concrete Highway Bridges.—By A. N. Johnson. Eng. Rec., Feb. 5, 1910. 1½ pp.

A paper read at the January, 1910, meeting of the Illinois Society of Engineers and Surveyors, giving cost data on 38 girder highway bridges erected in 1909.

Construction of Reinforced-Concrete Dam at Fredericksburg.—Eng. Rec., Feb. 12, 1910. 1⅓ pp.

The dam is of the gravity type 808 ft. long, varying in height from 23 ft. to 43 ft.

Tests of Concrete Columns Made Under Building Conditions.—By H. C. Berry. Eng. Rec., Feb. [illegible] 1 p.

Describes tests made on three plain concrete columns; three longitudinally reinforced columns and three hooped columns. The results showed that little additional strength was furnished by reinforcement and that hooped columns [illegible] forced columns.

Design of Retaining Walls for the Steptoe Smelter.—By S. Severin Sorensen. Eng. Rec., Feb. 19, 1910. 1 p.

A diagram is presented for designing reinforced concrete walls of any height up to 30 ft. A typical example is given with comparisons of cost of reinforced and plain concrete walls 20 ft. high.

Experiments on the Coarser Particles in Cement.—By George Sydney Binckley. Eng. Rec., Feb. 19, 1910. 1 p.

Some remarkable results were obtained with intermediate sized material and it would seem that a good field for investigation is here of-[illegible]

The Whole Field Of

CONCRETE AND REINFORCED CONCRETE

DESIGN—CONSTRUCTION—INSPECTION

is covered by the books briefly described below:

Concrete and Reinforced Concrete Construction

By HOMER A. REID

The best, most complete and comprehensive book covering both the theory of concrete design and the practice of concrete construction.

Cloth, 6½x9 inches—906 pages. **Price, $5.00 net, postpaid.**

Engineers' Pocketbook of Reinforced Concrete

By E. LEE HEIDENRICH

A book written by an experienced designer and specially fitted for the use of engineers engaged in designing concrete structures.

Leather, 4½x6¾ inches—374 pages. **Price, $3.00 net, postpaid.**

Theory and Design of Reinforced Concrete Arches

By ARVID REUTERDAHL

Presenting the theory in perfectly complete form, requiring no reference to other books in so far as arch design is concerned.

Cloth, 6x9 inches—132 pages. **Price, $2.00 net, postpaid.**

Diagrams for Designing Reinforced Concrete Structures

By G. F. DODGE

The diagrams, plotted on logarithmic paper, are so devised that results may be read direct for all conditions occurring in ordinary practice.

Half cloth, 12x15 inches—112 pages. **Price, $4.00 net, postpaid.**

Reinforced Concrete—A Manual of Practice

By ERNEST McCULLOUGH

Presents the subject of design in the simplest possible manner and sets forth lucidly the principles of safe and good construction.

Cloth, 5x8 inches—128 pages. **Price, $1.50 net, postpaid.**

Concrete Bridges and Culverts

By H. G. TYRRELL

A useful book for the engineer, presenting formulas without taking up their mathematical derivation and giving tables of dimensions and quantities and estimates of cost.

Flexible leather—272 pages. **Price, $3.00 net, postpaid.**

Concrete Construction—Methods and Cost

By H. P. GILLETTE and C. S. HILL

Devoted exclusively to the methods and cost of concrete and reinforced concrete construction and intended for engineers and contractors engaged in such construction and for designers who are seeking for the data upon which to insure economy in their designs.

Cloth, 6x9 inches—700 pages. **Price, $5.00 net, postpaid.**

Concrete Inspection

By C. S. HILL

A manual of information and instructions for inspectors of concrete work.

Cloth, 3½x6 inches—186 pages. **Price, $1.00 net, postpaid.**

Practical Cement Testing

By W. PURVIS TAYLOR

Written by a practical cement tester and the first exhaustive treatise on this important subject.

Cloth, 6x9 inches—330 pages. **Price, $3.00 net, postpaid.**

Cements, Mortars and Concretes

By MYRON S. FALK

A complete report of the results of tests made during the past fifteen years

Cloth, 6x9 inches—184 pages. **Price, $2.50 net, postpaid.**

Send for 32-page booklet—listing the above books in detail.

You can secure one year's domestic subscription to ENGINEERING-CONTRACTING for $1.50 when this amount is added to the price of any one of the above books.

The Myron C. Clark Publishing Co.

Publication Office, 355 Dearborn St., Chicago

Eastern Office: 13-21 Park Row, New York

EARTH AND ROCK EXCAVATION.

Some Notes on Specifications for Earthwork in Railroad Construction.—Eng.-Contg., Feb. 23, 1910. ⅔ p.

Gives suggestions for specifications covering cleaning and grubbing, classification of material, etc.

Methods and Cost of Hydraulic Filling at Cairo, Ill.—By Jean M. Allen. Eng.-Contg., Feb. 16, 1910. 2⅔ pp.

Describes hydraulic filling job notable for long length of delivery pipe, for the use of a relay pumping station and for the successful handling of sand long distances in small pipe. Costs of the work are given.

Design and Construction of Open Ditches to Reduce Maintenance, with a Description of Methods of Maintenance and Some Costs.—Eng.-Contg., Feb. 2, 1910. 1 p.

A well written argument for the design of ditches to reduce future maintenance costs, with some data on methods and costs of maintenance.

Modern Shaft Sinking.—By Francis Donaldson. M. & Min., February, 1910. 3 pp.

This installment deals with lifting water and the handling of pumps in shaft.

The Use of Miniature Excavating Buckets.—Eng. Rec., Feb. 26, 1910. ⅔ p.

A novel method was employed in sinking 350 cylindrical steel and concrete piles and about 14 ins. in diameter. Owing to lack of headroom ordinary well driving machinery could not be used, so small orange peel buckets were made, each weighing 28 lbs., and proved a success.

Operating Costs of U. S. Seagoing Dredges.—Eng. News, Feb. 24, 1910. 1 p.

Extracts from report of Chief of Engineers, U. S. A., giving performance of 23 dredges for year ending June 30, 1909. Unit costs are presented in tabular form.

SURVEYING AND DRAFTING.

Colliery Surveys.—By David C. Harrington. M. & Min., February, 1910. 2¾ pp.

The concluding article written in a very practical style, giving the methods used by an experienced man.

COST KEEPING AND MANAGEMENT

A System of Cost Keeping for Engineering Construction.—Eng.-Contg., Feb. 23, 1910. ¾ p.

Outlines requisites of a successful cost-keeping system and gives an example of classification for keeping costs.

Methods of Cost Analysis as Applied to Construction.—Eng.-Contg., Feb. 23, 1910. 2¾ pp.

A valuable general discussion of a system of cost recording, cost analysis as applied to labor and cost analysis as applied to labor, material and expense.

MISCELLANEOUS.

Sanitary Considerations in the Establishment of Contractors' Camps.—Eng.-Contg., Feb. 16, 1910. 1⅔ pp.

A general review of the requirements for sanitation, with suggestions for meeting them.

Seven Months' Work of the Permanent Finance Commission of Boston.—Eng.-Contg., Feb. 16, 1910. 1⅓ pp.

Abstracts, with comments, from the report of the commission outlining improvements made in methods of awarding contracts and the economies thereby secured and stating failures in administration.

Percentage Bidding.—Eng.-Contg., Feb. 9, 1910. 1¾ pp.

Two letters discussing and criticising various features of the percentage method of bidding on contract work.

Cost of Constructing a Service Telephone Line in Cuba.—Eng.-Contg., Feb. 2, 1910. 1 p.

Describes method of constructing a 13.36-mile telephone line for communication during construction between the city of Camaguey, Cuba, water offices and the reservoir and pumping plant. Itemized total and unit costs are given of each class of work.

The Relative Corrosion of Wrought Iron and Steel Pipes.—Ir. Tr. Rev., Feb. 24, 1910.

This is a report of tests made by a committee of the American Society of Heating and Ventilating Engineers. Contrary to accepted beliefs, the steel pipe showed up as well as the iron pipe and the tests suggest that the durability of a pipe depends primarily upon the quality of the metal.

Economics in the Use of Steel in Mine Timbering.—By R. B. Woodworth. Min. Wld., Feb. 5, 1910. 2½ pp.

The author is an engineer with the Carnegie Steel Co. and this article is an abstract of a paper read by him at the Huntington meeting of the W. Va. Coal Mining Institute, illustrating the use of steel I-beams for mine framing and giving the advantages steel possesses over wood for this purpose.

Compressing Air by Water.—By George C. McFarlane. Min. & Sci. Pr., Feb. 19, 1910. 3½ pp.

Describes methods whereby waterfalls and running streams may be utilized to compress air for mining and contracting purposes.

Boston Refuse Disposal Report.—Mun. Jl. & Eng., Feb. 16, 1910. 2½ pp.

A digest of a very valuable report containing data as to costs of collection and amount of refuse per capita in Boston. By districts garbage varies from 150 lbs. to 450 lbs. per capita per annum and ashes from 600 lbs. to 1,800 lbs. In Eng. News, Feb. 10, 1910, is a three-page abstract of same report.

Treating Timber with Crude Petroleum.—By C. Marshall Taylor. Eng. News, Feb. 3, 1910. ¾ p.

Abstract of a paper at the Chicago meeting, Jan. 19, 1910., of the Wood Preserver's Association. Discusses qualities of woods and oils.

PUBLICATIONS RECEIVED.

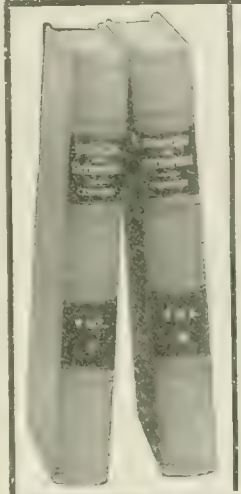
Industrial Engineering and The Engineering Digest.—Industrial Engineering, formerly published in Pittsburg, and The Engineering Digest, published by The Technical Literature Company in New York, have consolidated and the first issue of the joint publication appeared in January, under the title of Industrial Engineering and The Engineering Digest. Mr. William Kent and his son, Mr. Robert Thurston Kent, have become interested in the publication of this magazine and in its editorial work. Mr. Harwood Frost, who was the founder of The Engineering Digest and one of its editors since the first issue, has been forced, by the pressure of his duties in connection with Engineering News, to devote the whole of his working hours to that paper, and will relinquish the office of Managing Editor to Mr. R. T. Kent.

Mr. Kent has had a valuable journalistic experience, first as Associate Editor of the Electrical Review, then published in New York, then for nearly four years as Managing Editor of the Iron Trade Review (Cleveland), and since its first issue as Managing Editor of Industrial Engineering.

Mr. William Kent, who will regularly contribute editorial notes and special articles, is well known throughout the engineering profession as the author of Kent's Mechanical Engineers' Handbook. For eight years (1895-1903) he was Associate Editor of Engineering News, and for five years (1903-1908) he was Dean and Professor of Mechanical Engineering in the School of Applied Science of Syracuse University.

Test of Two Types of Tile-Roof Furnaces Under a Water Tube Boiler. By J. M. Snod-

FINANCING AN ENTERPRISE
By FRANCIS COOPER



TWO volumes that have helped hundreds of men win fortunes by ... promote their business or ... model making.

VOL. 1 tells conditions necessary for successful financing; how to investigate, protect and ... how to advertise; how to write a winning prospectus. Important chapters on stock, bonds, incorporation, etc., etc. Invaluable knowledge gathered from fifteen years' experience. Save you hundred times its cost. Full descriptive circular if you want it. 2 vols., 1000 pp. Buckram binding. Two vols., $4.00 prepaid. Either vol. separately, $2.00 prepaid.

grass. Bulletin No. 34. Urbana, Ill. University of Illinois Experiment Station. Paper. 6x9 ins. 20 pp., illustrated.

A Study of Base and Bearing Plates for Columns and Beams.—By N. Clifford Ricker. Bulletin No. 35. Urbana, Ill. University of Illinois Experiment Station. Paper. 6x9 ins. 36 pp., illustrated.

This bulletin is of value to engineers and architects. New formulas are given by which to design bearing plates.

A report on "The Influence of Forests on Climate and on Floods." By Willis L. Moore, LL. D., Sc. D., Chief of the U. S. Weather Bureau, Washington, D. C. Government Printing Office. Paper. 6x9 ins. 38 pp., illustrated.

Report on Examination of North Dakota Test Fences.—Bulletin No. 25. Philadelphia, Pa. Scientific Section, Paint Manufacturers' Association of the United States. Paper. 6x9 ins. 60 pp., illustrated.

Scientifically Prepared Paints and Laws Governing Their Manufacture.—A special bulletin for engineers, architects and master painters. By Henry A. Gardner, Philadelphia, Pa. Scientific Section, Paint Manufacturers' Association of the United States. Paper. 6x9 ins. 19 pp., illustrated.

The Fire Tax and Waste of Structural Materials in the United States.—Bulletin 418, U. S. Geological Survey. By Herbert M. Wilson and John L. Cochrane. Washington, D. C., Government Printing Office. Paper. 6x9 ins. 30 pp.

The Public Utility of Water Powers and Their Governmental Regulation.—Water Supply Paper 238, U. S. Geological Survey. By Rene Tavernier and Marshall O. Leighton, Washington, D. C., Government Printing Office. Paper. 6x9 ins. 161 pp., illustrated.

Proceedings, Tenth Annual Meeting of the National Civic Federation, Nov. 22 and 23, 1909.—New York, N. Y. The National Civic Federation, 1 Madison Ave. Paper. 5½x7¾ ins. 347 pp., illustrated.

Report of a Fire, Load and Water Test Upon Reinforced Cinder Concrete Floor Arches.—New York, N. Y. Trussed Concrete Steel Co. Paper. 6x9 ins. 28 pp., illustrated. 25 cents.

Baltimore's Municipal Dock Improvements.—A description of the financial and engineering features of the work. New York, N. Y., Raymond Concrete Pile Co. Paper. 8x11 ins. 26 pp., illustrated.

BOOK REVIEWS.

Concrete in Water Works Construction.—By William Curtis Mabee. Indianapolis, Ind., The Author. Paper. 6x9 ins. 34 pp., illustrated.

This booklet contains a reprint of a paper read by Mr. Mabee before the 1909 convention of the American Water Works Association, and is reprinted from the Proceedings. There are 5 large folding sheets of plans and 23 illustrations in the text; the paper being a description of the construction of concrete work on the Indianapolis water works aqueduct, filters, etc.

The Corrosion of Iron and Steel.—By Alfred Sang. New York, McGraw-Hill Book Co. Cloth. 5x7½ ins. 141 pp. $1.

This essay is based on a paper read by the author before the Engineer's Society of Western Pennsylvania, at Pittsburgh, Dec. 15, 1908, and published in the Proceedings. It brings together all the theories of corrosion and in the back is given a portion of the bibliography on the subject published by the Carnegie Library of Pittsburgh, Pa. Because the author has collected a lot of heretofore scattered printed matter, the book is worth buying. It is not satisfying, however, and after reading it through one feels it is merely a directory to enable seekers after information to go to original sources.

Wrought Pipe Drainage Systems.—By J. J. Cosgrove. Pittsburgh, Pa. Standard Sanitary Mfg. Co. Cloth. 5½x8½ ins. 151 pp., illustrated. $2

This book should be owned by every contractor. The title does not properly describe the book for it is really a good working hand book on how to handle and place piping in buildings.

Pattern Making.—By G. H. Willard. To which are added chapters on Core-Making and Molding. By Professor F. D. Crawshaw. Chicago, Ill. Popular Mechanics. Cloth. 5¼x8 ins. 214 pp., 312 illustrations. $1.

Pattern making today is considered one of the foremost of all the skilled mechanical trades. This book is very complete and apparently should be excellent as a text book and reference for pattern makers, apprentices and for use in trade schools.

Designer's Charts for Reinforced Concrete. Joint Committee Standards.—By H. B. Andrews. Boston, Mass. The Author. 166 Devonshire St. Paper. 9x12 ins. 23 pp., illustrated. $1.

The Joint Committee on Reinforced Concrete represents the American Society of Civil Engineers, American Society of Testing Materials, American Railway Engineering and Maintenance of Way Association, Association of American Portland Cement Manufacturers; and this committee has approved certain specifications and certain formulas for the design of reinforced concrete slabs, beams and columns. In this book Mr. Andrews gives a number of excellent diagrams for use in design according to the foregoing standards. The whole book is very good, but, of course, the scope is limited to the recommended fiber stresses. A number of useful tables are included. His table of quantities is based on a bag of cement being equal to 0.95 of a cubic foot, whereas it is usually considered to be a foot and is so declared in the National Association of Cement Users specifications. In giving expanded metal information the standards of one company are given and the new uniform standards are not mentioned.

The Flow of Water.—A New Theory of the Motion of Water Under Pressure and in Open Conduits and Its Practical Application. By Louis Schmeer, C. E., New York, N. Y. D. Van Nostrand & Co. Cloth. 6x9 ins. 228 pp. Numerous figures and tables in the text. $3.

The author was unfortunate in using the words "A New Theory" as a part of the title without stating in his book just what he meant. A careful reading shows he has done a great deal of work in developing a simple exponential formula. An immense amount of painstaking work is shown and the tables presented will greatly reduce the labor involved in hydraulic calculations. On the page preceding the index, in setting down the notation used in the book, the printer has used a subscript 1 instead of a comma which leads to a little confusion until the error is discovered.

After noting the labor performed by the author, the reviewer wrote, offering him space in which to set forth in a few words his aim and objects in getting the book out. His reply follows:

Water flowing down an inclined plane is retarded in its motion by resistances due to its internal cohesion and to its inertia. The resistance due to cohesion or viscosity are entirely independent of the nature of the surface in contact with the fluid or its degree of roughness and are proportional to the area of the surface in contact and the speed of flow. The resistances due to inertia vary with the degree of roughness of the surface in contact and are proportional to the area of the surface and the square of the speed of flow. The combination of the two resistances per unit area at unit velocity in terms of loss of head gives a term (Z) which is called the coefficient of friction. The square root of the reciprocal of the coefficient of friction, multiplied by the square root of double the acceleration due to gravity gives the coefficient (C), commonly called the Chezy coefficient. The circumstance that two factors proportional to different powers of the velocity enter, the one affected by the degree of roughness of the surface, the other not, makes the problem of an exact evaluation of the coefficients (Z) and (C), a task of great difficulty.

The variations of the coefficients (Z) and (C) were first revealed by Coulomb and the experiments of Buossot and Dubuat, but no serious attempt was made to define these variations until the middle of the last century. The formulas relating to flow in conduits under pressure now in common use are those of Weisbach and Darcy. The formula of Weisbach is theoretically correct, but he assumes the coefficient of friction to vary only with the velocity and to be constant for any diameter and any degree of roughness. Darcy's comprehensive investigations enabled him to deduce a formula defining not only the variation of the coefficient of friction with the velocity, but also with the diameter of the conduit, and to some extent, with the degree of roughness of the wet perimeter. Darcy's experiments were made with great care and precision, but they were limited to conduits of comparatively small diameters, and his formula gives accurate results only for these.

Darcy, and his successor Bazin, carefully investigated the influence of different degrees of roughness of the wet perimeter on the motion of water in small open conduits. The results of these investigations were summed up by Bazin in several special formulas, each relating to flow in a channel of a particular degree of roughness of the wet perimeter. Kutter in Switzerland investigated the motion of water in torrential mountain streams and similar channels, and in collaboration with Ganguillet elaborated the formulas based on all the experimental data known in his time. Both these formulas aim to define the variation of the coefficient (C) with the velocity, the degree of roughness of the wet perimeter, and the mean hydraulic radius of the conduit. According to one, which never came into use, the value of the coefficient (C) decreases with increasing velocity irrespective of the degree of roughness or the value of the mean hydraulic radius. According to the other the value of the coefficient (C) increases irrespective of the degree of roughness of the wet perimeter if the mean hydraulic radius is less than 1 meter (3.281 feet) and decreases if its value is greater than 1 meter.

The Journal OF Western Society OF Engineers

is a high grade bi-monthly illustrated magazine of about one hundred pages in each number, and contains the original papers of engineering interest that have been presented to the society, with the discussion of the same. These papers treat of subjects in all lines of engineering, are well illustrated and should be of value to engineers, chemists, scientific and business men everywhere.

The Subscription Price is $3.00 a Year

The circulation is about 1,600 copies of each issue, six times a year.

The JOURNAL is a valuable advertising medium, as it goes all over the world and to a high class of technical readers. Advertisements, if of interest to engineers, may be published in the JOURNAL.

For rates or other information concerning the JOURNAL of the Western Society of Engineers address or call upon the Secretary, **1735 Monadnock Block, Chicago.**

The October Number Contains

"Clay Products"

By A. V. BLEININGER,
Ceramic Chemist with the Clay Products Section of the U. S. Geological Survey.

An extensive paper on the work of the Section, giving results of tests on clay products used in construction work.

"Contracts for Structural Steel Work"

An extensive discussion by Attorneys, Architects, Engineers and Contract Managers, covering "Liabilities;" "Penalties," "Damages," "Arbitration," "Relations of Parties in a Contract," and "Payments." Forms of Contracts of unusual merit are given.

"Possibilities of Commercial Automobiles"

By W. W. MACFARREN,
Mechanical Engineer.

An illustrated paper with discussion covering commercial problems of transportation with data on costs per ton-mile, mechanical considerations, etc.

Proceedings

The Engineers' Society of Western Pennsylvania

50 cents per copy. $5 per year.

ELMER K. HILES, Secretary,
803 Fulton Building, PITTSBURGH

This formula is extremely cumbersome and is usually solved by graphical methods. For calculations relating to flow in open conduits it has almost superseded all others; it has even been applied to calculations of flow in long conduits under pressure. It does, however, not embody any true law of flow. The theory that the value of the coefficient (C) increases with increasing velocity irrespective of the degree of roughness of the wet perimeter if the mean hydraulic radius is less than 1 meter and decreases if its value is greater than 1 meter is not supported by any evidence to be found in the numerous experimental data at present available. A very careful analysis of all these data indicates that the coefficient (C) varies with the velocity of flow as follows:

1. The coefficient (C) increases with increasing velocity for smooth, long, fairly straight conduits of all descriptions irrespective of the diameter of the conduit or the depth of water in it. The increase is greatest for the smoothest surface; it diminishes rapidly with increasing roughness of the wet perimeter. The increase is also greatest for the circular and semi-circular section, less great for the semi-square and the trapezoid whose sides are tangent to a semi-circle, and least for other rectangles and trapezoids.

2. The coefficient (C) decreases with increasing velocity if the conduit is very short, if it has sharp elbows or bends or other obstructions producing shocks, if the bed of the channel is unstable, loose sand or earth, or else very rough.

It has been the aim of the author of "The Flow of Water" to declare a simple and flexible expression embodying all the variations of the coefficient (C) as indicated in the experimental data at present available; both those relating to flow in conduits under pressure and open conduits. Darcy's formula was sufficient for his time; we in our time have new types of conduits; we have the large riveted conduits, the conduits of planed staves and reinforced concrete, and to these Darcy's formula does not apply. The formula of Kutter is cumbersome and defective; it gives good results only when applied to calculations relating to flow in rivers and similar channels.

The formula deduced by the writer is simple and accurate, easy of solution, very flexible, it admits of being transformed in various ways, it may be transformed so it can be solved by graphical methods. Countless special formulas may be derived from it which admit of rapid solution by means of logarithms or the slide rule.

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Institute of Mining Engineers.
March 1-5. Annual meeting at Pittsburg, Pa. Secy., R. W. Raymond, 29 West 39th St. New York City.

American Railway Engineering and Maintenance of Way Association.
March 15-17, 1910. Annual convention at Chicago, Ill. Secy., E. H. Fritch, 962 Monadnock Block, Chicago, Ill.

American Water Works Association.—April 26-30, 1910. Annual convention at New Orleans, La. Headquarters, Gruenwald Hotel. Secy., J. M. Diven, Charleston, S. C.

THREE IMPORTANT BOOKS

WATER ITS ORIGIN AND USE

By WILLIAM COLES-FINCH

Resident Engineer to the Brompton, Chatham, Gillingham, and Rochester Water Company, Kent.

ELABORATELY ILLUSTRATED WITH 100 FULL PAGE PLATES

The conservation of our natural resources, water and water power among them, is attracting widespread attention. In this new book much interesting and reliable information about water is given. The scientific side of the subject, though not unduly emphasized, is not lost sight of in this work, which combines the sciences of heat, hydrostatics and physical geography. It tells in a popular manner of the various forms under which water is present in the solar system, the laws governing these changes of form and the uses man has made of it, so that it reads as interestingly as a novel. The volume is illustrated most lavishly, largely by excellent reproductions of photographs by Mrs. Aubrey le Blond, of Alpine phenomena associated with water, and should prove attractive to those who wish to know something of the facts of the physical world, and might be read with profit by many engineers.

504 pages Illustrated 8vo, cloth NET $5.00

WATER PIPE AND SEWER DISCHARGE DIAGRAMS

By T. C. EKIN

M. Inst. C. E., M. Inst. M. E., etc.

These diagrams and tables with accompanying descriptions and examples are based on Kutter's formula with a coefficient of roughness of 0.013 and give the discharges in cubic feet per minute of every inch diameter of pipe from 3 to 48 inches when running full on inclinations from 1 to 15 per 1,000.

Velocity curves for every quarter foot from 2 to 12 feet per second are shown on the diagrams, and amongst the tables is one giving a series of constants for seven other coefficients of roughness whereby the discharges and diameters of pipes—as found from the diagrams—can, by simply multiplying and dividing, be ascertained for any one of these coefficients. A diagram and table for finding the discharges and velocities in sewers and other pipes when running partially full are included.

1 folding diagram 6 tables 21 folio pages NET $3.00

WATER HAMMER IN HYDRAULIC PIPE LINES

By A. H. GIBSON

M. Sc., Assoc. Mem. Inst. C. E.

The problems involved during the acceleration or retardation of a water column seem to have been almost entirely neglected, for the treatment given this subject in most text-books on hydraulics is not only scanty but often grossly inaccurate, regardless of the fact that it is most interesting and not without importance. This little volume is a theoretical and experimental investigation of the rise or fall in pressure in a pipe line caused by the gradual or sudden closing or opening of a valve, and contains a chapter on the speed regulation of hydraulic turbines.

Cost Keeping and Management Engineering

By HALBERT P. GILLETTE and RICHARD T. DANA

This is the first book ever published on the subject of cost keeping on contract work. Its authors are pioneers in the field, and, although they have written much that has appeared in the form of articles—particularly in the pages of *Engineering-Contracting*—this book is the first presentation on the subject in a complete and logical sequence.

In the opening chapter the authors endeavor to reduce the **management of men** to a science, by laying down **ten fundamental laws of management,** each of which is fully discussed.

The second chapter contains **17 fundamental rules for securing minimum cost.** These two chapters are wholly novel and of far reaching importance to all men who are, or hope to be, in charge of other men.

The authors then proceed to describe and illustrate their own systems of cost keeping, which they have developed on their own contract work and have also been installed on the work of other contractors, giving both the **punch card reports**—a form of report which they were the first to devise—and the more common blanks to be filled in with pencil.

The last chapter contains numerous systems of cost keeping developed by other engineers and contractors, and is a **veritable mine of suggestive hints** as well as of examples of excellent blanks for special purposes.

The following is the list of chapters:

CHAPTER I—The Ten Laws of Management.
CHAPTER II—Rules for Securing Minimum Cost.
CHAPTER III—Piece Rate, Bonus and Other Systems of Payment.
CHAPTER IV—Measuring the Output of Workmen.
CHAPTER V—Cost Keeping.
CHAPTER VI—Office Appliances and Methods.
CHAPTER VII—Bookkeeping for Small Contractors.
CHAPTER VIII—Miscellaneous Cost Report Blanks and Systems of Cost Keeping.

Cloth, 6 x 9 inches, 360 pages. Price $3.50 net, postpaid.

SPECIAL OFFER—"Cost Keeping and Management Engineering" and One Year's Subscription to Engineering-Contracting—$5.00.

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of Engineering-Contracting—Contract News—Engineering World—The Dirt Mover.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week. The U. S. Senate on March 2 passed the bill authorizing the issuance of $35,000,000 worth of certificates of indebtedness for the completion of irrigation projects of the government already under way.——One of the largest drainage contracts that has been let for some time was secured by the Northwestern Drainage Co., of Grand Rapids, Wis. This contract called for the construction of Judicial Ditch No. 11 in Marshall and Betrami Counties, Minnesota, and involves 5,094,102 cu. yds. of earth excavation. The contract price was 10.3 cts. per cubic yard.——Among the principal railroad construction contracts awarded since our last issue are the following: J. D. MacArthur, Ltd., Winnipeg, Man., for the extension of the Tofield-Calgary line of the Grand Trunk Pacific from Camrose south to Calgary, Alberta, 135 miles; Horace C. Henry, Seattle, Wash., for building the Everett, Wash., extension of the Chicago, Milwaukee & Puget Sound Ry.; Foley, Welch & Stewart, St. Paul, Minn., for building two cut-offs for the Minneapolis, St. Paul & Sault Ste. Marie Ry., one being from Richmond, Wis., to Withrow, about 18 miles, and the other from Spencer to Owen, Wis., about 19 miles; the Pinkerton Construction Co., for constructing the 43-mile line of the Midland Pennsylvania R. R.; the Oscola Construction Co., Lincoln, Neb., for constructing the projected line of the Omaha, Western & Lincoln Ry.; the Pennsylvania Excavating Co., Allentown, Pa., for grading about 50 miles of line for the Huntingdon, Lewistown & Juniata Traction Co.; the Western Indiana Construction Co., Room 12, 6 Sherman St., Chicago, Ill., for the recently incorporated Illinois Oil & Coal Belt Ry., of McLeansboro, Ill.——Bids are now being asked by the Abilene Central Ry. for the labor and materials for the construction of 50 miles of main line and six miles of sidings and switches, between Abilene, Tex., and Rising Star. The bids are to be opened at Abilene, on March 21.——The Board of Estimates of New York City decided to refer to two expert engineers and a geologist for consideration the plan of the Board of Water Supply to build a big tunnel beneath Manhattan to distribute the Catskill water supply, as mentioned on this page some time ago. The mayor will make the appointments.——The total value of work on the New York State Barge Canal, put under contract up to Feb. 1, according to an official bulletin just issued amounts to $54,189,719. The total value of the work done to Feb. 1 amounts to $16,603,675; the work done during January amounted to $312,360.——The San Pedro, Los Angeles & Salt Lake R. R., which lost nearly 90 miles of roadbed in the Meadow Valley in Nevada by a washout some two months ago, has announced that the line would be opened to transcontinental traffic June 1.

The Poets of the Railroad Construction Camps.

Nearly all railroad construction camps some eight to twelve years ago, before the Irish and other foreign hobo laborers drifted to the cities and became ward politicians and policemen, had its hobo poet. These artists usually selected some smooth board or plank that happened to be lying around the camps, the sides of wagon boxes, bottoms of new wheeled scrapers and the surfaces of any other tool or board about the camp that a lead pencil could be worked over. These verses would be the talk of the camps for weeks, and all the "men of letters" about the camps could repeat them by heart; but they seldom got into print and the rains, sand storms and natural wear on the equipment soon blotted out all records, and those who wrote them and the ones that learned to repeat them were too busy writing and learning other verses after a week or two of "blowing in" at Chicago, Kansas City, Denver or other points where they happened to migrate to spend the dollars they had made during the summer months.

During the construction period of the Missouri & North Arkansas R. R. south from Leslie, Ark., to the Mississippi River at Helna, Ark., there was a considerable passing about of poetry, some of which dated back to the time "when Homer smote his blooming lyre." Very few of what is known as "hobo laborers" were used on this line, as colored labor was used on nearly all of the work south of Heber, Ark., and between Heber and Leslie the work was principally hand mucking or steam shovel work, and Austrians, Bulgarians, Italians, Greeks and other foreign labor was used. The poets of this line were the subcontractors and the civil engineers in the field, and their poems, instead of being written on wagon boxes or on other similar surfaces, were usually typewritten and enclosed in an envelope and mailed to the general superintendent in charge of the work for the contractors, Messrs. Burke & Joseph. While the authors did not sign their names to the poems, it was generally known on the line who was responsible for them. The first poem that was received by Mr. J. B. Ricards, General Superintendent, for the head contractors, Burke & Joseph, was signed "Sub-Contractor" and was dedicated to the engineers of the railroad. The first verse was as follows:

Who comes with Faber sharpened keen,
With profile long and sober mien;
With transit, level, book and tape,
And glittering axe to swat the stake?
The Engineer.

Within less than a week after the first poem had been received, and had been shown and read to the different engineers and contractors on the line, the engineers "came back" and a poem was received through the mail by Mr. Ricards, the first verse of which was as follows:

Who is it that cusses the engineer,
And says that the classification is weird and queer:
Who signs a contract dashing, gay and bold
And later swears specifications stale and old?
Who takes Class "D" at a sure losing price,
And wants it called "A" so his profit will be nice?
The Contractor.

Under the contract and specifications for the Missouri & North Arkansas R. R. work, they used an alphabetical classification: Class "A," being what is usually known as solid rock; Class "B," loose rock; Class "C," earth or common material, and Class "D," being an intermediate classification between earth and loose rock and intended to cover more particularly mixed material and bluff debris, etc.

One of the last and best poems received by Mr. Ricards while on this work was from a firm of sub-contractors on whose outfit Burke & Joseph held a mortgage for moneys advanced them to pay off other claims against the same equipment before they moved to the North Arkansas work. The poem was handed to Mr. Ricards by one of the members of this particular firm at the time they had been asking him for additional advances and had been refused by him. We are glad to report, however, that this same firm owed Burke & Joseph $5,000 when they moved on the work, and that they stayed with them, regardless of the refusal of further advances at one time, until the completion of the North Arkansas work, and paid off their note of $5,000 to Burke & Joseph and left the line with a little over $10,000 in cash and a few more mules and equipment than they started in with. The poem referred to reads as follows:

WHAT THE SUB SAID HE SAID TO HIS PRINCIPAL.

With visions of big estimates and gentle treatment you skillfully please us
And Oh! the soft, oily words with which you gleefully grease us;
While hints of big feasts, wild revels, and big diamonds tactfully tease us,
Weekly we yield—bad weather, low estimates, disasters—grievous;
Drive us in desperation to beg that you kindly relieve us,
With just a trifling advance. No fairy tales you trouble to weave us
But with stony stare and scornful words cruelly you freeze us,
And at last tell the Sheriff, with all our plunder, summarily to seize us;
Nor cease while there's wheeler, slip or mule: everlasting to squeeze us;
It is wicked and wrong, and we do protest, by thunder*.

*Poetical license for the benefit of the clergy.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ARKANSAS.

The Fort Smith & Interurban R. R. Co., has completed preliminary surveys for its projected 25 mile line and construction contracts will be let in the near future. The route is from Fort Smith, Ark., through Bonanza, Jenney Lind and Greenwood, Ark. George Sengel, Fort Smith, Ark., is President.

GEORGIA.

The Gainesville Midland Ry., which projects an extension north of Gainesville to some timber lands at Robertson, Ga., has made preliminary surveys for the line. The capital for construction has not been secured as yet and the time for awarding contracts is indefinite. Aaron Johnston, Gainesville, Ga., is Chief Engineer; Geo. J. Baldwin, Savannah, Ga., is President, and E. B. Eppes, Gainesville, Ga., is General Manager.

ILLINOIS.

The Illinois Oil & Coal. Belt Ry., of McLeansboro, Ill., recently incorporated, has awarded contracts to the Western Indiana Construction Co., Room 12, 6 Sherman St., Chicago, Ill. Surveys have just been started from Terre Haute, Ind., to Cairo, Ill.

IOWA.

The Omaha, Council Bluffs & Sioux City R. R. Co., projects a 100 mile line, the route being from Omaha, Neb., through Council Bluffs, Beebeetown, Logan, Magonial, Little Sioux and Onawa to Sioux City. M. H. Miller, Des Moines, Ia., is President.

The Red Oak & Northwestern Ry., which projects a 107 mile line from Red Oak, northeast to Des Moines, Ia., has completed surveys and has secured two-thirds of the capital for the construction of the line. Construction contracts will be let about Aug. 1. H. H. Von Hipple, Red Oak, Ia., is Chief Engineer; W. L. Battin, Greenfield, Ia., is President and W. L. Sonntag, Red Oak, Ia., is General Manager.

MINNESOTA.

The Minneapolis, St. Paul & Sault Ste. Marie Ry., has awarded a contract to Foley, Welch & Stewart, St. Paul, Minn., for constructing two cut-offs on the Wisconsin Central. The New Richmond to Withrow cut off will be about 18 miles and the Spencer to Owen cut off will cover about 19 miles.

NEBRASKA.

The Omaha, Western & Lincoln Ry. has completed surveys for its projected electric railway and has awarded construction contracts to the Osceola Construction Co., Lincoln, Neb. The total projected length of this line is 219 miles and it is to extend from Omaha through Nahoo, David City, Osceola, Aurora and Hastings with a branch from the river through Ashland to Lincoln. W. H. Fuller, Hastings, Neb., is Chief Engineer and Frank E. Schaff, Lincoln, Neb., is President.

NEW MEXICO.

The Citizen's Traction & Power Co., is to construct two miles of line in the Highland section of Albuquerque. Construction contracts are to be let when the company is incorporated which will be about April 1. A. W. Hayden, Albuquerque, N. Mex., is President.

NEW YORK.

The contract for constructing the 8-mile line of the Elizabethtown Terminal R. R. has been let to V. R. Coon, general manager, Elizabethtown, N. Y. The sub contractor for the work is Marco Lavorgna, Canton, Me. The contract includes 120,000 cu. yds. earth excavation and embankment, 6,000 cu. yds. rock excavation, 500 ft. of wood trestles and 82,000 lin. ft. of piling. Sub contracts for the trestle and a few miles of the work will be let about April 1.

OKLAHOMA.

Surveys are being made for the projected 35 mile line of the Wichita Falls & Lawton Ry., from Deval, Okla., to Lawton, Okla. The capital for construction has been received and construction contracts will be let within 45 days. J. A. Kemp, Wichita Falls, Tex., is President and R. A. Thompson, Wichita Falls, is Chief Engineer.

PENNSYLVANIA.

The Midland Pennsylvania R. R., recently chartered, as mentioned in our last issue, has completed surveys and is now securing the capital for the construction of its projected 43-mile line from Millersburg, Pa., to Ashland, Pa. The contract for constructing the line has been let to the Pinkerton Construction Co. Dodge & Day, Philadelphia, Pa., are the engineers, W. E. Harrington, the St. James, Philadelphia, Pa., is President and John H. Williams, Pottsville, Pa., is Secretary and Treasurer.

SOUTH CAROLINA.

Preliminary surveys have been made for the projected 34 mile line of the Greenville & Spartanburg R. R. The route is from Greenville, S. C. via Greers, Taylors, Duncans, Fair Forest and Spartanburg Junction to Spartanburg. Construction contracts are to be let as soon as final surveys and estimates are completed. Chas. W. Ellis, Greenville, S. C., is President and Will D. Neves, Greenville, is Chief Engineer.

TENNESSEE.

McCorkle & McGimpsey, Gatliff, Tenn., have a nice piece of steam shovel work 62 miles north of Knoxville on the L. & N. R. R.

TEXAS.

The Wichita Falls & Northwestern Ry will probably not let the contract for an extension from Altus, Okla., west to Wellington, Tex., 60 miles for several weeks. The work of grading this extension will be sub-let by the company to small contractors, giving them a few miles each and the track laying, bridging and building will be done by the Company forces. R. A. Thompson, Wichita Falls, Tex., is Chief Engineer. This work was mentioned in our Feb. 2 issue.

D. F. Johnson, Brownwood, Tex., secretary of the Brownwood Commercial Club, advises us that the Brownwood Southwestern has just been chartered to build from Brownwood to the Colorado River, near Rockwood, a distance of 30 miles. A contract has been made with Brownwood and the people along the line to build the road by Col. R. A. Love, who promoted and built the "Sunflower" road from Milas to Paint Rock. An engineering crew will be placed in the field at once and it is believed that grading may be started within 60 days.

Bids are asked until noon, March 21, by J. M. Wagstaff, Chairman, Abilene, Tex., for the labor and material complete for the construction of 56 miles main line and 6 miles siding and switches for Abilene Central R. R., between Abilene and Rising Star. The approximate quantities are as follows: Clearing and grubbing, 500 acres; earth excavation and embankments, 972,000 cu. yds.; loose rock excavation, 24,000 cu. yds.; solid rock excavation, 36,000 cu. yds.; galvanized iron culverts, 36-in. diameter, 2,400 lin. ft.; galvanized iron culverts, 24-in. diameter, 1,200 lin. ft.; trestles as per Standard plans, 5,600 lin. ft.; ties—Standard 80 per cent heart pine (or equal), 174,600; steel rail, 60 lbs., A. S. C. E., 5,846 tons; joints complete, 17,500; switches complete, 60; spikes, 1,860 kegs; track laying and surfacing, 62 miles;. Cattle guards, buildings, fencing, etc., will be let on separate bids. Further information can be obtained from H. J. Bradshaw, Engineer, Abilene, Tex.

WISCONSIN.

The Prairie Farm & South Western Ry Co., of Prairie Farm, Wis., previously mentioned in these columns, has bought the old right-of-way and grade from Graytown to Emerald, a distance of 17½ miles, and also what is known as the Glenwood spur. The company has also purchased a gravel pit to be used in the construction of the road, work on which it is hoped to have started soon. G. E. Scott, Prairie Farm, is president.

Power Developments, Levees, Drainage and Irragition Works.

COLORADO.

The Otero Irrigation District, J. D. Craighead, president, has ready for issue or authorized bonds to the amount of $300,000 for the purpose of enlarging its ditch from 12 ft. to 20 ft. in width and for putting in concrete works at head gate, stream crossings and so forth. Several syphons will be put under streams and over 1,750 ft. of earth tunnel will be bored. A general overhauling of the entire system will also be made in order to put the canal into perfect condition in conformity with modern engineering practice. Geo. G. Anderson, irrigation engineer of Denver, has charge of the work. Bids will be received up to March 17, 1910. Specifications and plans can be obtained from Mr. Anderson or from H. P. McKeen, resident engineer, Rocky Ford, Colo.

The Commonwealth Power & Electric Co., M. Sidney, president, Georgetown, Colo., has done considerable preliminary work toward the construction of its power plant in Black Tail Canon, 139 miles from Denver on the Moffat road, and is now selling bonds to complete the plant. The company proposes to build a dam in the canon 70 ft. in height above present low water, which with the natural fall of the stream to the power house will give a total head of 106 ft. The water is to be conveyed from the dam to the power house through a tunnel in solid granite, 5,000 ft. long, large enough to carry 1,500 cu. ft. per second. The dam will be 120 ft. long at water level and 158 ft. on top, founded on granite and both ends anchored in granite ledges. The dam will be built of monolithic concrete. As far as can be determined without actual excavations, the bed rock foundation is not far below the bed of the river. To carry the river during the construction of the dam a diverting tunnel 12x14 ft., 154 ft. long, has been driven, which will be fitted with proper gates and used as a wasteway. Trails and roads have been built, two crosscut tunnels driven to the line of the main tunnel to aid in disposing of waste rock and facilitate the driving of the tunnel by allowing work from different headings. Frank A. Maxwell is engineer. The work was noted in our Feb. 23 issue.

DELAWARE.

As stated in our last issue, bids are being asked until noon, March 18, by Maj. R. R. Raymond, U. S. Engineers, Wilmington, Del., for dredging of St. John's and Murderkill rivers and for similar work in Mispillion and Appoquiniminte rivers. These are small contracts, about $3,500 being available for the work in each of the above rivers.

ILLINOIS.

A. J. Kleutschy, Cairo, Ill., has been awarded the contract for cleaning out and reconstructing open ditches for Union Drainage District No. 2 of the towns of Harvel and King. The work includes 49,880 cu. yds. of dredging. Bids were opened March 1.

INDIANA.

H. E. Deneen, Imlay City, Mich., has been awarded the contract for the construction of the Swanson-Lampore Ditch in Porter County, Indiana. The contract price was $6,859.40 and the work includes 68,594 cu. yds. of excavation with a dry land dredge. Bids were opened March 1.

IOWA.

Bids are asked by A. W. Chamberlain, Auditor of Clay County, at Spencer, until March 18, for constructing the Ocheyedan River improvement known as District No. 6. The district is divided into seven sections, six of which will be let, as a whole, and the other as a separate contract. The ditch is 11.55 miles long with side slopes 1 to 1, and 6 ft. berm. The soil is black dirt and gravel. The work includes the following:

				Width.	
Sec.	Y'dage.	Max. Cut.	Av. Cut.	Bottom.	Top.
1	69,301.1	11.95	5.65	8 ft	20 ft.
2	227,233.9	11.75	....	....	....
3	83,058.3	11.20	8.20	25 ft.	41 ft.
4	74,489.8	11.70	9.20	23 ft.	41 ft.
5	100,985.0	11.40	8.45	22 ft.	39 ft.
6	55,685.7	12.05	8.50	21 ft	39 ft.
..	.....	....	9.55	20 ft.	39 ft.
7	11,167.2	6.90	8.60	18 ft.	35 ft.

MINNESOTA.

Contracts for constructing County Ditch No. 45, bids for which were opened March 1 by the county auditor, at Oliva, have been let as follows: Jerry Sherwood, Litchfield, Minn., main ditch and lateral No. 1; J. J. Hankerson, Glencoe, Minn., the other laterals; C. F. Clay, Renville, Minn., for the tile work. The contracts include 278,299 cu. yds. of earth excavation and 14.3 miles of tiling.

The Northwestern Drainage Co., Grand Rapids, Wis., has been awarded the contract for constructing Judicial Ditch No. 11 for Marshall and Beltrami counties. The work is located in the eastern part of the first named county and in the western part of the last named. The contract includes 5,094,102 cu. yds. of earth excavation and was let at 10.3 cts. per cubic yard. Bids for the work were opened at the office of the county auditor, at Warren, Minn., on March 1.

NEW YORK.

The contract for improving the State St. pier at Albany for that city has been let to John Dyer, Jr., Albany, at $96,166. Bids for the work were opened Feb. 21, as previously noted in these columns. Mr. Dyer's itemized bid was as follows:

Removal of southern portion of pier	$6,120.00
Round piling, 50,000 lin. ft.	.19
Sheet piling, 206 M. ft. B. M.	53.00
Walling timbers, 30.5 M. ft. B. M.	70.00
Wrought iron bolts, ladder irons, etc., 40,000 lbs.	.05½
Rip rap, 700 cu. yds.	2.00
Concrete, Class A, 800 cu. yds.	9.60
Concrete, Class B, 4,000 cu. yds.	7.25
Steel reinforcement, 12,000 lbs.	.04½
Snubbing posts, 34	15.00
3-in. sub drains, 4,000 lin. ft.	.09
4-in. sub drains, 300 lin. ft.	.30
6-in. vitrified pipe drains, 40 lin. ft.	.60
Sod, 1,450 sq. yds.	.32
Concrete pavement, 43,000 sq. ft.	.11
Settees, 70	10.00
Flagpoles, 4	35.00
Electric light poles and arc lamps, 6.	110.00
Electric light conduits and cables	700.00
Water piping	995.00
Shelters, 2	2,140.00
Lavatory building	2,800.00
Filling	4,200.00

TENNESSEE.

Bids are asked until noon, March 18, by Mayor M. L. Walker, U. S. Engineers, Memphis, Tenn., as stated in our issue of Feb. 23, for one piece of levee enlargement near Kangaroo Point, White River levee district, containing about 115,000 cu. yds. This work will be built to an 8-ft. crown with 3 to 1 slopes on both sides, and a 1-ft. topping added to the 8-ft. crown. About 4 acres of light grubbing; grubbing will be measured from the toe of the old slope to a line 5 ft. beyond the new slope line. The fill will have an average rise over old levee about 4 ft. to the new 8-ft. crown. Work will be completed not later than Jan. 1, 1911.

WEST VIRGINIA.

Bids were opened Feb. 24 by Capt. F. W Altstaetter, U. S. Engineer, Wheeling, W. Va., for constructing pile and crib guide walls for Locks Nos. 4-11, Kanawha River, the bids received being as follows: G. & W. Mfg. Co., New York, $49,348; E. L. Foley, St. Albans, W. Va., $33,062; The Ohio River Contract Co., Evansville, Ind., $31,598; M. F. Leonard, John V. Dale and C. R. Niday, Gallipolis, O., $29,613; Pfaff & Smith, Charleston, W. Va., $33,822; Clifton Bros., Zanesville, O., $25,922. The itemized bid of Clifton Bros was as follows:

White-oak timber, 211,863 ft. B. M.	$38.00
Riprap, 1,500 cu. yds.	2.00
Iron and steel, 34,000 lbs.	.06
Round piling, 32,900 lin. ft.	.39

The Louisville, Lincoln Farm and Mammoth Cave Traction Co., recently incorporated, proposes to build an electric railway from Glasgow, Ky., to Hodgenville, Ky., a distance of 50 miles. It is estimated that the cost of building and equipping the road, powerhouse and all will be $1,000,000. The road will pass by the Lincoln farm and connect with the Illinois Central railroad at Hodgenville. The right of way from Glasgow to Hodgenville has been secured by Charles Brandenburg. L. W. and J. C. Preston, Glasgow, Ky., are interested.

F. W. Hurlburt, representing New York capitalists, has been at Wadesboro, N. C. investigating a proposition to build a hydro-electric plant on Rocky River. The proposed plant is to develop 6,000, and it is estimated that the cost of the plant will be less than $600,000.

The Baltimore & Ohio, the Pennsylvania and the Pittsburg & Lake Erie railroads have about completed plans for the joint construction of a railroad from Fairmont, W. Va., to a point near the northern boundary of the state at a cost of about $3,000,000. When completed the line, which will be about 32 miles long, will traverse the heart of the rich coal property taken over by the three roads from the Little Kanawha syndicate. The road will be a part of the Buckhannon & Northern Ry. and by the plans now being prepared it will run through Morgantown, Fairmont and Rivesville to the state line. S. D. Brady, Parkersburg, W. Va., is chief engineer. This extension was noted in our issue of Feb. 16.

The Carolina, Clinchfield & Ohio Ry., M. J. Caples, General manager, Johnson City, Tenn., has decided to establish its coal terminals at Charleston, S. C., using temporary facilities at first at Adger's wharves while its terminals are being constructed on the big water front tract between the Atlantic Coast Line wharves and the plant of the Standard.

The Chicago, Milwaukee & Puget Sound Ry. is planning to improve its roadbed over the entire division between Deer Lodge, Mont., and Avery. During the coming season it is planned to move at least 400,000 yds. of gravel and rock ballast, together with a large number of yards of rip rap rock, which will be used to protect the base of the grades next to the water edge. The company will open and operate two gravel pits on the west and may use one or two more on the east from which to secure a supply of the proper material for ballasting purposes. It is expected that six work trains will be operated on the division, three between Missoula and Deer Lodge, Mont., and the same number between Missoula and Avery. The work will last about two months.

Advices from Pensacola, Fla., state that J. M. Kinney and Charles W. Merritt have been awarded a contract by the Pensacola, Mobile and New Orleans Ry., to grade for the roadbed which is now being built, the contract extending for a number of miles into Baldwin County, where the road is now being constructed. The contractors began work March 1, and are to grade approximately five miles per month on the road.

The Lantry-Sharp Co., of Kansas City, Mo., has begun work on its contract for double tracking the Santa Fe between Gallup, N. Mex., and Albuquerque, N. Mex. The contract involves second track west for a distance of about 75 miles. Work was started at Rio Puerco.

Residents of Wildwood, N. J., Holly Beach, North Wildwood and Wildwood Crest have formed the Wildwood & Delaware Bay Short Line R. R. Co., to construct a double-track railroad from Wildwood, N. J., to the mainland to connect with the Reading about three miles north of Rio Grande station, and also a 50-ft-wide boulevard. The rights of way have been secured the entire distance. The preliminary surveys, preparing plans, taking the soundings on the meadows to learn the amount of filling necessary, and securing estimates for the work, have been accomplished, and as soon as the full amount of $100,000 is subscribed the work of construction will be started. Subscriptions have already been received for nearly the full amount. The officers of the company are: President, Curtis T. Baker; vice president, Warren D. Hann; treasurer, R. W. Ryan; engineer, Harry E. Weir; secretary, V. G. Reynolds.

The Cumberland Calley R. R., G. C. Coons, Engineer, Chambersburg, Pa., is considering abolishing all grade crossings at Hagerstown, Md., and building a high line through the city. At present the Cumberland Valley and Western Maryland cross each other in the northern suburbs on grade. The Cumberland Valley proposes in building its "high line" through the city to build over the Western Maryland tracks.

The city of Dillon, Mont., has raised a bonus of $10,000 for the extension of the Gilmore & Pittsburg R. R. from Amstead, Mont., to Dillon.

Residents of Addison and Chaffee, N. Dak., are considering forming a company to build an electric railway to Fargo, N. Dak.

Extensive plans for improvements have been announced by the Frederick Railroad Co., recently formed by merging the Frederick and Middletown and Braddock and Jefferson trolley lines and the Washington, Frederick and Gettysburg steam road. These plans include the extension of the Jefferson line to Brunswick, 6 miles, and the building of a freight yard and car shops in the eastern suburbs of Frederick, Md. Walter J. Taylor, Frederick, Md., is General Manager.

Advices from Morgantown, W. Va., state that Harry R. Warfield has purchased from Congressman George C. Sturgiss the Sabraton railway and trolley line with all its rights and franchises, the consideration being $70,000.

The Atlantic Northern R. R. Co., has been incorporated with a capital stock of $50,000 and headquarters at Kingwood, W. Va., and proposes the construction of a railroad from a point near Parsons in Tucker County along the Cheat River to a point at or near Rowlesburg in Preston county. The incorporators are William M. Schaeffer, William S. Downs, E. M. Lantz, James W. Flynn and Julius K. Monroe, all of Kingwood, W. Va.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys for the projected interurban line between Bentonville and Rogers have been completed and surveys are now under way to bring the line to Gentry. The road will be 28 miles long, and it is believed that construction work will be started this month. G. G. Sutherland, St. Louis, Mo., is president, and Dr. Z. T. Martin, Bentonville, Ark., is secretary. It is reported that the Rosedale Contracting & Supply Co., of St. Louis, has been given the contract to build the road.

Surveys have been under way for some time by the Memphis, Paris & Gulf Ry. Engineers for the proposed line between Carthage and Arkadelphia. After the completion of preliminary surveys in this section work will be started between Pine Bluff and other points east of Carthage. H. C. McCluer, Nashville, Ark., is Chief Engineer of the company.

Committee of the Business Men's League, DeWitt, Ark., is taking steps to secure the $25,000 bonus required by the Memphis, Paris & Gulf R. R. About $7,000 of the amount has already been raised. J. M. Landis is Secretary of the Committee.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Southern Pacific Ry. is to begin work about July 1, removing its railroad yards, roundhouses and branch repair shops from Red Bluff, and will establish them at Alfalfa, a new town now being built between Red Bluff and Tehama. The change is made necessary by reason of the lack of sufficient room at Red Bluff to extend the switching yards.

Capitalists of Coalinga propose to build an electric road to connect the California Oil Fields, limited, with the town of Coalinga. The road will cost $400,000, and application for a franchise has been made to the supervisors.

Rights of way for the new electric street railway, which is an extension of the Mission Street, San Francisco, line to Visitacion valley have been conveyed by the owners of the lands lying along the boundary line between San Francisco and San Mateo counties to the San Francisco Electric Railways.

The Vallejo Traction Co., recently incorporated with a capital stock of $200,000, has asked the City Council of Vallejo for permission to construct and operate over and upon the streets of the city a standard gage railroad, to be propelled by either steam, motor or electricity. The company will at once begin the construction of a line from White Sulphur Springs, six miles northeast of Vallejo, to tidewater in Mare Island channel. The incorporators and directors of the company are H. M. Meacham, former assessor of Napa county, and president of the James H. Goodman & Co. bank of Napa; Theodore Bell, San Francisco; C. E. Doty of Vallejo, and Dr. E. Z. Hennessey and Joseph Levinson of Napa.

The Board of Public Works of San Francisco has approved the plans of M. Manson, city engineer, for the dam at Lake Eleanor.

The Abbot Kinney Co., has awarded the contract for extending the amusement pier at Venice to Charles Corbaley. The pier will be extended 100 ft. into deep water, at a cost of about $15,000.

The Los Angeles Pacific Ry. Co., P. H. Albright, engineer, Los Angeles, is planning to make extensive repairs to its wharf at Santa Monica. At least 2,000 new piles will be placed to replace those destroyed by teredoes.

The Pacific Light & Power corporation, with a capital stock of $40,000,000, has been organized for the purpose of acquiring the properties of the Pacific Light & Power Co., subject to outstanding bonds and enlarging these properties in order to adequately take advantage of the growth of the territory.

The Southern California Contracting & Grading Co., of Brawley has been awarded a contract for grading the eastern section of the San Diego & Arizona R. R. from El Centro to New River, a distance of 8 1-2 miles. The contractors undertake to complete the job by April 15.

The Town Trustees of Suisun have granted the Vallejo and Northern R. R. Co. mentioned in our last issue, a franchise to construct and maintain an electric railway line within the town limits for a period of 50 years. The new franchise covers the same privileges given by a similar franchise granted the company two years ago, which had expired. By the provisions of the franchise work is to be commenced within six months and the road completed within three years.

Advice from Oroville state that the South Feather Land & Water Co., is planning to change the main ditch line to higher ground. The purpose of the company is to run the main ditch as high as possible through the country under the system.

The Pacific Electric Ry., G. E. Pillsburg, Chief Engineer, Los Angeles, has secured right of way from Pillsbury through the Olinda oil fields, towards Riverside. It is probable that the 6 mile extension will be constructed at once.

W. H. O'Brien and his associates, who are farming about 20,000 acres to grain in the swamp district south of Tulare Lake in Kings county, are reported to have secured an agreement from the Santa Fe in which the railroad undertakes to lay the rails for a spur track from the main line to the grain fields, provided Mr. O'Brien and his partners grade the roadbed and supply the ties.

The Lakeside Farmers' Mutual Water Co., of Lakeside, has been organized with $25,000 capital stock, for the purpose of constructing ditches, reservoirs, etc. George J. Bach, F. J. Lebert and O. E. Busenberg are interested.

The recently incorporated Fullerton-Richfield R. R., mentioned in the last issue of ENGINEERING-CONTRACTING, has, it is said secured the last strip of right of way and construction work will be started at once. The line will be 5 miles in length extending from Fullerton to Richfield, Cal. A. G. Wells, Los Angeles, Cal., General Manager, Atchison, Topeka & Santa Fe, is one of the directors of the new company, which is subsidiary to the A. T. & S. F. Ry.

The Southern Pacific, it is said, is considering the immediate construction of a double track line between Colton, Cal., and Bloomington. William Hood, San Francisco, Cal., is Chief Engineer of the Southern Pacific Ry.

The Tecopa R. R. Co. has filed its certificate of incorporation with the secretary of state. The company has a capital stock of $500,000, and proposes building a line from the Noonday and Gunsite mining companies' properties in San Bernardino county to a point on the Tonopah & Tidewater railroad, near Tecopa.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Costilla Estates Co., H. Alexander Smith, Secretary, Champa street, Denver, Col., has begun laying steel on the San Luis Southern R. R., and it is planned to run the first train into San Acacio April 1. The San Luis Southern is a standard gage railroaad being built by the Costilla Estates Co. It connects with the Denver & Rio Grande at Blanca and will eventually be extended to Santa Fe, where it will connect with the Atchison, Topeka & Santa Fe and the New Mexico Central. Enough steel has been received to complete the line to San Acacio, which is on the estate. The company will continue to build the road to the territorial line, 34 miles, with its own money. Questa and Taos are the principal towns that will eventually be on the route.

Allan & Lafferty, of Pueblo, have started work at Dent on their sub contract for grading the Union Pacific branch line to Fort Collins.

The Denver Gas & Electric Light Co., Frank W. Frueauff, General Manager, Denver, is to expend about $700,000 in improvements in and around Denver in 1910. These improvements will include the construction of about 25 miles of gas mains.

A stockholders' meeting of the Kansas Colorado Railroad Co. will be held in Pueblo March 22, for the purpose of authorizing the issuance of bonds to build the road into Fremont county.

The Colorado & Southern Ry., H. W. Cowan, Chief Engineer, Denver, is planning extensive improvements for this year, and a budget submitted to the stockholders calling for the expenditure of $2,000,000 for new equipment and about $3,000,000 for improvements to track and equipment now in use was approved by the board, and the money will be utilized in the perfection of the system in this state. The budget provides for laying heavy steel on various divisions of the system and new tracks, bridges, spurs and new buildings, both in Colorado and Texas. The Pueblo-Walsenburg division, where a new double track will be built by the Rio Grande and Colorado & Southern together, is independent of these expenditures, and will represent another $5,000,000.

Good progress is being made with construction work on the Kansas-Colorado R. R. and track laying is completed some distance from Pueblo. The company expects to have the road completed to Turkey creek, 18 miles out of Pueblo, by the first of May and trains running at that time. The road will then be built on to Canon City during the summer.

A. B. Hicks, Engineer of the Denver & Gulf R. R., has been in Lamar making locations for the terminal in that city.

Work on the Union Pacific Crow Creek branch, which was suspended last Fall on account of the cold weather, has been resumed and will be pushed to Briggsdale. The Pleasant Valley branch in Colorado, will also be extended north one mile. G. F. Maitland, Ogden, Utah, is Division Engineer of the Union Pacific.

Chamber of Commerce of Windsor, Colo., is to take steps to induce the Union Pacific Ry. to construct a spur from the proposed Brighton-Fort Collins line to Windsor.

The Boulder Land, Irrigation & Power Co. of Boulder, Colo., has been incorporated with a capital stock of $200,000, the incorporators being Thomas V. Wilson, Fred. A. Fair and H. A. Anderson.

H. A. House, Pueblo, representing the Colorado Power Co., has filed in the office of the county clerk, at Aspen, maps for three large reservoirs on Roaring Fork river and two sites for dams on the Roaring Fork. The reservoirs are to have a capacity of 33,000,000 cu. ft. of water, which will be used for power and irrigation purposes.

It is believed here in Denver that the Santa Fe is planning to have a direct line into Colorado from Texas. It would not be necessary to do much construction work, as the Gulf, Colorado & Santa Fe could be utilized as far as Dawson, N. Mex., and from there a line 35 miles long could be constructed to connect with the Colorado & Wyoming, owned by the Colorado Fuel & Iron Co., but with which a trackage agreement could be made, thus bringing the Texas traffic into Trinidad and onto the main line of the Santa Fe, giving it an outlet to either the east or to the coast.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Middle Georgia Interurban Ry. Co., L. W. Roberts, President, Atlanta, Ga., has filed a petition with the State Railroad Commission in Atlanta to be allowed to issue first mortgage bonds to the extent of $1,050,000; also for the right to issue stock to the extent of $200,000. This is the first definite step in the direction of building the trolley line from Griffin to Social Circle via Jackson, Indian Springs and Monticello. If the matter is acted on favorably it is said that work will at once be taken up on the line, which has been graded two-thirds of the way from Indian Springs to Jackson.

Advices from Cordele state that engineers in the employ of the D. G. Zeigler Co. lines completed surveys on the Flint River near Warwick, ten miles from Cordele, with a view of building a dam across the river for a large power plant. This plant will furnish lights and electricity for manufacturing purposes to all the small towns within a radius of 50 miles of Cordele. It is said that the total expenditure in establishing this enterprise will reach considerably above $1,000,000.

Providing people along the route will donate right of way, surveys will be started at once by the Rome & Northern for the construction of an extension to that line from its present terminus, Gore, Ga., to Tunnel Hill, a little town 20 miles north of Dalton, where a natural pass through the mountains is located. H. M. Smith, Rome, Ga., is Chief Engineer of the company.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

H. M. Byllisby & Co., Inc., Electrical Engineers, 218 La Salle street, Chicago, Ill., have purchased the interests and plant of the I. P. T. Co., at Idaho Falls, and also at Rexburg, Sugar City and St. Anthony. It is stated that the company will expend $1,500,000 within the next 18 months on the plant, for new improvements, and on the new electric road to be constructed.

Mark Means, Lewiston, has asked the City Council of that city for a franchise on five miles of city streets for an electric railway.

According to reports from Payette, Idaho, the Central Idaho R. R. Co., has decided to construct a new line branching off of the Oregon Short Line at Owinza and connecting with the main line again at Payette, thus placing Boise on the main route of the Oregon Short Line again. J. P. Congdon, Pocatello, Idaho, is Supervising Engineer.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Illinois Traction Co., H. E. Chubbuck, General Manager, Peoria, is planning to expend $150,000 this year on extensions and improvements to its system in Quincy.

The Illinois Oil & Coal Belt Ry. Co., recently incorporated with a capital stock of $1,000,000 and headquarters at McLeansboro, Ill., is stated to have awarded contracts to the Western Indiana Construction Co., of Chicago, Ill., which will at once put surveyors in the field. The new company proposes a railroad connecting Terre Haute, Ind., Robinson, Olney, Fairfield, McLeansboro and Cairo, Ill., a distance of 190 miles. The incorporators and first board of directors are: James R. Campbell, McLeansboro; Isaac H. Webb, McLeansboro; Carroll C. Boggs, Fairfield; Aden Knopf, Olney, and Joseph B. Crowley, Robinson.

The U. S. War Department has taken favorable action on the application from the Iroquois Iron Co., 3267 E. 95th St., Chicago, for permission to build a dock and bulkheads and to fill submerged land on the south side of the entrance to the Calumet River, at Chicago.

The Springfield Traction Co. has been incorporated with a capital stock of $10,000, and headquarters at Springfield, and proposes to build an electric railroad from Springfield to Taylorville, thence to Pana, paralleling the B. and O. S-W. and another line to Pawnee, thence through Harvel and Hillsboro to Vandalia. C. E. Hazlett, Rochester, Ill., is President, and A. M. Fitzgerald, Springfield, is Secretary.

The Chicago, Indiana & Southern R. R., R. B. Seymour, Chief Engineer, Gibson (Lake County), Ind., is to double track its Danville division from St. Johns to Cheff. Work is to be started as soon as weather will permit.

Engineers for the Murphysboro & Southern Illinois Ry., recently chartered, have completed surveys of the route from Du Quoin to Pinckneyville, and as soon as weather permits will take in the route from Pinckneyville to Murphysboro. Another party is surveying from Du Quoin to Herrin.

The City Council of Charleston has granted a franchise to the Mattoon City Ry. Co. for the construction of an electric line extending from that city to Paris, thus establishing, when the line is completed, direct connection by trolley between Mattoon and Indianapolis.

The Cleveland, Cincinnati, Chicago & St. Louis Ry., Geo. P. Smith, chief engineer, Cincinnati, O., according to reports, is to receive bids tomorrow (March 10) for the construction of the branch from Evansville, Ind., to Mount Carmel, Ill., a distance of 32 miles. The line has already been surveyed and most of the right of way has been secured.

The Vandalia R. R. is securing land at Decatur for a new freight terminal.

James Ward, who was engaged in constructing the Burlington roadbed near Metropolis, has moved his outfit to Madisonville, Ky., where he will work on a contract for building 4 miles of roadbed for the Louisville & Nashville R. R.

According to reports, current at Robinson, Ill., The Illinois Central Ry. is considering the extension of its line from Meron to that city and ultimately to Terre Haute, Ind. A. S. Baldwin, Chicago, Ill., is Chief Engineer of the I. C. Ry.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

As soon as the weather will permit work will be resumed on the extension of the St. Joseph Valley R. R., from Angola to connect with the Toledo & Western at Pioneer, O. When this connecting link is completed there will then be a direct line from Toledo to Chicago.

The Indianapolis Traction & Terminal Co., of Indianapolis, is planning an extension of the East Michigan Street car line from Keystone Ave. to a point just west of the Belt railroad tracks this year, and a further extension to Irvington after the tracks at Michigan St. and the Belt railroad have been elevated, is to be made.

Efforts are being made to have the Central Indiana Lighting Co. of Columbus extend its street car line from the nearest point to the site selected by the Bartholomew County Fair Association for its fair ground, a distance of about one mile.

The Vandalia R. R. will shortly resume work on the completion of its new $500,000 round house in the east yards at Terre Haute.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Omaha, Council Bluffs & Sioux City Ry. Co. has been incorporated with a nominal capital stock of $10,000, and proposes to construct an electric railway. The incorporators are B. J. Ness, Des Moines, Ia.; M. H. Miller, Des Moines, and J. W. Russell.

Surveys have been completed and estimates of cost made for the projected interurban line between Ottumwa and Iowa City, a distance of 74 miles. Efforts are now being made to finance the line. Frank Tanner, Iowa City, and D. T. Davis, Sioux City, are interested.

The Black Hawk Construction Co. of Waterloo, has been incorporated with a capital stock of $25,000, the incorporators being Stanley D. Moore and Louis Moore.

The Supervisors of Crawford County, with headquarters at Denison, are planning in conjunction with Harrison County to make a new channel for the Boyer River. In Crawford the improvement will be eleven miles long and is estimated to cost $95,000. It will extend from Arion station, on the C. & N.-W. and Illinois Central roads, to just above Dunlap. The channel is to be dug out 40 ft. wide at the top and 20 ft. at the bottom.

The Southern Iowa Traction Co., mentioned in our last issue, as incorporated to take over the Albia & Centerville R. R., has recorded a mortgage for $500,000. and it is believed that this sum will be used for improving the line, putting in power plants, motor cars, terminals and extensions.

According to reports from Des Moines, Ia., the Chicago & Northwestern Ry. has begun active construction work on the extensions of its line in Monroe County, Ia., through the coal fields near Albia, Ia. The line from Belle Plaine will ultimately be extended to Albia, on the Chicago, Burlington and Quincy Ry.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Nebraska, Kansas & Southern Ry., which now has 15 miles of its projected 162 mile line in operation, has re-elected the following officers: J. C. Hopper of Ness City, Kan., president; T. T. Kelly, Paola, Kan., first vice president; J. Q. Adams of Stockton, Kan., second vice president; E. J. Williams of Stockton, treasurer, and F. T. Burnham of Kansas City, secretary and attorney. When completed the road will extend from Garden City to Stockton, Kan.

Work is to be started at once, it is said, on the construction of the Cherryville, Oklahoma & Texas R. R., south from Cherryville. Capital to the extent of $200,000 is said to have been secured in France by State Senator S. M Porter, with which to begin this work. B. L. Dalton, Lawrence, Kan., and R. H. Worley, Kansas City, are the engineers.

An agreement has been entered into between the Kaw Valley Drainage Board and the Chicago, Rock Island & Pacific Ry., whereby the last obstacle in the way of widening the channel and improving the Kaw River was removed. The final settlement of the dispute assures a channel widened to 734 ft. and an improved river from the mouth to the Fifth St. bridge at Kansas City. The agreement makes it possible for the drainage board to at once advertise and place on sale the $325,000 in bonds voted by the people of the drainage district six years ago and also to vote whatever additional bonds may be necessary to continue the work of river improvements to the mouth of the Kaw. The remainder of the $200,000 in bonds voted for the purpose of erecting a dike to protect the property of the drainage district also will be placed on sale. W. H. Daniels, Kansas City, is president of the Kaw Valley Drainage Board and A. M. Bunn is engineer.

Haskell County has voted to issue $48,000 of bonds to aid the Garden City, Gulf & Northern R. R. It is believed that location surveys from Garden City to Liberal will be completed by March 10. L. L. Graham, Syracuse, N. Y., is in charge of the location work, and W. H. Cose, New Albany, Ind., is Chief Engineer.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Michigan United Rys. Co. is stated to have made a tentative offer for the purchase of the Kalamazoo, Lake Shore & Chicago R. R., with the idea of electrifving the latter through to South Haven and Benton Harbor.

The Detroit United Ry. of Detroit, has formally accepted the ordinance by which double tracking is to be la'd on Harper and Mt. Elliott Aves., Detroit.

The Saginaw Valley Traction Co., J. F. Collins, General Manager, Saginaw, is to build a loop line in Germania and Franklin streets with tracks extending south to Janes avenue, at Saginaw.

Officials have decided to reconstruct the Wabash R. R. between Adrian and Detroit, Mich, and a meeting will be held soon to let the contracts for the work which will include the construction of bridges and trestles and laying of double tracks straight through from Detroit to Adrian. Grading and filling in-

volved in the work will require about six months' time. A. O. Cunningham, St. Louis, Mo., is Chief Engineer of the company.

Surveys of the Detroit United Ry. have been considering routes in Flint for a cross-town line.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Twin City & Lake Superior Ry. Co., 440 Railway Bldg., Minneapolis, Minn., which projects an electric air line from St. Paul and Minneapolis to Duluth, has filed a $4,000,000 trust deed. It is stated that $300,000 has already been expended in work on the right of way, with 50 miles of grade work completed, and that as soon as spring opened up, operations would be continued with the expectation of finishing the road within 18 months. The officers of the company are as follows: President, L. N. Loomis, Minneapolis; Vice President, J. H. Bradt, Rockwell City, Ia.; Secretary-Treasurer, E. E. Sidman, Minneapolis. Directors—M. C. Towne, Des Moines, Ia.; A. R. McConnell, Mitchell, S. D., and F. A. Griswold, Minneapolis.

The Minneapolis, St. Paul & Sault Ste. Marie Ry. is said to have sent out a party of engineers from Viking, the first station west of Thief River Falls on the wheat line of the Soo, to begin a survey southwest from that point in the direction of Grand Forks, N. Dak.

The Drake & Stratton Co., which has extensive shipping contracts in the Mesaba range, as previously noted in these columns, will employ about 1,000 men at mine stripping on the range this year. The work will be confined to the Dale-Uno and the Morris mines, both of them near Hibbing. The contractors expect to move about 3,000,000 cubic yards.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Trunk & Heim, Architects, Hughes Bldg., St. Joseph, have prepared profiles for a retaining wall for the McKinley school grounds in St. Joseph.

The Board of Supervisors of the Phelps City Dyke & Drainage District of Phelps City, have made a levy of about $60,000 for the purpose of straightening the Nishnabotna river from just below Watson to opposite Phelps City. The work will commence early this spring.

Business men of Kirksville have been in conference with C. M. Coe, Denver, Colo., regarding his proposed interurban line from Kirksville, mentioned in our last issue. It is proposed to build the line from Kirksville to Gibbs this summer and it is probable that a bonus of $60,000 and free right of way will be asked. If these are secured, it is proposed to have the road built to Gibbs by September 1.

St. Louis Items.

BY A. T. KOENIG

Conferences between H. D. Sexton, president of the East Side Levee and Sanitary District Board, and officers of railroad and ferry companies, regarding the scheme of flood protection for East St. Louis, Ill., Granite City and Madison, have disclosed arrangements whereby the Terminal Railroad Association will acquire ample acreage in East St. Louis for freight yards to contain 20,000 cars. The association has had surveys completed, and is preparing to start the East Side improvements. The acquisition of space for 20,000 cars by the Terminal is incidental to the comprehensive project for levee improvements. The East Side Levee and Sanitary District Board has practically approved plans for the construction of a concrete retaining wall, 45 ft. high and five miles long, following the Illinois shore from Merchants bridge to Pittsburg dike, near Eads bridge, and this structure will, the board's engineers report, protect East St. Louis, Madison and Granite City from inundation. The Terminal also has bought land in East St. Louis for yards, to acommodate 4,000 cars. The East Side Levee and Sanitary District Board of which W. D. Sexton is president, has virtually approved the plans of John A. Ockerson, its consulting engineer, to save the East Side towns from inundation. Bids will be received in a few days for part of the work, and negotiations are pending with the Atlantic, Gulf & Pacific Dredging Co. of New York City for the levee operations. The plans specify that Indian and Cahokia creeks shall be diverted, so as to rid East St. Louis, Granite City and Madison from devastating floods. A new bed with a pair of high containing walls, will be constructed to the Mississippi River at Oldenburg, near the south of the Missouri River, to furnish a course for one stream, and a similar bed, with high retaining walls, will be formed behind the bluffs, taking the stream in the rear of the East Side towns and emptying it into the Mississippi River on the south at Falling Springs. East St. Louis, Granite City and Madison will be left high and dry, according to the reports of Mr. Ockerson and other engineers, and they will not be in hazard of inundations. The diversion of Indian and Cahokia creeks, the building of their walls and the construction of the immense levee wall along the Mississippi River will entail an expenditure of about $8,000,000. The sanitary district will incur about $6,000,000 of the expense and the property owners along the river front about $2,000,000. The retaining wall will be constructed from the Merchants bridge to the Pittsburg dike, near the Eads bridge. Made of concrete, it will attain a height of 45 ft., with a slope of 250 ft. from the inner harbor line to the outer. The wall will be 5 ft. above the high water mark of 1844, and its length will be approximately five miles. This structure will, in the opinion of the engineers, make the East Side levee 16 ft. higher than the St. Louis. The filling behind the wall, to create 598.2 acres of new land, will require about 15,000,000 cu. ft. of dirt. H. D. Sexton, president of the East Side Levee and Sanitary District Board, has notified interested property owners that the plans have been approved and proposals for construction will soon be received. The intention is to begin work as soon as the contracts can be let and have the whole improvement finished in a few years. The Illinois Legislature has authorized the financing of the enterprise.

The Board of Public Improvements last Thursday laid out ground at the western end of the free bridge for the unloading of material. Work is to be started on the west land pier in anticipation of delays on the East Side during high water, which is expected next month. Material for another caisson has been ordered and will be on the ground near the foot of Chouteau Avenue in a few days. Each foot of rise in the stage of the river adds nearly half a pound per square inch to the necessary air pressure in the caisson. At a depth of 50 or 60 ft. in the caisson at the east land pier work will be very difficult at a high stage of the river necessitating a high air pressure. The contractor expects to get the west caisson in place and to sink the excavation the 30 or 40 ft. to the water level on the west shore pier by the time work is stopped on the East Side. It is proposed to build the caisson for the east river pier, just east of the middle of the river, during high water. It is to be built on barges to a height of more than equal to the depth of the water at the pier site and then will be dropped from the barges into position. The contractor now has only a year to complete the four piers.

Walter Dennison spent a couple of days in town and left here for Lubbock, Tex., where he has a contract on the Santa Fe to build a cut-off between Coleman and Texico, Tex.

Columbus S. Jones has finished his government work at Glasscock, La., and is in the market for more work. 1931 Marcus Ave., St. Louis, Mo., will catch him.

The Walsh Construction Co. got in on 700,000 yards of steam-shovel work on the Soo Line 20 miles out of St. Paul, Minn. List & Gifford Construction Co. are going to do this work for them.

The L. J. Smith Construction Co. of Kansas City placed an order with Koenig's Labor Agency last Sunday for 2,000 laborers to be shipped to their various camps at work ballasting the Missouri Pacific R. R. in Kansas and Colorado. This is probably the largest order that has ever been placed at one time for laborers by a single contracting firm in this country. Koenig filled the order in three days. Pretty fast work.

Bills to compel the Missouri Pacific R. R. to abolish the Chouteau Avenue grade crossing were introduced in the House of Delegates last Friday by the Board of Public Improvements. Two bills were introduced, so the Municipal Assembly may have its choice, one requiring the road to pay all of the expense, including the land damages, and the other providing that land damages shall be paid by the city. Bills from the Board of Public Improvement cannot be amended, and by affording a choice, delay is avoided and the bill decided upon may be passed before the end of the session next month. The bills provide for a viaduct in Chouteau Avenue over the railroad tracks, 56 ft. wide, 42 ft. for the roadway and the balance for two 7-ft. sidewalks. It is to start 290 ft. west of the center line of Tiffany St. and to run 42 ft. east of the center line of Manchester Ave., making the completed viaduct 1,244 ft. long. The lowest part of the viaduct at the railroad tracks is to be 18 ft. above the rails. The cost is estimated at $204,240, not including property damages. Four months is allowed after the passage of the bill for the presentation of plans by the railroad for the viaduct.

Nevada Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Good progress has been made with the plans for a new railroad out of Winnemucca, and it is probable that a portion of the line will be constructed this year. As proposed the road will start at a point about one mile east of Winnemucca and, after crossing the Humboldt River will pass near the Reil ranch, thence up the Little Humboldt River to near the Toll House. From there the road will extend to Paradise valley, making a considerable loop into that section, and will cross the low divide of the Cottonwood range at a point near what is known as Paradise Hill. From there the road will run directly northward through Quinn River valley to the mouth of Three-mile Creek canyon, that leads to the camp of National, and from there on to McDermitt and finally on to Caldwell, Idaho, a total distance of 249 miles. R. E. Tilden, C. E., Humboldt, is interested.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The St. Lawrence River Power Co., is planning to begin work early this spring on the construction of a concrete dam at Massena, extending eastward from the power house for a distance of 250 ft., then at right angles to this and extending northerly into the river bank a distance of 150 to 200 ft., the whole dam to be about 50 ft. high and resting on bed rock, excepting perhaps a portion of the wing where it goes into the bank.

Work is to be started about April 15 on the construction of the New York Central & Hudson River R. R., station at Rochester. The work will involve the expenditure of abort $1,000,000. J. B. Reinhardt is Resident Engineer, and J. W. Pfau, New York city, is Engineer of Construction.

The Buffalo, Rochester & Pittsburg Ry., E. F. Robinson, Chief Engineer, Rochester, is planning extensive improvements for its terminals at Rochester.

The Long Island R. R., J. R. Savage, Chief Engineer, Jamaica, N. Y., is planning to spend about $3,000,000 in the next few months in improving its facilities at the Jamaica terminal. Of the above sum, $701,000 is to be expended on a new terminal, $730,000 in eliminating grade crossings, about $645,000 on other grade work; for new trackage $22,000 and for a freight handling yard, $170,000.

The New York Central and Hudson River R. R. and Lehigh Valley R. R. have plans

under consideration for new passenger and freight terminals in Buffalo which will involve the expenditure of between $7,000,000 and $8,000,000. The New York Central is said to have secured options on property on the lower terrace between Erie and Church streets, upon which it will build a $6,000,000 station. The Central trains are to run into the station through the Terrace subway, and on additional tracks which the road will ask the city to permit to be laid. It is said that the Lehigh Valley has not perfected its plans. It may share the Central station, or it may build a new one, to cost about $3,000,000 on or near its present station.

Residents of East Meadow, L. I., are asking that the New York & Long Island Traction Co. extend its line from Hemstead to that place.

Surveys have been completed for the construction of a railroad siding from the Chenango Valley branch of the New York Central R. R. to the gypsum beds two miles east of Fayetteville, N. Y., and at the next meeting the Board of Trade will attempt to induce the railroad to lay tracks.

Hearing is to be held April 1 by Board of Estimate and Apportionment of New York City upon the petition of the New York and Queens County R. R., for a franchise to construct an additional track from Flushing, N. Y., to College Point, and from Jamaica to Flushing. Headquarters of the company are at New York City.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Citizens of Price Hill have requested the Cincinnati Traction Co., of Cincinnati, to lay a double track street car line on Glenway Ave., from Wilder to the junction of Warsaw, Glenway and Seton Aves.

City Engineer Brewer of Niles, is preparing plans for a subway at North Main St., to eliminate grade crossings.

The Mahonning & Shenango Ry. & Light Co. is planning a number of improvements for its street railway lines in Youngstown and vicinity this year. One of the most important improvements will be a double track on the Park & Falls line from the Public Square to Idora Park. The Market St. viaduct will be double tracked and also Market St., from the viaduct to the end of the present double track near Myrtle Ave.

The Breakwater Construction Co. of Cleveland, which is building the jetties and breakwater at Cold Spring Inlet, for the entrance to the Cape May Harbor, New Jersey, has expended $75,000 on new and improved equipment with which to resume work this spring.

The Akron, Canton & Youngstown R. R. has secured a complete right of way between Mogadore and Youngstown and has also secured some right of way east of the former place. Right of way has also been secured in Akron. New York capitalists were over the proposed route recently and it is believed that construction will be started this spring. The new road will be six miles shorter between Akron and Youngstown than the B. & O., and there will be but six curves between the city limits of the two cities. The maximum curvature is only 1 degree and the maximum grade will be 3-10 of 1 per cent. Work was started on the proposed new road in 1893, which was then the Akron & New Castle. Later the right of way was purchased by the present company, but the panic greatly interfered with the project. Z. W. Davis, Cleveland, is President, and H. B. Stuart, Canton, is vice president.

A bill is before the State Senate which if passed will permit the railroads in Ohio to construct as many tracks along their right of way as they please. The present law allows only the construction of two tracks, with sidings and the necessary turnouts. The bill proposes to allow more than two, with no limitation as to how many.

J. J. Turner, Vice President, Pennsylvania Lines, West of Pittsburg, Pittsburg, Pa., is reported to have stated that the company is negotiating for a new entrance to Cincinnati, O.

The Chesapeake & Ohio R. R. has decided to begin work on the double tracking of the Cincinnati Division of the road. The work as proposed includes the construction of a new outside terminal at Silver Grove, near Cincinnati, O. Board of Directors of the company recently granted an appropriation of $5,000,000 for the work. F. I. Cabell, Richmond, Va., is Engineer M. of W.

Work is to be started in the spring by the Pennsylvania R. R., in the elevation and double tracking of six miles of line through Piqua.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The citizens of Woodward have offered to give $25,000 to the recently chartered Woodward Interurban Ry. Co., which proposes to build an electric line from Woodward northwest to Fort Supply, where one of the state insane asylums is located. J. H. Spurlock, W. H. Pyne and J. A. Innis are interested.

The Chamber of Commerce of Altus has recommended that the city accept the proposition of Harry Bradford of El Reno, to construct an electric street railway in Altus, provided the city will furnish the power, the city to receive one-half of the proceeds of the line in return for power and the franchise.

Surveys have been completed for the Webbers Falls-Warner R. R. J. R. McClaren, Warner, is interested.

The Railroad Committee of the Commercial Club of Anadarko and the officials of the recently incorporated Oklahoma City & Panhandle Ry. Co., have signed contracts relative to the building of the road to West City. By the contract, the road will get right of way through the county, terminal facilities in Anadarko and a $60,000 bonus.

The Osage Western Ry. Co., of Pawhuska, has awarded contracts for grading between Nowata and Vinita and which is to be started at the latter place. Bonuses have been secured at Vinita, Nowata, Bartlesville and Powhuska, Clarence Walters, Pawhuska, is General Manager.

The Davis Contractors Co., at present engaged in grading for the projected line of the Shawnee Electric Ry. Co., of Shawnee, near Spencer, has been awarded another five mile section. The company is also preparing to let a 10 mile section shortly.

The city of Lawton has entered into a contract with J. A. Kemp and Frank Kell, of Wichita Falls, Tex., for the construction of a new line of railroad from Lawton to Wichita Falls.

Engineers engaged in the permanent survey for the Cherokee Belt and Interurban railroad which is proposed to be built from Pryor Creek to Skiatook, reached Claremore on Feb. 24, having completed the survey from Skiatook east to the Verdigris river. The bonuses have been raised by the several towns along the proposed route, and most of the right of way secured.

William Kenefick, President, Missouri, Oklahoma & Gulf R. R., and his associates are promoting the construction of a railroad from Coalton, the terminus of the Missouri, Oklahoma & Gulf R. R., to Preston, Okla., the new oil town on the Frisco, via Okmulgee. It is understood that bonuses amounting to $57,000 have been secured.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

An ordinance has been before the City Council of Portland to permit the Alameda Land Co. to extend the Broadway street car line from Fremont St. through the Alameda tract to Mason St. The proposed line will be operated as a part of the system of the Portland Railway, Light & Power Co.

The Oregon Electric Ry. Co., Guy W. Talbot, General Manager, Portland, is giving favorable consideration to the matter of extending its lines from Salem to Albany and from Tigard to McMinnville this year. The extensions would require the expenditure of $2,225,000 and the building of 57 more miles of electric railway to the Willamette Valley. Surveys for the lines have already been made.

Good progress is being made on the construction of the O. R. & N. Co.'s line from The Dalles to the mouth of the Deschute River. Twohy Bros., Spokane, Wash., have the general contract. They have sublet the entire work, but their outfits will be used on the job and all operations will be in charge of John Twohy, Jr.

The Carlton & Coast R. R. Co., with a capital stock of $500,000, has filed its contracts of the corporation at Salem. The company proposes to build a steam road from Carlton, west through Yamhill and Tillamook Counties to Fairdale on the Pacific Coast. The Carlton Consolidated Lumber Co. has been incorporated by the same parties for the purpose, it is understood, of taking over the Carlton Lumber Co., W. Carlton, W. D. Dennis, Fred Russell and S. B. Linthicum are interested.

William Galvin, a foreman, well known to all railroad contractors in the central states, died at Madres, Ore., about Jan. 16, of heart failure. Mr. Galvin has two brothers, Timothy and Michael, and they can obtain information regarding Mr. Galvin's death by writing to James Houston, Camp Timber, Ore.

Engineers of the Corvallis & Eastern R. R. have finished the second survey from Yaquina to Newport and have removed their camp to Elk City, 18 miles above Newport. They will continue a survey of the road to Blodgetts' with the plan of eliminating a number of curves in the road, the idea being to shorten the road some ten or more miles. W. W. Bosshke, Portland, Ore., Chief Engineer.

The Orchards Watering Co., of Brogan, has been incorporated with a capital stock of $50,000 to acquire water rights and impound water. The incorporators are R. B. Hoyt, F. L. Grimes and E. R. Hamilton, all of Vale Ore.

The Commissioners of the Port of Nehalem have adopted resolutions providing for the sale of $50,000 of its bonds to secure funds to construct a jetty at the mouth of Nehalem Bay to provide a ship channel to the sea with a depth of 20 to 22 feet. The bonds will be sold to the highest bidder April 16, and contracts for construction work will be let soon after that date.

The Hood River Farmers' Irrigating Co. held a special election at Hood River on March 5, to consider the matter of piping its irrigating system through the farming section of the valley.

Plans and blue prints have been prepared and are on file at the offices of the Oregon Railroad & Navigation Co., for the construction of railroad shops, round house and extensive system of side tracks at Ontario, Ore. G. W. Boschke, Portland, Ore., is Chief Engineer of the company.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Lehigh Valley R. R., G. L. Moore, Engineer Maintenance of Way, South Bethlehem, Pa., is said to have decided to spend about $1,000,000 for tunnelling Bear Mountain near Mauch Chunk. The tunnel, which will be about a mile long, will extend from the station at East Mauch Chunk half way to Packerton, and will cut off the three-mile curve around the mountain.

The Johnstown & Altoona Street Ry. Co. has about completed arrangements for its proposed electric line between Johnstown and the Mountain City. The last obstacle to the construction of the line will be removed with the granting of the ordinance now pending in Altoona council, which will give the Johnstown & Altoona Co. permission to enter that city with a third rail over the Logan Valley system.

The Johnstown Traction Co. has been chartered to operate electric lines in Johnstown and vicinity. The capital stock of $500,000 is nearly all held by E. M. Dupont.

The stockholders of the West Pennsylvania Ry. Co. have decided to spend a large sum of money for improvements and extensions. A new power house and several substations are

to be built immediately, and the intention is to extend the lines east and west until a network of trolley lines is laid over the entire coke district of western Pennsylvania.

The Pittsburg & Lake Erie R. R., J. A. Atwood, Chief Engineer, Pittsburg, is said to be planning building a loop on its lines this coming summer that will leave the main line north of Koppel and will run through that town and will then parallel the Fort Wayne road to College Hill and passing through that town on the left, will enter Beaver Falls at 25th street and occupy the right of way owned by the company through the north end and connect with the main line again near the site of the old paper mill at 17th street.

Grading for the construction of the second track between McCalmont, a point three miles south of Butler, Pa., and the Allegheny River, a distance of 18 miles on the Bessemer & Lake Erie Ry., has been started. The new track will avoid curves and will require heavy cuts and fills. The estimated cost of the work is $1,000,000. H. T. Porter, Greenville, Pa., is Chief Engineer of the company.

City Engineer McKinnon of York, Pa., is preparing a map of the proposed extension of the New Park and Fawn Grove R. R. from Fawn Grove to Delta, a distance of 8 1-2 miles.

According to reports, the officials of the Baltimore & Ohio R. R. are again considering the construction of a tunnel through the hill below the McKeesport Hospital, McKeesport, Pa., for which plans were prepared three years ago. Paul Didier, Pittsburg, N. S. Pa., is Assistant Chief Engineer B. & O.

Work on the Western Maryland Ry. extension into Pennsylvania will be started this spring, it is thought. The extension will be 83 miles long and will cost $12,000,000. H. R. Pratt, Baltimore, Md., is Chief Engineer. It is believed in some quarters that the contract has already been let to William McAdoo, New York City, the builder of the Hudson River tunnels of the Pennsylvania R. R.

Citizens of Bridgeville and Carnegie have requested the commissioners of Allegheny County, to build a tunnel which will connect the Bridgeville and Carnegie territory with Pittsburg. The project would cost $1,500,000. The scheme originally contemplated the building of a bridge over the Monongahela River at Liberty street, Pittsburg. The advocates of the tunnel have abandoned this plan and now propose to connect the tunnel with the Point bridge. The tunnel would be 4,000 ft. long and would run from a point near the Point bridge to Banksville. The tunnel would connect with the bridge by a spur running above the tracks of the Panhandle railroad. J. G. Chalfant, Pittsburg, is County Engineer.

The new owners of the Gettysburg Trolley & Lighting Co. of Gettysburg, have effected a re-organization. Jas. F. Hallowell, of Philadelphia, was elected president; C. Taylor Leland, of Philadelphia, secretary and treasurer; C. J. Craft, George W. Roydhouse, Jas. F. Hallowell and C. T. Leland, all of Philadelphia, directors.

Rights of way and franchises have been received for the projected electric railway from New Castle to Mercer, with a branch to Sharon, and it is understood that the J. G. White Co., New York City, will finance and build the line. The electric railway will be capitalized at 1,000,000.

The Chambersburg, Greencastle and Waynesboro Electric Ry. Co., is to increase its capital stock from $600,000 to $2,500,000 and the bonded indebtedness from $1,000,000 to $2,500,000. The money will be used to extend the road from Pen-Mar to Blue Ridge Summit and Monterey.

Tennessee Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Appalachian Ry. Co., of Knox County, has been incorporated with a capital stock of $10,000 and proposes to build a road from Obion Springs in Anderson County to Landing, in Morgan County. The incorporators are J. W. Prevost, J. M. Cassil, C. M. Franklin, E. E. Ferguson and John W. Green.

The Union Land & Improvement Co., of Memphis; proposes, at its owns expense, to extend the New Raleigh road street car line from its present terminus at Evergreen St. to the property recently acquired on the Belt line.

The Tennessee Central R. R. has secured right of way for the construction of a line from Harriman, Tenn., to Knoxville and it is believed that the road is planning the construction of a through route from Harriman, via Kingston through Loudon County to Knoxville and on through Sevierville into and through North Carolina to the Atlantic Seacoast. L. F. Lonnbladh, Nashville, Tenn., is Chief Engineer of the company.

The Tennessee Developing Co., with a capital stock of $10,000, has filed application for a charter of incorporation. The incorporators are W. H. Payne, Jr., J. L. Foust, W. C. Foust, E. F. McClure and Charles F. Higgins. The charter gives the company the power of improving and developing the water powers of the rivers and streams of the state and the right to manufacture electricity for all purposes.

The Louisville & Nashville R. R. is said to be making surveys for a freight route from Madison, Tenn, to Brentwood, in order to avoid terminal delays in Nashville. The plan contemplates bridging the Cumberland River above Nashville. The route as projected would eliminate the Maplewood grade, but would cost about $1,000,000 to construct.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The International & Great Northern R. R., H. A. Genung, Engineer Maintenance of Way, San Antonio, Tex., has had surveys made at Taylor, with the intention of reconstructing the general yard plan and the installation of much new trackage upon the completion and installation of the new railroad shops of the company, now in course of construction.

The Belton-Temple Traction Co., of Temple, has begun the work of paving between its tracks in the business section of Temple. New and heavier steel is also to be laid in certain portions of the city.

President Owsley of the Chamber of Commerce of Denton, has been raising a preliminary fund of $5,000 for making the necessary surveys and other preliminary work for an interurban line between Fort Worth and Denton. Fort Worth capital has been interested in the project and it is said that if the money can be secured at Denton for the preliminary work capital has been promised to put the line through. The distance is about 35 miles.

The Central Construction Co. of Moobeetic has been incorporated with a capital stock of $30,000; the company proposes to build railroads and railroad bridges. M. F. Stanley, J. E. Stanley and T. E. Durham are incorporators.

A permit to do business in Texas has been granted to the Falls City Construction Co., of Louisville, Ky. The principal Texas office is Panhandle; capital stock is $50,000.

The Texas Central R. R., C. H. Sharman, Chief Engineer, Waco, has closed contracts for right of way for the branch line from De Leon through Sipe Springs, Rising Star and Cross Plains. The locating party of engineers is making rapid progress. All ties and rails have been purchased, and the contract for the grading will be let in a short time.

The Enid, Ochiltree & Western R. R., has filed an amendment to its charter providing for an extension of 55 miles from Ochiltree eastward to the Oklahoma State line.

Steps are being taken to have construction work started on the Abilene Central R. R. Morgan Jones, Abilene, is interested.

The Louisiana Rio Grande Canal Co. of McAllen, has been incorporated with a capital stock of $20,000, the incorporators being H. N. Pharr, John J. Conway and J. C. Kelly.

The Grigsby Construction Co., Dallas, Tex., has been awarded the contract for constructing the Temple Northwestern R. R. from Temple to Hamilton.

The Beaumont & Great Northern R. R. has filed an amendment to its charter providing for an extension, 52 miles in length from Trinity to Jewett, through the counties of Trinity, Walker, Houston and Leon. R. C. Duff, Houston, Tex., is General Manager.

The Board of Trade of Fort Worth has raised $125,000 for the projected Fort Worth Mineral Wells interurban line, and dates are now being prepared preparatory to calling for bids for contracting the line. It is said that contracts for doing this will be let within 60 days. The road will pass through Springtown, Azle, Poolville, and Peasten and will have its terminus at Mineral Wells, J. S. Handford and Paul Hurley are the promoters.

Advices from Houston, state that a deal has been closed in that city for the purchase of all supplies except ties, for the railroad line in oNrth Texas, which is to run from Graham to Roswell. The movement for this line was started at Haskell, Tex., and some construction work has already been done there. M. R. Hemphill, Haskell, is interested.

A project is under construction for the constructing of a railroad from Gainesville to Weatherford, via Decatur. Col M. P. Kelley, President of the Commercial Club of Gainesville, is interested.

Train service on the Orange & Northwestern Ry., a new Santa Fe line, was started on Feb. 21.

H. J. Rix, Tyler, has commenced work on his contract with the Cotton Belt for the grading work from Bonner Spur, 2 1-2 miles south of Athens, to the Boone lignite mines.

Joel W. Hicks, Weatherford and the Mitchell-Pigg Construction Co. have made a proposition to the proposed Chicago, Weatherford & Brazos Valley R. R. whereby they will build, grade, construct and lay the steel ready for the rolling stock, upon said railway from Weatherford northward to Bridgeport or to an intersection with the Rock Island railway at some other point in Wise county, Texas.

E. S. Johns has begun work on his sub contract on the levee to be built in the Brazos River opposite Bryan. Roach & Stansell, Memphis, Tenn., are the general contractors for the work.

S. A. Anderson, formerly assistant chief engineer of the Texas and Pacific, has accepted the position of chief engineer for the Pecos Valley Southern Ry, and is in Pecos to personally superintend the construction of the road out of Pecos. The location survey is completed and the grade work is being pushed rapidly.

Commissioners of Atascosa County have granted J. F. Edwards, President of the San Antonio, Rio Grande & Tampico R. R., permission to enter Jourdanton, Tex., via Crouch avenue, to Main street, where terminals will be constructed.

Citizens of Del Rio, Tex., are subscribing liberally toward the required bonus of the Kansas City, Mexico & Orient R. R., $33,000 of required amount having already been subscribed.

Contracts have finally been signed by the city of Temple, Tex., and the promoters of the Temple Northwestern Ry., which insure the construction of the road. Citizens of the place have subscribed $175,000 for the project.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Announcement has been made that the San Pedro, Los Angeles & Salt Lake R. R. would be reopened to transcontinental traffic by June 1. The company will build a temporary track through Meadow Valley, in Nevada, where 90 miles of roadbed was washed out two months ago. A permanent roadbed will be built over the same route. E. G. Tilton, Los Angeles, Cal., is Chief Engineer.

The City Council of Provo has granted Jesse Knight a franchise for an interurban right-of-way through the city. This gives the Knight road right-of-way through all towns in the country with the exception of Springville.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Virginia Ry. is to have work started shortly on the erection of shops and a roundhouse at Roanoke, Va.

The Roanoke & Bent Mountain R. R. Co. organized to build a railroad from Roanoke, Va., to Floyd Courthouse, 50 miles, effected its organization at Roanoke, as follows: President, Arthur L. Sibert; Vice-President, R. H. Angell; Secretary and Treasurer, C. M. Armes; General Manager, C. G. Ogden. Directors—A. L. Sibert, C. M. Armes, C. G. Ogden, V. C. Lawson, L. C. Stewart, J. Coles Terry, M. M. Caldwell, J. B. Botts and E. A. Thurman.

Business men in Amherst, Va., have formed a company and will ask a charter for the construction of an electric railway through Amherst County. It is proposed to have the Southern terminus at or near Lynchburg, and to extend the line through in a northern direction to the Nelson line, and possibly into that county.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Tacoma Pile Driving & Construction Co., Tacoma, has been awarded the contract for driving the piling for the new passenger dock to be erected at Tacoma by the Commercial Dock Co.

The Wenatchee Valley & Northern R. R. has increased its capital stock to $300,000. D. Mackey, Leavenworth, Wash., is General Manager. This company, according to recent reports, had 18 miles of standard gage line in operation and seven miles additional under construction.

Plans for improvements at Hillyard, to cost about $300,000, have been submitted to the St. Paul office of the Great Northern. The improvements will involve new trackage facilities, additional roundhouses, engine shops and alterations.

The City Council of Renton has granted a franchise to the Valley Railway & Power Co., to build and operate a railroad from Renton to Kent. Practically all right of way has been secured.

Horace Henry, Seattle, Wash., has been awarded the contract for constructing the Chicago, Milwaukee & Puget Sound Ry.'s branch to Everett. The branch will be 45 miles long, and will leave the main line at Moncton. It will cost about $35,000 per mile. Work will begin March 15, and is to be completed in nine months.

Residents of Waterville have raised $80,000 for the construction of a 6½-mile line to a connection with the Great Northern at Douglas. All material has been ordered and construction will be started about April 15. A. L. Rogers, Waterville, is interested.

The Great Northern Ry., A. Stewart, Assistant Chief Engineer, Seattle, Wash., is said to be planning to expend $2,500,000 this year in improving its system through the Cascade Mountains. It is said that the company proposes to make radical alterations in right of way east of Scenic Hot Springs, to avert continued destruction of rolling stock and trackage by the slides. The company proposes to clear and grade a strip of land 500 ft. in width along a portion of this particularly dangerous right of way to eliminate further troubles. The company further intends spending a considerable sum building spurs and new passenger stations. Further double tracking facilities are also soon to be undertaken.

The Pacific & Eastern R. R. has been completed for a distance of six miles up Mill Creek, beginning at a point on the Willapa River, six miles above Raymond. This road is a common carrier and will eventually be extended from South Bend to Chehalis. It is owned by the Siler Mill Co., the Willapa Lumber Co., and the Columbia Box & Lumber Co., of Raymond.

The Commonwealth Power & Water Co., has been incorporated with a capital stock of $5,000,000 and is said to have acquired a power site somewhere in the Inland Empire which it will develop in connection with an irrigation project. The incorporators are, J. E. Burns, E. F. Waggoner and F. W. Dewart, all of Spokane.

The City Council of Olympia has passed an ordinance for the construction on the Swantown fill, and bids for the work will be asked at once. The estimated cost is $66,000.

The U. S. Department of Interior has approved the plans of reclamation engineers providing additional storage capacity for 40,000 acre feet of water for lands under an extension of the Sunnyside canal. The storage will be obtained at Lake Kaches by deepening the drainage channel. It will cost about $60,000. Ernest McCullough, Sunnyside, Wash., is Project Engineer.

Reports have reached Chehalis, Wash., that a route for the double track over the Napavine hill has been definitely decided upon by the Northern Pacific. The new route will be identical with the old one excepting at a point near Napavine where it will veer to the west. Right of way men are now busy closing deals for right of way and grading will be started in the Spring. The project will involve some heavy grading.

Officials of the Harriman System, according to reports, have announced that plans have been completed for great railroad yards and extensive car shops for the Puget Sound and Grany's Harbor lines at South Tacoma, Wash. According to the plans the storage capacity of the yards, which will be the first gravity switching yard on the Pacific Coast, is 2,200 freight cars, and it will cost $1,000,000.

Board of Directors of the Great Northern at a recent meeting were given authority to revise the surveys for the construction of a line through the Okanogan Valley, Washington. As projected the line will run from Orville to Vancouver, B. C., then to Brewster, a little to the southeast of the Colville Indian Reservation traversing a distance of approximately 50 miles. Work will be started in the Spring as soon as the weather permits and it is expected to have the line in operation next year.

Preliminary surveys for the Ritzville-Ellensburg cut off on the North Pacific Ry. have been submitted to the N. P. officials at St. Paul. It is believed that work will be started this summer.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Minneapolis, St. Paul & Sault Ste. Marie Ry. is to construct its own track between Neenah and Hilbert Junction, a distance of 20 miles. At present the Soo trains are run over the Milwaukee track between the stations named to connect with the Soo line to Manitowoc. This will give the Wisconsin & Northern road, which will be built to Neenah this summer, a direct line to Manitowoc.

The stockholders of the Chippewa Flambeau Development Co., organized to build dams on the Chippewa and Flambeau rivers to create reservoirs for the purpose of storing water during times of excess and letting out water during times of scarcity, have elected the following officers: President, J. T. Joyce, Eau Claire; vice-president, David Douglas, Eau Claire; secretary and treasurer, D. Buchanan, Jr., Chippewa Falls. The company now has a bill pending before a special legislative committee on forestry and water powers by which it is given the right to build dams on rivers and to maintain reservoirs to create uniform flow of water throughout the entire year.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Grand Trunk Pacific main line has now been completed as far as Edson, 120 miles west of Edmonton. From this point Foley, Welsh and Stewart, Contractors, St. Paul, Minn., have 1,000 teams hauling supplies and cacheing them along the survey as far west as Tete Jaune Cache, which is over the hill beyond Yellowhead.

The Canadian Board of Railroad Commissioners has approved the route of the Niagara, St. Catherines & Toronto Electric Ry. Co. for its projected road from Welland, Ont., to Bridgeburg, by way of Port Colborne. The link between Welland and Port Colborne is already under construction. The remaining section between Port Colborne and Bridgeburg will be proceeded with as soon as the weather renders work possible. The distance between Bridgeburg and Port Colborne is approximately 20 miles.

The Canadian Pacific Ry. is to spend $4,000,000 this year in improvements on its Western Division. Of this amount $133,000 will be spent in Calgary, $80,000 being appropriated for an extension to the station and the balance principally on the roundhouses and machine shops in East Calgary. At Medicine Hat from $40,000 to $60,000 will be spent on machine shops; at Red Deer, $20,000 on a new station; at Moose Jaw, $200,000 on freight sheds; at Regina, $200,000 on freight sheds; at Canmore, $26,000 on a railway Y. M. C. A.; at Banff, $30,000 on a new station. About $500,000 will be spent on ballasting and renewing with new steel, the line between Calgary and Medicine Hat receiving attention. About $117,000 will be expended in improving the wire system between Medicine Hat and Swift Current. A. Price, Calgary, Alberta, is General Superintendent Western Division.

A bill has been before the Canadian Parliament to incorporate the London Lake Erie Railway and Transportation Co. This company recently took over the South-western Traction Co.'s line from London, Ont., to Port Stanley, on Lake Erie, and it is the intention to build also other radial lines out of London and to operate boats from Cleveland to Port Stanley.

The Montreal Underground Elevated Railway Co., has applied to the Canadian Parliament for a charter. The company will have a capital stock of $20,000,000 and asks charter rights to build and operate by electricity or other motive power, underground and elevated railways through the city and the island of Montreal. L. T. Col. T. B. Butler, Montreal, Que., is attorney for the applicants.

The railway legislation promised by the British Columbia provincial government for the aid of the Canadian Northern railway was introduced in parliament on Feb. 28. The program consists of three bills, one an act ratifying the provisional agreement entered into between the government and Mackenzie and Mann, the second an act incorporating the Canadian Northern Ry. Co., and the third a bill ratifying the agreement between the government and the Kettle River Valley Ry. Co.

The Grand Trunk Pacific Ry. has awarded the contract for the extension of the Tofield-Calgary line of Alberta from Camrose south to Calgary, to J. D. McArthur, Ltd., and the work of connecting Calgary with the main line will be rushed the moment the frost leaves the ground. About 135 miles of line is to be constructed.

The Provincial Government of British Columbia has granted a franchise to the Hill interests to build a line of railroad from Princeton, to the point where the international boundary line is intersected by the Skagit River. The securing of the franchise indicates strongly that the Great Northern is to build from Princeton, the terminus of the Canadian Great Northern at present, down the Skagit river to a connection with the Anacortes-Rockport branch.

J. N. Logan, Winnipeg, Man., is busy securing right of way for the partly constructed railroad between St. Paul and Prince Albert, Can.

The Dominion Atlantic Ry. will start surveys shortly for its projected North Mountain branch. The branch will join the main line at Centreville, N. S., and will go north and west, passing through Billtown, Lakeville, Woodville and Grafton and will join the main line at a western point. P. Gifkins, Kentville, N. S., is General Manager.

Mexico Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Engineers of the National Ry's of Mexico, and Jas. M. Reid, chief engineer, City of Mexico are making preparations for the opening of

work on the Magdalena and Tlacolula extensions of the Oaxaca y Oriente Ry., now under lease to the interoceanic. The engineers have instructions to survey the lines as far as San Dionisio, about 20 miles southwest of Tlacolula.

The Torres & Priestas Ry., a 38-mile narrow gage line extending east from Torres, Sonora, Mex., is to be extended east through the Barranca region to a connection with the Yaqui River extension of the Southern Pacific. J. T. Symonds, Torres, Sonora, Mex., is assistant General Manager.

The City Council of Fremont, Neb., has granted a franchise to the Nebraska Transportation Co., for the construction of an interurban car line into Fremont. The proposed line is to be operated between Omaha and that place. The franchise calls for the completion of the line in 1912.

Following bids were received Feb. 23, by Capt. F. W. Altstaetter, U. S. Engineers, Wheeling, W. Va., for furnishing and delivering structural steel, forgings, bolts, etc., for Dam Nos. 8 and 11, Ohio River.

	Dam No. 8	Dam No. 11
The Richard Mfg. Co., Bloomsburg, Pa.	$0.055	$0.0525
Independent Bridge Co., Pittsburg, Pa.	.0332	.0236
Penn. Bridge Co., Beaver Falls Pa.	.0369	.0314
American Bridge Co., of New York Pittsburg, Pa.	.0274	.0274
New Jersey Foundry & Machine Co., New York, N. Y.	.0363	.0363
Hoisting Machinery Co., New York, N. Y.	.0577	.067
Lawrence D. Weaning, Cleveland, O.	.035	.0315

The Watson Contracting Co., of Birmingham, Ala., has been incorporated with a capital stock of $5,000, fully paid in, and will engage in contracting business for road work, railroads, etc. The incorporators are W. L. Woodruff, W. L. Watson and C. W. Woodruff.

The Fernwood Lumber Co., Fernwood, Miss., has taken bids for grubbing and grading about four miles extension of the Fernwood & Gulf Ry., in the west side of Marion County, Miss. The work is high and well drained and averages about 12,000 cu. yds. per mile.

The Harrison Southern R. R. Co., has been incorporated with a capital stock of $100,000 the incorporators being, P. H. Wall, M. K. Wall and A. A. Crane of Harrison, Idaho. The company proposes to construct a road from Harrison to Bell Creek and hence to the junction of the Chicago, Milwaukee & Puget Sound Ry. at St. Maries.

According to advices from Butte, the Montana Rapid Transit Co., has secured enough capital to assure the beginning of construction this spring for the electric line between Helena and Butte. The route for the new road will be over the old grade of the Northern Pacific R. R., which was made at the time the Northern Pacific Co. fought with the Montana Central, now the Great Northern, for an entrance into Butte. It will pass through Jefferson City, Corbin, Wickes and Amazon. The road will have a length of about 75 miles. Among those behind the project are officers of the United Missouri River Power Co., from which company the projected electric road will get its power.

The Norwich, Colchester & Hartford Traction Co., is making good progress with the promotion of its line, and is said to have already received subscriptions of $270,000 for its prefered stock. The estimated cost of construction is $985,000 and it is planned to have construction work started in April. The road is to connect Hartford, Conn., and Norwich, Conn., and of its line, 26 miles will be on tangent or straight track; twelve miles on light curves which will permit high speed; and the remainder of the distance on curves not ordinarily classed as light, including the curve work necessary in towns. Mayor Lippitt of Norwich, Conn., is President of the company.

The Stokes, Surry & Rockingham County Ry. Co., is to be organized in North Carolina for the purpose of building a trolley from Stoneville, N. C., on the Roanoke & Southern to Spray, Draper and Leaksville, a distance of ten miles. The project is backed by New York capital and it is probable that the road will be extended from Stoneville to Mount Airy a distance of 30 miles.

The Paducah & Illinois R. R. Co. filed a charter in the County Clerk's office at Louisville, Ky., listing its capital at $10,000, divided into shares of $100. The company is authorized to bond its enterprise. The incorporators and their holdings are: T. B. Toon, 82 shares; M. K. Gilbert, 3 shares; J. B. Hampton, 3 shares.

The Alexandria & Western R. R. has 600 tons of steel on the ground at Alexandria, La., for its projected line which is to traverse the Bayou Rapide territory in Louisiana in a westerly direction and may extend to Texas points. G. F. Cotton, Fort Worth, Tex., is President.

According to reports a project is under consideration involving the construction of a railroad from Miles City, Mont., to Sheridan, Wyo. E. E. Lonabaugh of Sheridan, Wyo., is interested in the project, it is said.

Surveyors are now at work running a line from the vicinity of Ashland, Neb, through Nebraska City and south. It is supposed that the party is setting stakes for the line which has been projected through Cass and Otoe Counties from Omaha.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

San Jose, Cal.—Until 11 a. m., April 5, by Board of County Supervisors for the construction of a reinforced concrete bridge over the Coyote River at San Jose and Oakland Road. Henry A. Pfister is Clerk.

La Porte, Ind.—Until April 4, by County Commissioners, for the construction of a bridge over the Kankakee River at English Lake. H. C. Miller is County Auditor.

Ames, N. Y.—Until March 15 by Town Board of Canajoharie, N. Y., for the construction of a steel and concrete bridge and abutments on highway No. 347 at Ames, N. Y. The structure will be 33 ft. long and 24 ft. wide. W. A. Gage is Supervisor.

Niagara Falls, N. Y.—Until 7:30 p. m., March 15 (readvertisement of bids called March 1) by Thomas H. Hogan, City Clerk, for the construction of the old Fourth St. bridge across Gill Creek at East Falls.

Muskogee, Okla.—Until March 29, by County Commissioners, for the construction of four bridges as follows: 160-ft. steel bridge over Dirdnie Creek, near Webbers Falls, Okla.; one 90-ft. steel bridge over Pecan Creek; one 120-ft. steel bridge over Coody Creek; one 36-ft. arch concrete bridge over a slough. J. J. Brotherton is one of the Commissioners. W. E. Looper is County Clerk.

Kalama, Wash.—Until 10 a. m., April 5, by Clerk of County Commissioners, for the construction of a steel bridge over the Cowlitz River at Castlerock, Cowlitz County, Wash.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Fort Smith, Ark.—Until April 7 by Board of School Directors for the erection of a manual training and science school building at Fort Smith, Ark.

Emeryville, Cal.—Until 7:30 p. m., March 14, by Board of Trustees for the necessary labor and material for the construction of a fire engine house on San Pablo Ave. F. H. Farr is Town Clerk.

San Francisco, Cal.—Until noon, March 25, by Light House Engineer, San Francisco, Cal., for constructing reinforced concrete light building, frame for signal building, frame principal keeper's dwelling, two frame assistants dwellings, frame blacksmith and carpenter shop, frame building and three frame outbuildings at Punta Gorda Light Station, Cal.

Fort Oglethorpe, Ga.—Until 11 a. m., April 1, by Capt. George Vidmer, Constructing Quartermaster, for screening quarters for field officer and two lieutenants at this post.

Fort Barrancas, Fla.—Until 11 a. m., March 25, by Constructing Quartermaster for the construction of a quartermaster's storehouse at Fort Barrancas, Fla., and installing plumbing, clothing closets, electric wiring and electric lighting fixtures therein.

Brookville, Ind.—Until 1 p. m., May 12, by Board of County Commissioners for the construction, heating and plumbing of a court house at Brookville, Ind.

Lyons, Kan.—Until noon, March 29, by County Commissioners for the necessary labor and material for the construction of a court house to be located at Lyons, Kan.

Browns Valley, Minn.—Until 7:30 p. m., March 30, by N. O. Nelson, Clerk, for the erection of a brick school building at Browns Valley, Minn.

Wayzata, Minn.—Until 1 p. m., March 19, by F. H. Snure, Clerk School Board, for the construction and completion of a school building at this place.

Columbus, Neb.—Until 3 p. m., April 14, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the United States post office at Columbus, Neb.

York, Neb.—Until 2 p. m., March 24, by A. H. Dyer, Architect, Fremont, Neb., for the erection of an Odd Fellows Home bldg. at York, Neb. George L. Loomis is Chairman of the Building Committee.

Ithica, N. Y.—Until 12:30, March 21, by E. L. Williams, Treasurer Cornell University, Ithica, N. Y., for the enlargement of the north wing of the State Veterinary College Building, Cornell University. The work will include heating, plumbing and lighting.

New York, N. Y.—Until 3 p. m. by Park Board, Arsenal Bldg., Manhattan Borough, New York, for furnishing all the labor and materials for the erection and completion of a shelter in the botanical garden in Bronx Park in this city.

New York, N. Y.—Until 11 a. m., March 14, by E. V. Frothingham, President, Borough of Manhattan, City Hall, New York, for repairs and alterations, restoration and redecoration of the offices of the President of the Borough of Manhattan in the City Hall.

Bismarck, N. Dak.—Until 2 p. m., March 30, by Department of Interior, Office of Indian Affairs, Washington, D. C., for furnishing and delivering the necessary materials and labor required to construct and complete a barn at the Bismarck Indian School, N. Dak.

Ashtabula, O.—Until 3 p. m., April 11, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus, electric conduits and wiring of the U. S. Post Office at Ashtabula, O.

Fort Sam Houston, Tex.—Until 11 a. m., March 31, by P. W. Guiney, Constructing Quartermaster, for the construction, plumbing, hot air heating, electric work in one double set of hospital corps, sergeants' quarters at Fort Sam Houston, Tex.

Saskatoon, Sask.—Until March 21, by Board of Governors, University of Saskatchewan, for the erection of the college building, students' residence, power house, live stock, pavilion, agricultural engineering building on the university grounds. David R. Brown and Hugh Vallance, Canada Life Bldg., Montreal, Can., are the Architects.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Danville, Ind.—Until 10 a. m., March 15, by Board of County Commissioners for the construction of the following highways in Hendricks County: Frank P. Reichard et al, road 6,656 ft.; David Hadley et al, road 4,497 ft.; Charles F. McCleland et al, 8,518 ft.; Charles A. White et al, 6,791 ft. William H. Nicholas is County Auditor.

Michigan City, Ind.—Until 10 a. m., March 22, by H. M. Miles, City Engineer, for 4,375 sq. yds. of brick paving.

Muncie, Ind.—Until March 9, by Joseph E. Davis, Auditor, Muncie, Ind., for the construction of 11,846 sq. yds. brick and concrete pavement. As planned, the work includes 5,719 lin. ft. of curbing. John O. Potter, Muncie, Ind., is Engineer.

Towson, Md.—Until noon, March 10, by the County Highway Commission for the improvement of the public highway between Broadway and Beaver Dam bridge known as the Falls Road. E. Stanton Bosley is Secretary.

Baltimore, Md.—Until noon, March 24, by John M. Tucker, Chairman State Roads Commission, for twelve sections of State Road aggregating 50½ miles.

Kirksville, Mo.—Until March 21, by J. C. Carothers, City Clerk, for constructing 15,000 sq. yds. of brick paving on 5 in. concrete base and 12,000 lin. ft. concrete curb and gutter.

ENGINEERING-CONTRACTING

A Weekly "Methods and Cost" Journal for Civil Engineers and Contractors,
WITH WHICH ARE COMBINED

CONTRACT NEWS-ENGINEERING WORLD-THE DIRT MOVER

Published every Wednesday by

THE MYRON C. CLARK PUBLISHING CO.

355 Dearborn Street, Chicago
Telephone Harrison 6198

NEW YORK OFFICE: 13-21 Park Row
Telephone 5613 Cortlandt
CLEVELAND OFFICE: 522 Rockefeller Bldg.

HALBERT P. GILLETTE, CHAS. S. HILL, ERNEST McCULLOUGH, C. T. MURRAY, F. A. SMITH — EDITORS
MYRON C. CLARK — PUBLISHER
F. P. BURT — MANAGER
CALVIN B. ROSS — ADVERTISING MANAGER

SUBSCRIPTION RATES (Payable in Advance).—
***$2.00** a year (52 issues) in United States, Cuba, Mexico, Alaska, Hawaii, Guam, Porto Rico, Philippine Islands, Republic of Panama, Canal Zone and Island of Tutuila.*
***$3.00** a year (52 issues) to Dominion of Canada.*
***$4.00** a year (52 issues) to all other countries.*
Remittance by Draft, Post Office or Express Money Order.

ADVERTISING RATES sent on application.
Copy for regular advertising, where proof is required, should be received the second Monday preceding date of issue. Corrected proof must be received the following Saturday. When proof is not requested, copy will be honored up until Friday preceding publication date. Your strict observance of these instructions will obviously work to our mutual benefit.

Entered as second-class matter, April 17, 1907, at the Post Office at Chicago, Illinois, under act of March 3d, 1789.

CONTENTS.

EDITORIAL:
The Practice of Engineering-Contracting in the Matter of "Write-ups" and "Mentions" of Commercial Devices and Methods 233
CONCRETE SECTION:
A Concrete Bucket With Controllable Center Discharge 234
Results of Tests of Model Concrete Arches Made in Connection With the Design of the Medina Aqueduct, New York Barge Canal 234
A Concrete Cart With a Self-releasing Leg. 238
The Efficiency and Cost of Concrete for the Preservation of Piles Exposed to Seawater 238
EARTH AND ROCK SECTION:
Methods of Open Cut Rock Excavation at the Pennsylvania R. R. Terminal Station at New York With Some Data on Drill Performance 239
ROADS AND STREETS SECTION:
Method and Cost of Constructing a Shell Macadam Pavement at Annapolis, Md... 241
Work of the Municipal Asphalt Repair Plant of Brooklyn, N. Y., in 1909, With Detailed Costs of Repair and Maintenance of Asphalt Pavements..... 241
Suggested Standard Specifications for Macadam, Brick and Granite Block Pavement, Creosoted Wooden Block Pavement and Concrete Pavement..... 243
RAILWAY SECTION:
Method of Constructing Concrete Lining for Bergen Hill Tunnel, Pennsylvania R. R. Tunnel Extension to New York City..... 245
Some Notes on Cost of Treating Ties With Preservatives 253
GENERAL SECTION.
New Formulas for Base and Bearing Plates. 254
LETTERS TO THE EDITOR 255
TECHNICAL SOCIETY MEETINGS..... 256
PERSONALS 256
CATALOGS WORTH HAVING..... 256

The Practice of Engineering-Contracting in the Matter of "Write-Ups" and "Mentions" of Commercial Devices and Methods.

Scarcely a mail passes that does not bring to the editors of this journal letters asking for the publication of submitted articles on or notices of devices or materials being marketed for the use of engineers and contractors. Often the matter submitted is published in some form, but quite as often it is not published. The manner in which these articles and notices are submitted and particularly the manner in which their acceptance or rejection is commented on indicates so frequent a misunderstanding of the reasons that must and should control the editors' action that we have thought it useful to state these reasons briefly.

Every article or item published in ENGINEERING-CONTRACTING is chosen because in the editors' opinion it contains news or data interesting or useful to its subscribers. This must be so. These subscribers pay for their paper—there is no "free list"; none receives the paper regularly who does not give money or service in payment. These buyers demand and they are entitled to demand that the matter for which they pay shall be the best that the editors can furnish them. The editor who chooses articles for publication on any other basis than its interest and value to his subscribers is defrauding those subscribers. An editor who defrauds a subscriber loses gradually the confidence of that subscriber and sooner or later he loses the subscriber himself. This is plain business sense. No engineering journal ever yet succeeded that did not keep faith with its readers; none can succeed permanently that does not hold and nourish their confidence in its faithfulness to them.

But—we have been asked this—does the paper not owe its advertisers a service as well as its subscribers? They are also buyers of the paper and buyers who, both individually and in the aggregate, pay it far more money than the subscribers. Yes. It owes its advertiser the service of placing his advertisement in the form he desires it regularly and promptly before every one of its readers. It owes him the duty of maintaining its list of readers and of increasing that list and of improving its character. It does not owe him space in its reading columns, but if he has developed some new or improved useful device or product of importance it does owe it to its readers to acquaint them with that device or product. It owes them this service whether the maker of this device or product advertises in the paper or does not. There is no other sound principle on which to handle the question. There can be no other. It is the only principle that in the long run works a benefit to the advertiser. Consider for a moment.

There was on the editor's desk, when he began writing, a letter requesting that a certain material be mentioned in our reading columns because the firm selling it is paying for space in our advertising pages. There has come with the last mail a letter asking that a certain device be described on the plea that the firm selling it will soon be in position to advertise in ENGINEERING-CONTRACTING. Within a few days another manufacturer seeking notice in these columns for his product has had himself introduced by a personal acquaintance of the editor. This is the story of every week, almost every day, in the year. Were we to publish the first article because the person interested buys advertising space, the second because that person promises to buy, and the third to please a friend, where shortly would be our service to anybody? The line cannot be drawn by noticing one advertiser's product and not the products of two or three hundred others who take space with the paper. Each has as good a right as a customer to receive mention as any of the others. With every advertiser equally a customer what shall follow? Shall better mention be made of the advertiser who takes larger space than of the one who takes small space? This is wholly logical if we admit that buying of advertising space entitles the purchaser to notice in the reading columns. Then why not the paid write-up to boom a certain product or to condemn its rivals? Is it not plain that there is but one rule to govern this matter? The readers' interests and their interests alone shall govern the selection of articles for publication.

This journal is glad always to receive notices and descriptions of new devices and materials. Their availability for publication will depend upon their degree of interest to its readers. All the items that go in the editors' opinion to make one article available and another article not available cannot be stated, but some of the general reasons can be stated. The news element is important first. A device or material that has been so long in use and so well advertised that it is generally known obviously is not of much news value; it gains news value, however, if it be applied to a new and unexpected use. A new device that has been described in half a dozen contemporary papers before it is presented for description to this paper has lost much of its news value. This brings us to the question of exclusive publication. An article which has been distributed broadcast for publication is less desirable than one which has been submitted to only three or four papers, and the latter is less available than one which has been submitted to this paper alone.

The manner of presenting the information is another thing that affects the availability of matter of the class being considered. The editor does not wish a page from a trade catalog itemizing the parts, their dimensions, the kind of material of which they are fabricated; these things can be told in trade catalogs and advertisements, the maker should make use of the reading space which he solicits to tell something else. The reading article should tell the nature and purpose of the device or material, its superiority for that purpose and how and why this superiority comes about. Then it should present evidence of the successful use of the material or device in actual work—not a general claim of success, but specific evidence. No better way of doing this can be found than by describing some specific engineering work in detail, bringing in every available bit of data, illustration and comparison that proves the utility and economy of the new material or device in prosecuting this work. Remember that the editor is seeking reading matter of interest and value to his readers first; if this reading matter carries an advertisement—and all reading matter does which mentions the successful use of some device or material—so much the better. But in his eyes the interest and value of the reading matter must exist first, the advertising feature is subordinated.

Most articles of the class we are considering are prepared without thought; they are of the stuff that comes to mind quickest and is turned off easiest. It is rare that an article of this kind comes to this journal which is not partly or wholly rewritten; quite as often as not more information is sought and obtained from the manufacturer and from those who have used his device or product. The article that appears is far different from that submitted by the manufacturer; it is more com-

plete and more useful and instructive to our readers, and frequently the manufacturer acknowledges that it is more useful to him by printing it in place of his own in his trade catalogs and circulars. Now the manufacturer in most respects is in much better position to write an interesting and useful article than is any editor, but it is only occasionally that he does it in the copy he sends out to bid for space in the reading columns of an engineering journal. Did the editor not see in the article received by him an item of value to his readers and for their interest develop the clue, often at much trouble, fewer of these "notices" of commercial devices and products would be published than are now published.

Very seldom does the manufacturer submitting an article for publication make any effort to cater in quality, form or style to the standards of the paper to which he sends it. Every good paper has its standards, and the nearer these standards are met in the article submitted the better are the chances that that article will be published. Only less rarely does the manufacturer make an effort in sending an article for reading space to appeal to the characteristic clientele of that paper. The subscribers to ENGINEERING-CONTRACTING are men engaged in engineering construction; the subscribers to one of our contemporaries are men chiefly interested in machine design. Recently both papers received the same article for publication. We know this because we saw the article in our contemporary, an article which we did not publish because it treated of the mechanical design of the device and not of its applicability, economy and efficiency for doing a certain kind of construction work.
